HANLEY.—Mr. Lewis's report is in 17*l.* for a tabular statement, but it contains a record of very important work. No fewer than 14,450 houses and shops were visited, with the result that 484 notices were issued for the remedying of defects or the removal of nuisances. Twelve new water-closets were provided, 220 pans were placed in old ones; 139 house drains were repaired and cleansed, and 103 sink pipes were reconnected. An immense number of houses were washed, 148 defective spouts were repaired, 83 bins were provided, and 16 were covered or altered for the better. As many as 660 complaints of the non-removal of dust were received and attended to, and 29 accumulations of refuse were disposed of. That seven convictions were obtained for selling milk points to the need of an active administrative provisions of the Food and Drugs Act.

HASTINGS.—Some really important work seems to have been performed by Mr. Inskipp during 1883, but particulars concerning it appear in his annual report in regard to the drainage of the town, he states that 10 of main traps fixed, air shafts and other sanitary improvements carried out by the inspector's suggestions, and much too brief to be satisfactory. In regard to domestic sanitation, Mr. Inskipp reports that 85 houses were inspected, that 12 were provided with new water drain-pipes, that 10 were cleansed and repaired, and that 70 were fumigated. Seventy-six drains were repaired, and 16 new closets were built; 50 accumulations of refuse were removed, and three animals were abated. Some 96 sets of bedding and clothing were disinfected by the authority, to whose hospital 41 infectious diseases were removed. Thirty-five tons of food, &c., were collected for analysis, and a considerable amount of fish was destroyed as unfit for human consumption.

RURAL.—The details of the work completed Thompson in this district indicates that the insanitary conditions received prompt attention. His reports that out of the 129 nuisances notified year 106 were satisfactorily abated. The major these nuisances arose from foul ashpits and offensive accumulations, whilst in several instances drainage or water-supply was at fault. A houses were reported as dilapidated and unfit for habitation, but Mr. Thompson does not record the action taken by the authority in reference thereto, nor explain why, in the case of two uninhabitable houses at Walwick, the proper legal notice was not

NORTON RURAL.—1. Mr. R. Godfrey, the surveyor of this district, has prepared a useful and practical report on the work that has been performed since the date of his last report in June 1882. It sets out in a concise manner the improvements that have been made in ventilating the sewers, the removal of refuse, &c., and gives particulars of the various structural works which have been completed. In connection with sewerage Mr. Godfrey thinks that there is often a local nuisance at a particular manhole causes complaint, and it is not a condemnation of a whole system of sewers because of one or two points. During the period of the year an automatic flushing-tank and a number of water-closets were provided. The removal of refuse, which was formerly left to householders, has been taken over by the sanitary authority, with very satisfactory results. A subject immediately connected with health, the use of means for the extinction of fire is one which the Public Health Act has, in certain circumstances, placed under the control of local sanitary authorities; and in this instance Mr. Godfrey points out the very means which his district possesses in this respect. The report is enhanced by the addition of a list of houses for which plans have been made, an inventory, and other useful statistics. The improvement in the scavenging of this district during the last year by the sanitary authority themselves for the regular removal of house refuse without the aid of the inhabitants. Mr. Clarke, the inspector, reports that since July 1883, 434 ashpits have been cleaned and the refuse removed from one part of the district. The number of nuisances dealt with during the year amounted to 458, no fewer than 119 arising from foul ashpits, and 108 from defective drains. Twenty-five of the water were found to be unwholesome, and samples obtained from wells and submitted for analysis. Fourteen were found bad and unfit for drinking and were pronounced as fair, and but two as unwholesome. Twenty-one persons suffering from scarlet-fever, and one from small-pox, were removed to hospital, and the houses were fumigated after the prevalence of infectious disease. Mr. Clarke briefly summarizes the contents of twenty-three special reports prepared last year, and thinks that the statistics of the year compare favourably with any other district of the county.

WIMBORNE RURAL.—A curious example of the appreciation on the part of the public of the value of the measures in their outward and visible form is given by Mr. J. Osborne, the sanitary inspector of this district in his last report. Speaking of the active manner in which disinfection was carried out in 1883, no fewer than 50 gallons of fluid having been poured down the streets, courts, and alleys of the town, and that the men engaged on the work were given the fluid to every one who applied for it with their own buckets. This was much appreciated by the public, especially in the crowded and filthy districts, and, the inspector adds, it was a sight to see crowds of women and children with carts, with buckets for a supply for the gullies in back yards. But what was done with these

buckets of fluid, and did they effect any real good? An important change for the better was the alteration of the system of night-soil collection, by which the borough was divided into districts, and the contractor required to call at a certain number of houses each morning. In addition to the performance of much miscellaneous work, Mr. Osborne reports that 8,834 feet of sanitary pipe drainage were fixed, that 775 gullies were provided, and that in 309 houses the drains were either laid or relaid. The constant and systematic inspection of the common lodging-houses and other licensed buildings led to much improvement, and a rigid examination of the food supplies of the borough revealed much that was unwholesome and unfit for consumption. Mr. Osborne reports that the refuse destructor proved of immense utility during the year, but he strongly recommends that instead of being used for road making, the residue should be made into mortar, for which it seems particularly adapted.

LIMEHOUSE.—The circumstances of this portion of the metropolis are such as to call for systematic and sustained work, and Messrs. Hurlock and Stace, in their last annual report, show that this has been bestowed on the district. House drainage in particular received special attention, no fewer than 215 drains being trapped or ventilated, whilst 146 were repaired and cleansed, 172 privies and closets were altered for the better, and 9 were supplied with water. As many as 2,950 complaints as to dust removal were received and satisfactorily disposed of, and various offensive accumulations of refuse were swept away. The covering of cisterns was actively carried on, and a number of new ones were erected. Altogether 2,425 houses were inspected, and 2,075 orders issued for the abatement of nuisances and the execution of various sanitary improvements. The inspectors report that in 195 cases information was afforded to the school authorities of the occurrence of infectious disease, and that 210 houses were disinfected. The bakehouses and slaughter-houses were regularly inspected, and two nuisances discovered at a factory were abated.

NANTWICH RURAL.—Mr. J. A. Davenport has written an excellent report on his work in this district as surveyor and engineer. After recording the results of a systematic inspection, and the number and nature of the nuisances abated during 1883, he proceeds to deal with more important subjects. The value of a supply of wholesome water is clearly shown by the marked increase that has taken place in the erection of new buildings, 132 plans having been passed last year as compared with 69 in 1882. Builders have assured Mr. Davenport that they would not have purchased land and erected dwellings had it not been for the public supply of water, and he thinks, therefore, that the sanitary authority may fairly claim to have contributed to the material prosperity of their district. Proper regard was had to the inspecting and certifying of houses under the Public Health (Water) Act, and numerous samples of water were collected and forwarded for analysis to the medical officer of health. The usual inspections were made in connection with outbreaks of infectious disease, and the slaughter-houses were subjected to a close supervision. From every point of view Mr. Davenport seems to have performed much good work, and his manner of reporting it deserves a special word of praise.

ST. GEORGE, HANOVER SQUARE.—Mr. Snooks' report, although in a tabular form, bears testimony to the performance of much useful work. Considerable progress was made during 1883 in improving the drainage of the district. Thus, 24 old brick drains were abolished, glazed stoneware-pipes being substituted, six new drains were constructed, and a number of sinks were trapped and disconnected. Twenty-four closets were supplied with water, 32 were unstopped and repaired, and 27 cisterns were covered. The other items in the report refer to the cleansing and limewhiting of houses, the removal of refuse, and the provision of dust-bins, &c. Numerous visits were paid to infected premises, and, as usual, an enormous

number of articles of bedding and clothing were disinfected. The erection of one of Dr. Ransom's chambers was an important addition to the sanitary organisation of the district.

NEW INVENTIONS.

NEW IMPROVED SLOW-COMBUSTION HOT-AIR STOVE.

MESSRS. STEVEN BROTHERS, of Upper Thames Street, London, and the Milton Iron Works, Glasgow, have recently introduced a new stove of the slow-combustion class, of an economical character, with attractive appearance, and possessing other commendable characteristics. Drawings in section and elevation are appended, by the inspection of which its arrangements will be fully understood. The interior of the stove is lined with thick fire-clay; and the

outer surface is of ornamental cast-iron, formed into a series of hollow columns, which greatly increase the initial heating surface. The heated air, first admitted

cold from the bottom, passes up these columns and out through the perforated top; the central portion of which

is formed into a reservoir for water for moistening the atmosphere if considered necessary. The well known qualities of fire-clay in reference to the accumulation of heat, and its subsequent slow and continuous radiation, have here good practical opportunities and a great warmth is the result, without the unpleasant smell that invariably accompanies a highly heated stove composed of iron only. There are two entrances to the flue—the one direct, but only necessary to be opened when the fire is first lighted for the purpose of drawing it up rapidly, after which this communication is closed by simply turning a handle in connection with a valve or damper, the access being then obtained by the heat passing down side flues, up the middle, and so to the main one. By this means the heat is nearly all extracted before it enters the chimney. The flues are easily accessible for cleaning out, and no difficulty should ever arise on this point. Any kind of fuel will burn in this stove, and if coke be used it becomes smokeless. It is calculated that the heating power of the smallest sized stove $3\frac{1}{2}$ inches high by 17 by 21 inches base—is sufficient for a room of 10,000 cubic feet. The general appearance and construction of this stove are of a satisfactory and ornamental character.

STOBBS'S PATENT SMOKE PREVENTOR.

IN our EXHIBITION RECORD of Sept. 15, we alluded to the Patent Smoke Preventor, the invention of Mr. Wm. Stobbs, since which a medal and certificate has been awarded it, and a company formed for developing it, whose offices are at 16 Duke Street, Grosvenor Square. The object of the invention is to prevent smoky chimneys, and to supply an apparatus that can be affixed to any existing grate as an independent appliance to promote combustion, and reduce the amount of smoke generated by bituminous coal. To accomplish this Mr. Stobbs introduces a kind of hood, so formed that it shall not be an unsightly appearance, that performs the double duty above mentioned, and in outward appearance is not unlike the common draught-plate in use in the Midland counties for drawing up the fire when dull, and that is to be seen in almost every house in those localities. It is only fair, however, to Mr. Stobbs to say that if he took his idea from this simple appliance, he has developed a commonplace article into a somewhat scientific apparatus, changing a fire to a quick draught, or slow-combustion principle, and at the same time arresting a considerable portion of the heat that usually passes up the chimney, and minimising smoke. At the tests taken at South Kensington, under the superintendence of Mr. D. Kinnear Clarke, the testing engineer of the Smoke Abatement Institution, the smoke shade

of this appliance was very low, registering in the mass between 'one and two' of the published colours of density of the Smoke Abatement Institution, which is almost as slight as it could be. The appended illustration shows the appliance resting on a hob-grate.

Where used for one without those additions it is hung from the upper part. Inside the hood is a swinging diaphragm, with a series of gills at the back, forming mixing chambers for the products of combustion; and this diaphragm is pressed forwards or backwards by means of the top knob shown in the illustration, by which means the draught is increased or diminished. The interior of the hood is necessarily filled with hot air, and into it all the products of combustion pass when they undergo a certain amount of distillation, and are rendered partially innocuous before they enter the chimney. Approval of this invention is based on these heads—viz.: That it is entirely independent of the fire-basket or grate itself, thus obviating the necessity of altering the grate, and from the absence of additional flues often difficult to keep clean; that it can be removed at pleasure for keeping the inner parts clean; that it is likely to prove an effectual cure for smoky chimneys, and, as shown, it reduces the amount of smoke to a minimum. The stove appears to burn any kind of fuel with equal facility, and particularly anthracite; and, as an appliance to attach to existing grates to effect the reduction of smoke, may be confidently recommended.

PATENT CAST-IRON INSPECTION OR ACCESS PIPES FOR HOUSE-DRAINS.

THIS pipe, of which an illustration is appended, is the invention of Mr. G. C. Davies, Lausanne Road, S.E., and is intended by the patentee to take the place of the ordinary circular cast-iron pipe, open a sufficient distance of its length and upper circumference for all purposes of inspection, insertion of cleansing-rods, and so forth. The lid or cover for this opening is so formed that when fixed in position the interior of the pipe is perfectly round and clear, the grooves necessary to effect a seal being on the outside. The cement used for making the joint is principally white lead, and this, while making it perfectly gas-tight, does not harden to any extent in use as to interfere with the removal of the cover when inspection is needed. The cover is also screwed down by the aid of gun-metal screws, rendering it doubly secure. It will be observed that as the interior of the inspection-pipe is secured against the admission of any of the surplus cement used in making the joint, no accumulation of effluvia can take place, neither can the joint be broken by heavy flushing owing to the presence of the gun-metal screws.

Fig. 1 is a plan showing the under side of the cover over the inspection aperture, A being the curved soffit forming a section of the inside periphery of the pipe; aa shows the position of the gun-metal screws, for securing the cover to the pipe; D is the groove for receiving the stuffing material for making the gas-tight joint.

Fig. 2 is a plan of the pipe with the cover off, showing the aperture for access, &c.; x being the tongue running round the aperture corresponding to the groove D, in the cover.

There are several advantages claimed for this invention, and they appear in the main to be well-founded. Economy and simplicity are two, as the presence of manholes and open channels is dispensed with, and the foul gas area of

the drain is reduced to the minimum. The effectual flushing of the drain is secured, and the cleansing rods can be worked with ease. The benching up of the sides of the manhole chamber, and the expense of an air-tight door on the top is obviated, the ventilating pipe necessary to the open inspection chamber is not required, and a stone, common iron door, or grating is all that is necessary. Cast-iron pipes are not likely to be damaged as stoneware ones, and the patent inspection pipe being made of the same sizes as stoneware drain-pipes, can be used with them, so that disturbance of the other pipes is not neces-

Fig. 3 is a transverse section enlarged scale through the centre of pipe A, showing the inside of the cover when fixed in position on the pipe; B the gun-metal screw; C, the eye at each end for lifting the cover; D the groove and tongue gas-tight joint running round the inspection aperture.

sary. The superiority of cast-iron over stoneware pipes for house drains is now an admitted fact, though, perhaps, somewhat tardily admitted. There is no doubt that Mr. Davies's inspection pipes supply a want in connection with the system of drainage, and possess several points of interest to those engaged in the laying of drains generally.

DISINFECTING CANDLES.

YOUNG'S Paraffin Light and Mineral Oil Company, the head offices of which are at 30 George Square, Glasgow, may be complimented on the success they have secured by the introduction of their disinfecting candles, which in appearance are sufficiently elegant for the drawing-room, whilst their cost does not preclude their use by the general public. The light given by these candles is as good as in the highest standard candles; and by the incorporation in their manufacture of carbolic acid and similar substances, an aromatic odour is given off wherever they are burnt. Although more particularly intended for sick rooms, or where contagious disease exists, these candles may be used under all circumstances, without any disagreeable accompaniment of disinfectant odours.

CEYLON TEAS.

It may not have been generally known until the 'Healthies' popularised the fact, that really fine tea is grown in the island of Ceylon, many of the planters having transferred their attention to the cultivation of tea in preference to coffee. The public are indebted to a late governor of the island, Sir William Gregor, and a few gentlemen connected with the Ceylon trade, for the opportunity now afforded them of obtaining the tea in a pure state, a Ceylon Tea and Coffee Agency having been established by Messrs. Wolstencroft and Forster, Imperial Arcade, Ludgate Circus. These teas vary in price from two to three shillings per pound; the three-shilling tea has a very fine flavour, somewhat akin to the India teas, though in the opinion of the writer more likely to please the English palate. These teas are, like those of

Indian growth, different in flavour from the Chinese kinds, and require a little 'education' of palate or 'acquired taste' to render them popular. A very short acquaintance will, however, in the judgment of the writer secure this requisite, and if people would pay a little more attention in the infusion of the tea-leaf generally, they would secure a much more aromatic beverage. The Ceylon tea sold at 3d. per cup at the Health Exhibition was extremely good, and was of the same quality leaf as now sold by this agency. Besides teas, Messrs. Wolstencroft & Forster sell pure Ceylon Cocoa in powder, from which a quantity of the superfluous oil has been extracted—a concentrated preparation which will compare favourably with the finest to be obtained. Ceylon Coffee is also imported by this company, and sold either in the berry or ground. Reverting again to the teas, those families whose consumption of tea or means enables them to purchase in original packages of 'caddy,' half-chest, or chest, will have a considerable reduction made to them, whilst they will have the patriotic consciousness that they are helping to foster one of the important industries of our own possessions.

REVIEWS.

House Drainage and Sanitary Plumbing. By W. M. PAUL GERHARD, C.E., Newport, R.I.

House Drainage as Constructed by the Durham House Drainage Company. Reprinted from *Engineering News*. New York. 1884.

Sanitary Drainage of Tenement Houses. Hartford, Conn. 1884.

Hints on the Drainage and Sewerage of Dwellings. New York. 1884.

ONE rises from the perusal of such works as these with feelings of candid admiration, and it would be difficult to imagine a series of publications—which are all by the same author—without acknowledging that sanitary science is deeply indebted to him for the systematic manner in which he has probed its depths and measured its influence. The works before us exhibit a complete familiarity with the sanitation of which he treats, the drift of which will be easily seen by the mention of his works. We do not think that the matter of scientific sanitation has been treated in any country outside of England, France, or Germany in a more comprehensive manner, and when we consider that our author has—over and above the exigencies of his own climate—dealt with the broad question, we acknowledge he has done so in a manner worthy of commendation. It would be needless and useless to discriminate between the contents of the four publications now before us, for they are simply compacted of reason and experience, and must commend themselves to all reasonable minds. The only way to ascertain the value of these works is to read them; for although the leading matter of each is germane, and slightly identical, there are points in each publication, which require a special attention on the part of a careful reader.

The author may safely associate his claim as a teacher of sanitary science with the production of his last-mentioned work, because in it will be found nearly everything which an ordinary sanitary practitioner, clerk of works, or inspector might be fairly asked to command from his points of knowledge. We may even say more than this, and aver that not only the humbler and necessarily less penetrating students will find pabulum for the mind in these pages, but the more abstruse and inquiring minds will find much to gratify, satisfy, and recollect.

Taking the last volume of Mr. Gerhard's, we are first of all struck with its table of contents, for it apparently ranges over the whole subject of sanitary science as applied to house building. The results due to sewer-gas, caused by defective plumbing—of which Mr. Ernest Hart and others have been discoursing in most serious manner—will be

found to have here a place. The defects of the soil and waste-pipe system are set forth in a very succinct manner and we are pleased to see that unventilated soil-pipes are properly treated. As regards traps—technically so-called—our author is very sound, and when he treats of the security of the water-seal, with its possible evaporation and syphonage, he must be credited with a thorough knowledge of these everlasting drawbacks to a house, and especially a house in which there is a perpendicular tier closets. In respect of the pattern of closets, he may be taken as an authority, and we say this because we can see that he is in concord with all the best authorities. We are gratified to find that our author—after commensurate study of the question—has approved of the system of employing rigid cast-iron piping, and we are especially gratified to find that the fresh air inlet system with its corresponding outlet delivery—whereby a constant current of air is maintained in the drains—has not been neglected.

Works upon drainage of all descriptions must, as matter of course, more or less repeat themselves, and we will not seek, on principle, to follow our author into all the worried details of pipes, bends, and junctions, but we may safely advise our many readers that this and other cognate subjects are comprehensively treated in special pages. We especially recommend our readers, when dealing with the last-mentioned work, to carefully study the chapter which deals with the removal and disposal of household wastes.

Our space forbids us to mention at greater length any list of the subjects which are treated in these four volumes by our author, and, although we must admit that much of the material contained therein is concretionary in its character, Mr. Gerhard's works will benefit the rising generation, especially in America.

The Report on the 'London Water Supply' for the Year 1883. By Mr. W. CROOKES, F.R.S., and Drs. ODLING and TIDY. London: Wertheimer, Lea, & Co.

THIS report contains much interesting matter—very much that is especially interesting to chemists in the way of novel methods of analysis and of reporting the results thereof, and a great deal also which ought to be considered of universal interest and importance, particularly at the present time. In this latter category, as it seems to us, falls the discussion of the learned authors upon the practical importance of the dissolved organic matter in water.

In the first place, the fallacy of attempting to fix a common standard of comparison for river waters and well waters is clearly and emphatically demonstrated. Without attempting to explain completely the fact that river waters invariably contain more dissolved organic matter than the water of wells, unless the latter are directly contaminated by some gross supply of excrementitious matter, it is in all events easy to assign some reasons for the essential difference between them. Consider, for example, the more abundant population—if we may use the term—the waters of rivers. If undefiled by human agencies such as waste from mills, manufactories, &c., the waters of rivers teem with fish and infinite varieties of infusorial forms of aquatic living beings. We know of no living beings whose tissues are not liable to undergo changes of composition by oxidation, &c.; these changes must inevitably result in the production of waste matters, which being worse than useless to the living being, are cast into the surrounding medium. These excrementitious matters are, of course, to a large extent organic—that is to say, they are compounds of carbon, nitrogen, hydrogen, and oxygen, and many of them yield 'albuminoid ammonia' when the water containing them is boiled with a mixture of caustic potash and permanganate of potash. The water of wells is, of course, not devoid altogether of animal life, but such waters are not adapted to the life of fish or the higher forms of aquatic animals, which require large

runs for the exercise of their organs of locomotion, and even in some cases the possibility of a periodical visit to the ocean. And surely these higher (and considerably larger) forms of aquatic existence must produce larger quantities of organic debris.

Granted that rivers are more liable to receive the organic matters washed by rain off the soil in the neighbourhood of their banks than the waters of deep wells; still, if there be anything in the view that organic matters undergo oxidation by contact with water holding air in solution, a view which is now practically adopted by all chemists, little of this can reach the river in an unaltered condition, except in the case of very violent and continued floods, when the water of the river does usually suffer to some extent as regards its degree of purity from organic matter, and even then the incompleteness of the process of oxidation during percolation through the soil is to a large extent compensated for by the enormous dilution which the organic matters receive by the purest natural form of water—the rain itself. In fact, the question of the advisability of drinking the water of any river resolves itself into a consideration rather of the *source* of the dissolved organic matter than of its actual quantity. Let us quote from the official report:—

‘Whether or not variations—it may be relatively large, but always falling within the limit of a very small absolute quantity per gallon—are matters of any real significance must obviously depend on the character of the dissolved organic matter present, &c.’

Who would be afraid of being infected with cholera by imbibing in a glass of water a small fraction of a grain of organic excrement derived from a healthy salmon or trout? Nature surely intended the waters of rivers to be used by man for drinking purposes, and obviously tends to keep them pure and fit for that object by numerous and never-ceasing processes, such as the respiration of aquatic plants, oxidation, &c. But the most fearful scourges of mankind proceed from members of his own race. Human excrement must not be allowed to enter our rivers, at all events above the sources from which the water supply of towns is drawn. And, however cheering may be the reports of accomplished chemists as to the nature of the water supply of London, Londoners cannot feel perfectly happy on this subject so long as they know that the towns of Henley and Staines are still to some extent drained into the river, and that numerous house-boats are still permitted to defile the stream along its whole navigable course. We are glad, however, to learn from Sir Francis Bolton's report, dated June 1884, that the contributions from Henley and Staines are to be arrested, though we see no mention therein of the house-boat nuisance.

We feel sure that the perusal of the Report on the Metropolitan Water Supply will inspire our countrymen with confidence and tend to prevent the occurrence of that state of mind, most disastrous at all times but more particularly in periods of real or threatened epidemics, known as panic.

Healthy Schools. By CHARLES E. PAGET. (International Health Exhibition Handbooks.) London: William Clowes & Sons.

THE questions of school hygiene are so various, so hotly contested, and so beset with practical difficulties, that nothing short of a wide and personal acquaintance with the circumstances, arrangements, and management of schools can enable anyone to discuss them satisfactorily. We would even go further, and venture an opinion that the work should have been committed to two men—one a medical member of a board of public elementary school managers, and the other medical officer to a high—*i.e.* a large boarding school. Though entertaining a high opinion of the abilities and promise of the author, we are at a loss to conceive why the preparation of such a handbook should have been entrusted to him, since, beyond having been a ‘public schoolboy,’ he has certainly had no

opportunities of acquiring the special knowledge demanded. The book is pleasantly written, but, as might be expected, contains nothing new or striking. It is a mere compilation, but a writer who cannot speak with the authority derived from personal experience might have given us a larger mass of facts and figures from other sources—as from the educational systems of France, Germany, and America, from which we may learn much both by way of example and of warning.

Mr. Paget very properly insists on the grossly defective air-space, and ventilation of elementary schools, but does not seem to be aware that what he rightly calls ‘the terribly low allowance of 120 cubic feet’ per child is the comparatively liberal allowance of the London and other School Boards, the amount prescribed by Section 96 of the Code being only 80!

On everything connected with schools for the upper classes the book leaves little to be desired, though to the description of the sanatorium devised by the author, and exhibited in the School Section of the Exhibition, a code of regulations for the management of outbreaks of infectious diseases, such as those so clearly expounded by Dr. Alder Smith at the Conference on School Hygiene, might well have been added. But from Mr. Paget's want of personal acquaintance with the working of the Education Act and Code, we look in vain for any attempt to grapple with the greater and vexed questions of the relations between the health of poor children and school work, the medical aspects of the pupil-teacher system, and the management of epidemics among the children in attendance. Nor is there a hint as to the medical inspection of schools, a question which is attracting the notice of hygienists and educationalists at home and abroad, and which, if fairly carried out, would go far towards the solution of the rest.

Water and Water Supplies and Unfermented Beverages.

By JOHN ATTFIELD, Ph.D., F.R.S., &c. International Health Exhibition Handbooks. London: William Clowes & Sons.

WE have read with much pleasure and profit Dr. Attfield's admirable handbook, in which he has condensed within the small compass of little more than 100 pages all that a layman needs to know concerning that most important compound, water.

Whilst the handbook may be recommended to the uninitiated and the general public as embodying the soundest teaching which the science of our day can give, the scientific reader will find much to admire therein, from the courageous manner in which the author advocates cremation, knowing it to be opposed to what he truly calls ‘a misguided sentiment, an ill-guided superstition, or simple ignorance,’ which are all lamentably prevalent, to the masterly way in which he expounds the intricate and difficult problem of the contamination of water with organic impurities, so that he who runs may read.

In treating of the properties of water, the author first enunciates briefly but accurately the ascertained scientific facts concerning any given physical or chemical characteristic, and then gives illustrations of practical effects of such property or behaviour of water upon the grand phenomena of nature, or the utility of the compound to mankind. In describing the varieties of water from different natural sources, the reader becomes familiarised, not only with the nature and sources of the substances found in solution in such waters, but also with the *modus operandi* of the grand processes by which natural waters undergo purification from what might otherwise be injurious ingredients: and is thus prepared to understand the chapter on ‘Water Purification,’ in which it is seen that the same processes are employed by man for the same purposes. In short the human artist in this, as in all other branches of industry, should sign himself, in all humility, ‘a long way after Nature.’

The fourth section of the handbook contains some valu-

able and interesting information on the subjects of tea, coffee, cocoa, and milk.

In the interests of humanity and of sanitary science, we hope that Dr. Atfield's work will be widely distributed and diligently read.

Sanitary Questions. By WM PAUL GERHARD, C.E. Hartford, Conn., U.S.A., 1884.

WE know that America is well advanced in sanitary proceedings, and this pamphlet, which hails from the other side of the water, is a *résumé* of the views to which we are well accustomed here. It is reprinted from 'Cottages, or Hints on Economical Buildings,' but economy and perfect sanitation can scarcely go hand in hand, and some of the suggestions made are of a very expensive nature. For instance, referring to *ground air*, which has a tendency to rise into the dwelling, especially in winter, owing to the warmth of the building, it is advised that if there be no cellar, the dwelling should never be placed immediately on the ground, but must be raised on piers, arches, or posts sufficiently to allow of a large air space and perfect circulation between the surface and the floor beams. This will at the same time prevent the quick rotting of the joists and floor boards. To prevent the rapid cooling of the basement floor this should be laid double with an intermediate space filled with a non-conducting material, such as mineral wool. To adopt a process of this sort of course means a considerable addition of depth of space and material, and these are points which are ruthlessly cut down when the estimates are found to be higher than expected, and these high estimates are the experience of those who indulge in the luxury of bricks and mortar. Our Metropolitan Building Act insists upon the whole area of the building being covered with a 6-inch layer of concrete, but we are here advised to supplement this with a quarter inch layer of hot asphalt, and on top of this a finish of Portland cement. This is indeed making assurance doubly sure, but it must be paid for, and for small buildings these luxuries would debar any reasonable pecuniary return upon the outlay. Among the damp-courses mentioned are slates bedded in cement, and layers of tarred roofing-paper; both of these are certainly cheap, but they are comparatively ineffective; experience in England goes to prove that tarred felt in a position like this is very apt to rot. Asphalt, of course, is recommended, and rightly so, as it is one of the best known substances to prevent damp from rising. The water-supply of cottages is next mentioned, and the why and wherefore of the different sources and means of distribution are fully capitulated, and attention is drawn to the use of drawn seamless brass tubes, which are used for hot-water pipes in some of the Eastern States. The only advantage over lead would seem to be their neater appearance and less liability to sag, although changes of temperature affect brass pipes by expansion and contraction, causing leaky joints. Such pipes, if used for drinking water, should be tinned on the inside, but then again the question of expense would preclude the general use, the more so that the advantages of the more expensive material are, to say the least, problematic. A useful suggestion is recommended, even in the smallest buildings, to have a plan showing the exact size, material, and location of all water-pipes, stopcocks, faucets, cisterns, &c. This would often facilitate an inspection if required, but unfortunately a completeness of this description usually falls upon deaf or unwilling ears. Some elaborate, yet sensible and practical remarks, upon household wastes and sewerage are given, and earth-closets and plumbing fixtures are summarised for and against, and are likely to be useful to the uninitiated who may be willing to learn. The system of sub-surface irrigation is adverted to—e.g. to place a series of common 2-inch drain tiles in parallel lines about 10 inches below the surface of the ground, and distributing the sewage water intermittently through such a network of pipes into the ground, where it is acted upon by the vegetation, and purified by the earth acting as a filter. This system is explained as being also practical when water-closets are

used inside the house; but in this case the solids should be intercepted in a small receiving reservoir, which must be frequently cleaned, otherwise the distributing tiles will speedily choke and create a nuisance by ceasing to work. This brings to mind the principle advocated elsewhere in America of binding loose joints of drain-pipes with men's bands, by which means the sub-surface water may be strained through the muslin and the sand, and other matter kept back. This seems to be a delicate treatment of a rough subject, and almost an ultra-refinement, as any uneven settlement of the pipes would give the muslin but a poor chance of withstanding the strain; and the question would also arise as to the length of time that such a flimsy material would effectually serve its purpose on its own merits. Although not mentioned in the pamphlet, the idea is probably known to the author, and any experience or views on the subject would have been asial.

The principles of warming and ventilation which are carried out so systematically in the new country are likewise discussed, and the difference is noted in the adequate performance of the work of open fireplaces under varying conditions; and it is agreed that an open fireplace which may be effectual in warm climates, is entirely inadequate to warm *per se* cottages in the Eastern, Northern, and North-Western States. Close stoves are naturally enough condemned, inasmuch as ordinarily arranged they make the worst possible devices for warming the air, for they remove practically none of the vitiated products of heat, ventilation and warming cannot in this case be one and the same thing, or at least be inseparable. The author, however, states that these stoves are the usual and most economical means adopted for heating small cottages and suburban dwellings in the country. With a working description of hot-air furnaces we come to the end of a series of facts and theories, which, although generally understood, are useful reminders upon a subject of all-round interest.

UNPATENTED INVENTIONS.

HAVING in the practice of my profession observed that exhibitors of unpatented inventions at international and industrial exhibitions are not generally aware that their position is affected by certain provisions of the 'Patents, Designs, and Trade Marks Acts, 1883,' I beg to point out through the medium of your paper that the six months' protection of unpatented inventions so exhibited is no longer accorded unconditionally, such protection being now obtainable only by compliance with Sect. 39 of the above-mentioned Act and Rule 17 of the 'Patents Rules.' Details of the mode of procedure may be obtained from the proper official sources of information, or I will supply information without charge on application.

W. T. WHITEMAN,

Fellow of the Institution of Patent Agents.
7 Staples Inn, W.C., November 21.

VENTILATION AND VENTILATORS.

Referring to Mr. W. P. Buchan's letter in your November number, p. 241, we would suggest a competitive test, on some such basis as the following:—

1. That the term 'ventilator' be understood to mean 'The apparatus from the point where the plain shaft enters to the extreme summit of such apparatus.'
2. The 'ventilator' to be capable of being contained within a cube of given dimensions.
3. The U-tube used for testing to rest on a pivot, so that it could be rotated as occasion demanded—(i.e. to insure the wind blowing directly through the U-tube).

ventilator being allowed to get to windward or to leeward of the other.

4. The circumference of the shaft immediately below the 'ventilating heads' to be marked off in eighths of a circle, numbered 1 to 8, and tests to be made in each of the eight positions.

5. Eight tests to be taken with ventilator 'A' on arm '1' of the U tube, while ventilator 'B' is on arm '2,' and eight more tests to be taken with the ventilators transposed.

On some such basis as urged in this and our previous letter, p. 189, a reliable result could be obtained.

For our own part, we are willing to enter into competition with any firm who will agree that the loser shall forfeit a specified sum of money to a given charity.

This suggestion seems to us more practical than making statements to the effect that 'We have obtained . . . medals,' that we were 'unaware that such and such tests were taking place,' or that 'our ventilator is the best in the market.'

With regard to the U tube test not being a new idea we did not for one moment suppose that it was. Our aim is not so much to seek after novelty, nor to lay claim to originality, as it is to endeavour to become apt exponents of laws which are founded on natural phenomena.

SHARP & CO.

AWARDS FOR VENTILATORS AT THE HEALTH EXHIBITION.

With reference to the inconsiderate letter of Robert Boyle & Son in your issue of the 15th, I may state that the writers are much in error so far as I am concerned, at least, as testing engineer to Jury 10. 1. They *did* know that tests were to be made of ventilators. 2. They were *not* excluded from the testing-rooms. 3. They were invited by me, in a letter dated Sept. 9 last, for the Jury 10, to send their ventilator for testing in the same terms in which other invitations were issued. I hold their acknowledgment of receipt of that letter of invitation, dated Sept. 12, in which they state that they cannot comply with my request. 4. 'The bottoms of the pipes attached to the ventilators' were not inside the 'tube' as they call it, which was 10 feet in length, not 8 feet. They were outside, and completely isolated from the action of the current.

As for their threat of sifting something to the bottom, let them sift away. They may come to a mare's nest.

D. K. CLARK.

8 Buckingham Street, Adelphi, London, W.C.

November 25, 1884.

In your issue of November 15 we see that Messrs. Robert Boyle & Son appear to be suffering most acutely from their failure in obtaining the principal award for ventilators at the International Health Exhibition; but we have no doubt most ventilator makers will agree with us when we state that this is the first exhibition in England where ventilators have been *tested* in the proper sense of the word. In compliance with a written invitation from the testing engineer, acting on behalf of the International Health Exhibition Jury No. 10, we sent a nine-inch ventilator to the testing-house, No. 10 Moreton Gardens, having first called to ascertain the mode by which the proposed contest was to be carried on. Finding that the *modus operandi* was as fair for one ventilator as another, whether of the form of Messrs. Robert Boyle & Son, other makers, or our own, we decided to send our ventilators. Now the purport of our present remarks is *solely* to refute mis-statements contained in Messrs. Robert Boyle & Son's letter—the good taste it displayed we leave your readers to judge. The tests were certainly not carried out in the manner stated by Messrs. Robert Boyle & Son. When our ventilators—the Rotating Cowl and the Fixed Final Ventilator—were delivered at the 'testing-house' our

representative noticed that several other makers had previously sent their ventilators. He inquired if Messrs. Robert Boyle had sent. The reply was in the negative. Inquiry was then made whether invitations to this contest had been sent to *all* exhibitors of ventilators, and an affirmative reply was received. After this, inquiry was made at Messrs. Robert Boyle & Son's exhibit whether they intended to send one of their ventilators to the testing-house, and their representative's reply was 'Oh, no; our ventilators are sufficiently well known to the jurors,' &c. It is, therefore, clear that Messrs. Robert Boyle & Son must have been aware that tests were being made, even assuming that their invitation to the contest did not reach them. We have before challenged Messrs. Robert Boyle & Son to a single combat, and we now do so again on the same terms; the loser to pay expenses of contest, and to forfeit his or their 100%, which shall be paid to some charitable institution; and *we* will further agree to forfeit the medal which has been awarded to us at the International Health Exhibition if we are the losers. This challenge to be taken up within one month from date, after which time (if not taken up) we shall consider that Messrs. Robert Boyle & Son admit the superiority of our ventilators over their so-called 'Self-acting Air Pump' ventilators.

We regret being obliged to ask you for so much of your valuable space, but we do so in the interest of fair play and truth.

BROTHERS & CO.

11 Billiter Square, E.C.

Upon first reading Messrs. Robert Boyle & Son's letter of complaint, stating (as they do on page 241) that they were *not asked* to send in their ventilator to be tested, and that they *knew nothing* of the tests until *after they were completed*, I felt somewhat inclined to sympathise so far with them, and more especially as I was disappointed at the absence of their ventilator from the testing-room, having looked forward to the chance of showing that my ventilator had again beaten theirs in the testing match.

Seeing, however, that Mr. Clark, the gentleman who conducted the testing, asserts that not only were Messrs. Boyle invited on Sept. 9 'to send in their ventilator for testing,' but he also holds a reply from them declining to do so, it is very curious, to say the least, how Messrs. Boyle can write as they have done.

Their ignorance of the testing of the ventilators that was going on, or was to be made, is all the more difficult to believe in, seeing that Messrs. Banner Bros. & Co. state that, observing the absence of Messrs. Boyle's ventilator from the testing-room, they called at Messrs. Boyles' stand at the Exhibition and spoke to their representative there on the subject. Under these circumstances, and as Messrs. Boyles' principal place of business is in London, it appears to me that no one is to blame for the absence of their ventilator from the International Health Exhibition tournament except themselves. Had they had the slightest anxiety to be present, and had faith in their ventilator carrying all before it, they should have been there. To stay away from the fight, and then after all is past fill every journal with their laments at not having had a chance to display their wonderful prowess, throws even the redoubtable Falstaff into the shade.

Messrs. Boyle say they 'understand' the method of testing was a farce, and that a tube '8 feet long by 3 feet square' was used, and that the pipe of each ventilator was inside the testing tube as well as the body. Now, the tube was not '8 feet long,' neither was it '3 feet square,' and the foot pipe of each ventilator was not inside the testing tube. Seeing they have made so many mistakes upon hearsay evidence, their opinion upon the method of testing cannot count for much, and more especially as it was not made known until all was past. I think, as one who did go in for the testing, that as Messrs. Boyle were absent from it their opinion on the subject is quite uncalled-for and superfluous.

It is true the method of testing was not what it should have been, but it was, or is, for those who sent in their ventilators to complain if not pleased.

Being in London on Oct. 20 to attend the Plumbers' Congress I looked in for a few minutes at the testing-room, it happening to be the last day of the testing, and saw the *modus operandi* of testing, and considered it was bound to give misleading results, so I asked Mr. Clark to have two of the ventilators tested inside in his style—say my ventilator and any other he liked—and then test the same two against each other by exposure to the wind above the roof, and thus compare the results; but he said he had no time for that. I therefore looked in again at the premises next morning and measured them, also the apparatus for testing, and afterwards wrote to the jury objecting to the method of testing as being likely to give misleading results. This letter was posted in London on the morning of Oct. 23, and was received by the secretary, but no reply from the jury has come to hand till this date. I asked that no awards should be published for exhaust ventilators until better experiments were made, but I expect the jury had dispersed before my letter arrived on Oct. 23.

The testing was made altogether *inside* a small room only 22 feet long. Two hand-driven fans, each with 8½ inch dia-delivery-pipe, were set up at one end, which blew air into a 10 feet long wooden tube, 3 feet high by 2 feet 6 inches wide at end nearest the fanners, and 4 feet high and 2 feet 6 inches wide at other end, which was only about 5 feet back from the solid wall. The ventilators to be tested were placed one at a time at end of tube farthest from the fanners. The effect of this arrangement was that, while the small-bodied ventilators showed pretty well, a larger sized one was placed at a disadvantage, owing to the tube being too narrow, and the dead wall in front of tube not allowing the wind to get forward to exert any pull upon the front of the large sized ventilator. In short, testing one of the small ones against my 22 inches in body one was like setting a tug-boat to run a race with a six days' Atlantic liner in a farmer's duck-pond.

We were asked to send in a ventilator for a 9-inch pipe, so, expecting Messrs. Boyle might perhaps send in a 27-inch one, I risked a 22-inch one, but, had I known the style of the testing, I would have been better with only a small 15-inch or an 18-inch one, or perhaps better still with my *chimney can*!

Some of the competitors saw the testing-room before the testing began, and so had an advantage over provincials like me who did not; while some again sent in *two* ventilators to be tested, and so had a double advantage. How my one managed to get a medal even under the untoward circumstances in which it was tested I do not know. Only had it got the ghost of a fair chance there was nothing I saw that I believe could have come near it. I intend to have some *open air* tests made to see as to this.

W. P. BUCHAN.

21 Renfrew Street, Glasgow.
Dec. 4, 1884.

We are not going upon the lines of the counsel, who when one finds the case going against his client, immediately turns round and abuses counsel on the other side. No one can offer Mr. Kite heartier congratulations than we do on his success, and we think whoever knows him as well as we do will think him well deserving anything good conferred upon him. He is a man who attends to his own business, and leaves others to attend to theirs, and we are at a loss to see how Mr. Kite can in any way be held responsible for the acts of the jury or the scientific gentleman who tested the ventilators. We do accuse them point blank of unfair actions, and to this they have pleaded guilty. If a criminal hears a charge brought against him, and the judge asks him what he has to say to the charge, and he keeps silent or answers 'Nothing, my lord,' that is in fact

a plea of guilty. The following correspondence shows they have no other plea to put upon the record will be seen in their answer to our inquiry. We did ask them or hint at their altering their decision, but did ask to be informed why we were prohibited sending a ventilator to be tested, and to this they have ventured one word of reply. If there was any reason why we should be so treated, what could be easier than for them to have revealed the reason? We asked no questions why the awards were so. We never questioned their right to do so. We express no dissatisfaction at the awards they made. Still we give our opinion, and shall say something about it at a future time. No. We asked the simple question which have totally failed to answer.

The following is a correct copy of our letter and replies thereto:—

Ours to E. C. Owen, Oct. 27, 1884.

Owen to us, Oct. 28, 1884.

Winter to us, Oct. 31, 1884.

Winter to us, Nov. 28, 1884.

[COPIES.]

International Health Exhibition
(No. 1,070, Class 25).

October 27, 1884

Edward Cunliffe Owen, Esq.

Dear Sir,—As an exhibitor and competitor in the class, I feel it my duty to ask for what reasons I was invited to send a ventilator for the purpose of being tested. I am informed by other exhibitors that only all except myself had that privilege. If there is any reason why I should be prohibited from competing should be very glad to know. Seeing that every exhibitor has some award, I know nothing of the award except by hearsay. Your attention will oblige
Yours truly,
EDGAR ALDOUS

[REPLIES.]

International Health Exhibition
South Kensington, S.W.

October 28, 1884

Dear Sirs,—I beg to acknowledge the receipt of letter of the 27th instant, which I will place before the Jury Commission.—I am, dear sir, yours truly,

EDWARD CUNLIFFE OWEN
Secretary.

Messrs. Edgar Aldous & Son,
I.H.E., No. 1,070, Class 25.

International Health Exhibition
South Kensington, S.W.

October 31, 1884

Jury Commission.

Dear Sirs,—I beg to acknowledge the receipt of letter of the 27th inst., which shall receive attention.
Yours faithfully,

THOMAS WINTER,
Jury Superintendent

Messrs. Edgar Aldous & Son.

International Health Exhibition
South Kensington.

November 28, 1884

Sirs,—I beg to inform you that your letter of Oct. 27 has duly been considered by the Jury Commission, and that they have decided, after consulting with the rest of the Jury No. 10, that no sufficient grounds exist to interfere with the awards of the jury.

I have the honour to be, sir,

Your obedient servant,

THOMAS WINTER,
Jury Superintendent

Messrs. Edgar Aldous & Son.

We are inclined to think after getting such a reply to our letter of Oct. 27, any unprejudiced mind must be

conclusion that we were not only badly treated by being prohibited from sending a ventilator to be tested, an insult is added thereto by the responsible parties giving a semblance of a reason in their answer to our query, and this cannot fail to open the eyes of your readers to the conduct of gentlemen who act as jurymen at exhibitions. In our letter to the *Architect* journal of the 22nd last, we challenged the accuracy of Messrs. Boyle Bros.' statement that they had been informed by official authority that everyone had been invited to compete; that firm has not verified their statement. As we again declare we had no invitation to send a ventilator for testing, and the Jury Commission have not ventured their reply to say we had; therefore this must be a conspiracy. Consequently our Ventilator has not been beaten by any of the number at the Health Exhibition, and the public will please understand the reason why our names do not appear in the list of Awards—viz. for the reason we were not allowed to compete, otherwise we have no objection about the matter.

EDGAR ALDOUS & SON,
Ventilating and Sanitary Engineers.
Elmhurst, Upton Lane, Forest Gate.

As winners of the highest award, the Gold Medal for Intake and Exhaust Ventilators, class 25, we shall be glad if you will kindly permit us to give our views on the matter, as, if the testing is to be considered a farce, any result we might naturally expect to derive is gone.

We regret that, from whatever reasons Messrs. Boyle's ventilators were not tested, such omission took place, but in contention that the tests were useless certainly negates that complaint. With regard to testing ventilators really we will not express our opinion on a subject on which those who should be better judges than ourselves do not appear to agree. With respect, however, to the test employed by Mr. Clark, we would ask if its conditions did give a fair chance to all the competing ventilators. Anemometer testing may not be accurate as regards the individual capabilities, but taken comparatively would it be calculated to show a correct result?

A weighing machine might be a few pounds out, but could tell by it which of a certain number of pieces was weighed the heaviest.

We do not see how any artificial test could be applied to the air currents ventilators are subject to in use on various parts of buildings, and therefore a simple test by which all stand an equal chance seems to us a perfectly fair means of arriving at a result. Under any circumstances there would be an outcry from the losers, a practical test of any kind gives a priority to the meritorious beyond awards, made from reasons only known to the judges themselves. An advertisement of one of our correspondents refers to a so-called ventilation competition in which the firm in question was successful of which we had not previously heard, but from enquiries we believe the entries were very limited, and that there was no test whatever.

We are sure this kind of thing is more calculated to lead the public than the awards at the Health Exhibition, which the same firm deplore principally we believe that ground.

We feel assured all right thinking people will deplore the attacks made on the jury and tester. They had a difficult task to perform, and there is not the slightest doubt that they did it conscientiously and with every desire to reach a right decision. We do not believe that they were unscientific or incompetent; and however much the system is criticised, it should be borne in mind that the jury was set them, that they were selected as men of ability, and that they did their best without malice or ill-will.

C. KITE & CO.
Christopher Works,
Chalton Street, Euston Road, London, N.W.

We observe in several contemporaries that our statements with respect to the non-invitation of certain exhibitors of ventilators to the testing, and the farcical nature of the tests, are fully corroborated by other exhibitors who were also *not invited* to the tests. On the face of this, how can it be asserted, as it is, that *all* were invited?

The more light that is thrown on this lamentable fiasco shows but all the more conclusively that there has been, to put it mildly, sad mismanagement somewhere, and it is only right, seeing that this is a public matter, that the public should know who is responsible for it, and also that measures should be promptly taken to secure the rectification of the blunder which has been committed, otherwise a lasting reproach will not only rest upon the conduct of Jury 10 and their testing engineer, but upon the Health Exhibition itself, and an injury will be done to the cause of sanitary science by bringing it into ridicule and contempt with the public that will take many years to eradicate.

As showing the opinion of the press on the matter we beg to give an extract from a lengthy 'leader' which appears in a contemporary:—

'In view of the remarks of Messrs. Boyle & Son, published in our present issue, it would appear that some strange mismanagement has overtaken the jury which decided the "Ventilation" awards at the Health Exhibition. If, as Messrs. Boyle say, their well-known ventilators were not included in the list of apparatus tested, and if their position as competing exhibitors has thus been practically ignored, we certainly feel entitled, in the interests of "fair play and no favour," to ask for an explanation of these anomalies. We approve of the demand of Messrs. Boyle, not only on account of the alleged grievance of that firm alone, but of all other firms who have competed in the section alluded to, whether they have received awards or not.

'No firm of inventors can have the slightest satisfaction in receiving any award the fairness and impartiality of which can be called in question. We are certain, therefore, that we only re-echo public sentiment and professional opinion when we ask that such a matter as that to which attention is being directed should be fully investigated. If exhibitions and their juries do not obtain the confidence of the public, the mainstay of these institutions is at once sapped and destroyed.'

A correspondent who signs himself 'An Architect' says 'it is to be regretted that gentlemen more practically scientific were not appointed to adjudicate on ventilators at the Health Exhibition.' And he asks, referring to the tests, 'Could any greater farce in the name of science be enacted?' All that we can say in reply to this query is, 'Time will show.' We believe, after what we have seen, that anything is possible in these days.

64 Holborn Viaduct, ROBERT BOYLE & SON.
Dec. 1, 1884.

THE INTERNATIONAL HEALTH EXHIBITION AWARDS.

I have observed in your columns complaints made by exhibitors in respect of the awards made for ventilators and filters, and I now beg to protest against the awards made in respect of the disinfectants exhibited at the Health Exhibition.

No practical investigation of the comparative merits of the different exhibits, as antiseptics, disinfectants, and oxidising agents, was made, and therefore it is not surprising to find that while gold medals have been awarded to certain chemical products which have been in use for generations, no award has been made in respect of the 'Sanitas' disinfectants, which have been adopted for use in preference to the said older preparations by a large majority of the Public Health Authorities in this country. A bronze medal was awarded to 'Sanitas' soaps in Class 31, but the 'Sanitas' Company very properly declined to receive such an award, as they could not consent to receive anything less than a gold medal.

The widespread dissatisfaction of the exhibitors, and the intrinsic merits of Messrs. Boyle's ventilating appliances, the Spongy Iron Filter, and the 'Sanitas' disinfectants, afford sufficient evidence of the unsatisfactory character of the awards.

Being acquainted, by personal experience, with the manner in which jurors at exhibitions are expected to discharge their duties, and the poor facilities that are afforded them for making adequate investigations, I do not hesitate to express a very strong opinion that it is quite time to put an end to awards made under such circumstances by irresponsible jurors. I feel quite sure that many manufacturers would be perfectly satisfied with the exhibition of their wares without looking for any kind of award, and considering that no, or very little, commercial value attaches to such awards (which are known to be generally founded upon imperfect knowledge or imperfect trials), it would be far better that, if exhibitions must be held in such great number, they should be conducted without awards.

In conclusion, so far as disinfectants are concerned, I protest against the awards made by the jurors of the Health Exhibition, and I consider them grossly unfair and entirely unworthy of scientific respect.

C. T. KINGZETT, F.I.C., F.C.S.

VENTILATION OF THE 'CASTALIA' NEW SMALL-POX HOSPITAL SHIP.

In the account given of the above, it is virtually stated that, in order to ascertain the value of wind-acting exhaust ventilators, they must be tested in practice. Now this is very good, only the practical test requires to be carried out in a practical manner, but I can see no evidence of such having been done from the description given on pp. 239 and 240 of your issue for Nov. 15.

We are informed that the currents of air going through the ventilating-pipes were measured, and that the amounts were very good, but we are not told whether this was due to the action of the ventilators, or to that of the pipes, for no mention is made of lifting off a ventilator to see whether the current went on better with the ventilator off or with it on. Consequently, to refer to the so-called experiments at the *Castalia* as being better than those made at Kew or elsewhere—as, for example, those described in THE SANITARY RECORD in the spring of 1878—is giving them more credit than, in my opinion, they deserve. It was stated on p. 190 of this journal for March 22, 1878, that a current of air which was going up a ventilating-shaft which had a Boyle's ventilator on it, was not due to the action of the ventilator, as when said ventilator was lifted off the upward current still went on; and, further, after the Boyle's ventilator had been replaced, and new testing made some hours after—viz., at 8 P.M.—instead of an up-current, there was a steady down-draught. Then, as further related on p. 222 of this journal for April 5, 1878, practical experiments or tests were made in presence of the late Mr. Robert Boyle, sen., when, even with windows open, a large amount of down-draught occurred in the ventilating-pipe, which was surmounted by a Boyle's Ventilator standing above the ridge, and freely exposed to the wind. Then, to give a ship test, it so happened that, before it was finally decided what ventilators to put upon the last four new additions to the Clan Line of East India steamers, experiments were made by the engineers, when, owing to the large amount of down-draught Boyle's Air-Pump Ventilator showed, it was set aside, and my ventilators used instead; so I beg leave to set the practical tests then made and since going on upon these four steamers against the *Castalia*. If there is really always a continuous up-current in the ventilating-pipes of the *Castalia*, Messrs. Boyle are to be congratulated upon their good fortune, but I think it is scarcely fair to drag in Sir Charles Dilke in support of this, for I hardly think that he would order a ventilator to be lifted off, or experiment during night as well as in the day time. In

fact, I don't suppose he did anything except pay a passing visit in the day time, when every thing would be done to make the hospital show off for the best.

It is stated on p. 240 that not the slightest down-draught has been found through any of the ventilators. If by this it is meant that no down-draughts have taken place, I am unable to comprehend this unless there are self-closing valves in to prevent it. Are there such? If so, give the valves the credit and not the ventilators. Without them, guarantees and testimonials are in thousands of cases mere waste-paper.

Either to puff up or guarantee as perfection an appliance which acts with such a variable motive power as the wind is an absurdity, while to point to large sales as sure evidence of good quality is a proof that might be brought forward by some medicine vendors to show that skilled physicians are superfluities—all that is needed being so-and-so's patent pills.

If Messrs. Boyle & Son's ventilators really always did what they are said to do, and were really entirely free from down-draughts, they ought to have, or might have, got the gold medal at the Health Exhibition even without testing there; but their absence from both the testing-room and the award list rather looks as if a good many people do not altogether believe in them. And what has taken place in the autumn of 1884 goes to prove that what was said in these columns in the spring of 1878 was pretty correct. The Kew experiments were useful, but the deductions which many people have made from them have been rather sweeping; even scientific men rushing from the extreme of laudation to that of condemnation, entirely ignoring that there is a happy mean in everything, and also acting as if no improvement were possible upon the three unfortunate appliances tested at Kew in A.D. 1878.

W. P. BUCHAN.

21 Renfrew Street, Glasgow, December 4, 1884.

WATER FILTERS.

Having seen a letter from the Spongy Iron Filter Company, which appeared in the columns of the SANITARY RECORD of Nov. 15, concerning my 'International' Water Filter, I beg to ask you to insert my reply to same. I am sorry that the Spongy Iron Filter Company have not enough confidence in their filter to accept the challenge that I have advertised in all the leading sanitary and medical papers. In the letter in question, in the first place the Spongy Iron Filter Company object to the use of animal charcoal in water filters. I perfectly understand why they object to this; but let the filtering medium be animal charcoal, proto-carbide of iron, silicated carbon, or spongy iron, or any other suitable ingredient, unless scientifically constructed or placed, it will materially add to the dangers we desire to evade rather than remove them. It is in this direction that I have for a considerable time laboured, and am satisfied with my results; hence the 'challenge,' of which, if the Spongy Iron Filter Company doubt the *bona fides*, they can soon satisfy themselves, by remitting you 100*l.*, which I will immediately cover, and fight on the points as laid down in the challenge. I cannot 'state a clearer case' which can easily be understood by anyone. If the Spongy Iron Filter Company keep out of the field owing to my not disclosing the nature of the composition of the cone block which I have patented, I will use nothing but pure animal charcoal in my filter during competition. The Spongy Iron Filter Company seem anxious to add one more point to my challenge, which they say is 'remarkably absent—viz., the chemical and physiological purification of the filtered water.' Allow me to call their attention to point six in the challenge, which states that the water to be filtered for the first two months must be taken from below London Bridge; also to point eleven—The purity of such water when filtered. I ask you, sir, whether this is sufficient or not? My object was, whilst framing my challenge, to embrace all defects or faults which are usually found in water filters, and the

majority of which I feel confident are absent from my own; and, in the interest of myself and the public, test same on the merits of the filter, according to the terms as laid down by me. In paragraph 5 the Spongy Iron Filter Company complain as to their 'intelligence,' and well they may if they contend that 'printed papers' have anything to do with the 'purifying action of a filter or the durability of same.' In a filter constructed on the principle of the Spongy Iron Filter Company's, the medium, whatever it may be composed of, would lose its oxidising powers in *one day* after filtering Thames water below London Bridge. I further add that the Spongy Iron Filter Company's filter would absolutely refuse to pass water through the filtered tap after filtering this water *one day*. This proves the necessity of a filter that will enable a person, however inexperienced, to effectually cleanse same at will, thus preserving the medium from contamination. When the Spongy Iron Filter Company speak of the filter being provided with two taps, and ridicule the idea, my explanation will show that they know nothing whatever about the construction of the International, as the *lower* or *sediment* tap is provided with a loose or movable key, which in a properly regulated household ought to be in the custody of the mistress; therefore 'servants' would not only be prevented from making mistakes as to which water tap to use, but would by this means be detected if they neglected to make frequent applications for the key, in order to cleanse the filter daily, or as often as would be necessary. Under these circumstances I say, in answer to the Spongy Iron Filter Company, that this should be sufficient to guarantee that *servants* will use the right tap. It is also not the fact that the 'International' has been promoted to the 'Universal' Filter, or that such a change has even been thought of. The English and foreign patents are exclusively my own property, together with all connected therewith. I hope the Spongy Iron Filter Company will either come forward and accept my challenge or own themselves defeated.

J. P. SAWYER.

1 Arthur Street West, London Bridge, E.C.

PARKS AND OPEN SPACES.

*The law condemns both man and woman
Who steals the goose from off the common;
But lets the greater felon loose,
Who steals the common from the goose.*

AT a recent temperance meeting at Leicester the Bishop of Peterborough said:—People talked of closing licensed houses as if it were an easy thing to do; but let them picture to themselves an artisan, with his wife and children, walking out on Sunday four or five miles in London, seeing all along the closed shops dull and uninteresting, and only two places open—the one the public-house where he could have a seat and welcome, and the other the church where he could not always have a seat and welcome. Some people fancied that they would succeed in driving all these into a church by the mere and single act of closing the only rival of the church. Let them close public-houses if they thought it right and necessary, but let them for pity's sake provide for those in whose face they shut the only place that they were accustomed to look upon as places of resort and amusement something else and something better. Let them give the people healthy recreation, innocent, elevating amusements, and open spaces in the great towns. By such means they would promote the great cause of temperance and check the great evil of intemperance.

The Corporation of Tynemouth are now employing a considerable number of persons in laying out the beautiful site at the North Dene, recently presented to the borough for a public park. This step has materially assisted in relieving much of the distress felt in that town from dearth of employment.

HOUSING OF THE WORKING CLASSES.

*'How best to help the slender store,
How mend the dwellings of the poor!'*

OVERCROWDING IN NEW YORK. According to a report recently presented to the Tenement-house Commission of New York City, the conditions under which thousands of the population of New York are compelled to live are worse than anything recorded in London or the large cities of the United Kingdom. The report states that 562 tenement houses visited by the inspector contained 5,050 families and 20,117 persons—an average of nine families and over thirty-five persons to each house. In many of the houses the occupants reached four times this number. In 90 per cent. of them the closets were in foul condition, 10 per cent. being most dangerous to the health of the inmates. It is suggested, in view of these revelations, that the Commissioners should be able to recommend to the Legislature some practical measure of relief, and to reinforce their recommendations by an amount of testimony as to the need of immediate action which will make the defeat of those measures impossible, no matter how vehement may be the opposition of interested and inhuman landlords.

The following figures in reference to Herr Krupp's establishment at Essen are of interest, in connection with the question of housing the working classes by employers of labour. In 1860 Herr Krupp's factory at Essen employed 1,764 hands; in 1870 the number of workmen had risen to 7,084, and the present number is about 20,000. Including the wives and children of the employed there are 65,381 souls depending for their subsistence on Krupp's works, 20,000 of these inhabiting houses belonging to Herr Krupp.

A further demolition of working men's houses in the centre of Newcastle is contemplated by the proposed new approaches to the Central Railway Station, and the additions to the Post Office. The parish of St. John, in which most of this property is situate, has already suffered a diminution of about four thousand of its working-class population in consequence of other 'improvements' which have been carried out since the present vicar, the Rev. E. H. Houldey, entered on his charge. The working class are being gradually driven to the outskirts of the city.

During the course of the ceremonial at the laying of the foundation-stone of a steam sanitary laundry in connection with the St. James's Home for Female Inebriates at Ebenezer Terrace, Kennington Park, Mr. Samuel Morley, M.P., said that, as a member of the Royal Commission for Inquiring into the Dwellings of the Working Classes, he had been struck with the evidence of relieving officers and others, which showed that by far the greater part of the misery of the poor was traceable to drink, and that three-fourths of the inmates of the London workhouses became paupers from the same cause. At another meeting, presided over by Lord Chelmsford, in reference to some remarks made by the chairman, Mr. Morley further said the revelations that had come to the knowledge of the Commission were simply appalling, especially in London. In some cases six and eight children were living with their parents in a single room, involving a condition of things, physically and morally, that was sickening to contemplate. The remedy for all this was the great problem of the day. But if the people would keep out of the public-house they might remove from their wretched hovels in a fortnight. The people had the remedy very much in their own hands. If, say, 100,000,000*l.* out of the 120,000,000*l.* annually spent in drink was diverted into channels of industry by the purchase of clothing, furniture, and household comforts, the mills of Yorkshire and Lancashire would be kept going and trade

and industry everywhere would revive. Thus, too, would be bridged over the great gulf that now existed between the rich and the poor.

CREMATION NOTES.

A CREMATORY FOR NEW YORK.—The corner-stone of a crematory temple was laid at Mount Olivet, Long Island, on November 20. The proposed edifice is being built by the United States Cremation Company, which expects to complete its work by February next. Twenty bodies already await incineration. The cost of the building is about 10,000 dols., that of incineration 10 dols. to 25 dols. The building is in the shape of a Greek temple, 40 by 72 feet. Incineration will take place at a temperature of about 2,500° F. It will require about forty minutes per 100 pounds of the subject, and will leave about 4 per cent. in weight of a pure pearly ash. No smoke will be visible, and no odour perceptible during incineration. The basement will also contain a *refrigeria*, where bodies may be kept when desired awaiting the arrival of friends from a distance; also a *calidarium* for cases of possibly suspended animation, the high temperature of which will induce speedy evidences of life or death, as the case may be. There will be also in the basement an *adularium* or urn room, and an atelier. This last will be used also for making autopsies, which will be required in all cases wherein it is not clear that death is the result of natural causes. The body of the building, or the ground-floor, will be fitted up as a chapel, where any service desired may be held.

The Italian Government has ordered the building of a crematory, on the Gorini-Gozzi system, for the cholera hospital at Varignano.

It is proposed as a measure of economy to burn the dead paupers of Brooklyn, instead of, as is at present the practice, burying them in two-dollar soap-boxes. The *New York Medical Record* remarks on this, that however admirable this scheme might be, practicable men will see the futility of trying to carry it out, since it would prevent the Brooklyn politicians from making their usual percentage on each coffin.

The first instance of the cremation of a priest in Italy recently occurred in Milan. The Rev. Don Giovanni Sarterio had left instructions by his will that his body be burned, and had disposed that in case of non-compliance with his wishes the heirs should forfeit the inheritance. As soon as this became known, the eleven priests who had been retained to perform the funeral service returned their fees, and the priest's remains were committed to the flames unaccompanied by any Christian rite.

The Cremation Society of England announce that they are prepared to undertake cremations under due restrictions and certificates, particulars of which may be obtained by communication to Mr. William Eassie, C.E., honorary secretary of the society, 11 Argyll Street, W.

THE PLUMBERS' COMPANY.—According to the report recently published of the Livery Companies Commission, the Plumbers' Company was incorporated in 1611; it has fifty members of the Livery; its corporate income is 882*l.*, and trust income 18*l.* Its ordinances, as shown at page 292, bear date 1365.

At the last monthly meeting of the Jarrow Town Council the Sanitary Committee reported that they had found the land laid out for building sites in Derby Street quite unfit for the purpose. During the construction of the sewers, the contractor had to cut through a quantity of night soil and other refuse which had been deposited there. Orders were given to prevent the erection of any dwelling-houses till the ground was put into a satisfactory condition.

SANITARY JOTTINGS.

UNSANITARY SURROUNDINGS OF AN ARCHBISHOP'S PALACE.—At the last monthly meeting of the York Sanitary Authority Mr. J. L. F. Marshall, the Officer, stated that his attention had been called to a cesspool behind the stables belonging to the Archbishop of York. On examination he found it received the effluent from a water-closet recently erected over the stables. There was no ventilation to the cesspool. The supply to the closet was collected from the roof. When he visited there was no water in the trap of the closet, the stench in the room was very bad, the gases from the cesspool passing freely into the room. He informed that the cesspool had not been emptied for several years. The overflow pipe also emitted a most offensive stench. Several members of the Board expressed astonishment that such an unsatisfactory state should exist so near to the Archbishop's Palace. The Medical Officer further stated that he had examined samples of water used at Bishopthorpe, and he found one of them fit to drink. Four of the samples were supposed to be filtered. He also had other evidence of singular neglect of sanitary matters in his district.

The Corporation of Newcastle, in view of the amount of distress existing in the district, has asked the city engineer to give employment to as many men as possible on the various public works now being done by that body.

At the last meeting of the Gateshead Town Sanitary Authority Mr. Dunn drew attention to the unsatisfactory state of their present building by-laws, which were useless. If they got an epidemic in the town they would not object to expense in order to get the matter right. He thought that in Gateshead they seemed to be waiting for panics.

About 80 per cent. of the cases of zymotic disease died in the medical officer of health for Newcastle the past month were cases of scarlet fever.

Samuel Boyce Newling, grocer and provisioner of 3 Johnson Place, Harrow Road, was fined 10*s.* on October 21, to the prejudice of the public, for selling on October 21, to the prejudice of the public, half a pound of coffee adulterated with chicory to the extent of 50 per cent.

The *Chicago News* states that the tenement inspection, under the New York State Commission, is progressing very satisfactorily. A conference recently decided that unless some change was made in the commission, the aim desired would not be attained. It was stated that the trouble was that so much testimony was being taken on unimportant subjects.

The following new version of an old rhyme was by Mr. H. E. Armstrong, the Medical Officer of Health for Newcastle-on-Tyne, in the course of the discussion on the Notification of Infectious Diseases. Dr. Alfred Hill, Medical Officer of Health for London, at a conference on sanitary subjects, the International Health Exhibition in June last. Mr. Armstrong said that it was evident that some of the men who took part in the discussion had come to the meeting with minds made up not to receive information and be convinced, but rather determined not to listen to what they seemed to have taken for their motto—

'Notification is vexation,
Inspection's twice as bad,
For isolation there's no occasion,
Disinfection drives me mad.'

The *Plumber and Decorator* is responsible for the following, let us hope, *jeu d'esprit*:—The N. plumber seems to excel even his London brother in the very particular for which plumbers are said to be distinguished. Here is an American plumber's bill for up Smith's busted pipes, to wit:—Going to see the leak, 1 dol.; coming back for tools and help, 2 dols.; the leak, 1 dol.; 50 cents; sending for more help, 1 dol.

25 cents; going for solder forgotten, 1 dol.; burned my finger, 2 dols.; lost my tobacco, 50 cents; getting to work, 3 dols.; getting my assistants to work, 2 dols. 50 cents; fixing the pipe, 25 cents; going home 2 dols. 50 cents; time, solder, wear and tear on tools, overalls, and other clothing, 5 dols.—Total, 23 dols. 50 cents.'

SEWERAGE.

Sir Joseph Bazalgette has submitted to the Lower Thames Valley Main Sewerage Board his report on his proposal for the sewerage of the united district. The broad features of the scheme are to collect the sewage of the various contributory places by sewers converging to a pumping station situated either on the east of New Malden or on a still more eligible site near Sutton Common Road—there to be raised into a tunnel sewer, the dimensions of which will be 6 feet 6 inches by 4 feet 4 inches, and through which it will be carried by gravitation, the sewer having a fall of nearly 3 feet to the mile, right away to a piece of land already provisionally secured at Crossness, lower down, but immediately adjoining the metropolitan reservoir, there to be disposed of in conjunction with the sewage of London; a proposal which, it is said, will find encouragement in the report of the Royal Commission which for some time has been considering the condition of the Thames. The scheme is estimated to cost less than 9d. in the pound. Sir Joseph Bazalgette assumes that two years will be required for the completion of the works, and he estimates the cost of pumping upon the basis of an increased population and rateable value in 1887. The total cost is put down at 563,711*l.*, and it is suggested that the annual charge for repayment of capital and interest, for pumping, contingencies, and cost of disposing of the sewage after its arrival at Crossness, will amount to less than 9d. in the pound, and that this rate will gradually decrease as the rateable value of the district improves. The report further states that the features which chiefly recommend the scheme are—that it requires no provisional order or Act of Parliament to enable it to be carried out; that it involves no interference either with Crown property or with the district of the Metropolitan Board of Works; that upon the sanction of the Local Government Board the works can immediately be proceeded with; and that the scheme would be final in its operations and results.

A scheme, called the Wandle Valley Main Drainage, has recently been completed for the Croydon rural sanitary authority. The district served embraces five villages, with a population of 17,000, and covers an area of 10,106 acres. The watershed contains sixty square miles of chalk, from which the Wandle is fed, and whence it runs over beds of alluvium overlying the London clay. The scheme is on 'the separate system,' the storm-water being provided for in the old sewers and water-courses, which have been improved for the purpose, while the new sewers as completed measure fifty-five miles, of which twenty miles have been laid with 9-inch Doulton pipes. The system was designed to allow as much of the sewage as possible to be carried to the land by gravitation, and where this was not possible a low-level sewer was laid, from which the sewage, after its arrival at the pumping-station, is pumped up into the gravitation outfall on an average height of 20 feet, and then flows into the depositing-tanks. The sewage, after it has been deprived of floating matter, and when the solids have subsided in the tanks, is filtered through a 4-foot bed of coke, and then passes on to the land set apart for filtration and its final purification. The sludge is first treated with milk of lime, and then pressed into cakes 2 feet in diameter and 1½ inches thick; and a farmer in the neighbourhood has contracted for the cake produced for twelve months, paying a sum of 42*l.*, and undertaking to keep the works free from sludge cake. Owing to the area, some 29 acres, set apart for filtration purposes being very swampy and liable to be flooded, it was necessary to construct a clay-

puddle dam entirely round it, and to 1 foot below the surface of the London clay. In the upper portion of this area an artificial filter was made of alternate 3-inch layers of burned ballast and porous soil through which the sewage passed first into the natural filter. The land irrigated by the sewage in its passage is devoted to the cultivation of rye grass, for which there is a good demand, the crops realising 30*l.* per annum.

WATER SUPPLY.

WASTE-PREVENTERS.—The Birmingham Corporation have determined to adopt a waste-water system in the borough at a cost of 1,200*l.*, such as is in operation in Liverpool and certain other large towns, with the view of ascertaining the locality of waste when occurring, and so preventing it. The system is reported to have effected a saving in some large towns of 50,000*l.* per annum.

John Wynn, of Plaistow, has been summoned at the instance of the St. Luke's Vestry for not having any water supply or proper apparatus in connection with the closets of seven houses owned by him in George Yard, St. Luke's.—Samuel Mellows, sanitary inspector to the Vestry, said the houses in question were inhabited by poor people. The closets had no water supply whatever, and were in a dreadfully dirty condition, rendering the houses unfit to live in. The defendant was very well to do.—Corroborative evidence was given by Mr. Eadds, late sanitary inspector for the district. It appeared that Mr. Wynn had disregarded a notice from the Vestry to remedy the defects complained of last October.—Mr. Barstow now ordered the defendant to pay a fine of 10*l.* for each house, making a total penalty of 70*l.*

COMPETITIONS.

TOTAL ABSTINENCE.

THE President and Council of the British Medical Temperance Association have offered a prize of 100 guineas for the best essay on the physical and moral advantages of total abstinence from intoxicating liquors, to be competed for by medical students in the United Kingdom. The essays are to be sent in by March 31, 1885.

HYGIENE.

MR. HENRY LAMB, of Rochester, New York State, has offered, through the American Public Health Association, four prizes, of two hundred dollars each, upon the following four subjects: 'Healthy Homes and Food for the Working Classes,' 'On the Sanitary Conditions and Necessities of School-houses and School-life,' 'On Disinfectants and Individual Prophylaxis Against Infectious Diseases,' 'On Appliances and Means for Saving Life and for Protection against the Injurious Influences of Some Work and of Certain Occupations upon Health.' These prizes are open to universal competition, and will be awarded by four independent committees consisting of five members each. The American Public Health Association is to appoint three members of each committee, the National Board of Health one member, and the President of the Conference of State Boards of Health one member.

NOTICES OF MEETINGS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH, 1 Adam Street, Adelphi, London.

SESSION, 1884-85.

T. ORME DUFFIELD, M.D., President.

THE next Meeting of the Session will be held on Friday, Dec. 19, at 7.30 P.M. The Minutes of the last Meeting will be read. The Council will present a report on—1. A Special Report of the General Purposes Committee of the Metropolitan Asylums Board, on the question of the Reception and Treatment of Non-pauper Patients at the Managers' Hospitals. 2. Brick-burning as an offensive trade. 3. Revision of By-laws of the Society. To receive a letter from the Clerk to the Metropolitan Asylums Board on the subject of Hospital Accommodation for cases of Cholera. The following gentlemen will be balloted for as Members of the Society: Nominated by Mr. S. R. Lovett and Dr. C. E. Saunders—T. G. Blackman, M.R.C.S., Medical Officer of Health, Great Salterns; J. S. Taylor, M.D., Medical Officer of Health to the City and Port of Liverpool; W. D. Wood, L.R.C.P., Medical Officer of Health, Oxford (Combined) Urban and Rural Sanitary District. Nominated by Mr. Shirley Murphy and Dr. C. E. Saunders—A. Newsholme M.D. Medical Officer of Health, Clapham.

APPOINTMENTS UNDER THE PUBLIC HEALTH ACT.

MEDICAL OFFICERS OF HEALTH.

BETHELL, Alfred, M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Bridgnorth Urban Sanitary District, at £32 per annum, *vice* Mathias, resigned.

BOOBIVER, Philip, L.R.C.P., M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Basford Rural Sanitary District, at £400 per annum, from year to year, *vice* Buckley, resigned.

BROWN, John, L.R.C.P. Lond., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Bacup Urban Sanitary District, at £30 for one year.

BUGGY, Dr. John Joseph, has been appointed Medical Officer of Health for the Gainsborough Rural Sanitary District at £83 for one year, *vice* Paterson, deceased.

COVEY, George, M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the East Grinstead Urban Sanitary District, at £20 per annum.

CROWFOOT, Edward Bowles, M.B. Univ. Lond., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Beccles Urban Sanitary District at £30, for one year.

DE'ATH, Robert, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Buckingham Rural Sanitary District, at £55, for one year.

EDDOWES, Charles, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Amesbury Rural Sanitary District, at £50 for one year.

FUSSELL, Dr. Edward Francis, has been re-appointed Medical Officer of Health for the Seaford Urban Sanitary District, at £23, for one year.

HALL, Egerton Francis, M.D. Univ. St. Andrews, L.R.C.P. Edin., has been re-appointed Medical Officer of Health for the Huyton-with-Roby Urban Sanitary District, at £32 per annum.

HOFFMEISTER, William, M.D., L.R.C.P. Lond., M.R.C.S. Eng. and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Cowes Port Sanitary District, at £17 10s. per annum, until March 27, 1885.

HOUGHTON, Lambert, L.R.C.P. Edin., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Amersham Rural Sanitary District, at £50 for one year.

McLACHLAN, Dr. Samuel French, has been re-appointed Medical Officer of Health for the Longtown Rural Sanitary District, Cumber., and, at £65, for one year.

MADDEVER, John Coombe, M.D. Univ. Glasg., has been re-appointed Medical Officer of Health for the Brownhills Urban Sanitary District, at £45 for one year.

MARSH, Frank, L.R.C.P. Lond., F.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Stafford Urban Sanitary District for one year (salary not yet fixed), *vice* Clendinnen, whose appointment has expired.

MASON, Thomas Edward, M.D. Univ. St. And., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Deal Urban Sanitary District, at £30 for one year.

MERCER, Mr. William Frederick, of the Kentish Bank, has been appointed Treasurer to the Maidstone Guardians and Rural Sanitary Authority, *vice* Wigan, his partner, resigned from failing health.

NEWSHOLME, Arthur, M.D. Univ. Lond., M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Clapham Division of the Wandsworth District, at £75 per annum, rising to £110, *vice* McDougall, resigned.

OSBORN, Charles, L.R.C.P. Edin., M.R.C.S. Fenz., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Bognor Urban Sanitary District, at fifty guineas for the year ending Dec. 4, 1885.

STEVES, George Walter, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Toxeth Park Urban Sanitary District, Lancashire, at £40 per annum, *vice* McClelland, resigned.

SYKES, Walter John, M.D. Univ. Edin., has been re-appointed Medical Officer of Health for the Portsmouth Urban Sanitary District at £45, for one year.

WEBSTER, George Leonard, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Bewdley Urban Sanitary District, at £20, for one year.

SURVEYORS, CLERKS TO GUARDIANS, INSPECTORS OF NUISANCES, &c.

ALLEN, Mr. Joseph, has been appointed Collector and School Attendance Officer to the Failsworth Local Board and Urban Sanitary Authority, at £30 per annum, *vice* Taylor.

ANScombe, Mr. Joseph A., has been appointed Inspector of Nuisances for the Hamlet of Penze in the Lewisham District, at £100 per annum, *vice* Butcher, resigned.

BAILY, Mr. Joseph, has been appointed Collector to the Melton Mowbray Local Board and Urban Sanitary Authority, at £40 per annum, *vice* Betts, resigned.

BOWEN, Mr. E. P., Manager of the Leominster branch of the Worcester City and County Banking Company, has been appointed Treasurer to the Leominster Guardians and Rural Sanitary Authority, *vice* Daggs, deceased.

BOYFS, Mr. John Frederick, has been elected a Member of the Hove Board of Improvement Commissioners and Urban Sanitary Authority, for the Medina Ward, *vice* Blandford, resigned.

BROWN, Mr. John, has been appointed Surveyor and Ins Nuisances to the East Grinstead Local Board and Sanitary Authority, at £60 and £40 per annum.

BRYAN, Mr. F., has been appointed Inspector of Nuisances for the Amersham Rural Sanitary District at the rate of annum, *vice* Smith, resigned.

BUCHAN, Mr. John, has been appointed Surveyor to the Council and Urban Sanitary Authority of Great Gr £200 per annum, with the services of a Clerk, and p to take pupils, *vice* Maughan, appointed Consulting E BUTCHER, Mr. Frederick, has been appointed Treasur newly-formed Chesham Local Board and Urban Authority.

COX, Mr. Henry, has been re-appointed Inspector of Nuis the Seaford Urban Sanitary District, at £20, for one year.

DAWE, Mr. R. Hill, Solicitor, has been appointed Town Clerk to the Urban Sanitary Authority of Kingston Deputy Judge and Registrar of the Borough Court and Steward of the Manor of Myton, at £1,000 per Town Clerk, *vice* Todd, deceased.

DE WORMS, The Baron George, has been elected a Member of Improvement Commissioners and Urban Authority, for the Adelaide Ward, *vice* Appach, resigned.

DIXON, Mr. William, has been appointed Surveyor to the Improvement Commissioners and Urban Sanitary Authority.

ELDRIDGE, Mr. John, has been appointed Inspector of Nuis the Ryde Urban Sanitary District, at £65 per annum, Daish.

EMMERSON, William Lindsay, M.D. Aberd., L.R.C.P. F has been re-appointed Public Analyst for the Borough of for one year.

EYTON, Mr. Thomas Slaney, Banker, Shrewsbury, has been Treasurer to the Ellesmere Guardians and Rural Authority, *vice* Campbell.

GEORGE, Mr. — Builder, has been elected a Member of the mouth Board of Improvement Commissioners and Urban Authority, *vice* Woollaston, resigned.

GLITHERO, Mr. Henry, has been re-appointed Inspector of for the Braintree Urban Sanitary District, upon the s as before.

HARLAND, Mr. Robert Henry, has been appointed Public for the Greenwich District, at £100 per annum, re deceased.

HARVEY, Mr. Sidney, has been re-appointed Public Analyst Borough of Deal, for one year.

HAWKINS, Mr. George, has been appointed Collector to the Urban Sanitary Authority, at £60 per annum, *vice* resigned (but who continues as Inspector of Nuisances per annum).

HAVES, Mr. Patrick, has been elected Chairman of the Town Commissioners and Urban Sanitary Authority, re resigned.

HILL, Mr. T. S., has been appointed Clerk to the Trowbridge and Urban Sanitary Authority, at £90 per annum, as Clark and Collins, resigned.

HODSON, Mr. Enoch, has been elected a Member of the W Local Board and Urban Sanitary Authority, *vice* Griffiths, resigned.

HOLMES, Mr. Valentine Webb, Branch Manager of the Provincial Bank of England, has been appointed Treasurer to the Urban Sanitary Authority of Leominster, re deceased.

HOPE, Mr. James, has been re-appointed Inspector of Nuis the High Sub-District of the Longtown Rural Sanitary at £15 for one year.

HOW, Mr. Frederick, has been appointed Clerk to the Local Board and Urban Sanitary Authority, at £50 for

ISHERWOOD, Mr. James, Solicitor, has been appointed Clerk to the Guardians and Rural Sanitary Authority, at annum as Clerk to the Guardians, and such further tion as Clerk to the Rural Sanitary Authority and Committees, as may be fixed annually, and fees as Officer, *vice* Woodcock, deceased.

KING, Mr. John William, has been appointed Surveyor Engineer, Inspector of Nuisances, and Collector, to the Improvement Commissioners and Urban Sanitary Authority, at £100 per annum, *vice* Dormer, resigned.

KNOTT, Mr. Jesse, has been appointed Building and Inspector to the Failsworth Local Board and Urban Authority, at £70 per annum, *vice* Allen.

LEWIS, Mr. Thomas, has been elected a Member of the Local Board and Urban Sanitary Authority, re resigned.

LOVE, Mr. Alfred George, has been re-appointed Inspector of Nuisances for the Beccles Urban Sanitary District, one year.

LOWNDES, Mr. William, has been elected Chairman of the formed Chesham Local Board and Urban Sanitary Authority.

MUNDAY, Mr. R. W., has been re-appointed Inspector of for the Buckingham Rural Sanitary District, at £45, 6

PURNELL, Mr. E. J., jun., has been appointed Surveyor to the Kenilworth Local Board and Urban Sanitary Authority per annum, *vice* Hillier, whose appointment has expired.

RAMSDEN, Mr. Arthur, has been appointed Surveyor to the Local Board and Urban Sanitary Authority at £500 rising to £300, *vice* Strachan, resigned.

RUSTON, Mr. William, Solicitor, has been appointed Clerk to the Twickenham Local Board and Urban Sanitary Authority per annum, *vice* Mr. William Ruston, senior, deceased.

The Romford Local Board and Urban Sanitary Authority have increased the salary of Mr. A. H. Hunt, their Clerk, from £50 to £700 per annum.

The Town Council and Urban Sanitary Authority of Gravesend have increased the salary of Mr. Arthur Henry Lukes, the Inspector of Nuisances, from £85 to £400 per annum.

John Byrne, of Shelborne Road, Dublin, was fined 40s. at the Northern Police Courts, on Nov. 23, for refusing to sell a pennyworth of milk to Inspector J. Madden on Oct. 21, for analysis.

At a public meeting at the Lecture Hall, Penzance, Mr. R. R. Victor, J.P., the Mayor, in the chair, it was unanimously resolved to purchase the site of the Coastguard Station, and to establish public baths.

The Loughborough Local Board and Urban Sanitary Authority have increased the salary of Mr. John Newman, the Collector, from £70 to £90 per annum.

The Finchley Local Board and Urban Sanitary Authority have voted £175 to Mr. G. W. Brummell, C.E., their Surveyor, for services in connection with the scheme of sewerage devised by him, and increased his salary from £130 to £180 per annum.

The Reigate Town Council and Urban Sanitary Authority have added £45 per annum to the salary of Mr. J. H. Apsted, the Collector.

NOTES AND QUERIES.

Having for some time back been in the receipt of Queries appertaining strictly to sanitary work, and which it would be easy to answer, without having to refer our correspondent to competent professional advisers, we have opened a column in which to register such Queries and Replies thereto as can fairly be expected from us, and our subscribers and readers are invited to make such use of this column as will tend to benefit themselves and the community. Both Queries and Replies will, however, be subjected, if unnecessarily long, to a strict curtailment.

136. DUTY OF MEDICAL OFFICERS OF HEALTH AS TO BARRACKS.

I shall be obliged if you will inform me whether it is the duty of a medical officer of health to inspect the barracks in his district. I ask the question because I was recently refused admission to some barracks, which had been visited with an outbreak of enteric fever? CIVIS NON MILES.

[The Local Government Board do not consider it necessary that these places should be visited by local sanitary officials. In regard to demanding admission thereto, see sect. 327 (2) of the Public Health Act, 1875, which provides that 'Nothing in this Act shall be construed to authorise any local authority to disturb or interfere with any lands or other property vested in the Lord High Admiral of the United Kingdom or . . . in Her Majesty's Principal Secretary of State for the War Department for the time being.' It is doubtful, therefore, whether a medical officer of health, in virtue of his office as such, is empowered to seek admission to barracks. — Ed.]

137. COMPENSATION UNDER ARTISANS' DWELLINGS ACTS.

A good deal is said about the 'extravagant cost of compensation' as a sort of excuse for the delays of the Metropolitan Board of Works and other authorities in exercising their powers under the various Acts passed for the improvement of artisans' dwellings. My impression is that recent legislation has tended to pare the claws of the rascally proprietors of tumble-down houses who are so ravenous for 'compensation.' Is this so? CURIOUS.

[By sect. 3 of the Artisans' Dwellings Act of 1879 (41 and 42 Vict., c. 61) the amount of compensation payable under any scheme was considerably diminished in cases where the houses or premises proposed to be taken could be proved to the arbitrator to have been at any time between the date of the official representation and that of the confirming Act a nuisance within the meaning of the Public Health Act, 1875, and any local Act which contained any provisions with respect to nuisances in the district. The Act of 1882 (45 and 46 Vict., c. 34) simplified very considerably the procedure for determining the compensation to be paid for lands acquired under the Act of 1875. The most important alterations were—the abolition of the provisional award of the arbitrator, and the increase from 500l. to 1,000l. of the amount which the compensation must exceed to enable a person to appeal to a jury against the amount awarded.]

138. QUALIFICATIONS OF PUBLIC ANALYST.

Kindly refer me to any Act of Parliament or official order which prescribe the qualifications required for the post of public analyst.

CANDIDATE.

[No qualifications are absolutely requisite: but the Food and Drugs Act of 1875 gave express power to the Local Government Board to require, in the case of any future appointment of analyst, satisfactory proof of his competency, and that Board invariably demand evidence of the candidate's possessing some analytical qualification, or of his having attended with credit a course of instruction in qualitative and quantitative analysis. The Act further provided that no analyst was to be appointed for any place in which he was engaged, either directly or indirectly, in any trade or business connected with the sale of food or drugs. Sect. 31 empowered the town council of any borough to engage the services of the analyst for the county or any neighbouring borough.]

139. MELKSHAM, R.S.A. v. THOMAS.

I am not surprised that a question should be asked in your *and Queries* about the failure of justice in the above case, as it is mentioned on p. 193 in the September number. It is very evident that there were three nuisances, and that to be dealt with in three different ways—(1) in the water supply, a second notice should have been given under of the Public Health (Water) Act, 1878. (2) in the drainage, if the authority's orders (so far as they could be given) were not complied with, the Inspector should have orders to do the work properly, and recover the cost by proceedings, and (3) in the case of the sewage hole, it should have been taken out before justices for the abatement nuisance. The two latter cases certainly needed no more. If the Melksham authority put all these matters into one same set of proceedings it is not to be wondered at that it is procuring a conviction. This is only an every day in the absurdly complex working of the Public Health Act not at all unusual to find these nuisances and defects on the same premises. I have this day met with a case similar. This multiplicity of processes raises needless in the way of gaining the desired end—and that speedy rectification of unwholesome premises, and it is much to be in any amendment of the Public Health Act that may be placed, that a greater simplicity may be arrived at in proceedings necessary for the suppression of nuisances.

I can, however, hardly believe that the case has been reported. If it has, the worthy justices have not done legal acumen in giving such absurd reasons for their. They should be advised for the future to give their without any comment.

It is very desirable that such matters as these should be given widely-circulating journal, as they tend much to the in those whose lot it is to conduct legal proceedings in questions.

Will the Melksham sanitary inspector throw some light on this question?

ORDINANCES OF THE PLUMBERS.

The following 'Ordinances of the Plumbers,' as 'Revived Guild Action,' by Mr. George Shaw published in 1878, will be read with interest in connection with the report of the Plumbers' Congress in the *SA RECORD* for Nov. 15, 1884.

38 Edward 3rd, A.D. 1365. Letter Book E (Norman-French.)

'May it please the honorable men and wise, the Mayor, and Aldermen of the City of London: to grant unto the Pl the same City the points that here follow:—

'In the first place, that no one of the trade of Plum muddle with works touching such trade within the said City or house or apprentices, or other workmen, in the same, if he be of the City: and that, by assent of the best and most skilful of the said trade, testifying that he knows how well and lawfully and to do his work, that no the said trade may not be used the commonalty damaged and deceived, by folks who do not the trade.

'Also, that no one of the said Trade shall take an apprentice than seven years: and that he shall have his enrolment with year, and at the end of his term shall make him take up his according to the usage of the said City.

'Also, that every one of the Trade shall do his work well fully, and shall use lawful weights, as well in selling as in without any deceit or evil intent against anyone: and that if a clove of lead for gutters, or for roofs of houses, he shall one halfpenny, and for working a clove for furnaces, belfreys, and conduit pipes, one penny: and for the same a lead when newly molten [he shall have an allowance of 10 as has been the usage heretofore.

'Also, that no one for singular profit shall engross lead the said City for sale, to the damage of the commonalty, by persons of the said Trade, as well poor as rich, who may be partners therein at their desire. And that no one, his another, shall buy old lead that is on sale, or shall be, with City or without, to sell it again to the folks of the same: enhance the price of lead, to the damage of the commonalty.

'Also, that no one of the said trade shall buy stripped le assistants to tilers, lagers, or masons, or of women who servants for the same. And if any shall do so, himself servants, or if any one of them be found stealing lead, in the place where he works, he shall be ousted from the for ever, at the will and ordinance of the good folks of the

'Also, that no one of the said trade shall oust another work undertaken or begun, or shall take away his custom employers to his damage, by enticement through carpenters, tilers, or other persons, as he would answer for the same, by good consideration of the masters of the said trade.

'And if any one shall be found guilty under any of Articles aforesaid, let him pay to the Chamber of the Guild London, for the first offence, 40 pence: for the second, half for the third, 20 shillings, and for the fourth, 20 pence forswear the trade.'

ORIGINAL PAPERS.

STEMS OF HEATING WATER
SYSTEMS OF HOUSES FOR
USE OF HOT WATER THERE,
ALSO HOT WATER FOR UP-
PER PURPOSES.*

By W. EASSIE, C.E.

A house requires a supply of hot water boiler for domestic purposes, then all incomes require the same, and I would even say that a cottage tenement is not complete without some sort of a hot-water supply. How, then, houses of the wealthier classes? A cottager requires a supply of water at his hand wherefrom he can draw hot water for a bath, and always for cooking purposes without having to boil the water in a kettle over a kitchen fire. I have been tempted to make this subject because I have often, in the houses in London, found the house supplied with hot water by a sole hot-water draw-off at the kitchen jamb, and whenever hot water was required for an upstairs bath, the domestics had to run up four or five flights of stairs. If I were to operate, then this lecture will prove useless. I am sure all will agree in thinking that a house is not thoroughly equipped, or the interests of the family or the domestics are not met. Certainly the health of the inmates, even the sanitary condition of the house, is aided in such a case, for a bath-room and hot water ablution is often a matter of life and death, especially on the nursery floor, and I intend that unless there be an adequate supply of hot water to the housemaids' sinks upstairs, for the cleansing of the floors and woodwork is not efficiently performed. For we know that if the housemaids have to mount a ladder or so of backstairs steps some eight feet high, with their concomitant ugly winders, the floors will be 'more honoured in the breach than in the observance,' and hot water will be taken into the nursery by dint of a discipline on the part of the lady of the house. I know cases of servant girls who die from consumption, due to the incessant fatigue caused by frequently carrying up daily to the bed chambers of a numerous family. Most amusing and distressing, if the two systems of mind can be associated, to visit a house with its simple draw-off tap at the kitchen and to notice behind the kitchen fire a boiler forty or fifty gallons capacity, heated by a range, with a tolerably furious fire, when, at the same time, at a little cost, the same fire could be used to supply upstairs baths, lavatories, and any of the three systems which I shall discuss this evening.

It is no doubt that there are householders who use the hot water circulating upstairs, owing to the tendency of boiler explosions in the kitchen, but due to want of knowledge, inasmuch as a managed hot-water supply is no more

dangerous than having none at all, provided that the hot-water supply is carried out on sound principles, and fixed by responsible hands.

The system upon which all circulating systems are based, is the exchanging of the water between the boiler behind the kitchen fire and the cistern, by means of flow and return-pipes, working in conjunction with a hot-water 'mixer.' Even with the worst form of boiler which circulates water, the pressure from the head of water is never great, and all will go well until incrustation, interposed foreign matter, or frost intervenes. In such cases the circulation is prevented, the pressure is continually increasing in the boiler, and, if the fire be very fierce, the resistance of the boiler will be mastered; and, as a rule, the thicker the boiler the greater the explosion, for the boiler generally gives way before the pipes.

The greatest culmination of disasters recorded in the press due to household boiler explosion occurred at the end of 1878. And both before and after that date, were the statistics of fatal cases obtained, to say nothing of maimings for the remainder of life, the figures would be truly appalling. It would be a waste of time to enumerate the details of any of such cases, because they are of yearly occurrence and reported in the newspapers. The cause of such explosions is commonly attributed (and, I think with Mr. Fletcher, erroneously) to the flowing into a heated boiler of a quantity of cold water. Steam thus generated might, I think, fracture the boiler; but the true cause of explosions is due to the constantly accumulating heat in the boiler, which, when it reaches a certain ungovernable power, overcomes the plates or joints of the boiler. In making these few preliminary remarks, I may say that I am perfectly aware that a properly constructed safety or escape valve, limited to a certain resistance, would prove efficacious and save many scores of lives. But there really is so much carelessness in the making and fixing of these valves that some better system—more worthy of the age, and meeting every probability full in the face—should be matured, until accident becomes more or less impossible.

There are, commonly speaking, three systems of heating water for domestic purposes; and for sake of convenience I would term them the single boiler with flow and return from the back of the kitchen fire, the circulating system with flow and return from the circulating cistern (the latter being placed at the top of the house), and the cylinder system, with the hot-water circulating cistern level, or nearly so, with the boiler, and thus obviating the necessity of a hot-water reservoir upstairs.

The time allotted to me would be altogether insufficient to afford in any detail an explanation of wherein the three systems agreed or differed. I think that I will therefore confine myself to the three methods of supplying hot water for domestic purposes, which are exhibited upon the diagrams which illustrate my lecture. The advantages of hot-water heating might take the forms of the degrees of comparison exhibited by an adjective—the positive, the comparative, and the superlative.

I would place the single boiler system, with its only reservoir in the boiler, in the first degree, shown on Plan 1, as the most primitive and also the most dangerous. I would place the upstairs circulating cistern, shown on Plan 2, in the comparative degree, because it possesses advantages over the single boiler which forms the whole and only reservoir. I would place the cylinder system, shown on Plan 3,

*Lecture before the members of the Parkes Museum, Dec. 11, 1884. J. Chasmon, F.R.S., in the chair.

as the outcome that is most feasible and best for hot-water heating for domestic purposes.

There are many differences in each of these systems, but it would amount to a farce to attempt to record them. It would be sufficient to say that all these systems suffer either from the diversity of ideas in the minds of the manufacturers, in the more or less insane wish to so alter a previous patent that it shall become ostensibly a different article, or from other motives, the metaphysics of which can only be registered in the High Court of Conscience.

Before proceeding to explain the three systems of heating water which I have chosen as mainly conducive to its due service in the economy of the house, I should like to remark that I do not seek for one moment to discriminate or make any invidious comparison between any of the systems now in use, and I determined upon this owing to the fact that sundry arrangements have notable advantages, and divers others more or less improvements of another sort which effect the objects in view.

The first system for heating water for potable or other uses, is that exhibited on plan No. 1, but it must be understood that in making choice of this example I am in no way forgetful of the many complications which are involved in the system in question.

FIG. 1.

Here, as may be seen, the boiler is situated at A, behind the kitchen fire, and the water, as it is derived from the cold-water cistern B, ascends the pipe C, and delivers its hot water into the bath D, or at the sink E. The faults of this system are obvious. First of all, there is no circulating cistern, either upstairs or downstairs, consequently the water in the boiler is allowed, unless frequently drawn, to boil and bubble up the expansion pipe F. It will easily be seen, that

supposing a bath were required at D twice in immediate succession, the boiler A would not be able to supply it, and the sink E would suffer, which is a decided drawback to the system. But, irrespective of this, and I will merely notice it in passing by, there is a danger possibly resulting from the boiler A being robbed of its water by the action of the ball-cock in the cistern B being stuck in its place, or by the freezing of a paucity of water in the same cistern. The result and danger can easily be imagined. This system was doubtless an acquisition in its time, and has served its purpose, but it is to be lamented that impecunious people still continue to erect them in connection especially with buildings of the speculative order.

FIG. 2.

On Plan 2 I have endeavoured to show an improvement upon the system, which comprises the necessity of a hot-water circulating cistern at the top of the house, in contradistinction to the want of a hot-water circulating cistern at all. The plan does not exhibit many of the characteristics of this method of heating water, because, as will here be seen, there is no feed cistern in connection with the hot-water cistern at A, and the cold water flows direct from the cold-water cistern at B into the circulating system and down into the boiler, behind the kitchen fire at C. This plan of Messrs. Stephens Brothers doubtless possesses some advantages over the more commonly practised methods for heating water for upstairs dwell-

s, but it has disadvantages as well. This plan is to be taken, not as representing the complete as of the devisers, but it may be taken to exhibit of the drawbacks which generally accompany a system of hot-water heating, the pronouncement of which is situated upstairs. For example, if the bath was at D was a housemaid's draw-off sink, where once a day, but ten times a day a supply were needed, the cold water would have first of all to be drawn off before the hot water arrived, owing to the effect of the establishment of a thorough system of circulation. I have already alluded to the possibilities of danger which surround hot-water heating, waiting for a favourable moment for development. There are systems of hot-water heating, the derivatives of which are situated far above the boiler, but I think that my readers will not care to be troubled with any description of these.

It is hardly conceivable that builders could be so stupid as to imagine the worst forms of circulating systems, and actually conjoin the supply cistern by a diaphragm of zinc. Of course, this is mere work, done for cheapness, and the case is not proved when I state that the cisterns were not galvanized or lead-lined, but of common brickwork lined inside. The entry from the cold-water pipe into the hot-water one, was by a small aperture at the base of the zinc division, and it can only be conceived that the cold water was mostly and the hot water mostly cold.

And here, by way of interpolation, I might mention a very curious circumstance that if responsible men are asked to conduct hot-water pipes up to higher storeys of a house, it is twenty chances to one that they will take the cold and hot water to be in closest clustering proximity. In other words, simply because there is an available chase in wall, they bring the water from the upstairs cold-water cistern down to the housemaid's sinks, jammed closely against the flow and return of the hot-water system. In summer, therefore, when a cold refreshing drink of water would be grateful, it is found, upon drawing it off, that it is just as efficiently lukewarm to act as an emetic.

In contradistinction to the systems of heating hot water for domestic purposes which has obtained in England for a very long time, with their corresponding disadvantages, I would like to explain what I consider are some points of vantage in the heating system introduced into England from America, namely by Mr. F. Dyer, of Camden Town, in 1868. It must be understood, however, that improvements resulted mainly from the introduction of the cylinder system as opposed to the circulating cistern in the rear part of the house, which I have endeavoured to explain in the former part of my lecture.

Take, for example, fig. 1, which exhibits the salient points of the system which I reprehend. There are all evils concomitant with heating water at a high level have been hinted at with their attendant dangers. The system which I beg to offer a few observations on is known in America as the cylinder system, and is opposed *in toto* to the method of heating water for draw-off purposes as extant in England and in other parts of the Continent.

I have explained in detail the system of heating water for domestic supply when that has been considered upon the upstairs circulating cistern, either in one way or the other, and I will now endeavour to explain the procedure when dealing with what I would prefer to call the rational system of hot-water

supply; so begin with the boiler, which is, after all, the parent of all hot-water heating. It is quite a mistake to fancy that it is necessary to have a boiler of large internal capacity. The truth is, that where the water is soft—and this obtains over a great portion of the country—a few pipes of an average internal sectional area of an inch, measuring altogether about 6 feet, and placed at the back of the fire, boiler-fashion, with a slight space between the pipes and the back of the range, with a slightly widened base of the cinder-space, will suffice. This cinder-space is also so contrived that the clinkers can be easily cleaned out, and bear in mind that clinkers form the veritable curses of hot-water heating. There is this advantage in a boiler formed of small interlaced tubular pipes, that clinkers do not get leave to form in point of time, as the intense radiated heat dislodges them.

In cases where hard waters are prevalent the pipe form of boiler is not applicable, owing to the speedy formation of carbonate of lime in the pipes. The ordinary form of boilers must then be selected, and, preferably the saddle-boiler for ordinary work would be found best, but this remark must be taken with caution, because it has always been found expedient in large mansions and public buildings where great quantities of hot water are used, to make use of such a boiler as the tubular flued boot boiler, for evident reasons of superior yielding of boiling water.

In the system of hot-water heating represented by fig. 3, advantage is taken of an acknowledged idea that means should be accorded whereby the boiler can be cleaned out of any internal impurities. It is not uncommon to find scores of boilers where such a necessity is perfunctorily provided for, but in such cases the emptying of the boiler will simply be by a draw-off tap at the side of the jamb.

Sometimes, unwisely, this draw-off tap is taken from the base of the boiler, in which case there is a possibility of accruing danger, owing to the heating of the boiler and the absence of cold water in the cistern. With a little more wisdom the draw-off tap here has been made at such a point as not to totally empty the boiler.

A glance at fig. 3 will show that the sluice-cock at A would empty both boiler and cylinder and the whole system of circulating pipes, and it would be, of course, a matter of the utmost importance that the delivery of the empties of the pipes and boiler should be disconnected into an open drain.

I might here point out the advantage which accrues from having a stop-cock placed immediately underneath the cold-water cistern at the top of the house which supplies the apparatus, so as to be able to control the delivery of the water to cylinder and pipes alike. This is a matter which is very rarely observed, to the great detriment of the household, for not only is there a possible contingency of causing an explosion in the boiler, but the water is emptied from the cistern without any possible advantage.

I will remark hereafter that there are several cylinder systems extant, both in America and England, but I have chosen the one represented at fig. 3 as being the best adapted to supply all the wants of a household without complication. Looked at from a broad point of view, the cylinder system by the side of the boiler or heating apparatus clashes entirely with the system of which the hot-water circulating cistern is the example. I do not for a moment seek to infer that, with due precautions at

all times manifest, the upstairs hot-water circulating cistern will not perform adequate duty, but I would

FIG. 3.

contend that all should claim to be possessed of an apparatus which is free from objections, and especially from those evils which result from careless management. I will not here reiterate a single word upon the disadvantages of the upstairs hot-water circulating cistern, because I have mentioned them in a former part of the paper, and I may add here parenthetically that in drawing attention to the relative merits of systems 1, 2, and 3, I have no interest in one system or another.

In the cylinder system, as I call it, every ounce of water is heated in the cylinder, which is shown at C, and the cold-water supply is derived from the cistern E, and flows by way of the pipe R, and enters the cylinder at the bottom at F.

As the water is heated in the boiler G, it delivers itself into the middle of the cylinder C, and thence, as in the case of the diagram, supplies the kitchen jamb H, and the scullery-sink J, the housemaid's sink K, the lavatory L, the bath M, the wash-basins N and P. It will thus be seen that as the water is heated it ascends through every ramification of the pipe, and, after it has supplied every draw-off, it joins the cold-water down pipe to the cylinder at the point R, thus enforcing a constant circulation. Between the point G, which represents the boiler, and the point S, the pipes are enlarged in size to 1½ inches diameter, and above the point S to all the draw-offs the pipes are reduced in size—the intention being by the enlargement between the boiler G

and S to allow a certain portion of the heat to act as a reserve in the cylinder, while at time retaining the natural circulation in the

Vexing is it beyond measure to the householder find many times, with an incomplete system of circulation, that he has to open the hot-water sometimes draw off a gallon or so of cold water according to the length of the service, but hot water is available, and should he draw hot water off again, he would find a disability in the hot-water supply, owing to the cooling of the pipes. By the system of continuous circulation, shown on Plan 3, this drawback is avoided. Of course this continuous circulation is not achieved with any apparatus, and I only mention it here because it occurs in sequence.

I may here interpolate that in common systems of hot-water heating an expansion tank is carried up, and delivers either on to the top of the cylinder, or above the level of the cistern. It should be taken at all events to some place sufficiently high over the hot-water supply, and it is not a wise thing to deliver any cold water into the cold-water cistern.

There is one advantage which the cylinder system possesses over all others, and that is the retention of hot water in the cylinder, when the circulation has been shut off, by actuating the valve beside the cylinder. The effect of this is that the circulation during the night, when it is supposed to be extinguished; and, this being the case, hot water in the cylinder would remain at a considerable temperature, and enable an early supply to be supplied with comparatively hot water before servants have lighted the kitchen fire. In sickness or sudden illness in the household the effect of this would be evident. Another advantage of this is that the water in the cylinder has time to cool, owing to its non-circulation during the night, and that a very little supply of fuel in the kitchen boiler and the unclosing of the cylinder would speedily supply hot water to all the fixtures before alluded to. Supposing that the circulation which stops the circulation at night so as to retain hot water in the morning before the fire is omitted to be opened again by the servant, the worst of all that could happen would be that it would necessitate the drawing off of a considerable amount of cold water before the hot water would arrive, and this would suggest to the servant that they had forgotten to turn on the valve V.

I ought perhaps to have pointed out before, but unlike some other cylinder systems which are in the market, it is perfectly impossible to draw the whole of the water in such a cylinder as this, owing to its being placed so close to the floor, and to its construction, whereby it can be seen to be impossible to empty it except by means of a sluice. For instance, the whole of the hot water in this case is derived from the top of the cylinder, and will be seen at the kitchen-jamb H and the tap J. And even supposing that a downstairs tap or cellar-tap was required to be supplied with hot water, this tap would also be derived from the top of the cylinder. It can easily be seen, therefore, that the boiler, from the mere fact that the cylinder is full, or nearly so, can never be placed in jeopardy, and weeks might elapse before danger could possibly accrue, even provided the ordinary carekeeper of a house ignorant of the system was left in full charge.

der heating of water of this kind it might be inferred from the foregoing remarks that extra pressure is hardly necessary, but the system in which I have been explaining lends itself to facility to the employment of what is called a safety valve. Such an apparatus is not used, but in no case in which I have seen it used has this precaution been discovered necessary, and it rather appertains to the present forms of hot-water supply.

It is very advantageous in a household to have a form of what are called hot-water circulating cylinders for the purpose of heating a room, a hall, a nursery, a bath room, or a linen room. The system of heating from the upstairs circulating cylinder is capable of performing this service, but with drawbacks. For instance, supposing a conservatory to be heated on an upper floor, the cylinder would be to stop the circulation of the water by a T-piece, and cause that hot water to go through the conservatory coils and on to the water cistern. But supposing the servant with cocks in connection with the conservatory apparatus—viz., the supply through the cylinder and the by-pass as well—instead of the cylinder or the other open as required, the consequence might be serious, especially when there is a circulating cistern and only the boiler.

Difficulties connected with the hot-water circulating cylinder upstairs, when in conjunction with a coil between the hot-water circulating cylinder and the boiler, is obviated by the use of a stop-cock.

For granted that the stop-cock was shut, the ascension or flow-pipe, there would still be circulation between the boiler, the circulating cylinder, and the stop-cock, and as the cylinder could be always supplied with cold water, the water became over-heated all that would be that the ring of metal on the safety valve could be lifted up, and the up-pressing water would go off, and be instantly supplied with cold water. In cylinder systems, however, of modern construction even temporary inconvenience is obviated, as a separate flow and return is taken in connection with the hot-water ascension pipe, and the water back with the return, so that it would not matter whether the stop-cock in connection with the cylinder was open or closed, as the circulation would go on the same.

In some cases two cylinders have been heated from one boiler, belonging to two tenements, and this is a difficult matter; but there it sometimes happens that there is no necessity for a separate supply beyond a lavatory above the cylinder in which case it would be unnecessary to have pipes up to the ceilings above the ground-floor again to the ground-floor level. They are therefore made in some cases to work in connection with pipes laid underground the cylinder, or, and the *Sanitary Engineer of New York* some very interesting cases of how this is

constantly kept up, and a proper safety valve provided. We can depend upon one thing, and that is, that the Americans thoroughly understand our English system of heating water for domestic purposes, and that they have deliberately rejected it, and have chosen the only system which is free from danger in their country where severe frost prevails. But this is only an additional reason why the cylinder should be adopted in England for the household, seeing that our household boiler explosions mainly result from our own much less severe frosts.

Since the first introduction of the cylinder into England of the kind which is shown at C on diagram No. 3, many various adaptations of the principle have been introduced by the English manufacturers, and different metals are used, but I do not here desire to enter into the inferiority or superiority of any one of them. I would only point out that not all the English makers recognise the value of the true cylinder, for some of them by placing the cylinder near the ceiling of the kitchen, and sometimes higher still, render it possible for the cylinder to be emptied at the lowest sink. They may make use of a cylinder, but this is not the cylinder system which I have been trying to explain in plan No. 3. For if the lowest sink or kitchen jamb draw-off empties the cylinder and there be a frozen pipe or stuck ball-cock in the upstairs cistern, there is no difference between such a cylinder, and a hot-water circulating cylinder upstairs. The true cylinder system, in my opinion, is shown at Plan 3, because that cylinder, where placed, can never be emptied, except by the sluice-cock A, forasmuch as the hot water is drawn off from the top of the cylinder.

If it can be proved that the hot-water circulating cistern, shown on Plan 2, is the best suited for this country, it will certainly prevail. But it seems curious to me, if this is the case, why so many more or less copies of the cylinder system exist amongst us. And it strikes me as curious, also, that I have never heard of any American house fitted up on the English principles; and it must be borne in mind that it has been stated by the best authorities that there are more domestic boilers for domestic purposes in New York State than there are in the whole of Great Britain.

I hope it may be my pleasing duty to listen in turn to a series of lectures upon this very interesting subject, which is so nearly allied to sanitary work. Without depreciating the City and Guilds of London Plumbers' competitions of which I happen to be the examiner, I would say that I regard it as a great pity that in the olden times there was no ancient Guild of Hot-water Heaters. Surely, however, now is the time, either to found a separate branch of technical education, or to join with the Worshipful Company of Plumbers, and give the public the best advice upon the subject of heating water for domestic purposes, seeing that the plumber must be often the sole hot-water engineer.

THE Worshipful Company of Fishmongers have granted a donation of £20 to the National Health Society, 44 Berners Street, W., for the diffusion of sanitary knowledge.

HER MAJESTY THE QUEEN has been graciously pleased to present to the funds of the Booksellers' Provident Institution, through Sir Henry Ponsonby, K.C.B., a donation of £20. Her Majesty has been patron of the Society since the year 1868.

it may be taken for granted, although it is a common argument, that the cylinder system has an advantage over what our Trans-Atlantic brethren call the English system. They argue that, the more the boiler is from the cylinder the more is the risk, and the greater the expense in any case, even with the temperature at zero, the cylinder out of doors, and run it with safety for days, provided that the fires be

THE SUPERVISION OF OFFENSIVE TRADES.

By ALFRED SPENCER,

Chief Officer, Special Purposes and Sanitary Branch, Metropolitan Board of Works.

THE diminution and prevention of nuisances arising in trade processes are objects which have always demanded the attention of sanitary reformers, and in recent years, from a variety of causes, the necessity for such attention has undoubtedly increased. Science has from time to time revealed the commercial value of much that was formerly looked upon as waste or refuse, and in utilising such refuse many new processes have been developed, which have increased the number and variety of the effluvium nuisances from offensive trades. I do not think there is now much difference of opinion on the general question of the necessity for regulating such trades, to the extent of requiring the observance of reasonable precautions for preventing public nuisance in carrying them on, and the tendency of modern legislation has certainly been to attain that object, by subjecting such trades to regulation and official supervision. Only some classes of offensive businesses have, however, been so dealt with, whilst other classes of trades, productive probably of quite as much nuisance, have been allowed to remain without interference. The anomalous state of the law on this subject is difficult to understand; and, if it can be shown that the result of the supervision given to those nuisance-trades which have been regulated by statute has been beneficial to the public and not injurious to the trades, I may, I think, be fairly inferred that the extension of such supervision to other offensive trades will also be of public advantage.

I will, therefore, endeavour shortly to describe, in illustration of this proposition, what legislation and supervision have done towards protecting the public from nuisance arising in some classes of offensive trades carried on in the metropolis, and then to briefly indicate some industrial operations causing nuisance which are not under legislative restrictions.

The Metropolitan Building Act, 1844.—Modern legislation on this subject may, so far as London is concerned, be said to have commenced with the Metropolitan Building Act of 1844. Section 55 of that Act provided, with regard to the business of a blood boiler, bone boiler, fellmonger, soap boiler, tallow melter, tripe boiler, slaughterer of cattle, sheep, or horses, and any other like business offensive or noxious, that it should be unlawful (1) hereafter to erect any dwelling within fifty feet of a building used for any of the specified businesses [I do not suppose that this provision has ever been enforced or acted upon]; (2) To establish or newly carry on any such business, either in a building, in a vault, or in the open air at a less distance than forty feet from any public way or fifty feet from a dwelling [I do not think this provision was enforced between 1844 and 1874]; and (3) That if any such business be *now* carried on within the distances prescribed in the last paragraph, then, from the expiration of the period of thirty years, it shall cease to be lawful to carry on such business in such situation, *save as hereinafter provided*.

As the expiration of the thirty years of grace provided for in the Building Act approached, the implicated trades grew alarmed, and were successful in obtaining the appointment of a committee of the House of Commons in the session of 1873 'to consider the operation of clauses 55 and 56 of Act 7 and 8 Victoria, cap. 84, and the best means of making provision concerning the offensive and noxious businesses therein specified.'

That committee, after taking a great deal of evidence from medical officers of health, from members of the trades, and from other persons (including members of the committee, who had personally inspected both private and public slaughterhouses in the metropolis), recommended that 'all businesses that may be called noxious, whether enumerated in the Act of 1844 or not mentioned in it . . . should not be actually banished from the metropolis unless a case of nuisance can be established against them, but that they should all be subjected to stringent rules and frequent inspection, and the sections of the Act of 1844 concerning the enumerated trades should be repealed.'

The Slaughter-houses, &c. (Metropolis) Act, 1844.—The Government of the day took no action on the report of the Committee, but a Bill was introduced by private members in the Session of 1874, embodying the recommendations of the Select Committee, and this Bill became law as the Slaughter-houses, &c. (Metropolis) Act, 1874. This Act repealed the 55th and 56th sections of the Metropolitan Building Act, 1844, only so far as concerned the business of a soap boiler, tallow melter, knacker, fellmonger, tripe boiler, and slaughterer of cattle. It absolutely prohibited the establishment anew within the metropolis of the business of a blood boiler, bone boiler, manure manufacturer, soap boiler, tallow melter, or knacker, but it permitted the establishment anew of 'the business of a fellmonger, slaughterer of cattle, tripe boiler, and any other business which the local authority may declare by order confirmed by the Local Government Board to be an offensive business,' provided the sanction of the local authority had been formally obtained. The Act also provided for the making of by-laws for regulating the conduct of the specified businesses, and the structure of the premises on which such businesses are carried on.

There were, at the time this Act passed, about 1,429 licensed slaughter-houses in the metropolis, and perhaps rather more than 200 premises upon which the other businesses named in the Act were carried on. The latter number has since increased, not in consequence of new businesses having been established, but because of the additional businesses which the local authority has since declared to be offensive.

All the businesses named in the Act, with one exception, arise out of the slaughtering of animals; in other words, they are trades in which the skin, bones, blood, fat, and offal of animals are utilised; and this is important in connection with the limitation which it imposes on the local authority in declaring other businesses to be offensive businesses within the meaning of the Act. For it is now well established in law, that any businesses dealt with under a statute, must be *ejusdem generis* with the businesses actually named in such statute. The business of a 'manure manufacturer' is, however, also specified in sect. 2 of the Act, and although

* Read before the Society of Medical Officers of Health, on Friday, Nov. 1, 1884.

y be manure manufacturers who exclude animal matter, that is not usually the

ter-houses.—Beginning with slaughter-houses the local authority made a set of by-laws in accordance with the sanitary conditions affecting the same, and these by-laws have proved adequate for their purpose, although they are open to amendment and could be improved. The Board's experience of slaughter-houses only partially confirms the view of the Select Committee that the London slaughter-houses are well kept, as it is found that that was true of only a small proportion of the whole. In a few districts where the local authorities had paid special attention to the regulation of these places, and had exercised the powers given them by the 93rd section of the Sanitary Management Amendment Act, of objecting to the licensing justices at the annual special meeting for the renewal of the licenses, the condition of slaughter-houses was found to be good. But the great bulk of the private slaughter-houses, which are not under local supervision appears to have been neglected, and their condition emphatically proved the necessity for uniform and persistent supervision. In the majority of premises, to the number of 620, have been abolished, and of those remaining it can be said that although many are, as to situation and surroundings, unsuitable, few or none are a cause of nuisance, or even of inconvenience.

It is not to remember more than one complaint has been made against private slaughter-houses by the local authority during the past year, and the absence of complaint is no sure indication of the absence of nuisance, in this case the observation of the officers of the Board. In the case of groups of offensive businesses dealing in animal substances are in Bermondsey (where tanning, fellmongering, glue and size making, such trades are carried on), and at Belle Isle, at Southwark, and at one or two other places, but isolated businesses of this nature are scattered in nearly all parts of London.

of Offensive Trades.—I need hardly say that the suitability of situation is one of the most important considerations in dealing with offensive trades, or that it would be desirable, if it were possible, that all such trades should be confined to specially suitable localities. It may be said, that the accumulation of a number of small nuisances in one place would have the same effect as making that place unwholesome and quite unsuitable for residential purposes, but that would not be the case if the trades were properly regulated, as all that could then arise would be occasional accidental discharges of effluvia which appears almost impracticable to prevent. Such an occasional temporary discharge might be noticed in neighbourhoods where offensive trades were carried on, but might be of no serious annoyance in a good residential locality. One of the most troublesome matters in connection with an offensive business carried on in a district is, that every nuisance experienced in the district is put down to it.

The second set of by-laws framed by the local authority under the Act of 1874, deals with the regulation of a blood boiler, bone boiler, manure boiler, soap boiler, or tallow melter. This is in accordance with the other by-laws made under the Act of 1874, attempting to deal with the conduct of

the businesses in detail; but provision is made in general terms for the storage of offensive material and the conduct of offensive processes in such a way that no effluvia shall escape into the external atmosphere.

As the trades in this group are mostly conducted on a tolerably large scale, and have been in the past productive of much nuisance, I will briefly describe the measures taken for minimising their offensiveness.

Blood Boiling.—The first in the group is the business of a blood boiler, but the process of blood boiling is almost obsolete, having been superseded by better methods. The old process of blood boiling was a most offensive one, consisting as it did in the elimination of moisture from the blood by means of dry heat. At only one establishment was this process found to be carried on in London, and the remedy for the great nuisance that arose was found in the abolition of the process. This was, however, only effected after legal proceedings had been taken and penalties imposed. Blood boiling may still be carried on in a few places outside the metropolis, and, should nuisance be experienced from the process (which would certainly be the case if the works were near inhabited houses), I should recommend that an endeavour should be made to induce the proprietor to adopt a more economical and less offensive method.

Bone Boiling.—The process of bone boiling is a more difficult one to deal with. The business of a bone boiler consists in the collection of both fresh and stale bones from slaughter-houses, butchers' shops, marine store dealers, and other places. These bones are first sorted, and those which are suitable for ultimate use in manufacturing purposes are sawn, usually by steam saws. The remainder are passed through a crushing mill, and are then boiled for the purpose of extracting from them the fatty matter, which is valuable for soap making and other purposes. The boiling is usually effected by free steam, that is, by the injection of steam into the boiling pans; but it is sometimes accomplished by boiling in water by means of a fire underneath each pan. When the process of boiling is completed, the fat is removed from the pans, the water run off, and the bones removed to a storage place called the 'bone hole,' where they accumulate until removed in bulk for use as manure or in manure making.

The nuisances arising in this business are from the accumulation in large quantities of bones that are not always fresh, and from the effluvia that comes from the boiling pans, but probably the greatest amount of effluvia arises from the heating of the decaying bones in the bone hole. This gives rise to fatty ammoniacal odours of an intensely disagreeable nature, which in certain states of the atmosphere will extend to a great distance from the premises; and it is not too much to say that a badly conducted bone-boiling business is an intolerable nuisance to the neighbourhood in which it is carried on. If model premises with the best appliances could be erected in a suitable neighbourhood, this business could, I have no doubt, be carried on quite without public nuisance; but in London such conditions do not exist, and I think the Legislature were well advised in omitting this business from the repealing section of the Act of 1874. The sections of the Building Act of 1844—still in force as far as this business is concerned—were in-

operative in effecting its abolition from the metropolis, although in very few cases were the premises at the prescribed distances from public highways or inhabited houses. The Metropolitan Board of Works were advised that it would be a good defence if a bone boiler could show that he had adopted the best known means for preventing nuisance from his business, and they came to the conclusion that they could obtain the adoption of such means more readily and economically by making and enforcing by-laws than by taking legal proceedings in the superior courts for enforcing the old sections.

That the Board have not been successful in entirely preventing nuisance from this trade is due chiefly to the fact that most of the premises in which it is carried on are old and unsuitable, and also to the fact that the premises are in some of the most thickly populated districts in London. One of the most effectual means for preventing nuisance from this business is, where the construction and arrangement of the buildings admit of it, to make the whole premises a series of close chambers, the outer one alone communicating with the external atmosphere, and then only by one opening on the ground level. This opening serves the double purpose of an air inlet and an entrance gateway. In the outer chamber carts can be loaded or unloaded, bones sorted, sawn or crushed, and, if necessary, the boiling pans (usually on a raised stage) can also be placed. The effluvia arising in this chamber can be disposed of and the place ventilated by the air being constantly drawn through it into an inner close chamber. The effluvia from the boiling-pans should not, however, be allowed to escape into the chamber, but should be drawn off from steam chests at the back of the covered boiling-pans, condensed, and then discharged through pipes into the enclosed ashpit under a furnace fire. In passing through this fire the organic vapours would be burnt.

The inner close chamber should be very solidly constructed, of concrete, if possible, but if of brick-work it should be thickly lined or coated with cement. This mode of construction is necessary, as the chamber is used for the storage of bones, the moist, pungent effluvia from which will otherwise gradually permeate the walls and thus cause external nuisance. This inner chamber should be ventilated by means of an air-shaft of sufficient dimensions leading into a condenser and then into a furnace. It will, I think, be obvious that, where the arrangement and construction of the buildings are good, where the motive power used is sufficient for ensuring that the air is always drawn into and never leaves the building except by means of the exhaust shaft, and where the processes of condensation and combustion are properly carried out, nuisance from this business is hardly possible. There are effectual methods of treating bones and of preventing nuisance other than that just dealt with; but I have described this method rather fully, because it has been applied with success to a variety of other businesses.

Manure Manufacture.—The business of a manure manufacturer was neither named in the Act of 1844, nor in the repealing section of the Act of 1874. It is, however, one of the businesses which are prohibited from being established anew in the metropolis, by the 2nd section of the last-named statute. There is no definition of 'manure manufacturer' in the Act, and the local authority has enforced by-laws in all cases where manure is

manufactured for sale. By manufactured, I mean any trade process, such as mixing, and no attempt to apply the Act has, of course, taken place in cases where stable or other refuse is merely collected and sold as manure. The term 'manure manufacturer' is, however, of wide range as practically applied in the metropolis, and includes on the one hand the collector of refuse fish and fish offal, who at once mixes his materials with such substances as sumach, seal dust, or other absorbent, and sells the mixture as fish manure; and on the other hand includes the large manure works (chiefly on the banks of the Thames), where superphosphates and other artificial or 'chemical' manures are made on a large scale in extensive premises. These latter works are included in the Alkali, &c., Works Regulation Act, 1881; but they were nevertheless under the operation of the Board's by-laws for some years before that Act came into force, and large sums were spent in making extensive alterations, in order to bring the business into compliance with the by-laws.

It will be impossible within the compass of this paper to describe, even briefly, the processes of the various nuisance trades which have been dealt with in London, and that is, perhaps, unnecessary, as they are more or less known to you; but I may say that the effluvia from artificial manure making are distinct in character from any arising in the other regulated trades, being chiefly evolved in the mixture of sulphuric acid with coprolites and other mineral phosphates. The fumes from this process are pungent, irritant, and most offensive, and they extend to a great distance from the works: in some places, and in certain conditions of the atmosphere, for upwards of a mile. It was found that most of the firms carrying on this business in the metropolis had not studied the manufacture from a nuisance-preventing point of view, and as the subject involved much technical detail, it proved convenient to prepare a set of suggestions for the prevention of nuisance in the manufacture, with drawings of appliances.

I believe these suggestions and drawings proved useful beyond the limits of the metropolis, as the Artificial Manure Manufacturers' Association caused them to be printed and supplied to their members in various parts of the kingdom. In the London works great improvement has taken place, and I do not think that any complaint has been made of them for some years past, either by the public or by the Board's inspectors.

Soap Boiling.—Of the business of a soap boiler it is only necessary to say that improved trade processes have so altered the character of soap boiling that it can hardly be now considered an offensive trade. Where, however, tallow or stuff melting is carried on in addition to soap boiling, as is usually the case, very great nuisance may arise. Stuff melting is the liquefaction, usually by free steam, of the refuse fat collected by marine store dealers and others; and, as this material is always in a more or less decomposed condition, the melting of it will prove offensive unless the effluvia are collected, carefully washed in a scrubber, and then passed through a furnace. Very great care is also necessary in the storage of the material, in the disposal of the residue, and in the conduct of the business generally.

Tallow Melting.—The same may be said of tallow-melting, which is a most offensive process when improperly carried on. Tallow-melters' pro-

in many parts of the metropolis, and, in were constant sources of annoyance; but, Act of 1874 came into operation, gradual ment has been made in the methods of with the raw fat, in collecting and destroy- effluvia from the melting, from the press- from the premises generally. Although sums of money have been spent in many of the London tallow-melting estab- lishments, I do not think there is one that I should hold up as a model. Complaints of nuisance, connected with this trade, have, however, now are; but I trust that improvement will still all the very best methods only are in use. Remarks also apply to the trades of *knacker* and *boiler*, which were formerly sources of nuisance, but which are now usually conducted. The only remaining business mentioned in the Act of 1874 is that of *fettmonger*, which is confined to the district of Bermondsey, and source of so little nuisance that no by-laws have been made for regulating it, although a general law has been exercised over the works.

Businesses.—The additional businesses, in which animal matter is the chief material used, have been brought under the operation of this Act by the local authority declaring such trades to be offensive, are: blood-drying, glue making, fat-melting and extracting, gut-making and the business of a gut-manufacturer. Other trades usually considered to be trades which are carried on in one district of the metropolis, but with which the Board have found it unnecessary to deal. I refer to the trades of tanner and leather-dresser, which, though not named in the Act, are *ejusdem generis* trades that are named. Complaints have not been made of these trades, and as they are entirely in Bermondsey (which is closely connected with them), it is doubtful if they can be considered a nuisance to the locality.

Means in securing Improvements.—In endeavouring to improve the methods of preventing nuisance, of effluvia in carrying on nuisance trades, the difficulty usually met with by a local authority is inability on the part of the trader to see the necessity for improvement. He usually holds fast to the view that his particular business is not offensive, but that it is positively not so, and he infers that the neighbourhood is rather grateful to him for carrying it on otherwise. He will be sure to refer to the time, probably over fifty years, that one or two men have been employed at the work, and instance the general healthiness of the locality as evidence of its salubrity. Having met with as best it is able, the local authority must overcome a matter of far greater difficulty—almost invariable ignorance of the owner of the methods of preventing nuisance. Arranged with the supervision of an offensive trade, in my opinion, be able to do little or nothing in improving the way in which that trade is conducted until he has obtained a tolerable knowledge of its conditions, and especially of the nuisance-preventing methods adopted.

To obtain real and permanent improvement, must be able to give good practical advice; and this he must always protect himself by enforcing the fact that the person carrying on the business is responsible to the law, and that,

although he may act upon the advice given, he will not be so doing be relieved of that responsibility.

Changes must be gradual.—In very few cases will it be found possible to obtain great changes at once. The educating effect of improvement, however, soon begins to tell, and it must be a very bad case indeed if a manufacturer takes no pride and credit for the perhaps small improvements he at first makes. When he does begin to feel such a pride it becomes possible to induce him to make greater changes, unless, indeed, he is prevented by want of means. Fortunately economy is on the side of improvement, and after a time the manufacturer begins to see that his alterations have prevented waste, and will probably pay. When that is the case the inspector's work is made comparatively easy. Additional suggestions are readily acted upon, and the manufacturer cordially assists in making his workmen properly use the appliances. Something of this sort has been going on in the metropolis. The persons carrying on offensive trades have been gradually made to improve their processes, and thereby to greatly diminish nuisance; and, where it has been possible, they have done this in a way that has paid them.

Workmen must be interested in Improvements.—But it is not enough to have the manufacturer on the side of improvement: some advantage must always, if possible, be also given to the workmen, as otherwise they will have no inducement but fear to keep them up to the constant use of the appliances.

This lack of sufficient inducement to the workmen is one of the great practical difficulties in the supervision of offensive trades, and it is a difficulty which lasts, as the temptation to shirk what may be a troublesome precaution is always more or less present, while the master or the inspector may be only occasionally on the premises. There is the further difficulty that a manufacturer may be induced to avoid the expense of using the sufficient additional fuel or water necessary in burning or condensing offensive gases. Although there has been often greater comfort to the workmen, and sometimes economy to the master, in adopting improved methods, that is not always the case, and until it is, the most effectual remedy is vigilant and persistent supervision.

Supervision by Inspector.—The qualifications necessary for effectual supervision are high ones, for, in addition to being able to acquire the special knowledge necessary for understanding the working of the regulated trades, an inspector must possess great rectitude, energy, persistence, and tact. If with these qualifications he unites firmness and a kindly manner, he may, and in time does, exert a most salutary influence on both masters and men, who will look with pleasure to his visits, and take a pride in satisfying his requirements.*

The times of inspection must be well arranged: they should be at unusual intervals and at all hours. Indeed, night and Sunday inspections have been frequently found necessary in the metropolis. I need hardly insist on the almost obvious fact, that to do effectual work an inspector must be thoroughly impartial and absolutely free from local or other influence.

I also regard uniformity in administration as of the utmost importance, and the difficulties in attaining this where a number of inspectors are employed

* See on this subject pages 330 and 334 of vol. xiv. of the SANITARY RECORD.

will be readily admitted by those engaged in work of this nature. The method adopted in the metropolis is for the officials to meet weekly to take instructions and to compare notes. This method ensures that the instructions are uniform, and that the experience of each officer benefits the whole.

Investigation of Complaints.—Notwithstanding all the care a local authority may exercise, complaints will now and then be made, and in investigating them no trouble should be spared, because they indicate weakness of supervision. Judicious inquiry should be made of disinterested persons in the neighbourhood of the implicated works, special observation should be kept thereon, and the arrangements for preventing nuisance should be carefully re-examined. The difficulty that a local authority experiences in tracing the source of a nuisance, which is, perhaps, only at times noticeable, is sometimes very great indeed: and several such inquiries, undertaken by the Metropolitan Board of Works during the present year, have terminated unsatisfactorily, the chief reason being the reluctance of householders to give information, and their apparent inability to take precise observations and notes as to the nuisance of which they complain. Although the conduct of those offensive businesses carried on in the metropolis, which are now under statutory regulation and supervision, cannot be said to be entirely satisfactory, it can, I think, fairly be claimed in respect of them that marked improvement has taken place, that such improvement continues, and that, on the whole, the resulting public benefit has amply justified the special legislation on the subject.

Nuisances from Mineral or Vegetable Substances.—I pass now to nuisance trades dealing with mineral or vegetable substances, but to these I can only briefly refer.

It will doubtless be in the recollection of members that a Royal Commission on noxious vapours was appointed, and took evidence during 1876 and 1877. The Metropolitan Board of Works gave evidence before the Commission as to trade nuisances in the metropolis, other than those with which they had power to deal, and urged that such trades should be brought under regulation.

No practical outcome appears to have immediately followed the labours of the Commission, but in 1881 the Alkali, &c., Works Regulation Act was passed. This Act does not deal with the greater part of the trades as to which the Board had given evidence before the Royal Commission, but it includes within its operations sulphuric acid works, gas liquor works, nitric acid works, sulphate and muriate of ammonia works, some of which are carried on in London. I do not know whether any benefit to the metropolis has resulted from the passing of this Act, as its administration is entirely in the hands of inspectors appointed by the Local Government Board.

Brick and Ballast Burners.—There are, however, other trade processes carried on in London which are productive of far greater and more widespread nuisance than any of those trades now under regulation; but of these I will only specially mention the processes of brick burning and ballast burning. Of the horribly offensive nature of the nuisance from these sources, I need scarcely speak, for it is notorious; and hardly a part of London, and especially of the suburbs, has escaped it. The nuisances consist in the pungent and irritating emanations, mostly also

of a putrid character, which are given off in volume during the processes. This putrid frequently the cause of the effluvia being for sewer gases, especially as such effluvia atmospheric conditions are carried over a large area, extending, in several instances, to own experience, for nearly a mile from the burning. It is unnecessary for me to detail causes of the intolerable nuisances arising processes, as now carried on in London suburbs, beyond mentioning that the worst are probably caused by the use of impurities for combustion, and that the whole, the whole, of the nuisances would cease, methods were adopted and proper material. There would be no hardship whatever in such processes as these, when carried on in towns, under regulation and supervision this were done, the metropolis, at any rate, be relieved of an intolerable and unnecessary of nuisance.

DISCUSSION.

The President, Dr. Orme Dudfield, in a vote of thanks to Mr. Spencer for his paper, said he would be glad to be informed it was really practicable to so destroy the of organic matters in an offensive state by no unpleasant smell could possibly escape chimney-shaft? He cited a case, within Mr. knowledge, which seemed to cast a doubt point. He was glad to hear that there was a probability of improvement in the method of and removing fish offal and similar matter present system was attended with nuisance referring to the trades not regulated, he said desirable something should be done to diminish annoyance from the usual system of bricks, which caused offensive effluvia in portions of the metropolis during the brick season. He noted that the most offensive of the trade of a bone-boiler arose from the practice of storing the bones after boiling in the hole. This was no part of the 'process' business, but the nuisance was analogous created by the storage of bones and other of animal origin on the premises of marrow dealers—a trade which was just as offensive practice as any of the regulated businesses which he was of opinion should be dealt with by the Act, so as to insure proper control by the sanitary authorities. He was able to draw from personal experience, with the stater 'stuff-melting' was a trade from which was very likely to arise, and often did arise at present time. This was due largely to the fact that the 'stuff' went to the melter in an open condition from the collecting shops—in other words from the marine stores. 'Very great care is necessary in the storage of the material,' as Mr. properly says. He means on the premises of the melter, but the same care was necessary, under the provisions of the Nuisances Removal Act, that the material should not be secured, at the marine stores.

Dr. Rogers said that in the East of London manufactures were carried on of a most offensive character; that he had had some experience of the nuisance from blood-boiling, and that at the present time a considerable nuisance was created in Shadwell by the process of bone boiling, and so offensive is this process that it is

ainly have been included in the list of offensive trades dealt with by the Metropolitan Board of Works.

Dr. C. E. Saunders referred to a very common nuisance, which had not been mentioned by Mr. Spencer. He alluded to the effluvia from fishing. He believed this was due to the very inferior quality of the oil which was used, and to certain natural defects in the houses in which the business was carried on. A difficulty in applying a remedy seemed to be due to the fact that it was necessary to have frequent access to the fat-pans, and that any kind of 'hood' which had been designed to keep the vapours confined failed on this account. He would be glad to hear any practical suggestion from Mr. Spencer. He also confirmed what had been said as to the nuisance from fish and poultry offal. This was taken to the outskirts of London, there used to extract such of the material as was good for pigs' food, or for the use of size-makers, &c.; and the rest was used as manure on the fields, causing a great nuisance, and one lasting for a considerable time.

Mr. Shirley Murphy referred to the nuisance caused by brick-burning when bricks were burnt in clamps and the out-puts of dust-bins used, and to the comparative absence of nuisance when this operation was conducted in kilns, with small coal for fuel. The Vestry of St. Pancras had, four years ago, proceeded against a builder who persisted in making his bricks in the former method after due notice had been given him by the Vestry. Although evidence before the magistrate as to injury to health was admitted by him to be proved, he eventually decided in favour of the defendant, the defence having been given that it was the custom of the trade to burn bricks in the manner which was the subject of prosecution. Mr. Murphy argued that brick-burning were to be permitted in close proximity to inhabited houses, the method adopted would be strictly regulated.

Dr. Gwynn quoted, as showing the necessity for constant supervision and inspection of certain trades, the case of some tripe-dressers at Hampstead, who were carrying on their trade, surreptitiously, in a shed and stable. Offal was thrust down the drains into the public sewer became blocked with masses of putrid and horribly offensive entrails. The result was a serious and dangerous nuisance. With regard to brickfields, the nuisance arising from burning bricks in open clamps with sifted dust-refuse was the cause of very great complaint and annoyance in Hampstead. A distinction must be made between burning bricks in properly constructed kilns, in which coal-dust was used as fuel. Here the nuisance was caused beyond the smoke given off.

But when dust-bin refuse was used in open clamps, no amount of sifting out of soft core would prevent the putrid emanations. So great had the nuisance become in the Fleet Road brickfields that the Hampstead Vestry had applied for an interim injunction to restrain owners from carrying on the business, but, owing to the application having been made on the last day but one before the legal vacation, Vice-Chancellor Bacon had declined to hear the case on the plea that the nuisance had been existing for three years. The Hampstead Vestry has now commenced an action at Common Law against the owners of the brickfield, which, it is expected, will be shortly tried.

Dr. Iliff drew attention to the arrangements at work in the parish of Newington for the disposal of

dust, house-refuse, manure, road-slop, &c. The Vestry of Newington own a piece of ground in the centre of the parish, through which the London, Chatham, and Dover Railway runs; they have a siding on the railway for trucks, a hydraulic lift, and below arches for stables. At first house-refuse and road sweepings were simply mixed together and sent down into the country, but the farmers objected to the broken glass and pots it contained. The hard core is therefore separated, the vegetable refuse is mixed with road scrapings and stable dung, and it is allowed to rest for several weeks and then sent into the country. Fish and meat offal is shot at once into trucks and covered with disinfectants and ashes. The Vestry pay about 15. 8d. per ton for any distance within a radius of twenty-five miles, with an extra penny per ton per mile to stations beyond that distance. During the year ending Lady Day nearly 2,500 tons was received above the cost of carriage. Depots in the country were found to be necessary to prevent accumulation in town, and a furnace was required for destruction of useless material.

Dr. Kelly spoke of the intolerable nuisance produced in some villages by the conveyance of offal from the metropolis. Much depended on the way in which the material was treated at the time of conveyance and deposit. Fish offal was especially offensive, but stable manure was not.

Dr. Corfield said that most of the improvements in the conduct of noxious businesses at Belle Isle, Islington, were due to Dr. Ballard, who was formerly Medical Officer of Health for that parish. The most offensive trades were the making of artificial manure from coprolites and gut-scraping. He could also corroborate what other speakers had said as to the nuisance caused by brick-burning where the outputs of dust-bins were used. After referring to the health of persons engaged in these trades, he mentioned a suggestion of Professor Bouchardat, that all such businesses should be grouped together, so that the fumes given out by the chemical works would counteract the effects of foul organic vapours from other trades.

Mr. Spencer, in summing up the discussion, stated in answer to Dr. Dudfield, that it was quite practicable to destroy offensive effluvia arising from organic matter by passing such effluvia through a good furnace fire. He found it difficult to ensure such fires being always maintained, excepting where a mechanical stoker was used. Such a stoker was in use at the works referred to by Dr. Dudfield, and any occasional nuisance caused by these works did not arise from unconsumed organic vapours passing out of the chimney shaft. Mr. Spencer, however, recommended that offensive vapours should, where practicable, be passed through a coke or other washer before reaching the furnace.

With regard to the nuisance caused by the collection of offensive material on the premises of marine store dealers, Mr. Spencer said that the Metropolitan Board of Works were of opinion that the remedy could be found under the Nuisances Removal Acts, and that appeared also to be the opinion of the Medical Officers of Health of the Metropolis generally.

With reference to the case of nuisance from the burning of bones for the manufacture of animal charcoal, cited by Dr. Rogers, Mr. Spencer stated that improvements were being made in the processes carried on at the works in question which would, he thought, get rid of the nuisance.

As to the nuisance from fish-frying, mentioned by Dr. Saunders, Mr. Spencer said he concurred in the opinion that the adoption of a hood connected with a chimney shaft did not dispose of the effluvia. He believed a remedy would be found in carrying on the process in an inner room, instead of in the open shop, as is usually the case. The room should have only one opening, protected by a canvas curtain reaching nearly to the floor. The fire and the ash-pit should be inclosed, and a large air-shaft should lead from the upper part of the room into the ash-pit. This plan, he said, had been tried with success in small tallow-melting works. The fire draws the hot offensive vapours out of the room through the shaft and burns them, the fresh air enters the room under the curtain, and no offensive smell escapes into the external atmosphere.

Replying to Dr. Cornfield, Mr. Spencer said that Dr. Ballard had reduced the amount of nuisance from the offensive trades carried on in Belle Isle, Islington, while he was the Medical Officer of Health for that parish, but that great improvement had been made in Belle Isle since Dr. Ballard's time, especially in getting rid of the nuisance caused in the manufacture of catgut.

Mr. Spencer said it was quite practicable to burn bricks without public nuisance. Probably the chief source of offence from the existing system was from the burning of soft core, which consists of vegetable and other offensive matters collected from the London dustbins. This is usually separated at the brickfields from the cinders, &c., and is burnt in the open air without any precautions, causing a horrible nuisance throughout the district. In addition to the successful method of disposing of such refuse adopted by the Vestry of Newington, many towns had got over the difficulty by using Fryer's 'Destructor,' or some other similar appliance in which the material is burned without offence.

SALE OF FOOD AND DRUGS ACT.—Mr Bernard Dyer, F.C.S., F.I.C., has been appointed public analyst for Southend.

MR. A. TAYLOR, inspector of the Local Government Board, has recently been making inquiries as to the water-supply in certain colliery villages in the county of Durham, especially those in the rural sanitary district of the Chester-le-Street, Durham, and Lanchester Unions, and has made an interesting and exhaustive report on the subject. Mr. Taylor says the common practice in these colliery districts is for the water to be supplied by the owners to their own workmen alone; the occupants of houses belonging to other landlords must get their supply as best they can. The universal opinion of colliery managers, as far as Mr. Taylor's experience went, is that water is properly and abundantly supplied if a single stout pipe be fixed at one end, or possibly at either end, of a long pit-row, numbering from fifty to one hundred cottages—double or single, as the case may be. The too common practice is to derive the supply from water pumped from the pit's 'sump,' which receives the urine and excreta from the horses and men down the pit. The inhabitants very naturally manifest a dislike to use such water more than they can possibly help, and often have to travel a considerable distance to get a purer, if scanty, supply from natural springs. He adds that the existing system of supply is radically bad, and ought to be everywhere superseded by the rural sanitary authorities taking the matter into their own hands. Several members of the Lanchester Rural Sanitary Authority, who are also colliery managers, have challenged the statements and inferences of the inspector, and a special committee has been appointed to inquire into the matter.

THE WOOD ENCLOSURES OF SANITARY FITTINGS.

By D. J. EBBETTS.

THOUGH so much attention has been paid to sanitary fittings of late years, but little has been said, so far as I know, of their enclosures.

It may be conceded at once that the sanitary fitting is of very much more importance than its wood enclosure, but, if we are to have perfect fittings, surely it is desirable that we should consider whether the woodwork generally employed is capable or not of improvement.

We all remember the early w.c. enclosures, with a lid hinged, but with seat and riser screwed. This arrangement satisfied all the requirements of the time. If any repairs were necessary to the apparatus, the workmen could readily remove the woodwork. Its removal by the householder for any other purpose was never dreamt of by the most advanced sanitarian—if such a being existed at the time of which I am speaking. A w.c. apparatus was a thing to conceal as much as possible, and when you had well cased it in and had shut down the lid, it was felt that you had effectually cut off any communication with the offensive drains, and had done all that the most careful regard for decency could expect.

Our ideas on such subjects are greatly altered nowadays, and I think it is not difficult to show how eminently desirable it is that sanitary fittings of all kinds should be capable of being readily uncovered and exposed on all side.

In boxed-in w.c.'s (in nearly all cases) the brickwork and flooring within the wood enclosures, being out of sight, are left by the builder in a rough unfinished and untidy state, such that the most fastidious housekeeper would find it impossible to keep sweet and clean, even if she were not obstructed by the woodwork in her efforts to do so. And as water will occasionally slop over the edge of the pan, and leakages occur, and dust and cobwebs settle and collect upon the apparatus, as well as upon the surrounding brickwork, it results that generally the precincts of the fitting are in a very dirty, sloppy, and grimy state. It needs no argument of mine to show that this ought not to be, and I think all will admit that, in order to insure the proper periodical cleansing of the space referred to, it ought to be readily accessible, if not constantly in sight.

Something of this kind has been felt, no doubt, from time to time, and the enclosure has been made more easily removable. Many plans have been advocated. In one which you may sometimes meet with, the seat is hinged to throw back, and the riser is hinged to open against the wall. This, no doubt, is a good arrangement as far as it goes, but it involves more fixed woodwork than necessary, encumbering seriously any examination or cleansing of the apparatus. Besides, it would appear very desirable that it should not only be possible to examine the apparatus readily, but that it should always be in evidence and accessible.

Out of sight, out of mind, is an old proverb, and its truth in this application will be admitted. It appears to me, therefore, that a spot requiring an exceptional amount of attention, should not be shut out from sight even by hinged doors.

I suggest, then, that the woodwork of a valve w.c. should consist of a strong mahogany seat, hinged to throw back, resting upon and hinged to retract

plugged to the walls, and with narrow skirts as shown in the illustration. This arrangement involves the additional advantage that the floor would have to be properly finished, and the would have to be plastered, cemented, or

d with tiles, &c., to agree with the room. If method of covering the apparatus is adopted, will be found a further incidental gain, in that set can be at once converted into a slop sink al by throwing back the seat.

e persons will object to the china pan, &c., visible, but those who have not seen a closet n this way will be surprised to find how little paratus shows. In a proper apparatus there ing visible that is really objectionable, and if pearance of the white pan is disliked by some, be supplied by the makers printed with ic designs to please the most exacting. h, as one of the canons of good taste insists l objects should be, above all things, appro- to their use, there would seem to be little to to in the clean white pan.

ve up the usual mahogany lid and frame y. It answers no useful purpose; it encum- ie closet and engenders in the minds of many a of safety which it cannot possibly satisfy.

ve confined my remarks to the fittings neces- r a 'valve closet,' because those who wish to 'wash-out' apparatus can purchase a w.c. of ind, which is already supplied by the makers seat hinged at back, and resting upon two orbels, and the pan of which is ornamented he intention that it should be fixed inde- ntly of any other woodwork.

re are at least two w.c.'s in the market of the refer to, namely, Doulton's 'Lambeth Com- on Closet' and Twyford's 'Unitas Closet.' f these closets have front outlets, and those lesire to use 'wash-out' closets cannot do than to inspect these goods before determin- on their purchase; although, personally, I ate very much the use of raised floral orna- upon the pans, as being decidedly out of place, g giving a multitude of unnecessary surfaces : retention of dust, &c.

ar I have spoken only of w.c.'s, as being the mportant of sanitary fittings, but the same ents will apply, with more or less force, to all , and it would be easy to show, on some future

occasion, how the same principles may be applied to them.

The subject of my remarks may appear to be a trivial one, but a careful consideration will, I believe, show that it is only by serious attention to such small details, that anything like real perfection of sanitary work can be attained.

THE REGULATION OF THE SUPPLY OF WATER TO CITIES AND TOWNS.*

By WILLIAM KEY,

Gas Engineer, Tradeston Gas Works, Glasgow.

THE subject of the more economical distribution of the water supply to cities and towns is admitted by all those who have given the problem any study to be one of the very highest importance, and it has afforded many engineers the opportunity of cracking one of the hardest nuts they have ever encountered in attempting to solve the difficulties pertaining to it.

The number of hydraulic engineers of experience who have made this problem a special study, and designed apparatus with the view of attaining by such means the object to be desired, and with results more or less successful, proves the general acknowledgment that some contrivance to be applied to the mains is necessary.

Such an instrument to be adequate must be self-acting, and receive the water from the main at its inlet, under great and ever-varying pressures, and shall pass the water on at a reduced, but more uniform pressure into the mains carrying it onwards.

The difficulty attending the regulation of water under heavy pressure in its passage along the mains, as compared with gas, is due chiefly to their physical differences as fluids, the gas being exceedingly elastic, while water is not.

Before I proceed to explain the design and action of the instrument, as shown by the diagram, which has been found to perform all the functions requisite for the perfect control and regulation of the flow of water, I will make a few remarks leading up to the reasons why such an instrument is necessary to the proper control and distribution of water.

Cities and towns are generally built on sites having within their boundaries districts differing greatly in level, and, when the water is led on, the elevated and low districts draw their supply from a source common to them both. Thus the pressure necessarily increases and accumulates excessively as it reaches the lower levels; and this is found to be the case more especially at night, when the consumption is least. Sometimes the pressure becomes double, or even more than treble, in the lower districts than what is actually required for an adequate supply in the higher districts.

A water supply distributed in this manner seldom gives unqualified satisfaction, for, whereas abundant pressure is found at the lower levels during the heavy withdrawing or consuming hours, the high levels too often have little or no water, or a supply and pressure adequate for their purposes only reaches them when the residents are preparing to go to rest for the night. The steady supply remains with them while they slumber, but with the early ringing of bells, sounding of horns, and blowing of whistles in the morning, the pressure steadily and surely disappears.

* Read at the meeting of the Philosophical Society of Glasgow, December 19, 1884.

This is not as it ought to be, for in a residential district we all know what it means, when our most approved system of sanitation depends wholly on water carriage and a regular and abundant supply.

Therefore, the first aim when water has been brought within the limits of a city should be, how to distribute the precious fluid, so that all levels would have at all times a supply abundant for the many uses for which it is required.

I believe much more water is now used than formerly, in our city and suburbs, during the spring, summer, and autumn months for the purpose of laying dust, than which a more subtle and perfect carrier of disease would be difficult to find; also, great volumes are used daily through hose pipes to

This statement brings me to a question that very naturally arises. Can a moderate supply of water be given to every customer under pressure, in such a way as to enable all to have share without in any way disturbing existing property fixtures, or seriously desiring to restrict volume of water used, and only as far as possible limiting the volume of water wasted?

It can, and to do so, our efforts toward an equitable distribution of water in cities, should only meantime tend to the stoppage of waste. Under this head, we are apt to ask, Does our present method of charging for domestic water supply at so much per pound of rental conduce to negligent waste?

thoroughly scour back areas, &c., and probably this is at once the cheapest way of maintaining the health of a great city, as it is without doubt the quickest method of cleansing and getting rid of the impurities inseparable from city slums, areas, and closes.

We have now for all these and other purposes a weight of water delivered for each individual, equivalent to a consumption for every man, woman, and child within the area of supply of 500 pounds' weight of water daily; this being equal to a supply to each dwelling of a weight of our pure Loch Katrine water, delivered in the enormous quantity of over twenty-four cwts. daily.

We know it does; we observe it daily. A weight of so much per pound of rental per annum produces no inducement to save; so the habitually thrifty have to pay for their share and a proportionate waste of those who are thoughtlessly careless of a glorious water supply.

There is no other commodity we know of that can be bought and sold in the same way; but then, say, water is a necessity to our health and our existence, and ought to be free to all to use as they please. I might with as good argument and as good reason say gas light has also become a necessity to our existence, and this argument carried with it

weight, and materially assisted in legalising the supply of gas works to corporations.

It is both the supply of gas and water are for the benefit of the citizens, and as it costs to bring water to the feet of gas, or 1,000 cubic feet of water in the reach of the customers—probably nearly alike—the rule by which the one is regulated at a rate of so much per pound of rental, and stands equally good for the other. If it were otherwise, there would still exist those who would use water from 100 to 800 times more than enough for domestic use, and still desire to pay no more than those who used their privileges with comfort and economy, without waste or abuse.

In the case, there is no disputing the fact that water was sold by meter for domestic use, and gas is now sold—the result would be a great benefit to the city as we enjoy in our Glasgow. There would be greater thrift and less waste of time has not yet arrived when the meter will be called upon to pass a 'Sale of Water Act,' although there is little doubt in the compulsory sale of water for domestic use, the meter will become law. Any arrangement for domestic water supply by meter, while preventing waste, would require consumers to pay for the volume they had actually used. Such a system, although appearing equitable and reasonable in the meantime not quite prepared to regard it as a method of reducing waste. Instead of endless trouble, it would conduce to proper cleanliness of the house, of the person, together with a stinted use of water in stairs and courts. Thus the compelling to pay for being comfortably clean, and surroundings, would be affected by those who stinted their use of water, and endangered by risks of epidemics from the use of the uncleanly. Our sanitary authorities should have more trouble, and the extra cost of examining and cleaning many more of the city than presently visited, together with the risk of an epidemic which no estimate of value, would entirely outweigh all the benefit effected by a supply of water for domestic purposes by meter.

To conclude, that the volume of water supplied should be stinted, but it ought to be so governed, that the pressure in a given hour of the twenty-four should be no greater than what has been found to be quite sufficient during the hours of greatest consumption. To accomplish this, streets and houses should have the supply governed by the contrivance for the purpose, and which is self-acting. And the leading main pipes should carry forward the high pressure to the houses.

The diagram of the apparatus employed is shown in the accompanying page 506. It is entirely self-acting, and consists of a valve chamber provided with an inlet pipe, and having a dividing web or partition with or forming a seat or casing for an annular equilibrium valve, through which the water passes, the arrangement being actuated by the pressure of water on a piston, connected directly to the valve. The piston is weighted to balance the pressure on it, and to correspond to the pressure at which it is intended the valve shall open, and allow the water to pass when the pressure of the water is greater

than and overcomes the opposing weight on the piston, the valve rises, and is partially closed, and the supply of water passing through the valve is diminished; and when the water pressure is less than, and is overcome by the opposing weight on the piston, the valve opens, so that a greater supply passes through it. The piston is open directly to the discharge side of the valve, and can be so loaded or regulated as to correspond exactly with the rate of consumption.

Next to the fact of the instrument being a most satisfactory controller of water supply, the important feature of the design is that, should the pressure from any cause on the inlet side of the valve fall below what the outlet had been set for to be maintained, the valve immediately falls full open, allowing all the water coming forward to pass full bore through the valve, and remains so until the outlet pressure rises higher than the valve was set for, when the extra pressure acting on the piston at once raises the valve, and cuts off from the outlet side the excess of pressure above what it was originally set to maintain; or, generally, when the pressure on the outlet is sufficient to overcome the load by acting on the piston, the equilibrium tubular valve is raised and shuts off the water, falling again, and allowing the water to pass whenever the outlet pressure falls below the point the governor was set to maintain.

I do not claim for this valve any of the offices of a stop-cock, or to govern a supply to be counted by drops. An essential feature of the valve is that the main leading from the valve is constantly kept charged with water, and, when shut, leaks sufficiently to maintain the outlet pressure that may be desired. It is extremely simple. The moving equilibrium annular valve gives neither wear nor tear in its action. It is compact, and adaptable to any situation. Once set, it requires no further attention. It is durable. It cannot go out of order. The exceedingly small range of travel of the piston in order to give full area of the connecting pipes gives very little wear and tear of the cup leather, and this is helped by the piston cylinder being lined with brass. An almost equable pressure would be maintained over the whole city. A better supply would be given to residences and factories situated at the high levels. All excess of pressure above what is found to be effective and sufficient during day for the streets and districts governed would be held back and concentrated in the leading mains through every locality. This would be a great advantage for purposes of extinguishing fire: the entire pressure would be concentrated in the high-pressure mains, and available for hose-pipes. The adoption of this system would constitute a 'constant service' in every meaning of the word, the present so-called constant system being more intermittent than constant, as the pressures in the mains vary every hour of the day. And in many cities the large volume of water that would be saved would not make so urgent contemplated new works which are presently absolutely necessary, to keep up existing leakage, and the looking out for additional sources of supply would be indefinitely postponed.

Before concluding I shall quote the opinion of the engineer for the Loch Katrine water supply, Mr. Bateman, in his report. On June 6, 1860, three months after the introduction of Loch Katrine water, Mr. Bateman made the following report. 'I must draw attention to the present consumption of water, which is increasing so rapidly as to be

really alarming, and quite warrants the apprehensions I felt, and the pains I took to guard against it, when writing my report on the city piping, 1858. Referring then to the habits of waste which existed, and to the imperfect state of the fittings, I observed that should the same state of things continue under a constant supply, and at high pressure, the waste would be enormous, and even Loch Katrine would be found inadequate to meet it.

At the same time I wrote this the consumption on the north side of the river was little under 13,000,000 gallons a day. In November last, eighteen months later, it had increased to 14,000,000, and in the beginning of March of this year, after the whole city on this side was supplied with the Loch Katrine water, it was 15,000,000 gallons per day. It has gone on increasing since then, till it now amounts to 18,000,000 gallons per day, being an increase of 3,000,000 gallons per day in three months. The consumption by the city was measured at the Mugdock reservoir every hour for twenty-four hours consecutively in the beginning of this week. The greatest draught is about one o'clock in the day, when it is at the rate of 22,000,000 gallons a day, and the least at two o'clock in the morning, when it amounts to 14,000,000. At this time of the night nearly the whole of this quantity must be wasted. The total consumption of the city from Loch Katrine and Gorbals together is 22,000,000 gallons a day, being at the rate of 50 gallons per head, and just twice, in gross quantity, as much as Manchester and Salford take for a larger population.

Upon this statement Mr. Gale, the resident engineer, was instructed to institute such an examination as would lead to the discovery of the cause of the excessive waste of water. He found that, from badly-constructed and leaky taps *alone* the waste amounted to 7,200,000 gallons per day, equal to 20 gallons per head, the value of which, if sold for trade purposes, would have been about 50,000*l.* per annum.

I may add that since the date of that report, fourteen years ago, the consumption has nearly doubled, having increased from 22,000,000 gallons per day to 40,000,000 gallons per day at the present time. This gives a consumption for all purposes still of 50 gallons per head of population, the population supplied by water being as nearly as possible 796,000. Of this 40,000,000 gallons per day, 36 gallons per head is accounted for as used or misused for domestic supply, and 14 gallons per head per day as used for trade purposes, making up the 50 gallons per head per day. So that, although means have been and are constantly being employed to reduce the waste, there is every reason to conjecture that there is still over the whole area of supply a waste of 20 gallons per head per day, or, say, 15,000,000 gallons wasted daily, being a volume equivalent to the total daily supply of water from Loch Katrine to the north side of the city during the first year of its introduction.

Mr. Gale, the Glasgow Waterworks engineer, is performing a great and valuable necessary work at the present time in subdividing the city into districts for the purpose of approximately ascertaining the leakage during the hours of night, by fixing waste-water meters in these districts.

The information thus obtained forms a guide in the searching for the cause of excessive waste, but is of itself incomplete; the ascertained fact saves none of the water from being run to waste, whereas

by fixing one of these pressure reducers would immediately be saved a considerable volume of water. And as the expense of on the street and breaking the water-main, fixing both a waste-water meter and a waste preventer, would be little more than the fix either separately, I would suggest that this be done, and when the leakage had been ascertained governor being put out of action, then, by removing the load from the piston, and regulating the pressure to what may be desirable, a test would at once show what volume of the loss had been recovered use of this instrument.

I have every confidence that the result will be very encouraging, and if the whole city be supplied as I have suggested, the ratepayers would get a very good thing. If only one fourth of the loss by leakage would be recovered, this would be equivalent to a saving of water at trade rates of the value of 12*l.* per annum.

Cities supplied at present under the intermittent system could now be put under a constant system, the only drawback to the old-fashioned system being the constant system having by this invention the pressure removed, as the pressures would now remain a constant.

Burst pipes, loss of water, and destruction of property thereby would be unknown.

A city fitted up completely in districts governed by this apparatus would have a complete pressure escape valves; the pistons yielding, and exhaust the force of any concussion.

These instruments are admirably adapted to be put in place of break-pressure lodges along line from reservoirs to place of consumption, and in duplicate for this purpose, will only cost one-tenth of the expense for a service reservoir.

The makers of Key's Patent Pressure Reducing Valves are Messrs. the Glenfield Company, Ltd., Kilmarnock.

[Since this paper was read we understand that the engineer of the Glasgow Waterworks has placed in place of Mr. Key's governors on a district of 2,100 inhabitants. The results are recorded by a meter, and the readings will be resumed after the holidays, far as ascertained the saving of water both day and night is considerable, and the inventor's claims have been more than realised.—*Ed.*]

NATIONAL HEALTH SOCIETY. Mrs. Priestly kindly consented to deliver a lecture for this society at the Parkes Museum, Margaret Street, on Thursday, 22nd inst., at 4 o'clock P.M. The subject of the lecture will be House Sanitation, and the title 'Unseen I in the House'. We are glad to know that the National Health Society is endeavouring to instruct women in this very essential branch of domestic education. It is of the utmost importance that the mistresses of homes and families such knowledge be made so important.

LIABILITY OF LODGING-HOUSE KEEPERS.—A question of law has been decided by the East London magistrates. A mechanic, who arrived in the town and set up his abode at a common lodging-house, was found to have died somewhat suddenly. The mother of the deceased, not having the means to meet the cost of the funeral, brought the matter before the magistrates. The borough guardians declined to interfere on the ground that the lodging-house keepers were responsible for the death of a lodger dying under such circumstances. The lodging-house keeper disputed his liability, but the magistrates decided that the funeral should be carried out at his expense.

PENNY DINNERS FOR POOR SCHOOL CHILDREN AND COOKING DEPOTS AT GATESHEAD.

By FRANCES JOHNSON.

[All rights reserved.]

THE better housing of the poor is a problem apparently as far from solution as ever, but the better and cheaper feeding of the poor—a question of equal importance—has been satisfactorily dealt with by the Rector of Gateshead. He finds it possible to dine children well for a penny per head, and can give a man an excellent and nutritious dinner for twopence, the profit in both cases being more than sufficient to meet the cost of labour and fuel.

Seven months' experience in providing penny dinners at St. Mary's National School, Gateshead, has proved that it is not necessary to have a large number of children dining in order to make the scheme self-supporting. During the month of August the average daily attendance was not above fifty, yet the average profit was a shilling a day, being more than was needed to pay for labour and gas.

The cooking-apparatus, specially devised by the rector for the purpose of economising labour and fuel, is a cylinder-shaped upright boiler, taking up very little room. The sides and lid are coated with a non-conducting material, so that nearly all the heat is retained, and it is possible to cook for two hundred children at an expenditure of not more than fourpence or fivepence in gas. Very little labour is required. The cooker being a sort of huge Warren's pot—a boiler within a boiler—the food cannot be burnt, and once placed in the apparatus, it may be left to take care of itself. The continual watching and stirring and attention to the fire that is needed in cooking with the ordinary boiler is saved. Most food is improved by being cooked very slowly; the use of the inner tin insures this. Where rapid boiling is necessary, as in the case of puddings, the inner tin is removed. The cooking is done by two of Fletcher's atmospheric gas-burners.

The Board Schools throughout Gateshead have adopted the scheme, and are working on exactly the same lines as St. Mary's Schools, with perfect success. They use Mr. Moore-Ede's cooking-apparatus, which takes up so little room that in several cases a disused coal-cellar has been converted into an admirable little kitchen, quite large enough for the cooker, the cook, and all culinary operations. The dinner being served in the schools, there is no rent to pay either for dining-room or kitchen. The teachers take it in turn—one from each department—to attend at dinner, to keep order and assist—not a very arduous duty. It is seldom that the same teacher is called upon oftener than once a week. The only voluntary helper is one lady for each school to order the dinner, check the stores, and keep accounts. The scheme is worked entirely by the school staff, thus avoiding that irregularity which so often attends work dependent on outside voluntary helpers. Only children of widows, or those whose parents are out of work or on short time, are allowed to dine at school. These are very inadequately fed at home, and are thankful to secure a good mid-day meal for a penny. The scheme has enabled the Relief Committee at once to grapple

with the distress—so far as the children are concerned—which at present exists in Gateshead. The teachers and School Board officers know the number of destitute children, whose parents are quite unable to feed them at home or provide a penny for the school dinner, and the Relief Committee issue weekly to each school the number of dinner-tickets needed. In this month of December 1,200 free dinners are allowed daily.

The effect of good food soon shows itself in the children both physically and mentally. From being white, listless, and dispirited, and slow at their schoolwork, they become bright, vigorous, alert, both in mind and body, and so full of spirits that their teachers sometimes threaten laughingly to 'dock their dinner allowance.'

Undoubtedly the scheme is also a strong civilising and humanising agency. The neatly-laid tables, the white cloths, the shining pewter spoons and mugs, have already brought about a more decent mode of eating and better manners generally. The lad who used to eat the 'figgiest' bit of his own pudding and then force the rest on to a smaller boy's plate, sending up his own for a fresh supply, understands now that it is unfair, and 'bad manners.' It is no longer considered the thing to throw bones, fat, and other rejected morsels under the table, or deposit them surreptitiously on your neighbour's plate. A boy who is caught in the act is immediately pounced upon by the next lad, and held up to scorn as '*a chap as knows no better nor chuck his bones under the table.*' The children are evidently ambitious to behave well, and pleased to be taught.

The dinners are also a humanising agency. Formerly many of the children, especially the bigger lads, would rush home famishing after the morning school work, ravenous as young wolves. There would be a fight for the largest share of the insufficient meal, and they would be driven out again by the worried mother with their hunch of bread, and a scolding or a blow for being so hungry. The better-tempered ones would try to forget their unsatisfied cravings in play, but others would prow about in a sullen, half-famished condition, ready to snatch the bread from a younger child, or do anything for food. It was a terribly hardening process.

These lads first came to the dinners looking anxious, watchful, distrustful—ready to fight for their share if necessary. When they at last realised that each would be helped fairly in his turn, and might have as much as he could eat, they became altogether different boys, so softened and humanised. They flock in now, smiling and confident, tuck their little bare feet safely out of harm's way under the forms, and speculate in delighted whispers as to what there will be for dinner, and how many helpings they think they can manage. Relieved from the one passionate absorbing anxiety as to whether he will get enough to eat, the boy is no longer the mere hungry animal full of selfish ways and fears; he develops into the human social being, with a kindly interest in his fellows, alive to anything humorous that is going on, and, better still, alive to the wants of others. The penny-dinner scheme is of enormous value to children who are inadequately fed and cared for at home. They are benefited physically, mentally, socially, and morally, and assuredly their lot is brightened. The comfortable dinner-table, the warm appetising food, the unstinted helpings, accompanied by kind words, and occasionally a little quiet fun—these do certainly make one

bright hour in the day for many otherwise very drear and cheerless little lives.

The *Cooking Dépôt*, established by the Rector of Gateshead, is an admirable scheme for giving greater purchasing power to the wages of the labouring classes. It is estimated that a working man's food costs him on an average 60 per cent. of his annual income! The following statistics show that the cheapening of food is a question of the first importance to the people.

	Per cent. of annual income.
The wealthy classes spend on food	30
Upper middle classes	30 to 40
Lower	40 to 50
Artisan classes	50 to 70

As a rule the poor get a smaller return for money spent on provisions than any other class. They know nothing of the relative value of the different kinds of food, and generally buy the most innutritious. They know nothing of the principles of cooking, and, assisted by defective apparatus, they waste, and burn, and otherwise render indigestible the midday meal.

In an article which appeared in the *Pall Mall Gazette*, by Mr. L. O. Smith, of Stockholm, headed 'My Social Revolution,' the following passage occurs:—

'The cooking question lies at the foundation of the whole movement. I have studied this question for many years, and I have seen that the condition of the people depends more than anything else upon their food. You have done a great deal here in this country for the lodgings of the poor. I have been to-day over the Noel Estate and the Peabody Buildings, and your building societies also are very good; but, take mankind as a whole, and you will find that of the expenditure of a working man 15 per cent. only goes as house-rent, while 60 per cent. goes in food. Therefore if you provide every working man with a free house for ever, the effect is only equal to saving him 15 per cent. of his wages. But if you can make a radical reformation in his food, you have a much greater margin to play upon. If you could provide him with food twice as nourishing as that which he gets now, so that he only needs to buy half as much of it, or if you give him as much food as he gets at present at half the price, you save him at one stroke 30 per cent. of his wages, or twice as much as the whole of his house-rent. And it can be done. For the proof of that, I have done it, and there is no reason why what I have done should not be done in every town and village in the whole world. Believe me, that is a source whence a great increase is to be made to the wealth of our labouring poor. That is where the waste is—a waste which is not only felt in actual expenditure of money on food, but in insufficient nourishment, causing physical degeneracy and a craving for stimulants, which lies at the root of much of the drunkenness of the present day. I begin my reform of society from the bottom—from the food which man eats.'

This theory commending itself to Mr. Moore-Ede, he determined to act upon it, and began by opening a dépôt intended in the first place to supplement the work of the relief committee by supplying nourishing food at the lowest possible rate to unemployed workmen and those working short time. To save rent, two disused school-rooms under an iron church were cleaned out, the walls coloured, and, as inexpensively as possible, they were fitted up, one as a large kitchen,

containing five of the penny-dinner cookers and a pudding-boiler, stores of every kind, and a small office, which is partitioned off; the other was converted into a dining-room, with four long tables covered with white oilcloth, and the necessary forms. A movable counter is fixed in the doorway between the two rooms. Here the customers are served. They wait upon themselves, carrying their food to the tables, and consuming it at their leisure. For a penny a man receives a basin containing a pint of excellent soup, and seven ounces of whole-meal bread. If he is inclined for and can afford a second course, he receives for a penny twelve ounces of very good raisin pudding, hot, light, and digestible; so that for 2d. a man is furnished with a substantial and nourishing meal. The soups are composed of ox-heads, beef bones, peas, lentils, barley, carrots, onions, and other vegetables, and all are highly approved of by the diners, who are artisans on short time, labourers, and men out of employment. The latter usually dine at 11.30 in order to make sure of their dinner before the twelve o'clock rush. Occasionally it happens that two or three arrive too late—all is sold out. The poor fellows know that their penny will do very little towards providing a warm meal elsewhere, and look anxiously at the long row of cookers. 'Can't you make up a basinful out of the lot, master; isn't there a drop o' soup among 'em?' 'Not a drop,' answers the cook. 'Is there ne'er a bit o' puddin' left neither?' 'Not one bit.' Great and unmistakable is the disappointment. Nowhere else can they dine for a penny, and dine well.

There is a large outdoor sale which goes on from 8 A.M. to 1 P.M., the customers being supplied through a sliding hatch fitted up in one of the kitchen windows. The establishment opened with six customers; in a few weeks from two to three hundred men were dining daily, and about 190 gallons of soup and nine stones of the raisin pudding are sold every morning.

The scheme is more than self-supporting. The staff consists of a man and his wife, who cook and serve, and a young fellow, who collects and washes dishes and makes himself generally useful. The goods required are all supplied by contract. The cooking is done scientifically and economically, and the result is that the rector finds himself with a handsome profit in hand, which he is placing at the disposal of the relief committee in the form of food tickets for presentation at the dépôt.

It is intended to extend the system, and a company has been formed to establish a Working Men's Restaurant on a large scale. First, second, and third class meals will be provided, and food will be sold out in large or small quantities. Factories at a distance will have their supplies sent in specially constructed vessels, so that the food may retain its heat. The cooking-apparatus will be similar to that used in Mr. Smith's workmen's kitchens at Stockholm, which does its work economically and scientifically. The dietary will be arranged so that each meal will contain the proportion of nitrogenous, starchy, fatty, and mineral elements considered necessary to supply every demand of the body.

To return to the simple cooking-dépôt, which may be established at so little cost in the neighbourhood of factories, or in the poor quarters of large towns, it is the best antidote to the numerous public-houses and a great boon to the labouring classes. The Gateshead men, who have given the scheme a trial, are unanimous in declaring that they

themselves as thoroughly sustained, and as equal to hard manual labour, after a twopenny dinner at the dépôt as when they had a 'meat dinner' at four times the cost.

PENNY DINNERS.

By EDITH SIMCOX.

WHEN Confucius admired the populousness of a certain Chinese province, a disciple asked what should be done with the people when they were thus numerous. The sage replied, 'Enrich them.' 'And what should be done with them when they are rich?' He answered, 'Teach them.' It must be confessed that we have still something to learn from the political wisdom of ancient China, but in a backhanded way we are drifting towards the same conclusion as Confucius. It was found that a large ignorant population grew poor, and in the attempt to teach the very poor, people have discovered that it is ill learning lessons on an empty stomach. In other words, to get rid of ignorance, which is the mother of poverty, we must get rid of poverty, which is the mother of ignorance; *ergo*, it is quite logical for the friends of education to form an alliance with those who advocate, either as a matter of justice or charity, the claim of children of school age to be provided with sufficient food for their bodies as well as their minds.

One incidental advantage of forcing the poorest children into school is that we are forced to measure the poverty as well as the ignorance of the masses. We see, marshalled in orderly rows for their easier inspection, the white-faced, undersized, bleary-eyed, shock-headed children of poverty, ignorance, and vice; the discipline of the school reduces the outward and visible signs of poverty in rags and dirt, but it also brings into evidence the bodily diseases and mental defects which are the product of chronic destitution, and it brings tens of thousands of half-nourished children into direct relations with persons—school managers, members of School Boards, and the like—who find it intolerable to be in relations with starving babies. The relation is established by the law of the land, and to make it tolerable to the feelings of educationalists, it appears necessary to feed the babies. But don't let us imagine that the hunger is a product of the 'education craze,' or that the children's sufferings were less when they were dirtier and more ragged, sat in heaps on doorsteps and kerbstones in the genial atmosphere of the street, instead of at 'dual desks' in warm and airy class-rooms. It is no kindness to the hungry, weakly children to leave them out of school, but the benefits of school attendance may easily be enhanced if it can be associated with cheap or gratuitous lessons in the art of dining.

There is a good deal in a name, and the phrase 'Penny Dinners' has a happy ambiguity about it which will allow nominally the same remedy to be applied to two different needs. Originally, both in town and country, the first suggestion of such dinners was derived from the sight of children not able for any reason to go home to dinner, who, as a rule, bring with them a slice of dry bread, flavoured with a scrap of cheese, a scrape of dripping, or some equally meagre fare. This is not necessarily a sign of poverty. The mother who goes out to work, or the widowed father, may earn good wages, and in

such a case the offer of a good hot dinner, provided at cost price, in or near the school, will be accepted with thanks, in every part of London, as well as at Gateshead, or in scattered country villages. Parents of this class would have nothing to say to meals provided out of charity for the class labelled 'destitute'; they would as soon send their children to a 'ragged school,' and their just susceptibilities should be considered in every way, so that they may accept the benefit offered to their children without any uncomfortable sense of being patronised or 'done good to.' If the dinners are made popular and kept 'respectable,' they will be used casually by the households in which a wholesome family dinner can be cooked—perhaps usually is—but still may have to be omitted, to save trouble, oftener than is dietetically desirable. These are the natural clients of a self-supporting penny-dinner system, and in some cases perhaps as many as 10 per cent. of the children in a moderately poor school may belong to this class. Then there is the thriftless section, from whom the child may coax a casual penny, though there is rarely money enough in hand to buy the materials of a good cheap dinner long enough beforehand for it to be satisfactorily cooked. Through their children many of the pennies of this class may be helped to a more profitable investment than they could get otherwise.

So far, then, the promoters of penny dinners are engaged in improving the dietary scale of children who would have something to eat anyway, but what about the children whose dietary is as insufficient in quantity as it is in wholesome variety? Take the case of a family neither drunken nor destitute—say a labourer earning 18s. a week all the year round, with a wife and six children under thirteen to keep out of it. Some people might think that this is just a case where penny dinners should be a boon, but a little consideration of the poor wife's budget will tell a different story. Most likely the money will go thus—Rent, 5s. 6d. (one room must be a good size if it is to hold eight people); father's dinner away from home, 6d. daily, 3s.; Sunday dinner for the whole family, say as much as 2s. 6d. (a wild extravagance!); coal, oil, soap, school pence, and all household necessities, 2s.; leaving a balance of 5s. for the food of mother and children throughout the week and the father's breakfast and supper. Put 4d. a week aside for clothes, and there remains just 8d. a day—that is to say, every child must either get its breakfast, dinner, and tea for a penny, or go without one of these elementary meals. The labourer is not to blame for the rack-renting which swallows up his surplus, but his children must be systematically underfed unless they are invited to share in the penny dinners without bringing the penny. But then charitable people say, 'Such cases can be investigated, and the fees paid if they prove to be deserving.' They must beware, however, that their 'investigations' do not repel exactly those deserving families that neither ask nor wish for charity, who can and do rub on without it, and therefore would have as much right as any doctor or shopkeeper to resent outside inquiries into their private affairs. Humane outsiders wish, in the interests of the children and the community, that the four or five children of school age of this typical labourer should be better nourished than the father's wages allow. (This is not the place to discuss whether the father's wages may not advantageously be raised.) But while there are thousands of families

who prefer to live in virtual starvation rather than go into the workhouse, it stands to reason that the labouring poor, who are not quite starving and not at all pauperised, would decline without thanks any offer of food for their children, accompanied by inquiries intended to discover whether or not they were fraudulent beggars. It is, I believe, a mistake to suppose that, if it were generally known that the teachers would give free tickets for the penny dinners to penniless children, all the children would pretend to be penniless, or that those who paid would be jealous of those who did not. The flood of pauperising charity generally flows through denominational channels; and there may be circles where 'humbugging the parson' is regarded as a lucrative industry; but the mass of Board School families have little or no contact for good or ill with any religious organisation; they receive no charity except from each other; and the mother, who, when she has bread to spare, lets her children give 'a piece' to their starving school fellows, will certainly not grudge the latter a good dinner if anyone else will give it them. It is hardly necessary to point out that if a labourer, in regular work at 3s. a day, cannot treat his children to penny dinners there must be a painfully large class of the casually employed, the sick, infirm, widows, and the like, who are even less able to pay, without being necessarily at all more inclined to beg. If we want to have these children better fed than their parents can feed them, they must be courteously and kindly made welcome to the dinner table on the understanding that they pay what they can and when they can; and if no fuss is made about the charitable side of the enterprise, its promoters need not fear being overrun by professional cadgers. On the contrary, I believe if it were known among the parents that outsiders might pay for the poorest scholars, odd coppers and sixpences would be volunteered as a subscription by the parents who thought the gain to their own children worth more than the regulation penny, and by workmen using the schools but too well off to use the dinners.

This is not mere opinion based on an abstract admiration for the proletariat. In the winter of 1881, Lady Brabazon gave some hundreds of pounds to be expended by members of the London School Board, in providing dinners for children attending the poorest schools, and the writer had charge of the experiment in Westminster. It began amidst warnings against ingratitude and envy, and the impossibility of giving to some without giving to the whole school, and certainly if a whole school could be expected anywhere to apply for free rations, it would have as good an excuse in Clare Market and Covent Garden as it could anywhere. But the teachers anticipated no difficulty, and in fact none arose. No child that asked to come was turned away; here and there a wealthy parent begged to send the children if they might pay a penny; the children known to be very poor were specially invited, and from one of these cases came an agreeable proof that Lady Brabazon's hospitality was accepted as it was meant, and not traded upon with unbecoming greediness. A little girl belonging to a very poor family did not appear one day, and when the mistress inquired why she had not come to dinner, she explained that they had all had soup at home from 'the kitchen'—a charitable institution in the neighbourhood. In two small schools, with an attendance together of about 1,000, about 250

children put in a claim for the free dinners. It is impossible to guess how many would have applied for the dinners if payment had been the rule, and were deterred by the appearance of a gift; but, when the funds were running out, the charge of a half-penny was made 'by request' in one school, so as to prolong the feast; with that the average attendance fell from 140 to 80, and though some of the 60 might perhaps have paid, if the condition had been imposed from the first, I should doubt whether more than 50 of the original number could under any circumstances have paid a whole penny. If we suppose another 50 who would have liked to have had the dinners on paying for them, we have from this small school (600) 100 possible clients for a self-supporting dinner system, 50 able to pay a half-penny for what costs a penny, and 50 or thereabouts who must be invited free. The problem is thus not at all hopelessly large, and the Penny Dinner Committees need not court the unpopularity of the Charity Organisation Society by setting up any elaborate machinery for 'investigation.' If the teachers and the School Board visitors recommend the children they know to be in want, if regular attendance is insisted on, and all are expected to pay who are not privately invited to come without, the applications will be few, and in nine cases out of ten from persons in such circumstances as to justify the appeal. There is, we fear, more likelihood of hungry children, too tidy and well-behaved to look very poor, being left without an invitation, than of free tickets being obtained by well-off humbugs anxious to save a pennyworth of food.

The dinners above referred to were provided in the school without any suitable appliances, cooked by the caretaker's wife in the family copper, and served by the teachers, the children bringing their own plates, mugs or bowls, and spoons. The dinners were usually given four days a week, and some days, to save trouble, consisted only of corn and bread, which seemed as popular as anything else, except lentil soup, made according to the sub-joined recipe, borrowed from a letter to the *Times*. When the dinners ceased, this recipe was given as a dictation lesson to all the elder boys and girls, together with a portion of lentils and vegetables enough for a family dinner, and they were begged to try and reproduce this favourite dish at home. With very few exceptions all professed to have tried and succeeded (only one aggrieved parent came to complain of her child having been set to make such a nasty mess). In catering for the poorest class it should be remembered that their stomachs have adapted themselves to a monotonous and meagre diet of bread and cheese, bread and tea, of the like, and cannot in all cases pass at once even to an ideal dietary; an attempt to give the children two courses every day must add to the cook's trouble without any certain gain to the children, and it would be probably better to repeat three or four favourite dishes often, with an occasional variety, rather than to ring the changes on a long

* Overnight put 2 lbs. of lentils to soak in 2 quarts of water. First thing next morning put the lentils on the fire in a big pot, with 5 gallons of warm water. Add any vegetables at hand, salt and pepper. Boil three hours, pass through a wire sieve; return to the pot with 8 ounces of dripping or clarified meat. Two kitchen spoonsful of flour are then added, after being gradually and thoroughly mixed in a cup with some of the liquor. In half-an-hour it is ready. The original recipe added, 'Half a loaf of bread may be cut up and biled with the soup.' We, however, added instead the contents of a 2 lb. tin of Australian meat, cut up small, or fresh bones to the same amount. The exact cost of 4,930 dinners was 4,495 pence, under over 7d. each.

orate bill of fare. The object is not to with any home cookery that is on a sufficient wholesome scale, and the most certain thing is to keep the dinners for the class that needs to cultivate a wholesome simplicity. Of course it is wasteful to attempt to divide the food into small portions. Each child should have a helping in proportion to its age and size, and provision for a second or a third helping to feed the most hungry ones, while equally of course no child should be allowed to waste or spoil the food. In poor schools there is a demand for $\frac{1}{2}$ d. per week, as a boon even more needed than cheap food. In most cases, to do any real good, these provisions are gratuitous, as a family must be very literally on its own when there is not even a morsel of bread and butter; but here there is in the nature of the thing a 'test' which will keep away all but the best. Early rising is abhorrent to Londoners, and no child that is not hungry and getting food on any other terms would go to school for a breakfast at 8.15 instead of 8.00. The last moment for getting an attendance

is the infant school probably that regular attendance makes most difference to the children's power. In the upper standards irregular attendance has more to do with the comparative success of poor scholars than want of food, as the struggle for existence sharpens the wits. A first-rate teacher will obtain as good a proportion from Clare Market boys as from a boy at average $\frac{1}{2}$ d. or voluntary school. It is not at all that in geography the upper standards of a school already referred to could challenge all the schoolboys of their own age; but where the teacher really shows, as in the spirited and intelligent recitation of passages of Shakespeare or Scott, as 'The Ancient Mariner,' the boys of this or that whether hungry or not, used to acquit themselves in a manner not altogether unworthy of the poet and critic to whose benignant inspection their answers were submitted once a year. Good teaching affects educational results directly, will do far more in a school than good feeding, and only affects them indirectly; the change from a bad teacher produces effects far more striking and immediate than the change from bad to good. But no one will seriously maintain that the only object of feeding the children is to help them to learn their lessons the better, and the lessons are alike means for producing a sane mind and body.

Members of School Boards, who hear all the excuses of parents whose children are kept from school, are as familiar as the doctors of the poor with the medical symptoms of 'poverty, hunger, and cold.' They hear as much about 'bad heads' as about 'Brighton Broune,' but it must be confessed that the outside, not the inside of the child, is that in fault. Under-feeding predisposes to what may be called generically 'dirt' in the blood, and the drain on the constitution caused by disease makes good food doubly necessary for a sickly child. There is still a vast amount of suffering from strictly preventable causes, but the School Board officers are the ones of the doctors against it, since they insist on medical advice being obtained for the heads of children for an indefinite time conveniently enough to warrant absence from school. 'A

copper penny soaked in ink' was the prescription tried in vain by one mother for a 'bad head,' and certainly the health of the juvenile population may be expected to gain when pressure is incidentally brought to bear through the Education Acts against the practice of that sort of domestic medicine. As to the vexed question of the prevalence of headaches among elementary school children, it seems curious that the inquirers have not tried to test their conclusions by asking how many children had a headache on that particular day. Of course some would still answer wildly from mischief, stupidity, or imitiveness; but 'habitual' is a hopelessly hard word, and it may be doubted whether 5 per cent. of the children in any elementary school could give a reliable answer, based on the correct interpretation of a question containing such a word. The querist should himself first determine what degree of frequency makes a headache habitual; then, if the 40 or 50 per cent. who claim habitual headaches had answered correctly, a definite proportion (according to the meaning assigned to 'habitual') should on the average have had headaches on any one day. It would not be surprising if the discrepancy was considerable; half the teaching in an elementary school is by leading questions, and the children fail to understand at the first attempt probably more than half the questions specially devised by trained teachers to lead out what they are supposed to know; when they do not understand a question they make a shot at the answer which they think is wanted, guided not by the meaning but by some supposed indication in the teacher's tone or words. An unfamiliar querist, though also trained for the purpose, like a school inspector, proves more unintelligible and is greeted with wilder shots; and the same tendency has to be allowed for in all inquiries addressed to children *en masse*. If headaches were as deplorably frequent as has been suggested, the fact would have thrust itself upon the knowledge of all constant visitors in elementary schools by unmistakable tokens. The poorest children are not Stoics; their feeble bodies give in to pain even more readily than the well fed (which is why corporal punishment is more unpopular in Board Schools than at Eton), and both they and their parents consider any sort of ache a valid excuse for non-attendance; yet headaches are (or were two years ago) practically unknown as an excuse for absence from school. Again, if a child with any ache or pain nevertheless comes to school, it never fails to tell by the motion of the hand whereabouts it is being sorry for itself; a handkerchief is held to the bad eye, a hand goes to the side of the face with the bad tooth or the bad ear, and if twenty children in a school had a headache the same day, twenty little paws would be seen caressing as many foreheads or temples. There is no fashion of malingering, and the teachers don't repress these little signs of woe; but the child supporting its aching head is not a familiar object even to the extent to which eye disease, spectacles, toothache and faceache, and half-wittedness are familiar. Every poor school will show signs of these every or any day, but the headaches are at least invisible. It would be rash to blame the school work even for the spectacles, as it is probable as yet that the school has only brought into evidence defects of eyesight that would not be the less real for being neglected. The faculty, however, would do well to keep their eyes on the needlework authorities of the

Education Department, and protest, with all the authority of their calling, against the ruin of the girls' eyes by their being required to count threads and stitches—and that in the murky atmosphere of London. No amount of penny dinners will guard against this real danger.

A little medical supervision of the time tables in most training colleges might also be a boon to the rising generation of teachers, as they seem devised so as to set as far as possible at naught all the precepts of the favourite 'subject,' animal physiology.

PENNY DINNERS.

BY H. FORBES CLARKE.

[All rights reserved.]

THE cry of 'overpressure' in connection with elementary education, of which the public has heard so much lately, has had at least one good effect. It has brought to light the fact, little realised before, that in our elementary schools are to be found thousands of children in a totally unfit condition to receive instruction, to say nothing of education, simply from the want of sufficient and proper food. This is no new evil; its existence has long been known to practical workers amongst the poorer classes, but no regular and systematic attempt has been made, until lately, to remove this great drawback in the education of the young. The only efforts to meet this difficulty were those put forth by the 'Destitute Children's Dinner Society' and some kindred local institutions, to whom all honour is due for their endeavours to meet, as far as they could, the need of the children in respect of food. But a dinner once a week was obviously inadequate to supply the want of daily meals. At the best it afforded only a temporary relief from hunger.

Whilst the children have, doubtless, benefited physically by their compulsory attendance, for several hours a day, in well-warmed and airy school-rooms,* it is a fact, which need not be dwelt upon in this paper, that the use of their brains, in performing their various school duties, necessitates a larger amount of nourishment than they would require if they had no mental exercise. The attempt at present being made in various parts of the country and in numerous districts in London, to supply sufficient and nourishing mid-day meals by means of penny dinners, partakes, therefore, of an educational even more than of a benevolent character, and must, if successfully carried out, prove of lasting benefit to the scholars.

The advantages of such meals from an educational point of view, none who have considered the subject will deny. When speaking recently to one of her Majesty's inspectors about an endeavour to provide penny dinners in the neighbourhood of the very poor school he was examining, he remarked, 'Now you are beginning at the right end,' and in reply to a gentleman who asked if the children would show any improvement if such dinners were supplied, he said he had no doubt about it.

* Since writing these lines I have met with a striking illustration of the statement made above. On visiting one of the largest infant schools under the London Board in the week after Christmas, and inquiring as to the number present, the head mistress stated that there were about a hundred and twenty children above the average absent on account of illness—this she put down to the recent holidays, during which they had played, more than usual, out of doors and in the draughty balconies of the so-called model dwellings near by, and, being insufficiently clothed, they had caught cold and were unable to come back to school.

In a speech delivered in the House of Commons on July 26, 1883, the Right Hon. A. J. Mundella, M.P. drew attention to the recent report of Mr. Marchant Williams, one of the School Board inspectors for London, giving some startling statistics of the number of children attending school without breakfast or without dinner, and also to the marvelously good work done at the Rousdon school. This statement has brought Mr. Mundella inquiries from all parts of the country, and in many places the experience of penny dinners has been tried with most satisfactory results. In this, as in many other respects, the country has set an example to the metropolis, which it has been somewhat slow in following, but at least public interest in the question is largely aroused, and dinner centres are springing up all around.

It is somewhat singular that the first person to take any active measures for providing penny dinners on a self-supporting basis in London was a gentleman unconnected with any school, either Board or voluntary. About a year ago, Mr. S. Fuller, of Bayswater, being much impressed by Mr. Marchant Williams's report, asked him to point out a good district in which to try penny dinners. Mr. Williams referred him to Gifford Street Board School, York Road, Islington, the third largest school under the Board, situated in a poor neighbourhood. Here he found the teachers of the school very willing to co-operate with him, and one of them suggested that he should apply to the Committee of the Mission carried on at Gifford Hall, nearly opposite the Board School. The result was that a large hall and kitchen, with coppers and other conveniences, were freely placed at his disposal. The only incidental expenses were the cook's wages, 2s., and the fuel, about 4d. daily, or a total weekly cost of about 9s. 4d. Here, then, cheap dinners for children on a self-supporting basis were first commenced in London on March 20 last. Ten thousand cheap handbills were circulated in the neighbouring schools, stating that dinners would be supplied at Gifford Hall on four days a week, viz., Tuesday, Wednesday, Thursday, and Friday. In the first week three halfpence were charged for each dinner, but it was found that this was a prohibitive price; it was, therefore, reduced forthwith to a penny. The effort to supply the scholars with satisfying and nourishing food proved most satisfactory. Many mothers who were out at work all day were glad to send their children to get a comfortable dinner for a penny each. In many cases jugs or tin cans were brought, and the dinners were taken away for consumption with other members of the family at home.

The teachers of the Gifford Street Board School were supplied with a limited number of tickets which they gave to the most destitute children, who frequently came to school in an underfed condition and whose parents were known to be totally unable to provide the necessary pennies.

Mr. Fuller writes to me of his operations thus:—'The dinners were continued, as far as I am concerned, with the exception of the holidays (and one week when illness prevented my carrying them on from March 20 until Oct. 24. In 93 days I sold 10,016 dinners, or an average of 107 dinners a day. My loss, after paying for provisions, wages, coal, and wood, amounted to 2l. 18s. 1½d. With my previous experience I consider I might have turned that into a profit. Moreover, a summer test of such an experiment was a severe one; but, in addition to the fact that the children need good food in summer

as in winter, I continued the experiment the summer, in order that I might gain experience before that winter set in, and be able to comparative leisure some of the problems—of penniless children—that would be sure to the front as soon as out-of-work days had brought the usual sufferings.

I readily admitted that carrying on the through the summer months, when the daily bill to between seventy and eighty, and the expenses remained the same as when he number attended, was, indeed, a severe trial. Fuller paid for his experience, as most to start these dinners will have to do, for the of one penny a meal leaves no margin through occasional superabundance of food her cause.

I only right to state that the teachers of the Street Board School heartily assisted Mr. his work by attending in turn to help serve the and to keep order. Some of the teachers Mission School also rendered valuable help, and in particular being present every day, and charge for many weeks during Mr. Fuller's in the summer. In the last week of the Committee of the Mission took over the management of the dinners, and, with the of winter, the attendance greatly improved. The average daily number of dinners supplied each been 97, 130, 132, 157, 217, 221, 217, and 211. A fixed scale of payment was arranged with the which she receives daily 1s. 6d. up to 100 dinners, from 101 to 150, 2s. 6d. from 151 to 200, from 201 to 250.

The experiment at Gifford Hall naturally attracted considerable attention, and numerous visitors came to the dinners and the class of children who themselves of them.

The next effort in providing self-supporting penny dinners was made by Mr. W. Bousfield, one of the Board members, who, with some friends, a dinner-centre on May 19 in a room below St. John's Mission, situated on the site of Cremorne Gardens, now known as the End, Chelsea. In the first four weeks the and expenditure there were as follows.

Receipts.		
Item	£	s. d.
23 1,620 dinners.....	6	15 2
30 729	3	0 9
13 673	2	16 1

be observed there was a decreasing weekly ce from the first; this continued as the advanced, so that in nine weeks on 5,545 here was a loss of 2l. 13s. 6d.

ners were discontinued during the holidays

and recommenced in September, but as the Mission room was a considerable distance from the surrounding schools, sufficient children did not come to make the dinners self-supporting. Mr. Bousfield, therefore, discontinued his operations there, but is arranging for dinners to be supplied in part of the covered playground of Cook's Ground School, which the School Board have placed at his disposal. Here he hopes to secure a better attendance.

In June last the Committee of Representative Managers of London Board Schools appointed a sub-committee to consider the question of cheap dinners in connection with children attending Board Schools. The sub-committee consisted of Lady Stevenson, Mrs. Maitland, Miss King, Rev. J. H. Rose, Messrs. Doll, Housden, and Wade, with Rev. R. J. Simpson as chairman, and Mr. H. Forbes Clarke as honorary secretary. After obtaining all the information they could get from those who had practical experience in the work, they issued a circular to the representative managers of each school or group of schools connected with the committee. In the circular they said—'In several of our Board Schools many children are unable to learn as much as they otherwise would from the fact that they are insufficiently fed. How to supply this want without pauperising the parents is a difficult problem; but from careful inquiry made by the sub-committee, they have ascertained that under certain conditions substantial and nutritious dinners can be provided at one penny each to pay all expenses.'

The conditions necessary to make such dinners self-supporting are:—

1. An average daily attendance of about 200 children, including those whose portions are purchased for home consumption.

2. Skilful organisation in buying and preparing the necessary food.

3. A suitable room, with one or two coppers available, in the neighbourhood of one or more Board Schools, which can be hired at a moderate rent.

4. A sum of about 10l. for preliminary expenses.

A series of questions asking for information was added, which the managers were requested to answer. It has been found in actual working that where no rent has been paid, and with good management, 100 or 120 dinners daily are sufficient to cover the expenses of food, fuel, and cooking.

The labours of the sub-committee culminated in a most interesting conference of managers and teachers, held on December 6, in the large hall of the Society of Arts, Adelphi, which was crowded. Mr. Sydney Buxton, M.P., presided, and amongst the speakers were the Right Hon. A. J. Mundella, M.P., the Rev. W. Moore Ede, of Gateshead, and several members of the School Board. (See SANITARY RECORD, Dec. 15, 1884, page 271.) A Central Council was appointed for promoting self-supporting penny dinners in connection with elementary schools. The Council is composed of the following ladies and gentlemen:—

President—Right Hon. A. J. Mundella, M.P.

Vice-President—Sydney Buxton, Esq., M.P.

Council—S. D. Fuller, Esq. (chairman); W. Bousfield,

Esq., M.L.S.B.; Lady George Hamilton; Miss

King; Mrs. Maitland; Miss Mundella; Rev. G.

M. Murphy, M.L.S.B.; Sir Henry W. Peek, Bart.;

Rev. J. H. Rose; H. Spicer, Esq., M.L.S.B.; Lady

Stevenson; Major Wade. *Treasurer*—H. E.

Hoare, Esq., M.L.S.B. *Hon. Secretary*—H. Forbes

Clarke, Esq.

The Council have ample evidence that penny dinners can be made self-supporting, after the preliminary expenses, if a sufficient number of children attend daily, and they have already received most gratifying reports as to the great benefit derived by children who have secured these dinners. The Council are prepared, where necessary, to make grants of a limited amount to managers and others who may wish to start dinners on a self-supporting basis. In all applications for grants the amounts of the preliminary expenses for plant, &c., should be stated.

Four months ago there were only two places in London where penny dinners were provided on a self-supporting basis. At the present time there are about fifty penny dinner-centres, either in operation or in preparation. Disappointment has been caused in some districts, owing to the falling off in the attendance, but patience is required to give the experiment a fair trial; faults of management may have to be corrected, and sometimes the quantities supplied need be increased in order to make the dinners more attractive.

As inquiries are often made for details of suitable dinners by persons desirous of providing them, the following dinner recipes are given. They have been tried successfully at Albany Place School Room, Hornsey Road, by a lady who has had great experience in cooking, and has kindly placed them at my disposal:—

DINNERS FOR 100 CHILDREN.

1. Currant pudding, and bread and jam—cost, 8s. 9½d. 4½ lbs. currants, 4½ lbs. suet, 25 lbs. flour.
2. Suet pudding, with jam, and bread and cheese—cost 8s. 10d. 4½ lbs. suet, 3½ lbs. jam, 25 lbs. flour.
3. Rice and milk, and bread and jam—cost, 8s. 0½d. 11 lbs. rice, 3½ lbs. sugar, 2 lbs. grated suet, 11 quarts milk.
4. Mutton broth, and bread—cost, 6s. 6d. 2 sheeps' heads, 6 lbs. barley, 6 lbs. potatoes, 4 lbs. onions, 6d. carrots and turnips, 10 gallons water, pepper and salt; ¾ pint each, and bread.
5. Potato soup, and bread—cost, 8s. 2d. 50 lbs. potatoes, 6 lbs. barley, 1s. bones, 1s. vegetables, 9 gallons water, pepper and salt; ¾ pint each, and bread.
6. Beans and bacon (hot), and bread—cost, 8s. 3½d. 9½ lbs. bacon, 15 lbs. beans, salt.
7. Irish stew, and bread—cost, 6s. 11½d. 8 lbs. mutton (neck), 6 lbs. potatoes, 4 lbs. onions, 1s. vegetables, 9 gallons water, pepper and salt; ¾ pint each, including 1½ oz. meat, and bread.
8. Pea soup, and bread—cost 7s. 8d. 15 lbs. peas, 6 lbs. potatoes, 1s. onions, 1s. bones, 9 gallons water, pepper and salt; ¾ pint each, and bread.
9. Suet pudding with meat, and bread and jam—cost 9s. 1½d. 3½ lbs. suet, 5 lbs. meat, 20 lbs. flour; slice of bread and jam.

There is, no doubt, considerable trouble involved in providing these dinners, and much good management is required to make them cover expenses, but it can be done, and the benefits to the children are so great that they more than compensate for all the labour incurred. All those who are engaged as managers, or otherwise, in elementary school work, should take an interest in the physical condition of the scholars.

That there is abundant need for such dinners is shown by the following table, which has just been

carefully compiled at Gifford Street Board School; in all cases the numbers have been understated rather than overstated.

	(1.) No. who often attend school without food.	(2.) No whose fathers have little or no work.	(3.) No. who have lost their fathers.
Boys.....	152	201	60
Girls.....	125	180	57
Infants...	72	212	33
	349	593	150

Taking the number of children on the registers at 2,000, the percentages appear thus—(1) 17 per cent.; (2) 30 per cent.; (3) 7½ per cent.

If any one doubts the need of penny dinners in many districts, or the advantages derived therefrom, let him visit some school in a poor neighbourhood, and note the pale pinched faces of the children, who are compelled by law to be at school, and often go there totally unfit for their duties, from want of nourishment. Then let him inquire of teachers, whose scholars have had the opportunity of getting penny dinners, say for four weeks, and he will be surprised at the testimony they will give of the improved condition of the children physically and mentally. It was hard work for the children of Israel of old, under the eye of the taskmaster, to make bricks without straw, but it is still harder work for the children of England to-day, under the eye of the schoolmaster, to learn lessons without food. This is an educational difficulty which cries loudly for removal, and the cry must be attended to, or the children will grow up feeble in body and mind. It is to be hoped that the experience gained this winter will show that penny dinners provide an easy remedy for one of the chief evils at present existing in connection with elementary education.

WORK AND FEEDING.—The following significant statement in relation to the difference between ill-fed and well-fed workmen is extracted from Mr. I. Lowthian Bell's recently published volume on the manufacture of iron and steel. It is contained in a letter from a German ironmaster to Mr. Bell:—'I am much amused that you are unable to understand why we require so large a number of men at our blast furnaces, but when I visited England I was also greatly surprised at the few men you employ. . . . We have often the same technical appliances as you in England, for anything an engineer sees he can imitate and construct. But what we cannot imitate is to work with our cheaply-fed men with the same vigour that your English workmen labour who enjoy their good meat.'

TRICYCLE LAW.—At Watford some few weeks ago two tricycle riders were fined for riding on their machines at night without lighted lamps. The decision of the magistrates was challenged, it being maintained that the law related only to bicycles. A few days ago a test case was brought before the magistrates, Mr. Benjamin Nickles having purposely driven a tricycle through the streets without a lighted lamp. After the point at issue had been argued the magistrates dismissed the case. Acting upon this decision, a solicitor applied to the bench to refund the fine imposed in the first case, and this application was eventually complied with.

THE South Stockton Local Board have accepted the tender of Mr. Hunt, amounting to 3,000l., for the construction of a number of new streets in that town. It is intended, as far as possible, to employ the distressed poor on the work.

DINNERS AT ROUSDON.

the Rev. J. CURGENVEN,

Rector of Rousdon.

he little south coast watering places of Seaton, which are six miles apart, connected by branch line with the South-Ilwray, and the former six miles by roadster Station, the country consists of a coast line almost unbroken by valley apt close to the sea. In the very centre plateau is the small parish and estate (pronounced *Rewsdon*, with the accent on the second syllable).

Peek, Bart., purchased it some dozen years ago, with the object of building a residence on the English Channel from Portland Bill to the English Channel, first rebuilding the disused Church, and the rectory with the perpetual annuity of the Wimbleton and Wandsworth Comutation Act.

Use of the estate was about coincident with the visits of Her Majesty's Inspectors of Schools, which led to the compulsory building of schools. There was no public elementary school within three miles of Rousdon. Before, however, the Education Department for the formation of a School Board for this neglected district arrived, Sir Henry Peek stepped into the field with a well-developed plan, the carrying out of which was local and direct, as well as indirect. The results we will now briefly

was simply to mark out a school district with Seaton as a centre, and build a school house on the premises for every convenience for a public elementary school for about one hundred scholars, and to carry out the system of all the day by giving a cooked dinner every day.

On the premises were ready the next step was to secure not merely a well-qualified headmaster, but the highest success in examinations as the result of the education, but one well adapted by matrimonial family circumstances to carry out the plan (as it then was), and to reside happily in the district, three miles from anything but solitary life. This choice Sir Henry Peek was, as the result, very successful. He determined to carry out the plan by making the education free, but to charge each child the payment of 5*d.* per week for the dinners, with a slightly reduced scale for children, the fathers being principally agricultural labourers with the average wages in that district.

In the autumn of 1876 the school was opened with ninety children (which has remained the number ever since). Most of these had no schooling at all before, and their entire want of education was such that scarcely have been conceived possible seven years this school would be mentioned in the

House of Commons by the head of the Education Department as one than which (as to its results) there 'could scarcely

This efficiency has been thoroughly maintained and increased; and, without robbing them of their due meed, there is no doubt mainly owing to the establishment and continuance of the dinner system.

The rule of payment in advance on Monday mornings and no rebate insures regular attendance during the remainder of the week, as poor parents cannot afford to pay for dinners and not avail themselves of them. It is fair to add that all in the district have regular employment.

The experiment of a very few months was sufficient to convince the parents how thoroughly well spent their pence was in feeding their children, leaving the desire or not for education for them out of the question. There is, therefore, a perfect unanimity throughout the school district, without the aid or existence even of any attendance officer, in aiming at regular attendance.

On the part of the children there is a cheerful alacrity from infant years to set off on their long tramp in almost all weathers in a most exposed country, because they can thoroughly appreciate the comfort and good warm food they get at school, with its consequent cheerful spirits and happiness.

The effect on the health of the children, now so robust and strong, may be well exemplified by the most recent illustration—viz., that in the third week of December, though whooping-cough had been and still was prevalent among them, and the weather was damp and raw, the entry on the master's weekly report was, absentees, 0—that is, every child on the register had appeared on the Monday morning and paid for its week's dinners. Probably such a circumstance in a rural school district (with radius of a mile and a half at least) in the height of winter is unprecedented; but it proves conclusively the good sanitary effect on the children of the daily well-cooked dinners, and their power of shaking off such a trying complaint as whooping-cough.

It is, we believe, a fact that in most of the agricultural labourers' families, at any rate in Devonshire, such a thing as warm cooked food, beyond a plate of boiled potatoes when plenty, is rarely given to their children. Bread, with or without treacle, hard skim-milk cheese, a slice of a dough pasty, &c. Compare the effect of such a diet as this on young children, having often really delicate digestive organs, with that of a regular succession of well-cooked meals all the year round, and it does not need one to be very skilled in medical science to account for the bright healthy appearance of those children who get the latter. From the teacher's point of view there are willing pupils whose bumpkin dulness even is penetrated, owing to good health and regular attendance, and as to corporal punishment or the need of it they are both entirely unknown.

The nature of the food supplied at Rousdon Schools will be found in the table at the end of this paper, and from these materials it will be easily understood how some fifteen or twenty varieties of dinners are given.

A few words about the details of management as to the preparation for cooking, serving, and partaking of meals. The schoolmaster's wife undertakes the whole business, and the elder girls are divided into parties of three or four, and take it in turns every morning to work under her in the kitchen in the preparation (more or less) for each day's dinner, thereby earning the grant for the teaching of cookery.

The only dinner recipe which seems to have puzzled any inquirers is that of the roly-poly bacon

pudding, which is simply made in the same way as the ordinary roly-poly jam pudding, thin slices of lean bacon being spread on the paste in lieu of the jam.

The potatoes are boiled and served separately, and the other vegetables as well, except in the case of soup.

By this means a choice is offered in the rare cases of children being inclined to be fastidious. It is remarkable that the majority of the children dislike the use of milk in rice or other puddings, but plain boiled rice, with the varied accompaniment of sugar, jam, or treacle is quite popular, as well as being the cheapest of the dinners.

The dining-room, as well as by the entrance from the schools, is approached by a short flight of stairs from the kitchen in the master's residence, the capital stove in which supplies also hot pipes to the girls' lavatory above, thereby quickly drying the little damp cloaks, &c., in case of a wet morning's walk. In the dining-room are three parallel lines of tables, on which are spread cloths and plates, with forks, knives, and spoons, as the coming dinner requires. The six eldest girls act as waitresses, a proper quantum of dinner being reserved for them afterwards.

The children are mustered and marshalled in due school order into their places at the tables punctually within a few minutes of noon. After the singing of grace the door from the kitchen opens, and the master appears, followed by his assistants (his own daughters, as it happens), carrying large, flat, iron enamelled pans containing the dinner. Each takes a position conveniently at the end of one of the tables. In the case of puddings the slicing is done in the kitchen. The little waitresses rapidly surround each server with a plate in each hand, darting to the other end for the other portion of the meal if required. The food is dexterously placed on each plate, without exception by *one* movement of the arm only; the most marvellous performance, *e.g.*—which practice makes perfect—being the placing of a quantum of treacle rapidly on each plate, without mess or sticky trail, by one twist round a broad common kitchen knife, and a dab on inside rim of the plate. No difference as to quantity is made on account of the various ages of

the children, except by the number of helps, and as to this there is no limit but the exhaustion of the day's supply. Hence all ages and appetites, balancing one against the other, have just as much as they require. It is a veritable case of Exodus xvi., 18.

Fifteen, or at the utmost twenty minutes, finishes the whole business, and leaves the six little waitresses dining at their leisure before the clearing up.

That, counting the extra grant earned, such dinners can be made (when the necessary room and plant is found) self-supporting, there is no doubt, as the cost of material used is well beneath the children's pence.

The only objection worthy of the name the writer has ever heard is that this system is only another instance of taking off parental responsibility from the labouring classes, which is so increasingly characteristic of the times. To which the obvious reply is that a labouring man—*e.g.* with 12s. a week and five or six children of school age—could certainly not regularly afford more than one penny a day for each of their dinners. It can hardly, therefore, be taking off his responsibility to give his children so far better a pennyworth of food than his wife could obtain for them at home.

The argument of Mr. Mundella, that it is not *over-pressure* but *under-feeding* that makes the requirements of the Education Code difficult of attainment, is undoubtedly proved by this school, as with such originally unpromising material it has been enabled to come up to the highest standard of excellence in elementary schools.

The subject of school dinners having now become one of almost national importance, the above sketch of the history of the first one established on a regular footing cannot be without interest. It has long ago more than rewarded its generous founder by the consciousness he must have of the good his thoroughly successful experiment has already done, and is destined, we trust, more largely to do. Moreover, as a secondary result, he has a population growing up around his family seat drawn towards him and his by ties of gratitude for bodily and mental improvement, and its consequent better worldly prospects.

Particulars of the hot Dinners for 100 Children (three-fifths Standard and two-fifths Infants), as given at the Resident (Devon) National Schools during the Summer Months. In Winter the proportion of meat is larger.

	Apples, 1d. per lb.	Bacon, 7d. per lb.	Beans, 1d. per lb.	Bread, 1½d. per lb.	Currants, 4d. per lb.	Flour, 1½d. per lb.	Jam, 4d. per lb.	Lard, 7d. per lb.	Meat, 6d. per lb.	Onions, 1d. per lb.	Potatoes, 1d. per lb.	Peas, 1d. per lb.	Raisins, 4d. per lb.	Rhubarb, 1d. per lb.	Rice, 2d. per lb.	Suet, 6d. per lb.	Sugar, 3d. per lb.	Treacle, 3d. per lb.	Turnips, 1½d. per lb.	Cost of materials
Apple Puddings	28					28										3	8			1
Boiled Rice and Jam							10													10
Boiled Rice and Sugar								3									2			12
Bread Puddings				3	8															12

Suet Puddings and Treacle						28										3				12
Soup				12					8	1	23	10			1				7	12
Total lbs.	28	9	7	44	17	184	19	3	8	1	46	10	8	28	41	18	34	8	16	12

The 1,100 dinners as shown above cost for material 1,094 pence. The meat used is fresh and tinned, alternately; and it is always given in soup. For fresh meat, ox-head, leg of beef, &c., is provided, for tinned meat, Australian or American, as the market offers best value and variety. The uncooked material averages (it will be seen) over 7½ oz. for each child's dinner, which is amply sufficient for such a school.

PENNY DINNERS IN ANCOATS, MANCHESTER.

ALEXANDER FORREST, Holt Town, Manchester.

SOMETIME near the end of October a neighbour came to me and said, 'There are a great number of very poor children at our doors, and I wish you would set about some plan to get them a bit of food.' I said, 'I will think it over and let you know in a day or two.' Now to those who know Ancoats I need not say that we have 'the poor always with us.' There may be some before whom this paper will tell of those who do not know Ancoats; to them I say no other associated with poverty in any city in England exceeds Ancoats in all the elements of a bad neighbourhood. Firstly, the nationality of the people is very largely Irish; secondly, not one trace of its former respectability in the shape of middle-class houses remains. True, the doctor and the sister live here, but it may be fairly assumed that some moved from necessity than choice that they have moved off with the others. Railway extension, closing of cellar dwellings, the conversion of stage property into business premises, have all contributed to the congestion of population that exists in Ancoats.

Twenty years' experience among the poor has convinced me that there are many forms of charity actively injurious; few will deny that it is a gross misuse of charity to minister to a depraved yearning for drink, while on the other hand it becomes as much a duty as a privilege to feed the hungry and the naked.

I am sure few will credit the amount of misery inflicted on our poor children who are compelled to bear the rigours of the 'Code' in addition to the effects of hunger, and the scant covering that does duty for clothes. I have gone from door to door for the past two months in the courts and alleys of Ancoats. I have heard life histories of misery and destitution long-borne and severe, the bare recital of which would harrow the feelings and lead those who are not conversant with the conditions under which thousands in the great city of Manchester live, to think that the descriptions were highly coloured, and to hope that the reality was surely not so bad. I appeal to all who have had experience in this work, that their souls have not sunk within them, to see the utter helplessness and hopelessness of many with whom they have come in contact.

In the course of my visitation to the public schools, there was placed before me most authentic and convincing evidence that from 20 to 40 per cent. of the children were under-fed; that in one classroom of boys, whose ages varied from 7 to 12 years, on Nov. 2, 1884, seventeen out of seventy declared they had not tasted food up till midday; that is, they had come from home without breakfast and with a hard forenoon's task before them. This, indeed, has so arrested school work, that many times Mr. Bright, the head master of All Souls' School, has, during school hours, sent for bread and distributed it to the starving lads. And frequently the lad who has brought with him a piece of bread has generously shared it with a schoolmate more hungry than himself. Another head-master, Mr. Powell, gave me the names of several boys whose absence was accounted for by their want of food. I visited many of the homes, and in every one I found the reasons given *bonâ fide*.

In one house in Buckley Street, Ancoats, where

three children attended Every Street Board School, I found two at home and one out. The two at home were minding two babies, and all huddled round the little bit of fire in the grate; there was not a vestige of food of any kind in the house. The father, a file cutter, had been out of work for months; the mother did a bit of charring when she could get it. The father had been out all night, and earned 1s. 6d. for watching, every farthing of which went for rent. The boys had neither shirts on their backs nor shoes on their feet, and their pinched looks and piercing eyes told of long-continued hunger.

Now it is a mistake to suppose that ordinarily a child prefers the street (especially in winter) to the warm, well-ventilated, clean school-room. The whole routine of a modern school is a happy experience to a healthy child. The singing, the physical exercise, the playground with its gymnasium, the lessons, and the surroundings are all calculated to minister to the best instincts of youth; but how each and all of these attractions lose their interest, and from being a pleasure become a terror and a pain, from the fact that nature's claims for food are pressing and paramount! There is only one subject before a hungry child's mind, or at least it takes precedence of every other—that is the wherewithal to satisfy its natural cravings, and if these are not in some measure cared for and provided for, all efforts at the instruction or improvement of the mind will be more or less abortive. Those who have had experience in teaching will bear me out in my statement that the difficulties of tuition increase, as the last minutes of the school hours drag their slow length along. We have failed to estimate the large quota of human nature in school-children, and this department needs a constant supply of fuel to keep up the steam at the standard of high-pressure, now demanded by the requirements of the Public Elementary Education Act.

While drink is the primary cause of three-fourths of the destitution in our midst, I may be permitted to cite a case where, from a variety of causes, poverty overtakes a family and the ability to rise above it seems to be denied them:—On Nov. 24, a Mrs. Gilbert came for a recommendation for a child who was ill. We had had four of her children at our penny dinners for near a month, and I at once returned with her to her house to verify the story of her troubles. I found her husband, a man about thirty, lying on a truckle bed with a couple of potato bags covering him, and in great agony from bronchitis. On the Saturday previous, the aged grandmother had, out of her penury, spared the family 3d. for food. Sunday passed, but no food. Monday, a few stray crusts. Tuesday, they all got relief from our soup-kitchen. The two youngest children were out-patients of the Ardwick and Ancoats Hospital, the third child had a withered arm, which was gradually wasting away. The eldest boy had sore eyes, the result of destitution and want. The father and mother were both sober, steady folk, but thoroughly overborne by the crushing conditions of their cruel fate. I said, 'My good woman, why don't you go into the workhouse, where your poor husband would be cared for, and your children, too, until times mend a bit.' 'No, sir,' she replied; 'we've suffered many a year like this, and we may pull through this one yet. I don't care for myself;

but, oh, sir, it's hard indeed to see five of them cry for bread hours at a time. I've pawned everything—furniture, clothes, even to what my children could ill spare—to tide over, but I'm at the far end now.' These are the short but simple annals of the poor that one sees and hears daily. It is not too much to assert that the midday meal given to such a family as this simply saved the children from premature death, and made it possible for those of them who were of school age to attend with some degree of comfort.

From the first day of our operations, the system of tickets was adopted. These tickets were distributed to the various schools, the teachers being enjoined to exercise every care that only those should have a ticket who could not procure a dinner otherwise. Those applicants who came without tickets were visited at their own homes, and if the circumstances warranted it, tickets were given to the children. This feature of home visitation is of the greatest importance, and is an 'essential' which it would be fatal to the success of the scheme to leave out. The attempts at imposition by the professional spongers and importunate sneaks are so numerous and so barefaced, that nothing short of a rigid system of home visitation will counteract this deplorable tendency. With some of the children, under vicious training and habits, a lie comes quite as pat as the truth, and no other method will meet the case but personal inquiry on the spot. This, of course, entails an immense amount of voluntary labour; but if a given area is marked out into small districts, say thirty houses, a willing worker will always be found to spend an hour or two in home visitation.

We have confined our attention to a good, warm, wholesome, midday meal given at one o'clock, fifteen minutes after the dismissal of the schools. The dinners are given in a room measuring 40 feet by 20 feet, with tables placed across. The elder children stand, and the little ones sit on the floor. Our dishes are of tin and spoons of tinned iron. I am sure if I had to refurnish I would have the dishes of earthenware, as the tin dishes rust and become offensive. To-day, Jan. 8, the dinner was Scotch broth, and to make 60 gallons, quite sufficient to serve 240 children, the recipe was as follows:—

12 lbs. ox-head at $3\frac{1}{2}d.$	3	6
6 „ marrow bones at $1d.$	6	6
10 „ carrots at $\frac{1}{2}d.$	5	
4 „ turnips at $\frac{1}{2}d.$	2	
Four cabbages.....	5	
Sweet marjoram, $2d.$, thyme, $2d.$...	4	
Parsley, $2d.$, leeks, $9d.$	11	
$\frac{1}{2}$ a peck of fine oatmeal.....	9	
Salt and pepper.....	3	
	7	3
12 4 lb. loaves at $4\frac{1}{2}d.$	4	3
	11	6

This will make 60 gallons of soup, and with the bread is ample for 240 children; the cost 11s. 6d., with wages, 4s.—viz. 2s. 6d. for cook, and 1s. 6d. for assistant, making 15s. 6d.—i.e. $3\frac{1}{10}$ farthings per head. This regimen is varied daily with pea soup, but the cost is about the same.

I conclude by appending the opinion of the head master of our largest Board School, which seems conclusive as to the necessity for such efforts.

Board School, Every Street, Manchester,
Dec. 12, 1884.

Dear Sir,—On behalf of the poor children attending this school, I beg that you will accept my most heart-felt thanks for your kind efforts in organising the system of 'penny dinners.' It is astonishing what an improvement has been effected in the appearance and intelligence of some of our poorest scholars, during the six weeks that they have been able to procure one good meal a day. Boys who were miserable-looking, restless, and wandering, six weeks ago, are now cheerful and attentive. The work of the Standards needs no over-pressure on boys who are fed, but a very small amount of men'al effort proves too much for an empty stomach. The fact that we have in this school, generally between two and three hundred children whose fees are remitted by the Board affords a means of forming an approximate idea of the amount of nourishing food within the reach of many in this district. The education problem would be easy of solution if it were not for the difficulty many experience in procuring food; but nothing can be done by way of training children whose stomachs are in a chronic state of emptiness. It is not only hunger that these poor waifs have to endure, but the condition bred of hunger makes them lifeless and insipid when at play, and inattentive and dull when at school.—I am, your obedient servant,
C. POWELL.

Alex. Forrest, Esq.

THE PENNY DINNER MOVEMENT IN BIRMINGHAM.

(FROM A CORRESPONDENT.)

THE penny dinner question has aroused some little interest in Birmingham, where there are thousands of children who scarcely know what it is to taste meat from one week's end to another, and various attempts have already been made at providing at as little cost as possible dinners of a nutritious, substantial, and sufficiently abundant character for the poor children attending the Board and denominational schools. It cannot and should not be overlooked that it is the first duty of parents in all cases to provide proper sustenance for their children, and as dinners good for anything cannot possibly be supplied at an inclusive cost of one penny per head, either great care should be exercised in order that careless and thriftless parents are not relieved of their proper responsibility while in a position to discharge it, or the prices charged should be such as to cover the cost—say $2d.$, $2\frac{1}{2}d.$, or $3d.$, an exception being made in respect of cases where the want is real and genuine; such, for instance, as a family of four or five having to subsist on 7s. or 8s. per week, a state of things which prevails in and around Birmingham to a greater extent than many people imagine. In these cases, rather than the children should starve, a system of remission in whole or in part, such as obtains in respect of school fees, would be found practicable, and could be worked through the same channel by which the remission of school fees is regulated. However it be done, if such a movement is to be a real boon to those most in want of it in a town like Birmingham, it will have to be carried on by voluntary effort, and be occasionally

outside contributions as well. There about the need for something of the successful it requires to be carried roughly business-like, systematic way, of a well-considered, comprehensive

successful attempts in the penny dinner have been made in Birmingham during the four weeks. To Mrs Birt Davies Cole of the former proprietor of the Acorns the credit of the first practical expedition. During last month a large rear of the hotel was fitted up, and the arrangements made for supplying a dinner for some two hundred of the poorest ending the schools connected with St. Mary's, St. Chad's, and Christ Church.

one penny was made, and the tickets sold to the children at their respective schools. On the first day (Dec. 8) the children had between a pint of soup and four ounces

between a pint of soup and four ounces of twelve ounces of peas-pudding. To ion one dish was served at each end of that the soup eaters, who were largely ity, were at one end and the pudding e other. The soup was composed of ts, onions, pearl barley, and beef bones.

the thus set was quickly followed, for on day succeeding the successful inaugura- above movement a committee of some

above movement a committee of some and gentlemen interested in education started an experiment of the same connection with the Board Schools of the area. At the Summer Lane School, a penny dinner at the Summer Lane School, about 300 children, under the supervision of Mrs. R. W. Dale, wife of the Rev. Dr. Dale, well-known pastor of Carr's Lane Chapel. The Board Schools contain about 2,000 children, and the dinner centre in themselves. The children are in their customary places, without being disturbed, however, to that discipline which obtains in the dining hours, and the soup or other food is brought to them. About half an hour is taken for the meal, after which grace is sung and the children are dismissed to the playground till the next day.

As much variety as possible is introduced into the bill of fare, of which the following may be taken as an example :—Tuesday, Irish stew ; Wednesday, milk soup ; Thursday, roly-poly meat and vegetables ; Friday, lentil soup, followed by bread and butter, and a soup, fig-pudding, rice pudding, and a portion of jam for treacle, are also down on the programme. Some useful hints have been

programme. Some useful hints have been given by the committee in the preparation of the little pamphlet published by Moore Ede, rector of Gateshead-on-Tyne. The recipes he has given have not been followed in all cases, some of the ladies on the committee having sufficient practical knowledge to improve upon them. There is, of course, a little difficulty in pleasing all tastes. For instance, when the dinner consisted of a palatable dish composed of milk, water, and sugar, it was evident some of the children were displeased with it. One little girl, asked to like her dinner, replied in the negative with a look of unmistakable air of having made up her mind to the subject; while another girl gave as the reason for her dissatisfaction that onions had been put in the soup instead of peas. Many children, it is evident, are averse to onions, unless they have

been so well boiled that their pungent flavour is destroyed. And on this occasion there seemed to have been a slight mishap in the culinary department which would doubtless not be allowed to occur again. All these little matters will, of course, be obviated as experience is gained, and meanwhile the demand for tickets proves the popularity with which the movement is attended. The committee having charge of arrangements includes several members of the School Board and a number of ladies connected with the Ladies' Useful Work Association. Mr. Osmund Airy is the chairman, Mr. George Dixon and the Rev. Canon Bowlby are vice-chairmen, and Mr. G. H. Kennick, of Maple Bank, Edgbaston, is treasurer. Three centres have been started, with a sub-committee for each. They are at Summer Lane, Mrs. R. W. Dale being president of the sub-committee, and Mr. Silas Cooper honorary secretary; at Gooch Street, for children attending ten Board and denominational schools, Mr. H. J. Ball being chairman and Mr. J. T. Husband honorary secretary; and at Unett Street, for children attending five Board and denominational schools, the Rev. J. J. Dixon being the chairman and Mr. Kimberley the honorary secretary. Provision has been made at each centre for 300 dinners, but if the experiment proves successful this will no doubt be increased, and the movement will be extended throughout the town. It is at all events gratifying to find that some of the most influential and best known public men in the town are associated with the movement.

The experiment was discontinued when the schools broke up for the Christmas holidays, and has not yet been resumed, the question whether they can be placed on anything like a satisfactory and permanent basis being under consideration. The actual cost per head was found to be 1*½*d. per head. A number of tickets were purchased by charitable persons and presented to some of the poorest children, and there was a tendency towards increase manifest in this direction. Whatever the result of the experiment in Birmingham may be, it has been demonstrated that the scheme is practicable, if carried out on some such lines as are indicated at the commencement of this article. It is satisfactory to find that the whole of the preliminary expenses—about 40*½*—have been met by donations forwarded in response to an appeal issued through the public press.

THE RECENT TYPHOID EPIDEMIC AT KIDDERMINSTER.—At their December meeting the Drainage and Waterworks Committee reported to the Kidderminster Town Council that the plans and estimates which had been prepared by Mr. E. Pritchard, C.E., for the improvement of the sewerage and the water supply, were under consideration. They were, however, waiting for the report presented by Dr. Parsons to the Local Government Board, relative to his inquiry into the recent outbreak, before coming to a decision thereon. The deaths during the month were 43, giving a death-rate of 21·9, compared with 24·4 in the corresponding month last year. Six of the deaths were from typhoid fever. The medical officer had forwarded to Dr. Parsons a report as to 883 cases of typhoid fever, and there were more to be sent. There, it was stated, still some cases in the town.

THE AEOLUS WATER-SPRAY AND GENERAL VENTILATING COMPANY, of 235 High Holborn, have received instructions from H.M. Office of Works, to apply their complete system of Inlet and Outlet Ventilation, and supply of warm or cold fresh purified air to the Registry Room of the General Post Office (New Building), St. Martin's-le-Grand.

A PENNY DINNER CENTRE.

By MISS E. A. GLADSTONE.

HAVING been asked to describe the penny dinner centre in connection with Edinburgh Road Board School, near Kensal Green, I will endeavour to do so, not for the purpose of holding it up as a model to others, but to show how easily and inexpensively these centres may be arranged.

Our premises simply consist of a front kitchen where the children eat their food, sitting in rows on benches; a back kitchen, with a small range; and a common wash-house, where the chief part of the cooking takes place. The copper serves equally well for making soup or boiling puddings, and if we want an extra quantity of either, we use a large iron pot over the kitchen fire. The cook starts work about eight or nine in the morning, and by twelve o'clock the food is ready for the children. With such accommodation we cannot offer a choice of dishes on any day, but sufficient variety is attained by alternating soup and pudding, and we often suit our provision to the climate of the day, pudding being more tempting in warm weather, while nothing is so much appreciated as hot soup when frost or snow is holding sway outside. It may be well to explain that soup is a comprehensive term for what is called Irish stew; meat and vegetables; meat and rice, &c., in some centres. These different elements predominate by turns; sometimes the soup is founded on potatoes, sometimes on fresh chopped vegetables, sometimes on rice, sometimes on peas, but it is always served in a liquid condition, and eaten in basins. These basins are equally convenient for suet pudding on other days, while large galvanised iron spoons are used, which, though not elegant, are safe and strong and serviceable.

These are two recipes as specimens:—

	s.	d.
Split peas, $\frac{1}{2}$ peck (8 lbs.)	0	6
Rice, 3 lbs.	0	4 $\frac{1}{2}$
Assorted vegetables.....	1	6
Meat (piece of pork or bullock's cheek)..	1	6
Salt, pepper, &c.....	0	2
	4	0 $\frac{1}{2}$

This would make about 8 gallons of soup, sufficient for from 60 to 70 children.

Suet pudding—

	s.	d.
Flour, $1\frac{1}{2}$ peck	2	1
Suetine, 2 $\frac{1}{2}$ lbs.	1	8
Jam, 3 $\frac{1}{2}$ lbs. (half a 7-lb. jar).....	0	10 $\frac{1}{2}$
Baking powder.....	0	2
	4	9 $\frac{1}{2}$

This amount will make four or five large roly-poly-shaped puddings, which we boil in cloths in the copper, and cut up into slices of about an inch in thickness, putting a lump of jam on each. Each pudding may be cut into 14 slices, so providing for from 60 to 70 children. Any pudding left over makes excellent dumplings in the soup.

Of course these recipes may be much varied, but many kinds of food may be arranged which shall cost less than 5s. for seventy children, and the profits of supplying 100 children might cover all the outlay, including wages of cook, fuel, and even expenses of original plant.

The children themselves consider that they get a very fair pennyworth, better than they could get in any cookshop, and testify to the food being 'real foine' and satisfactorily 'filling.' They come into the room in relays, infants having the first turn, as these little people like to plod through their food slowly and deliberately. The boys generally come in with a clatter, and swallow their meal as near the scalding point as they dare, and are quickly off again to join their comrades in games outside, where they need not observe such strict order as we find it necessary to enforce in our room. I ought to mention that every day one or two ladies are in attendance to help serve the children, to keep order, and to receive their payments; and we have the centre open on the four middle days of the week.

THE SANITARY RECORD.

JANUARY 15, 1885.

The Editor will be glad to receive, with a view to publication, announcements of meetings, reports of proceedings, and abstracts or originals of papers read before the members of any sanitary or kindred association.

Local Authorities throughout the country would confer a favour on the EDITOR of the SANITARY RECORD by forwarding to him all documents relative to Water supply, Sanitation, and Health matters generally, which come under their notice. He would also be glad to receive reports from Engineers of Waterworks, Sewerage Projects, and Domestic Drainage Improvements for notice, comment, and illustration.

THE HEALTH EXHIBITION AWARDS.

So fickle is the public mind, that the wonderful show which drew all the world to South Kensington last year has probably passed out of the memories of most of those who were connected with the exhibition only as admirers and wonder-gazers. The really serious part of the extraordinarily varied collection of objects that were gathered together in the Horticultural Society's grounds—viz., the judgments that were pronounced upon the exhibits by the jurors appointed by his Royal Highness the President, interested the world for a morning and an afternoon, and then had to make way for newer and fresher objects of curiosity. It would perhaps in any case be idle to expect that the public at large would manifest any very great enthusiasm as to the decisions of experts on the comparative merits of the several exhibits; but labours so onerous and protracted as those of the jurors ought certainly to have received more general public recognition than seems to have been given to them.

One reason why so little interest has been evinced in the matter is the unsatisfactory and imperfect in which the awards have been made known. There is no special reason that we can see why the adjudications, sent in by the juries in almost every case before the end of August, and finally settled by the Jury Commission in the early part of October, could not have been published in time for the public to be able to compare side by side, with their own eyes, the different exhibits of the same class, in which they might chance to be desirous of making a selection. And there is, in our view, still no justification for the publication in the first place of so bald a schedule of awards, and for the subsequent extraordinary delay in issuing the more definite list which was its necessary complement.

The original list, published in a *London Gazette* at the end of October, and reprinted by the Jury Commission, contained only the class, the name of the exhibitor, and the nature of the award. Now there was here an omission of which the unopulous exhibitor was not slow to avail himself. Though the jurors were enjoined to state specifically the particular articles which they considered deserve recognition, the *London Gazette* simply announced that such and such an exhibitor had received a gold medal in Class 509. What more natural than for the enterprising manufacturer to label his entire collection of exhibits as crowned with laurels at the hands of a discriminating jury? Hereas the fact was—though the world did not know it till two months later—that only one particular apparatus or exhibit shown by our friend the gold medallist had received any award at all. Early the fuller list of adjudications, which was for some inscrutable reason delayed in publication till Christmas time, ought to have been published when the earlier list was; ought, indeed, to have taken its place.

But even this much-delayed second list is unsatisfactory. It divides the awards into the several classes of gold, silver, and bronze medals, diplomas of honour, and certificates of thanks, and under each of these heads ranges the recipients of medals, &c., in alphabetical order, with a note of the class under which they exhibited, and the particular exhibit receiving an award. It is, however, absolutely impossible for anyone who does not make an index for himself to find out from this pamphlet what were, in the eyes of the jury, the comparative merits of the several exhibits in a particular class. Surely this is all-important. A person anxious to make a selection of a particular piece of apparatus may be bewildered—probably is plunged into unathomable despair—by the overwhelming merits which the prospectus of each individual maker shows to appertain to all his goods. A reference to the awards of the International Health Exhibition might save him this anguish, if the official pamphlet were arranged in proper form; but it is not. And so, for the behoof of all and sundry who may wish to have an intelligibly compiled abstract of the final results of the Exhibition, we have had a list of the awards of our own prepared. This will be published immediately—it could not be brought out before for the reason already stated—the final number of our popular 'Exhibition Record,' to which it will form a fitting pendant.

This labour has been undertaken not only because a great number of our subscribers have been mourning for an understandable list of awards,

but because it seems to us of importance that the adjudications of the juries should be accurately and precisely set forth for general information. Our revised version of the awards will therefore be arranged under classes. The gold medallists in each class will be given in alphabetical order, then the silver medallists in that class, then the bronze medallists, and afterwards the non-competitive recipients of diplomas of honour and special certificates of thanks in the same class. The precise address of each medallist, &c., is given, and the country under which the exhibit is grouped, e.g. France, Italy, &c.; and last, and most important, the particular exhibit for which the award is made. It would obviously not be fitting to say more of this supplement here; but we shall be disappointed and surprised if it is not found vastly more useful and practical for ordinary wants than the official publication of the Jury Commission.

CUTTING OFF WATER FOR NONPAYMENT OF RATES.

WE have already called attention to the power which the Water Companies possess, under the General Waterworks Clauses Acts, of cutting off the supply if their rates are not paid. Many people think that this is a power which should be taken away; and others that the companies should not be allowed to put it in force where the amount payable is in dispute. The power, however, exists, and the companies are by law enabled to cut off the supply where their charges are not paid. If they were ordinary traders, no one could deny their right to discontinue the supply of goods to a customer who did not pay for those he had previously had. They are, however, monopolists who carry on business under conditions prescribed by Parliament. One of those conditions is that they have the same right as an ordinary trader, to cease supplying a customer who will not pay, and they have lately shown that they are disposed to insist upon this right. The fact that a consumer asserts his water bill to be too large, does not exempt him from the liability of having his supply cut off if he refuses to pay. The Courts have recently refused to grant injunctions restraining the companies from the exercise of their powers in this respect, and have told the discontented consumers to take their statutory remedy of getting the assessment settled by two justices (or a stipendiary magistrate). Of course, if a company demanded excessive rates and cut off the supply for nonpayment, they might be liable to pay damages for so doing; but they cannot be restrained from cutting off the supply, by reason of a dispute as to the amount payable. One case in which the injunction was claimed and refused has had a curious termination. Refused the remedy he asked, the ratepayer at last went before a magistrate to have his assessment fixed. He ought, as we have frequently pointed out, to have taken this step in the first instance, but he preferred trying legal experiments instead. The magistrate's decision was that the company's valuation was right, and, as a consequence, it now appears that there was no overcharge, and therefore no reason, moral or legal, why the supply should not have been cut off in consequence of the nonpayment of the bill. This may not always be the case, but even where the charge is excessive, the proper course is to pay, *under pro-*

test, and, when the valuation is settled, to claim back the difference from the company. An aggrieved ratepayer may like to pose as a martyr, unable to wash because a tyrannical company refuses to supply him with water for which he will not pay; and, if he has only himself to consider, there is no great objection to his adopting this rôle. It is true that, if his premises remain long without a water supply, they may become a nuisance, to which his neighbours may reasonably object; but this is perhaps only a minor consideration. In many instances, however, where payment of rates is disputed, the ratepayer is not himself the only consumer. Where the houses are small, or are let out in separate rooms or tenements, the landlord pays the water-rates, as he pays the poor-rates, in a lump, and charges his tenants a rent calculated so as to recoup him this outlay, as well as to give a payment for the use of his property. In such cases the occupiers who use the water are not parties to any dispute as to its price, but, if it is cut off, they, and not the landlord, are the sufferers. This is not an imaginary grievance. Instances have occurred of water being cut off from houses densely crowded with poor inhabitants, because their landlord would not pay the water-rates. In such cases the public health is almost certain to suffer, and a nuisance to be created; and in times of epidemic, the probability of its spreading would be greatly increased. The tenants, who pay their landlord for water which he prevents their having, have, no doubt, a right of action against him for breach of contract. But the damages recoverable by any individual would usually be but small, and the chances of an action being brought to enforce their rights, are consequently so remote that landlords are not deterred by considerations for their tenants' convenience, when questions of reducing their own water-rates are raised. In such cases, where the cutting off of a water supply is likely to injuriously affect the health of several people who are no parties to the dispute, it is the duty of the local authority of the district to interfere, and if necessary, to restore the supply at the expense of the landlord. The inspector of nuisances ought to detect such cases, and put the local authority in motion. But any person who is aware of the facts may, and should, also inform the local authority; and if he is a ratepayer of the district and so a person aggrieved, may also inform the Local Government Board, and so oblige the local authority to exercise their powers for the protection of the health of the community.

VENTILATION OF PUBLIC BUILDINGS.—Messrs. Robert Boyle & Son, Ventilating Engineers, 64 Holborn Viaduct and Glasgow, are at present applying and have applied their self-acting air-pump ventilators and system of ventilation to the new Tabernacle, Auckland, New Zealand, being built for the Rev. Mr. Spurgeon; St. Andrew's College and Asylum, Algoa Bay, Africa; Waddesdon Manor, residence of Baron de Rothschild; Aston Clinton, Tring, residence of Lady de Rothschild; Crig-y-nos Castle, Wales, residence of Madame Adelina Patti; Wilton House, Wilton, residence of Lord Pembroke; residence of the Duke of Cleveland, Bath; residence of Earl Grey, Howick; Euston Hall, Thetford, residence of the Duke of Grafton; new Post Office, Boston; Reform Club; Delph Literary and Scientific Institute, Ebbw Vale, Mon; St. Pancras Workhouse; County Police Station, West Hartlepool; New County Court, Nottingham; new hospital, Douglas, Isle of Man.

HONEY AND ITS ADULTERATION.

In a lecture at the Conference of the Beekeepers' Association, Mr. O. Hehner, after describing honey as a mixture of water, dextro- and levo-glucose in certain proportions, pointed out that the presence of pollen grains and other colouring and odorous matters derived from flowers, gave to the honey the most diverse tints and flavours, and that when the abundance of any particular flowers, as clover, beans, limes, or heather, enabled the bees to indulge their well-known habit of keeping to one source at a time, the resultant product was as capable of recognition as was any vintage or description of wine.

Cane sugar, by treatment with an acid, yields a syrup almost identical with honey, though of course wanting its delicate aroma and flavour; but for several reasons, especially its cheapness, its lesser tendency to crystallise, and its not possessing the intense sweetness of cane sugar, starch syrup, which is largely manufactured in America for more legitimate purposes, as brewing, &c., is almost exclusively employed as an adulterant.

Of forty-two samples submitted to analysis by Mr. Hehner, twenty-six were avowedly English, nine American, four Swiss, two French, and one Transylvanian. The three last-named and twenty-four of the English were genuine, but only two of the American. On the other hand, all the Swiss, seven of the American, and two of those sold as English, but which he believed to be really American, were adulterated. Nor were these the lowest priced, for while perfectly pure English honey can be had at 6d. per lb., some of the Swiss cost as much as 12s. 3d. The practice of adulteration is favoured by the popular notion that good honey should be always clear and fluid; and though no prosecutions have as yet been undertaken, the manufacturers usually employ such descriptions as 'prepared,' 'fine table,' or 'Swiss' honey, just as the vendors of adulterated coffees call them 'prepared,' or 'French,' with a view to evading the law.

It is possible that the food value of corn syrup may be as great as that of honey, but the fact that bees refuse to take it until driven by hunger and then generally die of diarrhoea, makes even this doubtful. Still they are not honeys, just as an artificial mixture of spirit, water, tartaric acid, and colouring matter, is not wine; and in calculating the value of any human food, we must take account, not only of chemical composition, but of those vague and undefinable qualities due to minute traces of undetermined bodies which impart flavour and odour, and exert a stimulating action on the sensory nerves. Clover, bean, heather, &c., honeys are as distinct in their character as Bordeaux, Burgundy, and Rhine wines; and if the public taste could be educated to appreciate them, floral designations would be at least as attractive as the meaningless and delusive terms now in vogue.

SMALL-POX is still rife in the county of Durham; at a special meeting of the Brandon Local Board, Dr W. C. Blackett, the medical officer, reported an alarming outbreak at Langley Moor, where at that time there were upwards of twenty cases. Through the instrumentality of the vicar of Brandon two Sisters of Mercy had been engaged to nurse the patients. At the last monthly meeting of the Durham Rural Sanitary Authority, Mr. C. A. Bell gave notice that at the next meeting he would move a resolution that a proper hospital be provided at once for infectious diseases.

NOTES OF THE MONTH.

DANGEROUS FIREPLACES.

A HOUSE was lately burned down at Liverpool owing to some cinders or sparks finding their way through a crack or defect in the hearthstone, and thus reaching the woodwork of the floor. There is no doubt that fires occur in this manner more frequently than is generally suspected, but at the same time it may be said that occurrences of this kind should be of the preventable class, as it is owing to a wanton neglect or avoidance of ordinary care in building, and, in fact, it is a contravention of one of the fundamental provisions of the modern Building Act or of the Local Board rules in force. These rules demand that such hearth or slab shall be of stone, slate, or other incombustible substance, and shall be laid wholly upon stone or iron bearers or upon brick trimmers, and shall be solid for a thickness of seven inches at the least. The simplest and most convenient method, and therefore generally in use, is to turn a brick trimmer, or flat arch, 18 inches wide, under the hearthstone and concealed in the thickness of the wood floor; and as it is also enacted that such hearth shall be wholly bedded on an incombustible material, the haunches of the arch are usually filled in with concrete to form a level face to receive the hearth or slab. It therefore follows that if a defect should arise in the hearthstone itself, and any ashes or sparks should find their way through any such aperture, the danger is arrested by means of the brickwork or concrete with which the sparks come next in contact. If this legalised construction is adopted and carried out in a workmanlike manner there can be no excuse for casualties of the description reported, and it is gratifying to know that builders are sharply looked after by the district surveyors, or those in authority, and although their vigilance is occasionally evaded, such mishaps now-a-days are reduced in number; and when it is remembered how many fireplaces exist in an ordinary house, the only wonder is how successfully these scamped constructions are minimised. Antiquity can hardly be advanced as an excuse for careless builders, as the Act of 1774 specifies a very similar sound construction, and, indeed, the fear of fire animated the framers of the Act throughout, as it is described as an *Act for the better regulation of buildings, and for the more effectually preventing mischiefs by fire within the Cities of London and Westminster*, and herein perhaps lies the difficulty, as it was not until many years later that the provinces and country towns took their cue in this respect from the metropolis, although a Building Act was passed in 1667, as a result of the Great Fire. Another recent instance of neglecting ordinary precautions may be noted in a house at Notting Hill, built within the last twenty years, where the flames from the fireplace made their way into the room through the chimney-jamb or sides. These are specified to be at least one brick thick, *i.e.* about nine inches, but there are bricks and bricks; a soft, ill-burnt brick will soon crumble away if not protected, and a violent stirring of the fire may complete its downfall, and bring the flames in contact with the adjoining woodwork. These points, though apparently slight, and the danger being covered by a coat of plaster, have an unpleasant way of forcing their importance upon the uninitiated, and the grievance is the greater as the

householder has no real remedy, and as a rule no responsible party to proceed against, if even it were worth while to do so. An unfortunate case, bearing upon this in a measure, may be cited. It was brought before Mr. Justice Field and a common jury not very long since. The plaintiff occupied a house in Bayswater, and the defendant one adjoining. The defendant's chimney caught fire, and at the same time a fire broke out in the plaintiff's house on the drawing-room floor. It appeared that the houses were built about twelve years ago by the same owner, and that a half-brick had been left out in the flue just under the joists of the plaintiff's drawing-room, and by this neglect the fire had made its way through the aperture. When, however, it was stated in evidence that the aperture was in plaintiff's wall, and that his neighbour could not by reasonable examination have discovered it, it was admitted that the action could not be supported. It will thus be seen how much depends upon a little care and common-sense precaution in the construction at the beginning.

THE BOUNDARY COMMISSION.

It is refreshing and delightful to find the work of a Government Department done in a business-like and practical fashion; and, in common we suppose with most people, we have been agreeably surprised at the favourable manner in which the proposals of the Boundary Commissioners for the redistribution of electoral districts have been almost everywhere received. It is worth while pointing out, however, that the real difficulties—those, namely, in which the wishes of the great manufacturing districts of the North are concerned—have yet to be grappled with; and the Commissioners have been cautiously feeling their way in these districts, by sending in advance their Assistant Commissioners to feel the local pulse as to the divisions of towns which appear most generally suitable. The work of the Commission has certainly been got through with admirable promptitude and despatch; but we shall still be greatly surprised if they are within sight of the end of their labours when Parliament resumes. There is one point to which reference may properly be made at this juncture, though its interest is prospective only. Students of the redistribution scheme will probably have observed that municipal and Parliamentary boroughs are proposed by it to be made conterminous, which is not always the case at present. This unification of the limits of the municipal and Parliamentary borough has apparently been regarded by the framers of the Bill as a principle; but they have forgotten that the restless ambition of Town Councils is for ever tending towards the enlargement of their borders. Every year one or another of our great towns becomes greater still in the matter of superficial area, through the absorption of outlying suburbs. The municipal borough of Bradford, for instance, has been twice extended, the last occasion being in 1881. The Parliamentary borough of the same name has remained as it was, so that its population is now 15,000 less than that of the municipal borough. The new Redistribution Bill proposes to make the two conterminous. But, suppose the Town Council of Bradford, a year or two hence, folds other districts to its ample municipal bosom, how will the Parliamentary borough fare then, if its unity with the municipal borough is to be regarded as a principle? Will it

expand by automatic process, will it remain unexpanded, or will new redistribution, on a microscopic scale, be every now and then be necessary to readjust boundaries? The selection of one from the proverbial three courses above suggested we leave to any of our legislators who may be interested in the question.

THE SMOKE NUISANCE AT OLDHAM.

THE town councillors of Oldham have been much exercised in mind regarding the smoke nuisance arising from some of the factories, but the proverbial wisdom among a multitude of 'councillors' is conspicuous by its absence. At a meeting of the Sanitary Committee, when the facts were *again* laid before the conscript fathers, it was decided to defer the question once more, and it was also suggested that the smoke inspector, amongst others, should be discharged, although he had made a number of observations and tabulated them carefully. To discharge an official who had done his duty, be it observed, because the authorities had failed to do their portion of the work, is, to say the least, uncalled for and premature. In the metropolis, as we have often pointed out, the authorities, acting under the Smoke Abatement Act of 1853 (amended 1856), carry out their duties effectively and with great vigilance, and the same may be said of some of the provincial towns, notwithstanding the many difficulties in the way. A furnace fire when first lighted, and when replenished, must necessarily emit a considerable amount of smoke, and to meet this unavoidable fact a short time is allowed for the fire to become clear, or comparatively so, and the following saving clause also appears in the Metropolitan Act:— 'Provided always, that the words "consume or burn the smoke" shall not be held in all cases to mean "consume or burn all the smoke," and that the justice or justices before whom any person shall be summoned may remit the penalties enacted by this Act, if he or they shall be of opinion that such person has so constructed or altered his furnace as to consume or burn as far as possible all the smoke arising from such furnace, and has carefully attended to the same, and consumed or burned as far as possible the smoke arising from such furnace.' The time referred to varies generally from five to twelve minutes, this latter being apparently the grace which is allowed to the Oldham manufacturers; but, in spite of this limit, the owners of the objectionable chimnies seem to think they are entitled to a run of half an hour, and one sapient member implied that any interference with their selfishness will cripple their trade and drive it from the town. It is obviously wrong to entrust the sanitary regulations of a town to those who are afraid to put in force the proper legislative action, and the sooner an impartial administration is effected the better for the general good, and also for the individual malcontents, in spite of their short-sighted policy. By the use of anthracite coal a great deal of smoke may be avoided at the outset, and a good stoker may, without any apparatus or specially constructed furnace, considerably diminish the nuisance; and, bearing upon this, an Engineer's letter to the *Times* on this burning question, on a small scale, however, may be quoted. 'There are among the varieties of coal two distinct types. The so-called smokeless coals have their carbon in large and gases in small proportions; their structural appearance is crystalline, from having been more or

less coked during some freak of nature. As they require more oxygen when burning than other coal, from their excess of carbon, they send up the chimney proportionately larger volumes of nitrogen and carbonic acid, both of which, being invisible, escape the name of smoke. That they require a great draught is the unscientific expression for a large supply of atmospheric air; they may smoulder with less, but will not burn without it: hence they are rarely suitable to our liking in existing grates. House coal, from being of a laminated structure, is the other type. Its carbon is in smaller and gases in larger proportions. The laminated form of house coal can be used to good purpose, since it presents well-defined faces, which are the front and back of the coal as it was in the coal measures, and also shows ends where it was broken off. Now, if either face of a lump be tapped with a hammer in the coal-cellar, it will open out without loss into shaped pieces, suitable for being put on the fire; but if it be struck random blows it may be smashed up into odd bits, which, being pitched on the fire in a haphazard way, burn as best they may, when unnecessary soot is the consequence. Or, better still, put the lump on hot embers at the end of the fire with a face downwards, and in a minute or so the upper face will be seen to split along the laminae, when with a gentle tap it falls to pieces, and, igniting with the best advantage, may be spread.'

It will have been seen that offenders are not treated with undue harshness, or want of notice, and being in possession of various ways and means of doing right, it rests very much with themselves as to whether they are open to conviction, mentally or legally.

POPULAR APPRECIATION OF INFECTIOUS HOSPITALS.

WE have recently recorded in these columns several gratifying instances of the growing appreciation by the public of the utility of infectious hospitals. Writing to the sanitary authorities of the Gloucestershire Combined District, Dr. Bond observes that the hospital at Cirencester affords ample proof of the fallacy of the statements which the opponents of these institutions are so fond of urging, that patients cannot be got to enter them, and that parents especially will not allow their children to be taken to them. During the past year the hospital had a more severe strain put upon its resources than in any previous year, twenty-five cases having been admitted to it, and of these more than half were under twelve years of age. The period during which the patients remained in the hospital varied from nine to forty-five days, with an average of 26½ days. In no case was anything charged beyond the bare expense of food; medicine and medical attendance being debited to general establishment charges, which are divided between the two authorities (poor-law and sanitary) in agreed proportions. The total cost of the patients was 49*l.* 11*s.* 7½*d.*, which gives an average cost per diem of 1*s.* 4½*d.* The total amount charged to patients was 6*l.* 12*s.* 2½*d.*, and 27*l.* 1*s.* 1½*d.* was charged to the urban sanitary authority, from whose district all the patients were received, the remainder being paid by the board of guardians of the whole area. Certainly, as Dr. Bond observes, money could scarcely be spent better than this. It is especially to be hoped that this evidence may not be without its influence upon

oration of Gloucester, who, for some un-
der reason, cannot be prevailed to unite
local authority for the erection and main-
tenance of a joint hospital.

THE PARASITES OF FISH.

Attention with the 'mackerel scare' of last
year is somewhat remarkable that a similar
case of the same season of the year should have
arisen at Madras. The agitation became so
great that the Government determined upon
investigation into the subject, which was en-
trusted to Dr. M. C. Furnell, the deputy sanitary
officer of the province. Upon making in-
quiry Dr. Furnell was unable to trace a single case
arising from eating fish; and he attributes
the agitation principally to sensational newspaper para-
graphs and the somewhat hasty conclusion of
officials. Appended to the report is a list of
fish which infest fish, and Dr. Furnell dis-
cusses how it happens that these are
transferred to mankind, who, in India,
are large fish-eaters. He thinks that there are
three, obvious answers to this question.

First, the parasites are generally found in the
intestines, and more frequently in the free
outside the viscera, between that and the
peritoneum, not so often in the fish itself. The
parasites are not unfrequently found in the flesh, but
not in the coats of the intestines; and it is
not so common for even the lowest classes to eat fish
which are thrown away and the entozoa with
the life of these entozoa (with the exception
of the filaria or thread-worms), when once
removed from fishes, is very feeble. Water raised to
the boiling point effectually kills them. Careful ex-
amination has shown that even in cysticerci (beef
tapeworm) when exposed for five minutes to a
temperature of 135° to 140°, life becomes absolutely
destroyed. Dr. Furnell found that much less than this
temperature destroys most entozoa. All the soft paren-
chymatous tissues die when removed from their
natural put in fresh water to await their turn for
examination under the microscope. In an hour,
or in considerably less time, all signs of
life are departed. It is not, therefore, very
difficult that even simple cooking renders them
harmless. It is possible also, though on this point
Dr. Furnell writes with diffidence, that the fish
do not find man a congenial territory for
habitation, or unquestionably more cases would
be noticed.

NOTIFICATION OF CASES OF MEASLES.

MR. ISWODE CAMERON, in his last report on
the subject, repeats a plea he made some time ago
for compulsory notification of cases of measles.
He points out to the Town Council,
that ample power to require this under their
Sanitary Act, as measles is a disease very difficult to
prevent once it gets a fair start, and it is a disease
which has a very great amount of culpable negli-
gence in the matter of disinfection exists. The fact
that deaths have happened in one year in Hud-
dersfield sufficiently shows how very fatal it may be.
He does not ask his authority to depart from the
usual practice of declining, except in very

special circumstances, to take cases of this disease
into hospital. The children usually affected are too
young for this; but there are many means that can
be adopted at their own homes, such as separating
the sick from the healthy, the careful disinfection of
the house and the patient's clothing, the prevention
of other members of the family from attending
schools and the like, which would help to keep this
disease within more reasonable limits. When an
epidemic occurs, the sanitary officials are almost
powerless to cope with it; but, if they had information
of the cases as they arose, much might be done to
prevent the disease from ever assuming an epidemic
form. The outbreak of last year emphasized the
belief that an epidemic gathers virulence as it ex-
tends; it began mildly, and as the number of cases
increased the proportion of fatal cases amongst them
increased also. If, therefore, the disease may be
prevented from becoming epidemic, it may, by the
same means, be kept less virulent. Most cases are
not attended by a medical man, and the householder
will himself be bound to report, so that no cost will
be entailed. Dr. Cameron regrets that this course
was not adopted last year, and proceeds to show
how he dealt with the disease in its absence. Nearly
200 houses were visited in one portion of the town
where the disease was most violent, and disinfectants
distributed with instructions how to use them. The
school authorities were communicated with, and
their co-operation obtained in preventing the attend-
ance of children from infected houses. It is only by
taking such measures very early that any great good
can be expected to result. Once measles has ob-
tained the upper hand in a crowded neighbourhood,
little can be done to arrest its spread. There is no
question but that the notification of cases of this
disease would be of immense utility to health-
officers in their efforts to stay the spread of infection,
especially as the disorder, like other zymotic com-
plaints, is regarded as a trifling illness, and as
inevitable to childhood as dentition.

PURITY OF MILK.

THE following circular has just been addressed to
all cowkeepers and milk-dealers delivering milk from
the rural districts into the city of Coventry:—'The
Dairies, Cowsheds, and Milkshops Order, 1879.—
Jan. 9, 1885, St. Mary's Hall, Coventry.—Sir,—As
you sell milk in Coventry, and it concerns the public
health here to know that all milk brought into Coventry
comes from dairies in which sanitary requirements
are observed, I am instructed by the sanitary com-
mittee of this city to inquire, for their satisfaction,
whether your dairy is registered under the Dairies,
Cowsheds, and Milkshops Order, 1879. A note or
certificate from the sanitary inspector of your district
addressed to me would be sufficient. Your
obedient servant, FREDERIC BOOKER, Inspector of
Nuisances.'

SANITARY MATTERS IN AUSTRALIA.

YOUNG communities like the Australian colonies
ought not to show such heavy death-rates as Euro-
pean countries, which are only now and with diffi-
culty working down the accumulated sanitary arrears
of centuries. The last recorded death-rates of these
colonies are unduly large when their circumstances
are taken into consideration, and some of the towns

especially seem to need thorough overhauling. From the last report of the Central Board of Health of South Australia we extract the following figures as to the death-rates:—New South Wales, 16.03 per 1,000; Queensland, 17.99; Victoria, 15.31; South Australia, 14.55; Western Australia, 14.16; Tasmania, 15.79; New Zealand, 11.19; City of Melbourne, at least 17.9 per 1,000, and more if our English method of calculation were adopted; City of Adelaide, 19.93 per 1,000. The sanitary administration of this last town by its local board appears to have been scandalously bad, and probably the same thing would have to be said of other capitals. Our antipodean cousins will evidently soon have to learn the lesson that has been so easily acquired by certain of our municipalities here of raising 'loans for sanitary purposes.'

THE PURIFICATION OF WATER.

At the last meeting of the American Franklin Institute, Dr. William H. Wahl, the secretary, alluded to the experiments that were being conducted under the direction of Chief Engineer Ludlow, of the Water Department of Philadelphia, with the object of purifying the water supply by a system of artificial aeration. These experiments had proved very encouraging, and promised to yield important practical results. The plan employed, which is that suggested by Dr. Albert R. Leeds, differs from others that have been employed for a similar purpose. Laboratory experiments made by Dr. Leeds indicated that the advantageous action of atmospheric air in modifying and, in part, removing the impurities of water in contact with it, was greatly increased by producing the intermingling of the two fluids under pressure. The greater the pressure the greater is the absorption of oxygen, and consequently the greater the reduction of the impurities. The precise measure of this increase has not yet been ascertained. In order to try the experiment on a larger scale, and in such a manner as to afford some evidence of its value in practical operation, one of the Fairmount turbine engines (No. 8) was altered so as to convert it, in part, into an air-pump, by simple mechanical artifices unnecessary to describe. The result reached by the action of the pumps thus modified was the delivery of about 20 per cent. by volume of free air into the water discharged into the main, this proportion being that which had been shown by experiments of Professor Leeds to be sufficient to surcharge the water.

By subsequent comparison of samples of water from the Fairmount pool taken into the pump, and of the water discharged into the Corinthian basin after passing through 3,600 feet of main, the results of the experiment were made apparent. The percentage of oxygen in the aerated water was 17 per cent. greater than before; that of carbonic acid was 53 per cent. greater; and that of the total dissolved gases 16 per cent. greater. The percentage of free ammonia was diminished to 1.5 of its former amount. The percentage of free oxygen represents the excess over and above what was required to effect the oxidation of the organic impurities. These results are most favourable, and point clearly to the entire feasibility of reducing the percentage of organic matters contained in water unduly contaminated with sewage, within the limits of safety.

THE PUBLIC HEALTH

DURING DECEMBER 1884.

THE mean temperature during the month of December at the Royal Observatory, Greenwich, was 40° 8'; it was 1° 7' above the average December temperature in one hundred years, and exceeded that recorded in the corresponding month of either of the two preceding years. An excess of temperature prevailed on fifteen days of the month, while during the other sixteen days it was below the average. The warmest day of the month was the 6th, when the mean was 52° 0', and as much as 9° 3' above the average; the coldest day was the 30th, when the mean was only 33° 0', and 5° 5' below the average. Rain was measured at Greenwich on eighteen days during the month, to the aggregate amount of 2.5 inches, which exceeded by half an inch the average December rainfall in sixty-one years. During the year 1884 the rainfall did not exceed 18.0 inches, which was less than that recorded in any year since 1864 (when the amount was only 16.5 inches), and no less than 7.3 inches below the average annual rainfall in sixty-one years. As one inch of rain represents a weight of water equal to one hundred tons per acre, it follows that the deficiency of rain during last year was equal to about 730 tons per acre. The sun was above the horizon during 242.7 hours during December, but only 13.3 hours of bright sunshine were recorded at Greenwich; this amount was considerably below the average, though it slightly exceeded that registered in the corresponding period of 1883. South-westerly winds prevailed during the first three weeks of the month, after which the wind was easterly until the end of the year.

In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, which have an estimated population of more than eight millions and three-quarters, 28,334 births and 19,115 deaths were registered during the five weeks ending the 3rd inst. The annual birth-rate, which in the two preceding months had been 34.9 and 33.8 per 1,000, further declined to 33.7 during December, but exceeded the rate recorded in the corresponding month of the preceding year. The lowest birth-rates in these twenty-eight towns last month were 28.3 in Huddersfield, 28.5 in Brighton, and 29.4 in Bristol; in the other towns the rates ranged upwards to 38.9 in Preston, 40.1 in Sunderland, and 41.5 in Cardiff. In London the birth-rate last month was equal to 33.1 per 1,000, while in the twenty-seven provincial towns it averaged 34.3.

The annual death-rate in the twenty-eight towns which had been 20.5 and 21.7 per 1,000 in the two preceding months, further rose to 22.8 during December, and exceeded by 0.9 per 1,000 that recorded in the corresponding period of 1883, which was 21.9 per 1,000. The lowest annual rate of mortality last month in these towns was 18.7 in Portsmouth. The rates in the other towns, ranged in order from the lowest, were as follow:—Huddersfield, 20.1; Plymouth, 20.5; Birkenhead, 20.6; Sheffield, 20.1; Brighton, 21.2; Wolverhampton, 21.3; London, 21.7; Leeds, 21.7; Bristol, 21.9; Birmingham, 22.0; Bradford, 22.4; Derby, 22.4; Nottingham, 22.5; Salford, 23.0; Bolton, 24.4; Hull, 24.5; Newcastle-upon-Tyne, 24.5; Sunderland, 25.3; Oldham, 25.3; Liverpool, 25.5; Halifax, 25.6; Leicester, 25.9; Manchester, 26.5; Norwich, 26.7; Blackburn, 26.8; Cardiff, 30.3; and the highest rate during the month, 32.3 in Preston. While the death-rate in London during December, as above stated, did not exceed 21.7 per 1,000, it averaged 21.7 in the twenty-seven provincial towns. The 19,115 deaths from all causes in the twenty-eight towns during the five weeks of December included 1,869 which were referred to the principal zymotic diseases, of which 406 resulted from measles, 399 from whooping-cough, 318 from scarlet fever, 226 from 'fever' (principally enteric), 187 from small-pox, 182 from diphtheria, and 151 from diarrhoea. These 1,869 deaths were equal to 9.8 per cent. of the

s, and to an annual rate of 2.23 per 1,000. The rate showed a further slight decline from the preceding months, and was below that recorded in the corresponding period of either of the two preceding years when it was 2.82 and 2.71 per 1,000 respectively. The rate in London from the principal zymotic diseases was equal to 2.1 per 1,000 during December, and was below the average rate in the twenty-seven towns, among which the zymotic death-rate was 0.7 and 0.8 in Huddersfield and Portsmouth, 3.6 in Bristol, 4.2 in Leicester, and 4.1 in Cardiff.

Small-pox was the most fatal zymotic disease in the twenty-seven towns during December last. The rate of mortality from this disease, which in the two preceding years had been 0.27 and 0.42 per 1,000, further rose to 0.48; in London the death-rate from this disease was 0.33 per 1,000, whereas in the twenty-seven towns it averaged 0.62, and showed the highest mortality in Bristol, Leicester, and Cardiff. The death-rate from whooping-cough, which had been 0.37 per 1,000 in the two preceding months, rose during December to 0.48, which differed but slightly from the rates in recent corresponding periods. Small-pox continues to be considerably more fatal in the twenty-seven towns than in London, and was most prevalent in Bristol, Norwich, and Preston. The rate of mortality from scarlet fever, which in the two preceding years had been 0.38 to 0.45 per 1,000, declined again to 0.38, and was considerably below that which prevailed in the corresponding month of either of the two preceding years. In London the scarlet fever death-rate was 0.30 per 1,000, while in the twenty-seven towns it averaged 0.45, and was proportionately most prevalent in Halifax, Newcastle-upon-Tyne, and Sunderland. The mortality from 'fever' (enteric or typhoid), which had been 0.41 and 0.50 in the two preceding months, further fell during December to 0.27; this disease showed the largest mortality in London and in the twenty-seven towns.

Measles and diphtheria. The death-rate from measles showed a slight increase upon that recorded in the two preceding months; this disease was proportionately three times as fatal in London as in the twenty-seven towns. During the five weeks of December 187 deaths from small-pox were registered in the twenty-seven towns, showing a considerable further increase in the numbers in the three preceding months. Measles, however, was confined to London, for while the mortality from this disease registered in the metropolis increased during recent months, those occurring in the twenty-seven provincial towns have shown a decline. Of the 187 deaths from small-pox during December were registered in London, 3 in Liverpool, 1 in Brighton, and 1 in Cardiff. Judged by the returns of the Metropolitan Asylum Hospitals, the mortality from small-pox in London continued to increase during December. The number of small-pox patients admitted in these hospitals, which had been 536 and 540 at the end of the two preceding months, further rose to 540 at the end of December. The average weekly number of new patients admitted to these hospitals, which was 73, 84, and 203 in the three previous months, rose to 217 during December.

The proportion of infant mortality in the twenty-eight towns, as shown by the proportion of deaths under one year of age registered, was equal to 151 per 1,000 during December, against 165 and 159 in the corresponding months of the two preceding years, 1882 and 1883. The rate of infant mortality was equal to 136 in London, whereas in the twenty-seven provincial towns it averaged 163, and ranged from 110 and 127 in Brighton and Hove, to 206 in Oldham, 213 in Halifax, 223 in Manchester, and 249 in Norwich.

The death-rate from diseases of the respiratory organs, as shown by the metropolitan returns, was considerably above the average during December. The weekly number

of deaths referred to these diseases in London averaged 470, and the annual death-rate was equal to 5.9 per 1,000. In Liverpool the annual rate of mortality from these diseases was last month equal to 7.3 per 1,000.

The causes of 505 of the 19,115 deaths registered in the twenty-eight towns during the five weeks of December were not certified, either by a registered medical practitioner or by a coroner. These uncertified deaths were equal to an annual rate of 2.6 per cent. of the total deaths, which showed a slight further increase upon the proportions in recent months. In London the proportion of uncertified deaths was only 1.4 per cent., while in the twenty-seven provincial towns it averaged 3.6, and ranged from 0.0 and 0.7 in Derby and Plymouth, to 6.2 in Liverpool, 7.4 in Oldham, and 8.2 in Hull.

Among the population living in the outer ring of suburban districts around London, estimated at rather more than 1,000,000 persons, the annual death-rate from all causes during December was equal to 19.9 per 1,000, against 20.9 and 17.9 in the corresponding periods of 1882 and 1883. During the five weeks ending the 3rd inst. 104 fatal cases of small-pox, 33 of measles, 29 of diphtheria, 29 of whooping-cough, 25 of 'fever,' 17 of scarlet fever, and 10 of diarrhoea were recorded in the outer ring. These 247 deaths were equal to an annual rate of 2.4 per 1,000, which exceeded that recorded in the corresponding month of either of the two preceding years. The fatality of small-pox, measles, 'fever,' and whooping-cough showed an increase, while that of scarlet fever and diphtheria declined. Of the 104 deaths from small-pox recorded in the outer ring during December, 85 occurred in West Ham district (including 16 of London residents registered in the Metropolitan Asylum Hospital at Plaistow), 5 in Tottenham, 7 in Croydon, and 3 in Barking Town. Of the 25 fatal cases of 'fever,' 7 occurred in Tottenham sub-district, and 9 deaths were referred to measles in the sub-district of Mitcham.

NOTIFICATION OF INFECTIOUS DISEASES.

IN a table on page 330 are published uniform statistics relating to sickness and mortality in thirty-two of the thirty-nine urban sanitary districts of England and Scotland in which the notification of infectious diseases is compulsory. The estimated population of the thirty-two districts for which we are enabled to publish complete statistics for the month of December last is more than two-and-a-half millions of persons. The annual rate of mortality from all causes per 1,000 persons estimated to be living in these towns, which in the two preceding months had been 20.51 and 21.91 respectively, further rose during December to 24.00. In the twenty-eight large English towns dealt with by the Registrar-General in his weekly returns, the death-rate during December last averaged 22.80 per 1,000, and was, therefore, 1.20 below the mean rate in the thirty-two towns in the accompanying table. The rates of mortality last month were considerably below the average in Barrow-in-Furness, Heywood, Reading, Accrington, and Birkenhead; while they showed an excess in Dundee, Burnley, Preston, and Stalybridge. The death-rate from the eight infectious diseases dealt with in the table averaged 0.71 per 1,000 in the thirty-two towns furnishing this information, showing a further decline from the rates recorded in the two preceding months, which had been 0.98 and 0.91 per 1,000 respectively. No death from any of these diseases was returned in Accrington, Hartlepool, Lancaster, or Macclesfield, and only a single fatal case in Leek, Heywood, and Warrington, while they caused the highest rates of mortality in Burton-upon-Trent, Bury, Halifax, Preston, Salford, and Stalybridge. Small-pox caused 1 death in Birkenhead; scarlet fever was proportionately most fatal in Halifax, Preston, and Rotherham; diphtheria in Burton-upon-Trent and Salford; and enteric fever in Halifax, Aberdeen, and Bury.

Two deaths from puerperal fever were returned in Greock, 1 in Huddersfield, and 2 in Salford. Typhus caused 4 deaths in Edinburgh, and 2 in Salford. With reference to the notified cases of infectious diseases in the thirty-two towns, it appears that the proportion of the population reported to be suffering from one or other of the eight diseases was 5.24 per 1,000, against 7.92 and 6.71 in the two previous months. The proportion did not exceed 0.53 per 1,000 in Warrington, 1.08 in Jarow, 1.39 in Accrington, and 1.73 in Huddersfield; in the other towns it ranged upwards to 8.13 in Halifax, 2.28 in Stalybridge, 8.95 in Barrow-in-Furness, 9.07 in Edinburgh, and 9.92 in Derby. The high rates recorded in the last-mentioned towns were caused by the excessive prevalence of scarlet fever. Twenty-two cases of small-pox were notified in Birkenhead during December, against 32 and 30 in the two preceding months; scarlet fever was proportionally most prevalent in Barrow-in-Furness, Derby, Halifax, Leek, and Rotherham; enteric fever in Salford, Bury, Derby, and Aberdeen; and diphtheria in Dundee, Edinburgh, and Greenock.

SPECIAL REPORTS.

REPORT ON OVER-PRESSURE OF THE SUB-COMMITTEE OF REPRESENTATIVE MANAGERS OF LONDON BOARD SCHOOLS.

THE sub-committee appointed to consider the question of 'Over-Pressure' (consisting of Messrs. Sydney Buxton, F.P., R. S. Doll, J. Faulkner, F. Fermor, Albert Ruton, Miss Gladstone, Miss Hickson, Revs. A. W. Jepson, J. H. Rose, R. O. Thorpe, R. J. Simpson, Lady Stevenson, and Major Wade) have obtained much information on the subject, and have carefully considered the question submitted to them. 1. They are convinced that the children are, as a whole, not only educationally, but physically, much the better for attending school. 2. At the same time, there is evidence that under certain conditions (on the one hand, where the child is underfed, suffers from bad health, defective intellect, longstanding neglect or irregularity; and on the other hand, where the child is over-excitable, too eager or anxious) some over-strain does occasionally occur. But the cases of over-pressure are proportionally not numerous, nor is the evil widespread. 3. They believe that much has been done, and more will in the future be done by the New Code to prevent over-pressure. 4. But they think that the New Code cannot produce the results intended, unless it is administered in spirit as well as in letter; and they do not think that this is always the case at present. 5. With this preface, the sub-committee beg leave to make the following recommendations:—

(i.) *Home Lessons*.—As a general rule they do not think home lessons desirable; and they recommend that their imposition should be left to the discretion of the managers and teachers jointly. The sub-committee are of opinion, moreover, that home lessons should be absolutely prohibited for children below the third standard, and altogether in schools of 'special difficulty.' (ii.) *Keeping in for Lessons in cases of backward children*.—They endorse the recent circular of the Board on this subject, which absolutely prohibits 'keeping in' except for punishment. (iii.) *Board Inspection*.—They strongly recommend that the Board's inspectors should be more of inspectors' and less of 'examiners.'

They also recommend that, except under special circumstances, the reassessment of H.M.'s inspectors' reports by the School Management Committee should be discontinued. (iv.) *Returns, &c.*.—They recommend that all returns, accounts, correspondence, &c., falling on the teachers, should be, as far as possible, minimised. (v.) *Power of withholding children from examination, and*

from preparation for examination.—By the Code, the managers have power to withhold children from examination, if they can satisfy H.M.'s inspector of the reasonableness of the ground for withdrawing them. Such withdrawals do not in any way affect the grant. Managers can also, for reasonable cause, present a child a second time in the same standard. The sub-committee find that these provisions of the Code are not generally understood. They recommend, therefore, that managers should be specifically instructed that they have the power, and ought to undertake the duty, of withdrawing from examination such children as are likely to suffer from the examination itself, or from the preparation for it; and that it should be pointed out to them that they cannot perform this duty unless these children are watched throughout the year. The withdrawal should be consequent on the managers' own observations and the recommendation of the teachers. (vi.) *Managers*.—The appointment of competent managers in sufficient numbers is a matter of the greatest importance, and the sub-committee recommend it as demanding the serious attention of the Board. It is impossible without the frequent visits of competent managers, co-operating with the teachers, that the discrimination required by the Code between those children who are fit and those unfit to be prepared for examination should be properly made; and it is obvious that in many other matters in the course of their school life, some of them bearing on over-pressure, children may be materially helped and befriended by the managers. (vii.) *Underfeeding and Irregularity*.—Though both these matters largely conduce to such over-pressure as exists, the sub-committee make no recommendation in regard to them. The first subject is now being considered by a council appointed for the purpose; the second is one largely depending on the administration of the compulsory powers of the Board, and on the personal influence of the teachers.

Signed:—ALBERT RUTSON (*chairman Sub-Committee*), SYDNEY BUXTON (*chairman Committee of Representative Managers*), R. S. E. DOLL, J. FAULKNER, F. FERMOR, F. M. GLADSTONE, E. H. HICKSON, A. W. JEPSON, T. H. ROSE, R. T. SIMPSON, C. STEVENSON, R. O. THORPE, J. M. WADE.

December 1884.

SANITARY MATTERS IN AMERICA.

[FROM OUR OWN CORRESPONDENT.]

THE state legislature of New York, at its session last winter, provided for the appointment of a tenement-house commission, which should make an exhaustive investigation into the tenement-house question in the city of New York. The commission was liberally provided with money, and it was sincerely hoped by all sanitarians who recognised the extent of the danger from this cause, that the commission would find a remedy to propose to the legislature, which should ameliorate the condition of the people living in tenements, and abate the nuisances caused by the herding together of so many people. The commission, through its inspectors, began work last summer on a very extensive plan. One of their schedules of inquiry lies before me as I write. It contains 519 blank spaces in which to write information desired. The commissioners held a meeting recently, and it was reported that they began to realise that the amount of work demanded of the inspectors was so great that they could not hope to cover all the desirable territory in time to formulate their report which, by the organic law, they are compelled to make to the legislature during this winter's session. The trouble, it is thought, lies in the fact that the Commission tried to accomplish too much. One of the leading members of the Commission, Professor Felix Adler, delivered a lecture on the tenement-house question in New York, before a very wealthy and distinguished audience, gathered in Chickering Hall, in that city, on Sunday, Nov. 30.

From his standpoint the greatest evil to be feared is that which results from overcrowding, and he related the case of a man who, with his wife, children, and nine boarders, lived in two small rooms. He reproved the Health Department of New York, indirectly, when he stated that the law providing an allowance of 600 cubic feet of air for each person was constantly being violated. He recommended that steps should be taken to raise such a sum as was done in London, viz., 12,000,000 dols., for the purpose of erecting dwellings for 50,000 persons on 42 acres of land. He also urged that the public baths should be kept open continuously, instead of closing them during the winter months. The report of this Commission, and the recommendations it makes, will be awaited with much interest.

There have been some very sensational stories vigorously presented through our daily press, concerning the terrible ravages of an epidemic disease among the people inhabiting that mountainous region lying in Western Virginia and Eastern Kentucky. Members of the State boards of health of West Virginia and of Kentucky have been despatched to the scene, and, while their reports have not yet been made public, it is believed that the disease, which has been credited with the deaths of hundreds of persons, and is said to have resembled cholera, will prove to be nothing but an aggravated epidemic of dysentery, caused by contaminated water taken from wells with a very low stage of water, owing to a protracted drought.

From various parts of the States come reports of epidemics of contagious diseases, as diphtheria at Chicago, and measles at Cleveland, Ohio, where there have been 800 cases and 270 deaths since June last.

But the most alarming epidemic exists in the province of Ontario. Small-pox in a very malignant form is raging at two localities about 100 miles from Toronto. Dr. Bryce, the Secretary of the Provincial Board of Health, who has just returned from a visit to the township, writes that there have been over 100 cases there, with a large death-rate. In one place eight persons were found sick in one room. In the village of Stoco the disease had invaded nearly every house. The Board is doing its best to confine the spread of the disease.

There comes from Columbus, Ohio, this month, a tale of the worst derangement of ventilation and sewerage which could possibly exist. It is in no less pretentious a building than the State-house of Ohio. Two deaths from typhoid fever have occurred from among the clerks engaged in the office most affected, while the head of the department has just recovered from a severe attack of the disease. These are not the only cases, for some of the officers have lately been on the sick list nearly the whole time. The credit for determining the cause of the sickness must be accorded to a correspondent of the *Cincinnati Engineer*, who made a searching investigation, and has just published its results. The systems of heating, ventilation, and sewerage were originally satisfactory. Seven years ago the State treasurer desired a water-closet put in his own apartments, which was done. The soil-pipe, however, instead of being carried to the common soil-pipe of the building, was conducted into one of the brick fresh-air flues. Last winter a ladies' toilet room, the waste-pipe from which was properly connected with the soil-pipe, was changed into a water-closet, the proper connection destroyed, and a new soil-pipe carried directly into the main brick air-chamber. There was no escape for the sewage from these chambers, unless it evaporated into the fresh air supplied the employes of the State. It is a good sanitary lesson to the legislature which may now be induced to pass a law creating a State Board of Health.

The past few months have been peculiarly unfortunate in that so many prominent sanitarians have died. Thirteen members of the American Public Health Association died last year, a death-rate of about twenty-six in a thousand. Four secretaries of State Boards of Health have died: Harris, of New York; Chamberlain, of Connecticut; Farquharson, of Iowa; and Hatch, of California. Lastly

comes the news of the death of Dr. Samuel M. Bemiss, of New Orleans, a prominent sanitarian and member of the National Board of Health.

The National Board of Health hopes to receive recognition and an appropriation from the Congress just assembled. The President of the United States, in his annual message to Congress, recommended that laws be enacted requiring that all rags be disinfected before being allowed to be entered into our ports. Otherwise, he failed to speak of the health of our people and the danger from cholera. However, the President's recommendation amounts to but little with our Congress, and we shall probably receive no sanitary legislation. The National Board of Health now existing without financial support, hopes to secure control of the fund which may be set apart to combat cholera should it come to our shores. It is probable, however, that the control will be given to the surgeon-general of the marine hospital service.

The Conference of State Boards of Health, which met in Washington, December 10 and 11, transacted a good deal of business, and listened to several reports relating to the sanitary condition of various states and cities. The chief work of the session was the adoption of the report of the Committee on Federal Legislation, which consisted of a draft of a Bill for a new National Board of Health. As finally adopted and presented to the Public Health Committees of the Senate and House of Representatives, the Bill provides that a National Board of Health shall be established, to consist of one member from each State Board of Health now established, or which may hereafter be established in the United States, to be appointed by the President and confirmed by the Senate, and whose compensation, when actually engaged in the performance of duty, shall be 10 dollars a day and reasonable expenses. The Board will meet annually in Washington, and, in cases of emergency, upon the call of its chairman and secretary, or upon the extraordinary call of the President of the United States. The duties of the Board shall be to make investigations at any place in the United States or at any foreign port or place, and to collect information upon all matters relating to the public health, and to frame necessary rules and regulations for the government of the quarantine service, the rules and regulations of the Board to be carried out by such departments of the Government as the President shall direct. The Board shall co-operate with and aid State and Local Boards of Health in the enforcement of their rules and regulations in preventing the introduction of contagious diseases. The Board shall also make rules and regulations to be observed by vessels at ports of departure, where such vessels sail for the United States. The penalty for any vessel which enters the ports of this country contrary to the regulations established by the Board is 1,000 dollars. The Board is to maintain a weekly exchange of reports of sanitary conditions of domestic and foreign places. There is mentioned the sum of 500,000 dollars, as being the proper amount to appropriate in order to carry out the provisions of this law.

The Conference, after adopting the Bill, of which the above is a brief abstract, adjourned for one year. It now remains to be seen whether Congress will pass the Bill. If so, it will be a satisfactory solution to the vexed question as to which department of the Government shall have charge of our health administration.

As an illustration of the difference in the average death-rate of the several districts of one town, it may be noted that during the fortnight ending January 6 the number of deaths in the South Ward of the borough of Gateshead exhibited a ratio of 12.95 per 1,000 per annum, while during the same period the West Ward of the same town showed a ratio of 37.16 in the 1,000 per annum; the other wards of the town also showed a marked difference in their average death-rate. There is no serious epidemic, and the excessive mortality arises principally from the frightful infant mortality which seems indigenous to certain localities.

NEW INVENTIONS.

"PATENT SMOKE CONSUMING AND VENTILATING GRATE."

outcome of an appliance shown in a very vainly as an attachment to existing grates) at the International Exhibition, South Kensington, in 1884, although at that time in a very imperfect form. In the testing-house was so satisfactory a result that a prize medal was awarded it. Since that time, Messrs. Reeve and Ratcliffe, Little and Co., have made several improvements on the original, and a sectional and elevated drawing of the complete grate, is appended, although the claim that they can alter existing grates as to cost, &c., to their system. The

the residuum entering a small flue at either side, when they are carried upwards, and eventually meet in the chimney proper, which comprises the syphonic action before alluded to. The effect of the ventilator under the fire-basket is to draw in fresh air, a portion of which, after passing through the heated passages it has to traverse, is emitted into the apartment, and the other portion is carried up the side flues, this action tending, in combination with the other effects, to promote combustion. The advantages of this grate are considerably enhanced by the length of time the fire is in force. The effects of many good grates are considerably reduced by the short time they are in daily use. The system of allowing fires to go out at night too often interferes with the best points in their construction, and in one like the 'Cosy,' the advantages of banking up at night, which may be done with perfect safety, would soon be realised. In the asbestos lumps in the filter we have an indestructible fuel that

drawn out in this grate is that of filtration of the products of combustion before they enter the apartment—a somewhat novel but admirable idea—and the withdrawal of the vitiated air of the room by the mild or almost draughtless syphonic action, instead of the great rush of draught or cold air which is the result of an ordinary or direct action open grate. A portion of the heat that usually passes up the chimney is arrested and utilised as it should be for warming the room, economising fuel at the same time, the draughts being decidedly conducive to the smoky chimneys. As shown by the engraving, the sides of the fire-basket are of fire-clay, and underneath communicating with the back. A range of louvres at the back of the grate carries the products of combustion into the chimney, communicating with the chimney by means of a valve, which, when opened, assumes a conical shape, and is actuated by a knob in front of the grate. The valve is, however, only opened when the fire is lighted, after which it is closed, and the products of combustion reach this chamber and finding their way down the chimney closed, are drawn downwards into a filtering chamber composed of small asbestos lumps, from which they are drawn mainly of their unburnt particles,

quickly becomes red hot, and remains incandescent so long as a fire of ordinary proportions is kept in the grate, and one that only loses its heat when the fire is allowed to go out altogether. It must be palpable, then, that the more the heat is retained in the asbestos filter the better will be the effects obtained from this grate. The fire is lighted with little trouble, is of the most genial character, easily kept up, and remarkably free from smoke, while considerable heat is diffused throughout the apartment. Owing to the syphon action obtained by means of the side flues, the thorough-exhaust ventilation of the room can be effected by the addition of a tube at the sides of the chimney-breasts communicating with them.

Wherever the 'Cosy' grate has been fixed it has met with the most unqualified praise. It can be made in any kind of design, and, should a large demand arise, at what may be termed popular prices.

HOME GYMNASIA.

AN illustration of the capability of combining in one simple apparatus, arrangements for exercising every muscle in the body, such as hitherto has only been attained by the use of a variety of appliances, is shown in the new 'Excelsior' Health Exercising Apparatus recently intro-

duced into England by the Chadborn & Coldwell Manufacturing Company, 223 Upper Thames Street, London. It will be universally conceded that a portable gymnasium, capable of being used in a house of the most moderate dimensions, suitable alike for the child, the adult, and even those in declining years, at a cost within the means of persons with limited incomes, is a very useful hygienic invention.

The apparatus in question is made in three sizes, each of which is sufficiently large for the use of an adult; the smallest occupying a ground space of only 2 ft. square and the largest 4 ft. by 2 ft. and 7 ft. 6 in. high; yet in this limited area over one hundred different combinations or exercises are provided for. Here the athlete can keep himself in constant practice by exercising on the horizontal or parallel bars, the trapeze, or, if he be a rower, take his position as in a boat, and, with either sliding or fixed seat, go through a course of exercise so apparently real as scarcely to differ in its minutest effect from the actual pastime. The child can enjoy the pleasure of a secure swing, the tilting board, or 'see-saw,' and juvenile trapeze; and besides these, there are innumerable exercises for promoting the cure of certain surgical diseases, effected by a mere change of position, and readjustment of the ropes

Rowing Reverse Movement.—Expands the Chest and Strengthens the Legs and Arms.

FIG. 1. Rowing—Start and Finish. To develop the Arms, Legs, and Back.

FIG. 2. Direct Chest Movements. To deepen the chest and draw the shoulders back.

FIG. 3. Curved Board—To Strengthen the Back, Neck, Abdominal Muscles, and Expand the Chest.

FIG. 4. For Curvature of the Spine.

and weights. Four small illustrations of a few of the exercises are appended. Further examples of this Home Gymnasium of an unique character will be given in future numbers of the SANITARY RECORD.

Each of the exercises is clearly set forth with illustrations on a chart, enabling any one to perform them without further tuition. In the rowing illustration the operator is seated on a fixed or sliding seat. In his hands he grasps two handles attached to ropes passing through pulleys over the top of the machine, and connected with weights (dumb bells), regulated according to the power of the user, and which slide up and down a pair of tramway frames. In fact, this system of weights is the main feature running through all the exercises. The curved board is an excellent and pleasant mode of performing the exercise mentioned at the foot of the illustration, and the exercise for curvature of the spine (the movements being shown by dotted lines) is only one

of many provided by the machine for this disease. The apparatus is constructed from maple, hickory, or wood, securely bolted together, yet capable of being taken to pieces in a few minutes. A variety of small apparatus for carrying out some of the exercises are sent with the main apparatus, and this apparatus has already attracted considerable attention among the medical profession, gymnasts, and private individuals, and a very flattering testimonial to its merits has been received from the Instructor-General of Gymnastics at Aldershot, who anticipates a marked physical development of recruits by its use.

IMPROVED DISINFECTING APPARATUS

AN apparatus for the disinfection of wearing apparel, bedding, and other materials has lately been patented and put to practical use by Mr. Thomas Jennings, of Lambeth, S.E., and this apparatus bids fair to cause quite a revolution in respect of contrivances prepared for the destruction of *contagia viva*.

The heat is produced by gas-jets placed at the bottom of the apparatus, and the dispersed heat passes through the openings, producing in the interior of the apparatus a newly-formed current of heated, but less, unburnt air. In order to prevent the production of smoke, atmospheric burners are made use of instead of ordinary ones. We give a view of the interior of the apparatus. It is composed of an outer box, A, which is at present of iron, covered with ash or some other suitable non-conductor, and in this is an inner box, B, of less depth and somewhat taller, the bottom of which is fixed. The top of this inner box is hinged to the top of the outer box, and a number of

formed through the upper part of the side of the inner box as shown at G. The burners for the ignition of a mixture of gas and air are placed at C, below the bottom of the inner box. By taking advantage of the natural law of circulation of heated air, a complete circulation is

l throughout the whole of the interior of the inner and a uniform and penetrating, but moist heat is con- y generated.

e outlet from the inner box is provided with a valve e can be regulated at pleasure.

e lid by which the box is closed at the top is shown and this can be worked either by balance-weights, or chet-wheels, which are easier to actuate.

e box can also be made with the front or the ends to

conclude this short description of the apparatus, we point out that the means of upholding the articles d in the interior of the box are by rods placed across inner box at F. A similar grating is placed just above otom of the inner box at H to receive other materials ing disinfection. As a matter of course, so long as rinciple is preserved, so that no moisture or conden- e be gathered from the atmosphere, and an uniform rating heat insured in the interior, the apparatus can nstructed of such a size as readily to take in whole asses, chairs, or sofas; the only difference being that asses would take longer to disinfect on account of thickness. For furs, and such like articles, an uniform an be held in suspension by a very little proper regu-

e value of this new disinfecting apparatus, which justly ed both a silver and bronze medal at the late Interna-

Health Exhibition, 1884, was sufficiently made mani- t a lengthy and crucial series of experiments conducted r. Bartlett and other gentlemen some months ago. In more than half an hour the temperature rose to 262° , and afterwards, for the space of 41 minutes, this le and nearly unvarying temperature was main- d at a total expenditure of 100 feet of gas. The rs tested were cambric, muslin, calico, flannel, a cushion, bakers' yeast, and certain germinal matters. e latter were obtained from the air of an hospital, and ded pus cells, bacteria, nomads, entozoa, and fungi. e result proved that, even at the high heat main- d, such was the uniform disposition of the heat and emoval of vapour that the fabrics placed even near ottom of the box, were taken out perfectly uninjured without loss of colour or textile strength. The yeast completely sterilised, and produced no fermenting r upon sugar solutions, &c., and the germinal and id growths were all killed, and could not be revived r by moisture or by treatment with Pasteur's solution. mites, the vibrios from decomposed meat, and the n parasites were also destroyed. Other experiments shown that linen, flannel, &c., have been subjected 0° Fahr., and muslin to 300°, without sustaining the est damage. Bedding and mattresses are not only id, but improved, inasmuch as the heat causes the g-in material to expand, and thus saves the trouble of king them. It can easily be understood also that a d lot of materials can be purified in a less time with a nished consumption of gas. Moreover, the apparatus, h can be made to run on wheels, is well adapted, not for disinfecting purposes, but for drying and airing. apparatus, 7 feet 4 inches long, 3 feet 4 inches wide, 1 feet 4 inches deep, outside measurement, has pro- d 280° of heat in 25 minutes, with a consumption of et of gas. Three hundred and fifty degrees can be ned in 55 minutes, at an expense of 150 feet of gas, his is more than what is necessary to destroy harmful s. Practically, thorough disinfection of fabrics and destruction of hurtful germs and vermin can be ved in this apparatus in one hour at a temperature of 240° to 260° Fahr., with an expenditure of a little 100 cubic feet of gas, which at ordinary rates would es than 4d.

simplicity, cheapness of working, and rapid action d recommend this disinfecting apparatus to the autho- of hospitals, infirmaries, sanatoriums, schools, public tions, and mansions, as being alike suitable for dis- ion, perfect drying, and airing of all kinds of material.

THE 'SILENT' SYSTEM OF VENTILATION FOR PRISONS.

THE ventilation of prisons has always been a matter of peculiar difficulty, as, owing to the necessity of having the cells thoroughly isolated from each other, any system that did not effect that object and at the same time secure a continuous change of air in each cell was practically useless. As there was really no system in existence whereby a number of cells could be ventilated into one shaft, and at the same time sound prevented from passing from one cell into another, Messrs. Robert Boyle & Son, the well-known ventilating engineers, have, after giving the matter the most careful consideration, devised an arrangement which is most ingenious and yet exceedingly simple, and there can be very little doubt but that it will effectually answer the purpose for which it is intended. The system may be described as follows:—Take a block or wing of a prison, consisting of, say, three tiers of cells on each side, composed of thirty cells on each tier or row, making 180 in all. Three brick flues, internal measurement 2 ft. x 2 ft., are built at equal distances against each of the side-walls, and carried up above the roof, where they are surmounted with the Self-acting Air-pump Ventilators, of 3 ft. diameter. Three horizontal shafts run along each tier immediately underneath the ceiling and close to the wall. Each of these shafts is connected with ten cells by means of protected openings, varying in size in proportion to the distance of the opening from the upcast shaft, so as to equalise the quantity of air extracted from each cell. Three of these horizontal shafts, one on each tier, are connected with one of the upcast shafts, which forms a junction in the centre. The horizontal shafts vary in size according to their proximity to the top of the upcast shaft, so as to equalise the quantity of air drawn from each tier. A ring of gas-jets is fixed at the bottom of the upcast shafts for the purpose of warming them in cold weather and preventing condensation of the ascending column of foul air. The peculiar feature in this arrangement is that the ventilating opening in one cell is isolated from the openings in the other cells by means of a metal plate or partition extending from it along the shaft and past the opening of the second cell to it; and so on with all the other cells, they being treated in a similar manner, one partition plate overlapping the other the length of two cells from the one it is connected with until the central upcast shaft is reached, where a divisional plate is fixed in the horizontal shaft to prevent the two currents (travelling in opposite directions) from striking each other and creating a swirl as they enter the upcast shaft. Each partition plate is deafened round the opening into the cell by means of a double plate packed with sand. The horizontal shafts as they pass through the cells are also protected and deafened by means of a double casing, having the space between packed with sand.

The advantage of this system is that every cell is equally and separately ventilated, whilst perfect isolation is secured, it being impossible for sounds to pass from one cell into another through the ventilating shafts or openings, whilst as many as from ten to twenty cells can be ventilated by the one pipe, and three or four of these lead into one upcast shaft. An important feature is that there are no valves used in connection with any part of the system; so that when once fixed no further attention is required, and the ventilation cannot be interrupted through negligence, as is usually the case where ventilating arrangements are employed that require looking after. Messrs. Boyle have entitled this arrangement the 'Silent' System of Ventilation for Prisons, a very appropriate name.

Fresh warmed air is introduced into each cell through vertical channels cut in the walls protected outside and inside with strong iron gratings. These channels open into the galleries on the inside of the building, and are supplied with air from two large openings at each end of

the block, through which the fresh air passes over a heating arrangement in cold weather, and is thoroughly warmed before entering the cells through which it must pass before finding an exit.

We understand that Messrs. Boyle are taking steps to have the system practically tried at one of our large prisons.

AWARDS FOR VENTILATORS AT THE LATE HEALTH EXHIBITION.

In reply to Mr. Clark's letter *re* the above, which appeared in your last issue, we have only to repeat that we were *not* invited to send our air-pump ventilator, which is the only exhaust ventilator we either manufacture or sell, for the purpose of being tested, nor were we notified that tests were being made with exhaust ventilators; we, as already stated, not being even aware that such tests were instituted until after they were completed and the awards made. Under these circumstances, it seems rather superfluous for Mr. Clark to say that we were *not* excluded from the testing, seeing that we—why, we cannot understand, though we mean to find out—were left in entire ignorance of the existence of such tests. Mr. Clark states that we were invited in *proper* form to send our ventilator to be tested, and also that he holds a letter from us declining to comply with his request. As this is really a matter of not only private but public interest, we now call upon Mr. Clark to publish the letter referred to, so that your readers may be enabled to judge between us, and that we may have the opportunity of showing how we have been treated.

With respect to our error in the length of the testing tube, stating that it was eight feet, whereas Mr. Clark informs us that it was ten feet long, this additional length, instead of improving the position, shows all the more conclusively that the mode of testing was a *farce*, and we are prepared to argue this point with Mr. Clark either as a question of science or practice, or as both, and to prove the correctness of our assertions, which we make as practical men of extended experience.

From the accounts we have since read of the experiments and the manner in which they were conducted, we much fear that they will have the effect of bringing sanitary science into discredit with the public, and do it almost as great an injury as the notorious 'Kew Experiments,' which is greatly to be regretted, as it retards and hampers the efforts which earnest and practical men are now making to popularise the cause amongst the people.

We derived the information from a credible source that the shafts of the ventilators tested were inside the tube, but, as Mr. Clark affirms, and we have no knowledge of ourselves to the contrary, that such was not the case, we will concede the point, which does not affect materially the method of testing the ventilators.

As we in the whole course of our experience as ventilating engineers have never heard mention of Mr. Clark as an authority on ventilation, it might, as indicating the value to be attached to that gentleman's labours, be satisfactory to your readers, as it certainly would be to us, to be informed of his qualifications to decide a question relating to ventilation in such an off-hand manner, which has hitherto baffled the most scientific and practical experts on the subject, viz., the determining by *scientific experiment* the relative values of ventilating cowls.

Mr. Clark stigmatises part of our letter as 'abusive.' If stating that we will not allow this matter to drop until we have sifted it to the bottom and discovered the individual or individuals really to blame is 'abuse,' then we

admit the impeachment; or, if our remark that the experiments in question are a reflection on the intelligence of the nineteenth century be considered 'abuse,' then we again admit the impeachment.

As we presume we may look upon Mr. Clark's letter as a final reply, so far as the jury are concerned, to our letter of protest addressed to Sir Philip Cunliffe-Owen in his capacity of official representative of the jury, and receipt of which that gentleman duly acknowledged, we herewith beg to append that letter as showing how the matter stands.

Queen Anne's Buildings,
64 Holborn Viaduct, London, E.C.,

Nov. 4, 1884.

To Sir Philip Cunliffe-Owen, Secretary to the late Health Exhibition, South Kensington.

Dear Sir,—We are informed, and for the first time, that the exhaust ventilators exhibited at the late Health Exhibition, South Kensington, have been submitted by the jury to a series of tests, with the view of ascertaining which was the best and entitled to the first prize. As we received no notification that such tests were going to be made, nor were we invited to submit our self-acting air-pump ventilator, exhibited at the Health Exhibition, for the purpose of being tested along with the others, we beg to ask you, as the representative of the jury, for an explanation of the omission, and the reason for our ventilator being excluded.

We have also to ask you if it is correct that Mr. J. P. Seddon, architect, formed one of the jury on ventilation, and that five medals have been awarded to the ventilating and sanitary appliances of a firm which that gentleman has been the public advocate of for these last seven years, he being also well known to be strongly antagonistic to us personally and to our ventilating arrangements?

During the time of the Exhibition we repeatedly attempted to ascertain the names of the jury; but, for reasons best known to that body, none of their names were allowed to be divulged—an unprecedented proceeding, and entirely contrary to the recognised rules which control all Exhibition juries. We beg to remark, however, that in England men do not submit to be condemned by secret tribunals without even having been brought to trial, as is the case with us in the present instance.

Enclosing a pamphlet containing the notorious Seddon correspondence *re* the application of our system of ventilation to the London Custom House, and hoping to be favoured with an early reply to the foregoing queries,

We have the honour to be,

Your obedient servants,

(Signed) ROBERT BOYLE & SON.

P.S.—We beg formally to protest against the awards given for ventilators, on the grounds that our self-acting air-pump ventilator was not tested, and that we were not invited to submit it for the purpose of being tested along with the others, and that therefore the awards given do not show that the ventilators receiving them were justly entitled to them.

R. B. & S.

As it is evident, from the position Mr. Clark has taken up, that the above letter has failed in its purpose, and that we may expect but scant satisfaction at the hands of the gentlemen—whatever they may be—who formed the jury, we will now appeal to the executive through its head, his Grace the Duke of Buckingham.

We are, yours truly,

ROBERT BOYLE & SON.

64 Holborn Viaduct, Jan. 2, 1885.

Our letter to Mr. Clark will be a partial reply to Mr. Banner's, which appeared in your last issue. We have now to say that, had we known at the time that Mr. J. P. Seddon formed one of the jury on ventilation, we should have lodged a formal protest against his acting in that capacity, on the grounds that he was declaredly antagonistic to us, and that he was also the advocate of another system

of ventilation (Mr. Banner's), upon which he would also have to adjudicate. Had we been invited to send our air-pump ventilator for the purpose of being tested, which we were not, and had we been aware that Mr. Seddon was one of the jury, we should most certainly have declined. And it has yet to be explained why the names of the jurors were kept so strictly secret in spite of all our attempts to ascertain them.

With respect to the value of the tests, we have already, through the medium of your columns, expressed our opinion, and that opinion we not only maintain, but are prepared to prove, is correct. As to the efficiency of Mr. Banner's or any other ventilator, as compared with the air-pump ventilator, there is no surer or more crucial test than the test of time, and no better judge than the public. It is not for us to boast of how long our ventilators have now been in use, nor of the number of buildings, public and private, in almost every country in the world, which we have successfully ventilated, nor of the almost incredibly large number of ventilators which we have sold during the last fourteen years. The fact that they are known and extensively used in every quarter of the globe is in itself, we think any reasonable and unbiassed person will admit, sufficient proof that the air-pump ventilators have been found to satisfactorily answer their purpose, or they would not have been so generally adopted. But that is not all. We recently made an appeal to the principal architects in the United Kingdom to be favoured with their experiences of our ventilating appliances, and we received, in *immediate response*, over 400 most valuable testimonials, amongst which are to be found the names of almost every leading architect in the kingdom. We humbly think that the testimony of gentlemen who all speak from extended practical experience, such as Mr. Arthur W. Blomfield, Mr. Arthur Cates, the late Sir Gilbert Scott, Sir William Thompson, Dr. B. W. Richardson, the late Professor Macquorn Rankin, &c., will have a little more weight with the public than the pottering experiments of a few amateurs, whose ideas on the subject are possibly as vague as their practical knowledge is limited. Mr. Banner is simply making a farce of a serious matter when he again offers his bellicose challenge to 'single combat' for 100*l.* a side, &c. Considering that he has now offered this challenge to almost every ventilator maker in the country, and we believe has been also himself challenged, we should have thought that by this time he would have seen the folly of his conduct, and the ridicule he was bringing on the cause of sanitary science by his treatment of it as if it were the 'prize ring.' If Mr. Banner is so very desirous that his name should be handed down to posterity as one of the great sanitary reformers of the present age, let him, instead of giving away his 100*l.* in the way he proposes, expend it in applying his system of ventilation gratuitously to one of our city hospitals or homes, and then invite his friends and the press to witness what he has done. We can assure him that, if he does this, he will accomplish his desire, and at the same time have done a good deed, which will be doubly satisfactory.—We are, yours truly,

64 Holborn Viaduct, ROBERT BOYLE & SON.
Jan. 2, 1885.

Sir,—From their letter on page 285, Messrs. Kite & Co. would have it to be inferred that their 'exhaust ventilators' were tested by Mr. Clarke at the Health Exhibition testing room; but, from all I can learn as yet, they had no 'ventilator' tested there, but only their *chimney can*! Consequently, while they might deserve the Gold Medal for their inlet and outlet ventilators—in the latter case their chimney breast ventilators being meant—it is a different matter to speak of 'winning' the Gold Medal with an appliance which was never in the contest at all.

Kite's ventilator, with two vertical openings on the principle patented in 1846, is, in my opinion, a very poor exhaust appliance, and I said so several years since; and

this opinion is further confirmed by experiments lately made by me with said ventilator, as modified now by Messrs. Kite & Co. from the old diamond shape to a round section. On the other hand, I consider their chimney can, which I have also tested against my chimney can, to be a very good one. Yet, had I known that chimney cans were to be tested, and had sent in my own, Kite's might have been second instead of first. I say so because I tested both on December 27, when in six testings of one minute of each the one gave 1,328 feet of up-current, and the other 1,300 feet; the highest in one minute of the one being 308 feet, and of the other 320 feet, so that the two cans might be said to be six of the one and half-a-dozen of the other.

I also before this tested Kite's exhaust ventilator for a 4-inch soil-pipe against mine for a 3-inch pipe, the pipe of Kite's ventilator being only $3\frac{1}{4}$ -inch bore to go *inside* the pipe, while the pipe of mine was $3\frac{3}{4}$ inches in diameter. The best result of each showed Kite's in four minutes 1,400 feet up; my one, 2,140 feet up; plain pipe, 1,510 feet up.

I again tested Kite's 4-inch ventilator with its $3\frac{1}{2}$ -inch pipe against my 4-inch one, with its $4\frac{1}{2}$ -inch pipe to go over the 4-inch pipe. In this case the highest Kite's gave in one minute, with its shut side to the wind, was 470 feet, while the lowest my own gave was 750 feet. With its open side to the wind, however, the highest of Kite's was only 150 feet a minute; the lowest of the plain 4-inch pipe was 370 feet a minute, and its highest 500 feet.

How does the result of these experiments bear upon or tally with the attempt made by Messrs. Kite to make the public believe that their exhaust ventilators had been tested at the Health Exhibition, and that they had got the Gold Medal therefor?

Gold Medals were given to three firms in the ventilating section, including a French and a German firm; but, as said section comprised a variety of appliances, it is quite possible the Gold Medal in no case had anything to do with *wind-acting* exhaust ventilators. An outlet ventilator into a chimney, or one acting by gas or machinery, has nothing to do with wind-acting ones.

Glasgow, Jan. 3.

W. P. BUCHAN.

We should not have noticed this particular point any further, but for Messrs. Kite & Co.'s letter, which we feel somewhat surprised at after the confession they made. Now they say all right-thinking people will deprecate the attacks made on the jury and tester. Surely, after they have acknowledged theirs was a chimney-top and not a ventilator which was tested, they cannot wish the public to believe that the tester was a competent man to perform such a duty. Does it not show his utter incapacity to do so? In their letter they would have one and all overlook their previous letters, and give heed to the sympathy they offer to the man who undertook a duty, and 'by their own showing' was incapable of performing. We think the tester should have objected to the chimney-top being included in the list of ventilators. It was sent as a ventilator, it was tested as a ventilator, but it was not a ventilator. How was it, if everything was done conscientiously, this was not discovered by the judge? In our opinion it shows one of two things, either the incapacity or the inconsiderateness of the judge. Messrs. Kite & Co. say their chimney top or apparatus, which took the Gold Medal, was made on the same lines as their turret ventilator; so much more is the reason why the judge should have objected to it, as being wrongly entered. If A had a sailing yacht entered for a race, and B had a steam yacht built upon the same lines as the sailing yacht, would that entitle B to enter his yacht for the same race, simply on the plea that it was built upon the lines of a sailing yacht? Would not the umpire or the judge at the entering discover this before the race commences. If not, they would be unequal to the duty they undertake. Should it be overlooked, and all entered as sailing yachts, the race completed, and

the steam yacht came in first, then comes the question—'Is she a sailing vessel, and entitled to the prize?' We wait for no answer to this question. Should the prize be handed over to the owner of the steam yacht, we think so much blame could not be attached to the recipient of the prize as the donor. We have said before, we do not begrudge any successful competitors their award; but we think we should have been spared the harassing remarks of 'without malice or favour,' for this fairly implies that all exhibitors must have had an equal chance. It is very easy for a prize-winner to use language so modest and becoming, but not so easy for one who has been refused a fair trial 'as we have been;' and without the reason or explanation why we were so treated. To use the language of Messrs. Kite & Co., we are inclined to think the public will deprecate our lot, rather than facts made known of the jury and tester. As to the means so applied for testing, we say there is not a particle of truth in it; and we are in a position to prove it. There is a means of testing the merits of a ventilator as easily as a gauger can gauge a cask of spirits as to quantity and quality, which he can do to the greatest exactness by means of proper apparatus; but he might as well put a two-foot rule into the cask to find the strength as to put an anemometer into a ventilator to see what extracting power there is in it where a forced current is set up. Let anyone fix a ventilator, the bottom coming down into a room, make the air therein quiescent, and no natural element acting upon the outside of the ventilator: see what the result will be. In the case of the late testing all the natural element was cut off from the outside, and a forced current set up from the inside, which brought about a passing through the anemometer an amount of cold air, and whichever passed the most forced current was considered the most effective ventilator. Nothing can be more misleading. In proof of this take an instance that has within a week from this date been demonstrated in the following manner:—A 14-inch ventilator was fixed at the head of a grand staircase, with very large rooms at the foot of the stairs. To the ventilator were attached five injection tubes. At the ceiling line and at the bottom of the ventilator when the gas was alight, the temperature was 75°; the ventilator was passing, by the anemometer's register, 78,000 lineal feet of air per hour; this was then reduced to 60,000 feet per hour, and the temperature was also reduced to 62° and 65° maximum and minimum; that being so, when was the ventilator doing the work it was intended for? These facts lead us to the conclusion that we are right in what we have always said, that cold air passing through a ventilator is not only unreliable as to its merits, but to a great extent destroys the power of extracting hot air. Over and over again we have proved this to be the case, and in the presence of a commissioner to a trade journal, who took a great interest in the experiments made with ventilators. It was our intention to have written a few letters upon the art of testing ventilators, but we are sorry to find that some of the trade journals who claim to be the leading organs have closed their columns to such articles, and thus deprived their readers of any information that they themselves are unable to give.

Sir, we feel sure your object always is to give space for matter upon scientific questions and to set the wronged righted, and you will therefore give space and insert this in your next issue, and oblige

EDGAR ALDOUS & Son,
Ventilating and Sanitary Engineers,
2 Elmhurst, Upton Lane,
Forest Gate, E.

Jan. 1, 1885.

A NEW DEPARTURE IN HOUSE DRAINAGE.

Page 253 in the SANITARY RECORD for December bears the above title, and it is, I think, worthy of the attention of all who possess, or who aspire to have, authority in the design and execution of private sanitary work.

This is my opinion because I see in Mr. Ebbetts' work (there described) evidence of that thoughtfulness in the application of the principles which commended themselves to him which is indispensable to the attainment of satisfactory results, but which, I believe, is not always sufficiently exercised.

My object in writing is, by calling attention to its importance, to encourage such thoughtfulness, especially among the many new and earnest workers in sanitary science who are being brought forward by the growing demand in the public mind for good domestic sanitation. Is it not distinctly needful for such, indeed for *all* sanitary workers to remember that an intimate knowledge of good principles, though necessary, is not by any means sufficient? What is urgently called for is thought in the application of these principles to the conditions of each particular case. This thoughtfulness is clearly manifest in Mr. Ebbetts' paper, and it is a quality which finds ample room for exercise in the design and the carrying out of sanitary work where inattention to 'points of detail' may so easily prove disastrous, and may wreck the usefulness of an excellent general design.

It is given to only a few workers to lay down principles which prove themselves worthy of general acceptance, but the honour of applying these well can be attained by everyone who makes it his purpose.

In writing this I am not to be taken as agreeing with all that Mr. Ebbetts says; in fact, I am unable to do so. It is not so much his scheme as his method of going about his work which is, I think, suggestive. But Mr. Ebbetts might reconsider whether the 'inspection holes' (which he shows) are called for on a drain which is straight, which is laid to a gradient of as much as 6 inches in 10 feet, which is terminated by a sweeping eye and by a chamber, and which is provided with a special flushing tank. He might also reconsider whether the waste-pipes of a housemaid's sink and bath, even if 'trapped,' should have been allowed to remain joined to a soil-pipe. But perhaps, in this case, Mr. Ebbetts had no authority to alter internal arrangements.

As to the design of the ventilation being 'new,' Mr. Ebbetts will find his principle laid down, and at least permitted, by the 'Model By-laws (issued by the Local Government Board) with respect to New Streets and Buildings,' clause 65, sub-section (i) (b). The details specified there are, however, somewhat different from those in the case described.

I do not write, however, with the view of criticising the paper in question, but from a strong wish to point out the great use of *painstaking thoughtfulness* in putting into practice good sanitary principles, and the wide scope which exists for its exercise by individual workers.

ALEXANDER A. KYD,
An Engineer of the London Sanitary
Protection Association.

London, Dec. 31, 1884.

I have read with some interest Mr. D. J. Ebbetts' paper upon 'A New Departure in House Drainage,' in the SANITARY RECORD of December, because the principle he has applied, and advocates, is a child of mine, and I have applied it to a large number of buildings, and with success.

If you refer to the proceedings of the Annual Conference at the Society of Arts, on National Water Supply, Sewage, and Health, May 15 and 16, 1879, p. 144, you will see a paper by me upon the double check system of house drainage, and I extract from it the following:—

'In the present day, every closet should be constructed so that it may be flushed by about two gallons of water; this quantity of water, if it were possible to be forced at once into the 4-inch soil-pipe, would form a solid piston of water, about a yard long, and would, in descending, push before it with considerable power the air in the pipe; and if the soil-pipe were 10 feet long, 20 feet of air would

ced, and forced out of the open end of the pipe, the time air would pass into the top of the soil-piston, and follow the water piston, so that during it was acting as a displacer of foul air, it would the vacuum with fresh air; and, if I had not objection to mechanical valves, I could easily construct that would retain the yard of water in the soil-ch. being released suddenly, would act with very effect; but as in practice I have found it is desirable the water for pan flushing by a large pipe, say one, taking care that the valve which allows the escape from the flush tank, and also the way into pan, be of equal capacity to the pipe; a good secured, and the descent of water passing down pipe, acting in a zigzag and spiral form, produces similar to the solid water piston described; and it advantage of being more gradual in its action, and displacing more foul air than though it acted

All open-top soil-pipes, having no exit pipes, large extent, this piston power for displacing and those having an opening near the ground (as systems) act as I have described, but with the use, that upon each occasion of the closet being action of foul air is forced out of such openings, ones in course of time very objectionable, produce a low level disagreeable odours, and in the our doors and windows. The double check the advantage of being free from the objections noted out. The soil-pipes and drains being opened, so that any foul air in them may be displaced easily acted upon, and I have found that a warm water thrown down a kitchen sink, has current of air to circulate through the pipes; every water-tap, allowing a small quantity to pass down the drain constantly, has effect; night, and at other times, caused a moderate rise in one direction, and also in the arrangement when one pipe is at the back of the house, and at the front, should the sun shine upon one pipe, reduced will cause a free circulation so long as it is warmer than the other. Of course, the waters described do occasionally act one against the other; there may be times when the water piston forcing air in one direction, and the bucket of water, but in practice this has but little effect successful working of the system, for upon which I have found the drain and soil-pipes very foul gases.

Above extract it will be seen that Mr Ebbetts' system has been anticipated, and I may say that houses lined by me upon this system as early as 1863, as I exhibited at the Health Exhibition, London, of the double check system. I take exception to his scheme, such as waste-pipes connected pipes, and the rain-water pipe, because such an it does occasionally untrap the waste-pipe traps, they become ducts for air to enter the house, being contaminated by passing through slimy ducts, and pipes are properly laid, I see no need of special sweeping ends.

I seldom a hot flue can be met with to fix an it against; the idea, though, is a good one when applied to it.

HENRY MASTERS.

Dec. 30, 1884.

December number of the SANITARY RECORD, article called 'A New Departure in House

Mr. Ebbetts says he connected a soil-pipe with water-pipe with the drains by means of bends—apparently in order to prevent an of gas. Will you kindly tell me in your next at it is a 'quadrant bend,' such as Mr. Ebbetts

F. W. JORDAN.

house, Heaton Chapel, Stockport.

'Quadrant bend' is simply a stoneware drain-pipe

moulded to the shape of a quadrant of a circle—a curved drain-pipe in fact. It was used in the works referred to to connect the vertical with the horizontal pipe with an easy bend, and was mentioned in the article because such connections are generally made with traps, which interrupt the flow of the water besides producing other inconveniences. —D. J. EBBETTS.]

PATENT INSPECTION OR ACCESS-PIPES FOR HOUSE DRAINS.

On p. 279 there is illustrated and described, and also highly approved of, what is purported to be a new style of 'Access-pipe' for house drains, said to be invented by a Mr. G. C. Davies, of London. I doubt however, he is rather late in bringing this longitudinal opening on the top of the pipe with a lid for same as a 'new invention,' seeing that I got an award of merit for it at the International Medical and Sanitary Exhibition, London, 1881; and it has also received two or more certificates of merit from the Sanitary Institute of Great Britain since then. These Access-pipes were patented by me at the end of 1879, and I have used them since in a variety of ways at a number of buildings, while many architects have used them on their drainage works. I mention some in the fourth edition of my book on 'Plumbing and House Drainage,' published two years since. These pipes of mine can be made of any suitable material—fireclay, stoneware, iron, lead, &c. Sometimes iron lids are used with the fireclay ones.

It is a pity for Mr. Davies that he is too late, but I cannot help that.

W. P. BUCHAN.

Glasgow, Jan. 5, 1885.

WATER FILTERS.

Our criticism of the 'International Filter,' as we stated at the time, was not prompted by Mr. J. J. P. Sawyer's 'challenge,' which is beneath our notice, but by your editorial paragraph. However, not to appear discourteous, we will in a few words reply to your correspondent's letter in the last number of the SANITARY RECORD.

There is no novelty whatever in his filter as far as its general arrangement is concerned. Thus, 'Gray's improved self-cleaning rapid filter' is almost identical with the 'International,' excepting the cone-shape of the filtering medium. Mr. Sawyer's proposal to use for the purpose of the 'fight,' as he pleases to express it, not his patented material, but animal charcoal, is contrary to common sense, for if there is any use in testing a filter it can surely only be in the form in which it is offered to the public. Any filter containing, say, coarse gravel only, through which the water would pass without being in any way purified, would, we submit, produce results similar to those claimed in the challenge. For this reason we drew attention in our last letter to the omission in the 'challenge' of any distinct reference to the most important question, which is the purification effected by the filtration. Your correspondent's observations do not remove this, for 'one week submitted to other tests, with permanganate, &c.' (point 6), refers, as it stands, merely to a testing of the filtering medium, and not of the filtered water. Even should the latter have been intended, the phrase quoted is too vague to do away with our objection. A point 11, to which he refers as with reference to the testing of the filtered water, does not exist, there being only ten points, as will be seen on p. 6 of your issue quoted above.

Declining further correspondence on this subject, we remain, Sir, your most obedient servants,

The Spongy Iron Filter Company,

Purveyors to the Queen by appointment.

22 New Oxford Street, W.C.

Jan. 2, 1885.

SANITARY JOTTINGS.

SANITARY.

VACCINATION IN SOUTH AFRICA.—The following extract from a private letter of an English medical man practising in the Orange Free State contains some remarkable recent instances of the efficacy of vaccination:—"Everybody in these parts is now convinced of the value of vaccination. There were many sceptics before the outbreak of the disease, but we have had so many conclusive proofs of the value of vaccination that no one here can doubt its efficacy. Among other cases I may mention that a small community of thirty-four Korannas were infected and tried to conceal the fact, but were not long successful. Three had been vaccinated last year. All except these three were stricken with small-pox, and eighteen died. The three vaccinated ones nursed all the rest but did not take the disease. On a Boer's farm I vaccinated the Boer and his children. His wife alone refused the operation; she alone caught small-pox. The whole family lived in a small house, and although exposed to contagion, not one of the others took the disease." The writer is Dr. George Davis, Government Doctor of Hoopstad, Orange Free State.

The Senate, after two days' debate, to-day adopted, by 96 votes against 21, a Bill for improving the sanitary condition of Naples. A sum of 100,000,000 francs is to be expended for this purpose during the next ten years. The works will be carried out under the direction of the Government, which will also guarantee a new loan, to be raised by the city.

Scarlet fever still forms the largest percentage of cases of zymotic diseases notified to the medical officer of health at Newcastle. It is also very prevalent in the surrounding district.

WATER SUPPLY.

The vicar of Esh has written to the Lanchester Rural Sanitary Authority requesting them to provide the necessary water supply and complete system of sewerage for the village of Esh, the inhabitants of which place at present suffer much for want of such provision.

Frequent complaints have been made recently both in Newcastle and Gateshead relative to the quantity and quality of the water supply. The public have suffered much annoyance from the supply being turned off for several hours at uncertain times without notice; when turned on again, the water has often been found unfit for domestic purposes.

CREMATION NOTES.

THE corner-stone of a new crematory temple has been laid on Mount Olivet, Long Island. Professor Felix Adler conducted the services. Twenty dead bodies are now awaiting its completion. The cost of cremation in each case will be from 10 dols. to 25 dols. The edifice is designed as a modified Grecian temple of brick and marble, 40 x 72 feet. The basement will contain in the rear the furnace, which will be constructed chiefly of fire-brick, and will be adapted to coke with a regenerator. The incinerating chambers will consist of retorts which will exclude all fuel and flame from contact with the body, and from which the volatile products of the incineration will be carried into the furnace for recombustion. Incineration will take place at a temperature of about 2,500° Fahrenheit. It will require about forty minutes per hundred pounds of the subject, and will leave about 4 per cent. in weight of a pure pearly ash. No smoke will be visible, and no odour perceptible during incineration. The basement will also contain a refrigerarium, so that the body may be kept, when desired, awaiting the arrival of friends from a distance; also a calidarium for cases of possibly suspended animation, the high temperature of which will

induce speedy evidences of life or death, as the case may be. There will be, also, in the basement an urn room and an atelier. This last will be used also for making autopsies, which will be required in all cases wherein it is not clear that death is the result of natural causes.

The Lancaster, Pennsylvania, crematorium, built by the Lancaster Cremation and Funeral Reform Society, was dedicated on Nov. 25. The building occupies an elevated position in the southern part of the city. The remains of the body subjected to incineration were reduced to ashes in an hour.

The New Orleans Cremation Society has purchased a square of ground near the city, and a furnace for burning the dead will be built without delay. The society is one of the largest and wealthiest in the country.

We give below for the information of our many readers who are interested in the subject of cremation the text of the circulars lately issued by the Council of the Cremation Society of England, who have now decided to open their crematorium at St. John's, Woking, Surrey, for the cremation of those bodies, relative to which the requirements of the Society are complied with. Any further information desired can be obtained on application by letter to the honorary secretary, W. Eassie, C.E., 11 Argyll Street, London, W.

The Council of the Cremation Society of England purchased, in the year 1878, a freehold site at St. John's, Woking, in Surrey, especially adapted by position for the purpose, and erected thereon a building, with an apparatus of the most approved kind, for effecting cremation of the dead. They next tested it by experiment, and found that it accomplished the purpose required without occasioning nuisance of any kind. Since that time the place has been maintained in perfect order, but has not been used, owing to a doubt raised, soon after the date referred to, as to the legality of adopting the process at present in this country. A recent decision, however, of Mr. Justice Stephen declares that the cremation of a dead body, if effected without nuisance to others, is a legal proceeding. Under these circumstances the Cremation Society feel it a duty to indicate, without delay, those safeguards which they deem it essential to associate with the proceeding in order to prevent the destruction of a body which may have met death by unfair means. They are aware that the chief practical objection which can be urged against the employment of cremation consists in the opportunity which it offers, apart from such precautions, for removing the traces of poison or other injury which are retained by an undestroyed body.

The following, therefore, are the conditions on which the employment of the crematorium will alone be permitted by the Council:—1. An application in writing must be made by the friends or executors of the deceased. 2. A certificate must be sent in by one qualified medical man at least, who attended the deceased until the time of death, and one also by a second medical practitioner, both unhesitatingly stating that the cause of death was natural, and what that cause was. These conditions being complied with, the Council of the Society reserve the right in all cases of refusing permission for the performance of the cremation, and, in the event of permitting it, will offer every facility for its accomplishment in the best manner.

CREMATION SOCIETY OF ENGLAND.

This Society was founded to Promote the Objects set forth in the Following Declaration—'We disapprove the present custom of burying the dead, and desire to substitute some mode which shall rapidly resolve the body into its component elements by a process which cannot offend the living, and shall render the remains absolutely innocuous. Until some better method is devised, we desire to adopt that usually known as cremation.'

The Conditions of Membership are—1. Adhesion by signature to the above declaration; 2. The payment of an annual subscription of 1 guinea, or a single payment of 10 guineas.

APPLICATION FROM RELATIVE, EXECUTOR,
OR FRIEND OF DECEASED.

I, (Name) _____

(Address) _____

(Occupation) _____ hereby request

the Cremation Society of England to undertake the
Cremation of the body of _____and I certify that the deceased expressed no objection
(orally or in writing) to being cremated after death.

A Medical Certificate of the cause of death is enclosed.

(Signature) _____

NOTE.—When no Medical Certificate is enclosed, an Autopsy must be made and certified by a Medical Officer appointed by the Society, and at the expense of the Applicant or of the Estate of the deceased.

* The second General Practitioner will sign here.

This Certificate must be signed by another Registered Medical Practitioner.

The Cremation Society reserves to itself the right of refusing to carry out cremation in any case without assigning any reason.

Particulars as to Terms, &c.

The cost of performing cremation and everything connected with it, is, as compared with an ordinary funeral, small.

Ample arrangements are made for the conveyance of a body from London to the crematorium, St. John's, Woking, Surrey, on reasonable terms. Messrs. Garstin & Sons, of 5 Welbeck Street, Cavendish Square, London, W., the well-known undertakers, provide a hearse and arrange for the removal from any part within the four-mile postal circle to the crematorium itself. The entire cost of this is 5*l.* 10*s.*

The charges for the use of the crematorium, for all attendance there, and all expenses connected with the ceremony, beside the cost of transit above named, amount, for the present, to 6*l.*

In all cases two clear days' notice are necessary to arrange for a cremation, and if the body is not removed by Messrs. Garstin & Son, it should be stated, for the information of others, that a suitable cotton or linen shroud and an ordinary shell must be provided, and the arrival at the crematorium must be arranged at a certain time agreed upon, in order to insure all proper attendance and reception.

It must be understood, unless special arrangements are made to the contrary, that only one representative of the deceased is permitted to attend at the cremation. The ashes will be placed at his disposal, and can be dealt with as he directs.

PARKS AND OPEN SPACES.

*The law condemns both man and woman
Who steals the goose from off the common;
But lets the greater felon loose,
Who steals the common from the goose.*

ON Jan. 12 the disused burial-ground adjoining St. Mary's, Whitechapel, was opened to the public. It has been tastefully laid out by the Rev. A. Robinson, vicar, and the caretaker is supplied by the Metropolitan Public Garden, Boulevard, and Playground Association. This ground is in an exceedingly important position, being at the junction of the great thoroughfares of Commercial Road and Whitechapel Road.

Through the generosity of a member of the Metropolitan Public Garden, Boulevard, and Playground Association the sum of 100*l.* has been offered to the vestries of Lambeth, St. Pancras, Mile End Old Town, and St. George's-in-the-East, with a view to their supplementing it by a similar sum, and expending it in planting trees in the chief thoroughfares of their respective parishes.

The Consett Iron Company have promised to set apart an excellent site, called the Blue Mountains, for the pur-

poses of a public park, provided the Consett and Benfield-side Local Boards will jointly engage to fence and lay out the ground in an appropriate manner.

Mr. George Hedley, J.P. of Burnhopeside Hall, in the county of Durham, has, at his own expense, planted a number of lime and chestnut trees in the village of Lan- chester, thereby adding much to its natural beauty; he has also in certain places protected the trees with a sub- stantial iron fencing, 10 feet in height. At a public meet- ing, held on the 14th ult., in the national schoolroom of the village, under the presidency of Dr. Wilson, a vote of thanks to Mr. Hedley for his munificence was carried by acclamation.

THE HOUSING OF THE WORKING CLASSES.

*'How best to help the slender store,
How mend the dwellings of the poor?'*

LONDON LOCAL BOARDS AND SANITATION.—In his evidence before the Royal Commission on the Housing of the Working Classes, Mr. Hugh Owen, permanent secretary to the Local Government Board, furnishes some significant particulars of the relations of the London district authorities to the sanitation of the dwellings of the poor. Mr. Owen states that there are twenty-three vestries and fifteen district boards under Schedule A of the Metropolis Local Management Act, making, with the City, thirty-nine authorities. It is almost invariably the case that but a small number of persons take part in the elections to these boards, the event being not much known among the inhabitants; and Mr. Owen has heard of such a case as of a vestryman being elected by three votes on a show of hands. The sanitary officers appointed by these boards are not in any way subject to the Local Govern- ment Board either as to tenure of office or as to salary. The proportion of population to each inspector of nuisances in Islington is 56,000, in St. Pancras it is 59,000, in Greenwich it is 65,000, in Bermondsey it is 86,000, and in Mile End it is 105,000; whereas in St. George's-in-the-East the proportion is one inspector to 15,000 population, in Woolwich one to 12,000, in St. Olave's, Southwark, one to 11,000, in St. James's, Westminster, one to 9,000, and in St. Giles's one to 9,000. By the Sanitary Law Amendment Act of 1874 it is provided that the Local Government Board may, at its discretion, by notice in the *London Gazette*, declare the 35th section of the Sanitary Act of 1866 to be in force in any part of the metropolis, and it also confers upon the local authority additional powers as to the regulations which may be made. The regulations may extend to ventilation of rooms, paving and drainage of premises, the separation of the sexes, and precautions to be taken in cases of any dangerously infectious or con- tagious disease. Before December last these enactments had been put in force in only twenty-two districts, and in only thirteen of these had regulations been made. Appli- cation was necessary before 1874, but since that time the Local Government Board might have put this enactment in force at any time without application. Asked why that power was not exercised until last year, Mr. Owen ex- plained that the mere putting in force of the enactment would be of no avail, unless the local authority were willing to make regulations, and, when the regulations were made, to enforce them. The fact that they did not apply for the authority was regarded as showing that they were in- different in the matter, and were it not for the pressure of public opinion recently, it would have been quite useless, Mr. Owen thinks, to have put these regulations in force. There is some evidence of that view in the fact that in several cases where on their own application they had the power conferred upon them they never exercised it, and made no regulations under the statute. As regards those places in which the enactment had been put in force, the Local Government Board issued a circular asking what

action had been taken with reference to regulations under the Act, and it was found that only two have been really acting upon them—Chelsea and Hackney. As regards the other districts, the effect of their answers was in some cases that they had almost forgotten that they had the powers. There was one case where they proposed to have the enactment put in force, although it had been 'put in force' a long time previously. The Local Government Board, when they put the enactment in force, supplied the vestries and district boards who had already made regu- lations with a series of suggestions for regulations for their consideration. These regulations admit of the inspection of lodging-houses at any time, including the night, night inspection being chiefly desired with a view of detecting overcrowding.

EXHIBITIONS.

PARIS INTERNATIONAL EXHIBITION, 1885.

It is the intention of the Minister of Commerce to have here exhibited a collection of teaching material and specimens of results from French schools. The Educational Section in Group V. (classes 38 to 44) will comprise Plans, Models, &c., of Schools and other Institutions. Teaching Appliances, Gymnastics, Printing and Books, Stationery and Office Furniture. In the Scientific Annexes will be included Hygienic discoveries, Instruments and Apparatus for Medicine and Surgery. The London offices are at 1, Casle Street, Holborn, where applications for the remaining available space and all communications from British exhibitors should be addressed to Mr. Edmund Johnson, Commissaire Délégué.

NOTICES OF MEETINGS.

THE METROPOLITAN PUBLIC GARDEN, BOULEVARD AND PLAYGROUND ASSOCIATION.

By permission of Lord Brasenose, a meeting was held at 83, Leicester Gate, on the 6th inst., Mr. Ernest Hart in the chair. Sixty-four members, including many prominent persons, were elected, and the half-yearly financial statement was laid before the Council. The secretary announced that the Newington Vestry had agreed to take over and maintain the playground on the site of Horsepower Lane Gaol, and that the Surrey magistrates had agreed to accept this change in their tenants, thus relieving the Association of a heavy burden. Fountains have been presented for Ebury and Canonbury Squares, the latter garden being now much used by those persons who originally objected so strongly to its being opened to the public. The council agreed to offer seats for the thoroughfare at Christ Church, Westminster, and to improve the garden at Christ Church, Brompton, according to a plan supplied by Miss Wilkinson. The new seat taken in hand included the proposed opening of the Basement and Princess Square burial grounds, Trinity Square, and Tower Garden, E. Arlington and Union Squares, N., the Marylebone burial grounds, and a vacant space in New Oxford Street, and the meeting adjourned after having considered the forty-one separate items of which the agenda consisted.

CANTOR LECTURES.

The second course of Cantor Lectures at the Society of Arts on 'Climate and its Relation to Health,' by Dr. G. V. Poore, and the lectures are fixed for Monday evenings, Jan. 18, 19, and 20. The first lecture of the course was delivered on the evening of Monday last, and dealt with the chief constituents of climate, latitude, height, and barometric pressure. The second lecture on Jan. 19, will treat of the effects of soil, drainage, and vegetation upon climate; and the subjects of the third lecture, on Jan. 20, will include the chief sources of atmospheric impurities, both inorganic and organic; climatic diseases and climatic health resorts.

APPOINTMENTS UNDER THE PUBLIC HEALTH ACT.

MEDICAL OFFICERS OF HEALTH.

ADDENBROOKS, Edward Homfray, M.R.C.S. Eng., L.S.A. Lond., has been appointed a Medical Officer of Health for the Ketter minister Rural Sanitary District until June 24 next, at the rate of £30 per annum, *exce Roden, deceased.*
BOURNES, Charles, L.K.Q.C.P. Irel., L.R.C.S. Irel., has been appointed Medical Officer of Health for the East Division of the Godstone Rural Sanitary District, at £30 per annum.
BRIGHAM, Henry George, L.R.C.P. Edin., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Kidsgrove Urban Sanitary District, at £20 per annum, until March 25, 1885, *exce Thomson, resigned.*

Robert, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Buckingham Rural Sanitary District, at £55, and for the Buckingham Urban Sanitary District, at £15, both for one year.
 Wm. L. R.C.P. Edin., L.R.C.S. Edin., L.S.A. Lond., has been appointed Medical Officer of Health for the Heanor Urban Sanitary District, at £50 for one year, *vice* Woolley, resigned.
 John Winter, M.R.C.S. Eng., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Kettering Sanitary District, at £50 for one year.
 Wm. Aneurin, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Flint Sanitary District, at £50 for one year, *vice* Jones, *resd.*

Wilfred William Ernest, M.B. Cantab., M.R.C.S. Eng., Lond., has been appointed Medical Officer of Health for the Ruskirk Rural Sanitary District, for four years, at £50 per annum, rising £50 each year to £500, *vice* the Poor-Law Medical Officers, whose appointments have expired.
 T. Thomas Porter, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Ruskirk Rural Sanitary District, at £115 for one year, *vice* whose appointment has expired.

Jonathan Atkinson, M.D. Univ. Glasg., has been re-appointed Medical Officer of Health for the Haslingden Urban Sanitary District, at £50 for one year.
 James, M.B.C. Univ. Edin., L.R.C.P. Edin., L.R.C.S. Eng., has been appointed Medical Officer of Health for the Wey Rural Sanitary District, Wiltshire, at £80 for one year, *vice* Gordon and Hartley, whose appointments have expired.

Arthur Wightman, M.R.C.P. Edin., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Budleigh Urban Sanitary District, Devonshire, at £20 for one year.

Robert, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Godmanchester Urban Sanitary District, at £20 for one year.

Thomas, M.R.C.S. Eng., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Market Harborough Rural Sanitary District, at £70 for one year.

William Ellis, L.R.C.P. Edin., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Pudsey Urban Sanitary District, at £40 for one year.

Frederick, M.D., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the West Division of Stone Rural Sanitary District, at £50 for one year.

Alfred Gordon, M.B., C.M. Univ. Edin., has been appointed Medical Officer of Health for the Rhayader Division Rhayader Rural Sanitary District, Radnorshire, at £50 per annum, *vice* Richard Richardson, L.R.C.P. Edin., L.F.P.S. deceased.

William Lanham, M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Horsham Urban Sanitary District, at £15 for one year.

G. Benjamin Arthur, M.D. Univ. Lond., M.R.C.S. Eng., *resd.* Camb., has been appointed Medical Officer of Health for the Nottingham Urban Sanitary District, at £500 per annum, 6s. a year for travelling expenses, *vice* Seaton, appointed to *resd.* Chelsea.

Robert Archibald, M.D. Univ. Glasg., has been re-appointed Medical Officer of Health for the Lunsdale Rural Sanitary District, at £35 for one year.

RES, CLERKS TO GUARDIANS, INSPECTORS OF NUISANCES, &c.

Mr. George, has been appointed Assistant Surveyor to the Ley Local Board and Urban Sanitary Authority, at £100 per annum.

Robert, has been elected Chairman of the newly-formed Wilt Local Board and Urban Sanitary Authority.

Alfred Henry, has been re-appointed Public Analyst for the Borough of Wakefield for one year.

William, has been appointed Inspector of Nuisances for the Forest Rural Sanitary District, at £40 for one year, and for of Highways, at £125 per annum, from year to year.

Mr. William Henry has been re-appointed Inspector of Nuisances for the Rye and Lewington Spa Urban Sanitary District, at £100 per annum.

Mr. James, has been appointed Surveyor and Inspector of Nuisances to the Longridge Local Board and Urban Sanitary Authority, at £75 per annum, *vice* Kirby.

Mr. Thomas John, has been re-appointed Inspector of Nuisances for the Evesham Urban Sanitary District, at £70 for one year.

Charles Edward, F.C.S., F.I.C., has been appointed Analyst for the Parish of St. Mary Abbots, Kensington, 6s. per annum for not less than 500 analyses, and fees for scale, *vice* Cleaver.

Mr. J., has been elected a Member of the Longridge Local Board and Urban Sanitary Authority, Lancashire, *vice* Kay, *resd.*

John, has been re-appointed Inspector of Nuisances for the Mowbray Urban Sanitary District, at £35 per annum, *vice* years.

Lewis William, has been appointed Surveyor and Inspector of Nuisances to the Chestnut Local Board and Urban Sanitary Authority, at £175 per annum, *vice* Mr. Lewis Dewey, *resd.*

Dyer, Mr. Bernard, F.C.S., F.I.C., has been appointed Public Analyst for Southend, Essex, at 10s. 6d. for each analysis of food, and 21s. for each analysis of water.

Gottch, Mr. James Alfred, has been appointed Surveyor to the Kettering Local Board and Urban Sanitary Authority, at £75 per annum, *vice* Johnson, deceased.

Grice, Mr. William, has been re-appointed Inspector of Nuisances for the Hoole Urban Sanitary District, at £20 per annum, for three years.

Hamp, Mr. H. J., has been appointed Surveyor to the Swindon New Town Local Board and Urban Sanitary Authority, at £150 per annum, *vice* Jolliffe, deceased.

Hagler, Mr. Joseph, has been appointed Surveyor to the Town Council and Urban Sanitary Authority of Bury St. Edmunds, at £50 per annum, *vice* Siggers, deceased.

Hellwell, Mr. John, has been elected a Member of the Stockbridge Local Board and Urban Sanitary Authority, Yorkshire, *vice* Fox, resigned.

Hudson, Mr. P. J., has been elected Chairman of the Stockbridge Local Board and Urban Sanitary Authority, *vice* Fox, resigned.

Hudson, Mr. Thomas Charles, Secretary to the Bucks and Oxon Union Bank, has been appointed Treasurer to the Corporation and Urban Sanitary Authority of Buckingham, *vice* Carter, deceased.

Hughes, Mr. Thomas, has been appointed Clerk, Surveyor, and Inspector of Nuisances to the newly-formed Llandulio Local Board and Urban Sanitary Authority, Montgomeryshire.

Humphries, Mr. George, has been elected a Member of the Tipton Local Board and Urban Sanitary Authority, *vice* Mason, deceased.

Jarvis, Mr. Edmund, has been appointed Surveyor to the Melton Mowbray Local Board and Urban Sanitary Authority, at £50 per annum, *vice* Johnson, deceased.

Jowett, Mr. J., has been re-appointed Inspector of Nuisances and Surveyor for the Lancaster Rural Sanitary District, at £150 for one year, instead of £150 per annum for five years, as before.

Marshall, Mr. John, has been re-appointed Inspector of Nuisances for the Lunsdale Rural Sanitary District, Lancashire, for one year.

Matthews, Mr. William, has been elected a Member of the Dawlish Local Board and Urban Sanitary Authority, *vice* Conley.

McKean, Mr. Andrew, Branch Manager of Lloyd's Banking Co., has been appointed Treasurer to the Walsall Guardians and Rural Sanitary Authority, *vice* Blackburn, resigned.

Mills, Mr. James, Solicitor, has been appointed Town Clerk and Clerk to the Urban Sanitary Authority of Beverley, at £500 per annum, *vice* Crust, deceased.

Mitchell, Mr. Alexander, has been appointed Surveyor to the Bedwelly Rural Sanitary Authority, Monmouthshire, at £200 per annum.

North, Mr. J. W., has been appointed Surveyor to the Skipton Local Board and Urban Sanitary Authority, Yorkshire, at £130 per annum, *vice* Ramsden, appointed to the Chiswick Local Board and Urban Sanitary Authority.

Ogden, Mr. W. H., has been appointed Collector to the Moseley Local Board and Urban Sanitary Authority, Lancashire, at £100 per annum, *vice* Dempsey, resigned.

Pettman, Mr. Thomas, has been elected a Member of the Horne Bay Local Board and Urban Sanitary Authority, *vice* Wachter.

Potts, Mr. Joseph Nixon, Branch Manager of the Manchester and County Bank, has been appointed Treasurer to the Stockport Guardians and Rural Sanitary Authority, Cheshire, and to the Hayfield Guardians and Rural Sanitary Authority, Derbyshire, *vice* Hooley, deceased.

Rhino, Mr. Peter Smith, has been appointed Treasurer to the Corporation and Urban Sanitary Authority of Liverpool, at £1,000 per annum, *vice* Tweedie, deceased.

Royle, Mr. Fred, has been appointed Surveyor to the Shirley and Freemantle Local Board and Urban Sanitary Authority, at £100 per annum, *vice* Finn, resigned.

Sargent, Mr. Alfred Frank, has been elected a Member of the Hove Board of Improvement Commissioners and Urban Sanitary Authority, for the St. John's Ward, *vice* Young, resigned.

Smith, Mr. Henry, has been appointed Public Analyst for the Plumstead District, at £100 per annum, and 2 guineas for each analysis of water, *vice* Wigner, deceased.

Thompson, Mr. Stodhart, has been elected a Member of the Levenshulme Local Board and Rural Sanitary Authority, *vice* Rayson, resigned.

Tye, Mr. John Frederick, has been appointed Public Analyst for the Borough of Monmouth, at £4 4s. per annum, 20s. for each ordinary analysis, and extra remuneration for special work, *vice* Foster, whose appointment has expired.

Vanstone, Mr. Robert, has been elected a Member of the St. Thomas Local Board and Urban Sanitary Authority, *vice* Cuthbertson, deceased.

Ward, Mr. William Henry, Banker, has been appointed Treasurer to the Tetbury Local Board and Urban Sanitary Authority, and to the Tetbury Guardians and Rural Sanitary Authority, *vice* Wood, resigned.

Warne, Mr. John, has been appointed Treasurer to the Ottery St. Mary Local Board and Urban Sanitary Authority, *vice* Greenwell, resigned.

Watson, Mr. Henry, has been appointed Collector to the Longridge Local Board and Urban Sanitary Authority, at 30 shillings per cent. commission, *vice* Kirby.

Whittaker, Mr. A. H. (who has been acting pro tem.), has been appointed Collector to the Corporation and Urban Sanitary Authority of Macclesfield, *vice* his father, deceased.

WITTS, Mr. John W., has been appointed Surveyor and Inspector of Nuisances to the Skelton and Brotton Local Board and Urban Sanitary Authority, Yorkshires, at £175 per annum, *vice* Cross, appointed Surveyor and Waterworks Manager to the Loughborough Local Board and Urban Sanitary Authority.

VACANCIES.

MEDICAL OFFICER OF HEALTH for the Cheltenham Urban Sanitary District: £300 per annum. Application, 26th inst., to E. T. Brydges, Town Clerk.

MEDICAL OFFICER OF HEALTH for the Llandysilio Urban Sanitary District: £111 per annum. Application to Thomas Hughes, Clerk to the Authority.

MEDICAL OFFICER OF HEALTH for the Ilkerton Urban Sanitary District.

PUBLIC ANALYST for Herefordshire. Application to the Clerk of the Peace, Hereford.

SURVEYOR to the Town Council and Urban Sanitary Authority of Shrewsbury. Application to the Town Clerk.

SURVEYOR to the Burton Local Board and Urban Sanitary Authority. **SURVEYOR AND INSPECTOR OF NUISANCES** to the Town Council and Urban Sanitary Authority of Honiton. Application to the Town Clerk.

INSPECTOR OF NUISANCES for the Waverley Urban Sanitary District: £120 per annum.

INSPECTOR OF NUISANCES for the Llandysilio Urban Sanitary District, £51 per annum.

LOCAL INTELLIGENCE.

The Worcester Guardians and Rural Sanitary Authority have been invested with urban powers, &c., under Sects. 155 and 156 of the Public Health Act, as to the line of building frontage.

The Guildford Guardians and Rural Sanitary Authority have been invested with urban powers, &c., under Sects. 157 and 158 of the Public Health Act as to the making of by-laws with respect to the making of new streets and the structure of buildings within the contributory place of St. Nicholas, Guildford.

The enactment contained in Sect. 90 of the Public Health Act, authorising the making of by-laws as to houses let in lodgings, has been declared by the Local Government Board to be in force within the Watford Local Government district.

There were 130 applicants for the Surveyorship of the Swindon New Town Local Board and Urban Sanitary Authority, at £180 per annum.

AMBLESIDE LOCAL BOARD AND URBAN SANITARY AUTHORITY—The first election of Members has resulted in the return of Messrs. Thomas Backhouse, John Brown, James Gibson F. M. T. Jones, Thomas Newton, H. Redmayne, Godfrey Rhodes (Colonel), John Russell, and Edward Tyeen.

The Ventnor Local Board and Urban Sanitary Authority have voted £100 to Mr. R. S. Scott, the Surveyor, for his services in connection with the Act of Parliament obtained last session authorising the construction of a new pier and the making of other improvements.

The East Grinstead Guardians and Rural Sanitary Authority have, by agreement with Mr. W. Orrin, the Inspector of Nuisances and Surveyor, whose duties have been materially altered by the formation of a Local Board, fixed his salary at £120 per annum (£110 and £10) from Lady Day next.

Dr. Henry J. Alford, Public Analyst for Somersetshire, in his report to the Epiphany Court of Quarter Session, reported that he had analysed 819 samples during the year, of which 52 were adulterated. During the last quarter he had analysed 242 samples, of which 24 were adulterated, viz., five of mustard, six of coffee, two of cocoa, three of gin, three of brandy, four of whisky, and one of rum, but none were prejudicial to health.

New Year's Day was celebrated by Mr. William Whitaker, the chairman of the Rawmarsh Local Board and Urban Sanitary Authority, in entertaining the officials and servants to the number of twenty-five, at a dinner. Mr. Whitaker occupied the chair, and Mr. Benjamin Simcox the vice-chair.

The Wortley Guardians and Rural Sanitary Authority have been invested with the powers, rights, &c., of an Urban Sanitary Authority. 1. Under s. 153 and 155, and under sect. 160, so far as it relates to naming streets and numbering houses, and to ruinous or dangerous buildings, within the whole of the district. 2. Under sect. 66 within the contributory place of the Chapelton Special Drainage District. 3. Under sect. 150, within the contributory place of Chapelton Special Drainage District so far as regards 'Pleace End' and 'Whitefield,' and within the contributory place of Ecclesfield so far as regards 'Taplin Road,' except as to sewerage, and under sect. 152.

Mr. A. B. Creeke, the Town Clerk and Clerk to the Urban Sanitary Authority of Burnley, has been presented with a solid silver salver and an illuminated address by the principal officials of the Corporation, in celebration of his majority as an official, and of his silver wedding.

The Abingdon Guardians and Rural Sanitary Authority, at their last fortnightly meeting, unanimously passed the following resolution upon the motion of the Rev. E. H. Robinson, seconded by Mr. W. H. Comins: 'That the members of the board, in recording the death of their late chairman, J. S. Bowles, Esq., desire to express their high appreciation of the manner in which he at all times discharged the duties devolving upon him, and do express their deep sympathy with Mrs. Bowles and the family of deceased at the great and irreparable loss which they have sustained.' A copy of the resolution was ordered to be forwarded to Mrs. Bowles.

Mr. William Foster, Public Analyst for the Borough of Monmouth, stated in his quarterly report that nothing had been submitted to him for analysis during the year.

NOTES AND QUERIES.

Having for some time back been in the receipt of Queries relating strictly to sanitary work, and which it would be easy to without having to refer our correspondent to competent professional advisers, we have opened a column in which to register such Queries thereto as can fairly be expected from us, and our writers and readers are invited to make such use of this column as to benefit themselves and the community. Both Queries and will, however, be subjected, if unnecessarily long, to a strict criticism.

140. RETURNS OF SICKNESS AND DEATHS.

I have recently been appointed health officer for a sanitary without, I confess, much previous experience of the duties now receive from the Local Government Board forms of which are to be filled up which are to include tabular statements of the and of the sickness amongst paupers in my district. I plied for statistics of the deaths to the registrar, but he really wants to be paid for them, and my salary is too small to warrant my incurring the expense. My fellow practitioner as poor-law medical officers will let me have access to them but decline to do more. Am I expected to get out for the particulars required, and ought there not to be some ment made for my receiving the information I want forth of my office before it is too late for anything else than dry returns?

[As our correspondent has but recently joined the noble sanitary workers, we forgive him a crime for which there otherwise be no benefit of clergy—that, namely, of not having contents of his SANITARY RECORD. If he will turn to the number for February 14, 1879, he will find this difficulty solved. But for his comfort, and that of others in we may observe that in order to enable medical officers to discharge efficiently the duties imposed upon them by Government Board, it is essential that they should be with returns of the deaths registered in their districts. That information on the subject is required to be sent to is a secondary consideration, the primary use of such returns to make the medical officer acquainted with any infectious existing in his district, so that he may take the necessary prevent the spread of infection. For a similar reason as to sickness amongst paupers which are the only class there is at present any sort of general registration of deaths needed by the medical officer. We recommend our correspondent to lay these considerations before his sanitary authority them to give instructions for the information he wants of him. He may properly add that the law officers of the Government decided that sanitary authorities may lawfully pay for deaths from registrars, and that the fee to registrars section 28 of the Registration of Births and Deaths Act at twopence for each return and twopence for every day in such return. As regards pauper sickness, arrangements be made by the sanitary authority with the guardians in of which their clerk would be instructed to copy from the medical officers' relief lists the new cases which are at each meeting of the guardians, and forward the copies to the local officer of health.—Ed.]

141. TAILORS' SHOPS.

What should I do in cases such as the following? A tail 47 by 8 by 7, average number of men seventeen, no gas burning almost all day in winter, and work going on night occasionally. There are, of course, also a number very hot rooms in the room. The cubic space per man is 155 feet, and the air is so hot that the smallest opening causes an intolerable draught. At present not an invidious thing to demand admission to and to repair workshops, but in the absence of information of the some definite nuisance, I doubt whether the medical health has a right to demand abatement. If you think duty of inspection in such cases is clearly laid upon me, for our guidance would be very acceptable.

[It is sufficient to have reasonable grounds for suspecting shop to be overcrowded or injurious to the health of the to take action with reference to it. No doubt tailors often disgracefully overcrowded and ill ventilated. would be as well in the first instance to direct the sanitary factory inspector to the matter, but our correspondent is aware that by section 91 of the Public Health Act a workshop kept in a cleanly state, or badly ventilated, or so overcrowded work is carried on as to be dangerous or injurious to the those employed therein, is legally a nuisance, and dealt with as provided in section 94 of the Act. The Act gives power of entry to the sanitary officers into any premises for the purpose of examining as to the existence of a nuisance therein.—Ed.]

142. MORTALITY FROM CHOLERA.

What was the number of deaths from cholera in London in 1866?

[14,125 in 1849, and 5,596 in 1866.—Ed.]

ORIGINAL PAPERS.

THE INFLUENCE OF LEASEHOLD TENURE ON SANITARY QUESTIONS.

By J. VESEY FITZGERALD, Barrister-at-Law.

THE reports recently issued by the Foreign Office in the systems of tenure of dwelling-houses existing in the various countries of Europe contain much that is interesting and instructive. English law, as we know, differs in origin and in many essential particulars from the laws of other civilised countries; and though, as a whole, English lawyers consider it to be superior to any of the systems established elsewhere, no one denies that we might with advantage borrow some provisions from the laws of other countries. The reports in question have been procured at the instance of those who consider that our system of building-leases ought to be abolished, and freehold tenure, at any rate for dwelling-houses, substituted for leasehold. They show that the English system is unique, inasmuch as leasehold tenure is unknown in some countries, and uncommon even where it is permitted by law; and they also show that there is no such agreement among the laws of other countries as should lead us to think that the system established anywhere else must necessarily be the right one, and that systems which differ from it must necessarily be wrong. We do not propose here to attempt to analyse the merits and demerits of the different continental systems of tenure, except so far as those systems provide restraints against the creation of nuisances, or the erection of buildings which may be detrimental to the neighbourhood. In this respect, as in others, the laws of different countries vary greatly; and, if our law as to household tenure is to be altered, we should observe the merits and demerits of the various systems, so as to profit if possible by the example of our neighbours.

In England at present the erection of buildings is subject to certain restrictions imposed by the general law. New buildings must have the approval of the local authority and be constructed in accordance with their by-laws; certain regulations as to ventilation and drainage and similar matters must be complied with; and the site and size of the house must be such as not to interfere unduly with already existing buildings. Not only is the local authority of each town charged with the duty of seeing that these provisions are carried out, but any neighbour whose light and air is interfered with, or the value of whose property is diminished by the erection of a new building, may be able to prevent the threatened injury or to recover damages for it through the medium of the law courts. Besides these provisions which affect all houses of whatever tenure, a practice has grown up of inserting covenants in leases which bind the tenant to conform strictly to the requirements of his landlord. For instance—if a landlord wishes to lay out his land as a residential estate, he binds his tenants to erect houses of a certain minimum value, and sometimes according to plans to be approved of by himself, and he also binds them not to use their premises for any trade or business which will interfere with the character of the neighbourhood. Such covenants are strictly interpreted and enforced by our courts, and as a consequence there are to be

found in or in the neighbourhood of towns, which elsewhere are devoted to unpleasant trades or manufactures, districts occupied solely by private residences. Every tenant on such an estate may have an interest entitling him to enforce the covenants against his co-tenants, and consequently during the currency of the leases, the character of the neighbourhood is preserved, if the houses are all leasehold. The owner of a freehold plot, however, cannot be restrained from using his ground as he likes, so long as he avoids erecting a nuisance, and erects a building in conformity with the by-laws of the local authority. He may turn his house into a shop or manufactory, and so change the character of the neighbourhood and lower the value of the houses for residential purposes, without his neighbours having any right of objecting. The system of building-leases in use in this country, thus, among other things, tends to impose restrictions on changing the character of a neighbourhood, and to prevent the spread of industries which are detrimental to enjoyment.

The reports now published to some extent enable us to see how far restrictions on the building of houses, and on the uses to which they may be put are possible in other countries. In several instances the reports have evidently been furnished by persons who were not specially conversant with the law either of England or of the country to which they referred, and their value is consequently diminished. But, making allowances for their generality, it seems that in all the more important and more civilised countries of Europe restrictions of some sort are imposed by law, in the interests of the community, on the erection of houses in towns. These restrictions of course vary, but the right of the State or of the municipality to impose them is universally recognised. In many States also, though apparently not in all, a neighbour who is injured by the erection of a new building, or by the use to which it is put, has a right to invoke the interference of the courts of law, sometimes with the object of obtaining a decree in the nature of what we call an injunction, and sometimes merely for the purpose of obtaining damages. The right of the original owner of the soil, or of those who derive their title from him, to object to the erection of any particular house or to the establishment of any particular trade, is much less universally recognised.

Leases, such as we are used to in England, are comparatively rare, and in some countries are impossible. In France and in Belgium leases similar to those in England are sometimes granted, and the observance of covenants in them can be enforced by law. Besides this, restrictions may be imposed on land, which are *binding on a purchaser* as well as on a tenant. Such restrictions are called in Belgium 'servitudes,' while the French report gives them no specific name; in both countries not only the vendor but purchasers of other lots from him can, for their own benefit, enforce these restrictions against a purchaser who infringes them. Similar restrictions on the use of plots of ground which have been purchased are recognised in Germany, and may be enforced by the vendor or his successor in title to whom the right has been conveyed, but only when the restriction and the title of the person who claims to enforce it have been duly registered in the State 'grund buch.' Purchasers of neighbouring plots have no right of action, unless the vendor has expressly granted it to them. In certain suburban districts in Denmark it is customary to sell plots for

building burdened with conditions or provisos called "servitut." This word, 'though a very comprehensive term, applies usually to the obstruction of a view, to the erection of unsightly or unsafe buildings, and to their being applied to noxious or offensive trades.' 'It is a nice question of law as to the qualification necessary for making application to the courts in cases of breach of servitut;' and the report, while stating that it is usually the business of the municipality, at the instance of the landlord, 'to see that a clear and adequate decision be arrived at,' omits to say whether the purchaser of an adjoining plot has a right of action, or what is to happen if any one considers the decision of the courts to be obscure or inadequate. In Norway restrictions exist similar in character to the Danish 'servitut.' These restrictions are for an unlimited time. The sellers as well as neighbours, in so far as the restrictions affect the latter, can enforce the restrictions with the assistance of a tribunal.

The above are the principal countries in which restrictions at all similar to the covenants in English building-leases seem to be generally recognised. It is worthy of remark that such restrictions are generally applied not to leasehold but to freehold land; and consequently that easements which an English lawyer would consider as repugnant to the idea of freehold tenure are found to be not incompatible with freehold tenure in other countries.

In several other countries in Europe, such as Baden, Bavaria, the Netherlands, Italy, and Wurtemberg, the sale of land for building is treated as a question simply of private contract. If the parties to the contract insert any special conditions in it, those conditions may be enforced. Such conditions are, however, said to be very unusual; and, where they are inserted, only the parties interested can enforce them. There seems to be no means by which neighbours or purchasers of adjoining plots can enforce the observance of conditions which would be beneficial to themselves. In certain other countries, according to the reports, private restrictions on the uses of land purchased are not only never inserted in the contracts, but are actually prohibited by law. In Russia and Poland it is said, 'As to restrictions upon purchasers of houses, it appears that none are legally allowed.' And the Swiss report says:—'Land may be sold in large or small plots, but in all cases unconditionally; no restrictions, accordingly, can be imposed saving obedience to ordinary municipal regulations in or near towns.' This language would seem to imply that contracts as to the user of land by the purchaser are forbidden. Whether that be so or not, it seems certain that they are practically unknown; and that, in effect, a purchaser of land or of a house is free to do what he likes with it, subject only to municipal laws, but without paying any regard to the wishes of the previous owner or of his neighbours. In England we have become accustomed to restrictions on the uses to which leasehold property may be put, and we recognise that such restrictions may often actually enhance the value of the property to which they apply; but we should find it difficult to enforce such restrictions against a freeholder. If compulsory powers of enfranchising leases are to be given by law to the tenants, it certainly seems desirable to provide that restrictions on the use of the plot enfranchised, which are in the nature of easements for the benefit of the neighbourhood, should be retained. The German plan of registering such easements, and

of only allowing those registered to be binding security against doubt as to what the easement in a particular case may be. In case enfranchised leaseholds, the title would be one, and the difficulties which stand in requiring compulsory registration of easements would not exist. We think, therefore, that the proposed alteration in the English law, security against the character of a neighbourhood being spoilt, by the conduct of its occupiers, may be given by turning existing easements into easements and requiring their registration, and that a right of action should be given to any person who could show that he was aggrieved by any interference with such easement. If the security to others against the misdoings of a tenant which is now given by leasehold is to be preserved, and the change will do no harm from a sanitary point of view, nor need it interfere with the enjoyment of comfortable dwellings.

Leasehold tenure in England has been one of the worst among other grounds, as being responsible for the existence of the worst slums in our large towns. It is said that the most insanitary dwellings are generally houses held under leases which have expired, and where, consequently, it is difficult while to lay out money for repairs or improvements. These assertions are no doubt some-what founded. It would, from our point of view, been well if the reports furnished to the Sanitary Office had given us some information which would enable us to compare other countries with our own. But the reports are generally silent on this subject. They mention that leases are uncommon on the Continent, but in some countries are unknown. Yet from other reports we know that overcrowded and insanitary tenements occupied by the poorer classes of the population exist in the towns of other countries besides England. It would seem, therefore, that the building-leases is not responsible for all the failures which are sometimes ascribed to the system of building, but that it is instrumental in preserving districts and from being treated in a manner which is not only unpleasant even where it is not absolute, but is also a hindrance to health.

Whenever the threatened legislation of a new system is brought forward, we hope that some will be taken to preserve the useful parts of the existing system, and that alterations will be made for the sake of change by persons who have not, at any rate, tried to realise what their own system would be. The reports which have been issued show some extent what is the state of the law in other countries, and we have some idea of the condition of the inhabitants of those countries, but we have no idea of the law in our own country, or of the wishes of the inhabitants of our own country. The reports are worthy of perusal, and may serve to show what changes in our law may be desirable, but where it is well to leave existing institutions undisturbed.

SCARLET FEVER AT NEWCASTLE.—Scarlet fever has been reported to have killed 77 out of a total of 91 cases of infectious disease reported to the medical officer of health for Newcastle during the night ending Jan. 31, 1885.

MORTUARIES.—At the last meeting of the Local Board it was resolved that a mortuary should be provided for the district. The chairman was informed of the scandals that had arisen from the use of an old stable for the purpose.

COTTAGE BUILDING.

By G. H. BLAGROVE, A.R.I.B.A.

THE moral as well as the sanitary benefits conferred upon the labouring classes by sufficiently commodious dwellings cannot be overrated, and the means whereby those advantages can be obtained, with a due regard to economy, form part of a question which has for years past been recognised as one of national importance. Time was when the agricultural labourer was scarcely so well housed as the horses and cattle of his employer; but we are happy to think that, except in a few isolated cases, such treatment has become obsolete.

The average amount of accommodation requisite for a labouring man with a wife and family comprises not less than five rooms—viz., a living room and washhouse or scullery upon the ground-floor, and three bedrooms above. This allows separate rooms for boys and girls—a highly important consideration. The three-roomed arrangement, consisting of a living room, washhouse, and one bedroom, only provides for accommodating one or two very young children, and does not afford the most economical type of cottage residence.

The living room, of which the size may vary between 120 and 150 feet superficial, should have a boarded floor, raised at least one step above the ground level, in order that it may be properly ventilated and kept dry. Wood blocks laid upon concrete are much in use now for floors, but it is to be doubted whether they will continue popular, from their liability to retain moisture. The entrance doorway to the living room should be protected from the weather by an enclosed porch; and when several cottages are built contiguously in rows, one porch may be made to serve for every two, the doors of the two living rooms being placed upon the skew, cutting off the corner of each room, so as to reduce the width of the porch to a less dimension than would be required for the full width of two doorways, and thereby to leave more frontage space available for windows. In semi-detached cottages, where economy is best served by bringing the fireplaces into the centre of each block, so that one chimney stack may avail for both tenements, it will be desirable to keep the entrances apart, because it is a disadvantage to have a doorway upon the same side of the living room as the fireplace. Under these circumstances we may either build an external porch at each end, or form an internal lobby by cutting a square portion out of the room. It is not necessary to provide a lobby in addition to a porch, unless the lobby can be made to contain a staircase, by which an ascent can be gained without passing through the living room.

It should be remembered that the occupants of small tenements prefer doing all their cooking operations in the living room during the winter, to obviate the necessity of having an extra fire for warming purposes, and that the living room should therefore be provided with a cooking range. In the summer, however, a fire in the living room would be unduly oppressive; and for summer cooking there should be a small range or stove in the washhouse besides the copper, which may occasionally be employed for culinary purposes, but whose main use will be for washing. A height of not less than eight feet from floor to ceiling should be arranged for the living room, which would thus contain from

900 to 1,200 cubic feet of air. The washhouse floor may be of cement, and some persons prefer making it one step lower than the living room floor, to preserve the latter from becoming wetted. However this may be, we should advocate placing the stairs between these two rooms, as most accessible from each, and as affording space beneath for a cupboard. If the total width be 12 feet or 13 feet, the stairs can easily rise by the aid of winders, so as to bring the top landing into a central position, with 8-inch treads and 8-inch risers—a sufficiently comfortable ascent. The superficial area of the washhouse may be from 60 feet to 100 feet, and it should have a small pantry attached. The water-closet or privy may be erected at a short distance from the dwelling, as at the end of the back garden, or in any other convenient situation, or it may be placed within the walls; but it should, in any case, be entered from the outside, and have no communication with the interior. The same observations apply of course to the dustbin. For this we recommend the galvanised-iron portable bin, now in vogue. It has a hinged flap at the top, but has no bottom, so that when full it has only to be lifted up, and the refuse can be removed with a shovel.

The principal (or parents') bedroom should not be of a less area than 100 feet superficial, and may be more with advantage. It should contain a fireplace, and ought to be 8 feet high in the clear from floor to ceiling. The two other bedrooms may be from 60 feet to 90 feet each in superficial area, and a fireplace in at least one of them is desirable. In calculating the requisite space for the accommodation of the inhabitants, it may be useful to remember that from 450 to 500 cubic feet of air is held to be sufficient for a healthy man during twelve hours. The ventilation also should be such as to allow of a constant renewal of the air, and this is the chief reason for providing fireplaces in bedrooms where possible. We must not forget, however, that a large amount of vitiated air will, when heated, ascend to a height above the chimney opening, and that perfect ventilation cannot be obtained without openings high up in the room, either in the ceiling or in the upper parts of the windows. The latter formed with top-lights hinged to transoms, so as to open inwards, and provided with side gusset-pieces, either of wood or zinc glazed, will admit fresh air without danger of draught. Below these there should be ordinary sashes or casements, or lights hung on central pivots, by which the rooms can be thoroughly purified when not in occupation. Openings formed at the opposite sides of the rooms will afford the most effectual means of doing this; and sometimes ventilation holes can be made to communicate with pipes, which may be carried above the roof and bent down.

For the external walls to cottages, brick or stone is of course to be preferred. Should flint or rubble be adopted, it will be more than usually a matter of importance to employ the best mortar. In concrete walling, either in blocks or *pisé* in moulds, especial care must be taken that the foundations are dry, and that the tops of the walls are sufficiently protected by overhanging eaves. We need scarcely insist upon the importance of a proper damp-proof course above the ground and below the floor in all walls. It may be of slates or tiles, a double course breaking-joint in cement, or of asphalt, or other suitable material, of which there are many now to be obtained. But whatever material be used for

walling, it is generally desirable to build hollow walls, to effectually exclude such damp as may accrue from driving rains. The thinner portion of a hollow wall should be built upon the outside, so that it may protect the greater thickness from the damp. The two thicknesses should be bonded together with the ordinary galvanised-iron cramps, formed with drips, to prevent any moisture from being conducted along them to the inner part of the wall. As the hollow space is liable to become a receptacle for accumulated moisture, it should be weathered outwards in cement at the bottom, and openings should be left here and there to allow the water to run out.

When, as in building with rubble or flint, it is found impracticable to execute hollow walls with a proper economy of space and material, the exterior may be protected against the weather with hanging tiles or slates, on those sides of the dwelling at least which are most exposed to damp winds—namely, the south and west. It is often customary to make up the level of the ground around cottages, paving it with a slope to fall away on every side. This is always desirable, especially in low-lying districts, where it serves to prevent accumulations of damp at the base of the walls. It will often be necessary in the country to provide some kind of receptacle for storing rain-water. The well-known water-butt is in common use, but an oval tank has been recommended to be placed between each pair of cottages, such tank to be about 7 feet by 4 feet and 3 feet 6 inches deep, divided into two compartments, with an oval flap to cover each side. The water from the down-pipes can be led into it through 4-inch earthenware pipes.

For cottage roofs tiles are generally admitted to be warmer than slates, and, as they involve less lead-work, they are perhaps cheaper on the whole. Probably the most economical form of roof will be found to consist in carrying a ridge parallel to the front, and from side to side of each dwelling. It will be safer to carry the party walls up to form raking parapets above the roof as a precaution against fire. In the interior, wall papers are not always as healthy as could be wished. They cannot be washed, they are prone to harbour vermin, and they constantly absorb foul air. White-wash, or colour in distemper, frequently renewed, is much to be preferred. Simple as the internal aspect must be from considerations of economy, we should never lose sight of the fact that everything tending to promote cheerfulness is conducive to health.

SPREADING SMALL-POX IN HULL.—Thomas Barrat, master of a small sailing vessel, was summoned before the magistrates at the Hull Police-court on the 2nd inst. for unlawfully and wilfully exposing his son, when suffering from small pox, without proper precautions against spreading the disease, in a public place—viz., the Tigris Inn, High Street. The town clerk stated that the defendant's son contracted small-pox about the end of October, but defendant took no steps whatever to isolate him, but pursued his usual avocation, and proceeded from place to place, taking no precautions whatever to prevent the spread of the disease. The result was most disastrous, for no less than twelve cases of small-pox were directly traceable to the neglect of the defendant. Dr. Mason, medical officer of health, and other witnesses gave evidence in support of the charge. Mr. Twiss, the stipendiary magistrate, said it was terrible to think of the grievous results following this reckless conduct of the defendant. *He was fined 40s. and costs.*

DEEP DRAINAGE AND SEWAGE PURIFICATION IN THE BLACK COUNTRY.

(FROM OUR OWN CORRESPONDENT.)

[Third Article.]

THE municipal and parliamentary borough of Walsall, though not strictly speaking within what is correctly known as the Black Country district, adjoins the parishes of West Bromwich and Wednesbury, which are, and it occupies a very important place in the consideration of the sewerage question as affecting the district. The borough comprises the towns of Walsall and Blaxwich, and contains a population of some 59,000, occupying 10,700 houses, and covering 8,080 acres. The river Tame, the pollution of which with sewage has been the chief factor in bringing about the revolution in the drainage system of the district which has been going on since the passing of the Rivers Pollution Prevention Act, touches the southern boundary of Walsall, and also forms the boundary between the parishes of West Bromwich and Wednesbury, whence it flows through Great Barr, Perry Barr, Hamstead, and Aston, into Birmingham. The practice of sending raw sewage into the Tame had existed for very many years, becoming intensified as the population of the district increased. The Walsall Corporation were one of the first public bodies to move in the direction of remedying this evil, for as early as Sept. 18, 1876, the month after the passing of the Act, a resolution was brought before the Town Council bearing upon the subject, declaring that the time had arrived when it was imperative to take effectual measures to prevent either solid or liquid sewage being discharged into the river, or the brooks connected therewith, and directing the Sanitary Committee to carefully inquire into the whole matter. It being subsequently found that the committee could not give the necessary time to it, a special Sewerage Committee was formed, the members of which visited a number of towns in search of information and experience to guide them in dealing with the subject. Mr. Angell, C.E., was the first expert called to the assistance of the Corporation, and he was succeeded in 1877 by Mr. Hawksley, who inspected the various outfalls into the Tame, and reported to the Council on the subject at considerable length at their meeting in November of that year. He stated that the borough contained at that time a population of 55,000, and that the dry weather discharge of sewage into the river averaged twenty-five gallons per head daily, that being increased at times of ordinary rainfall to forty gallons per head. So that the quantity of sewage to be dealt with at that time was about one and a half million gallons per day in dry weather, and 2,400,000 in wet. There were two courses of treatment open to them—irrigation and precipitation. With regard to the former, although there were two or three sites which might be made available, they were either unsuitable, inconvenient, or would necessitate the outlay of an enormous sum. With regard to the precipitation system, the only difficulty was in utilising or otherwise getting rid of the deposited matter which did not possess manurial value. Seeing, however, that the water of the river Tame was never likely to be used for domestic purposes, he considered the defecation of the sewage waters, so as to render them fit to be admitted into the

stream without becoming a nuisance injurious to health, could be effected by a primary precipitation with caustic lime, succeeded, when necessary, by a secondary precipitation by crude sulphate of ammonia. For this treatment from twenty to thirty acres of land would be sufficient, and the works, he estimated, would cost about 40,000*l.*, with about 1,500*l.* per annum for working expenses and cost of material.

Upon this the Sewerage Committee reported that, by the sheer force of circumstances, they were driven to the method recommended by Mr. Hawksley, of purification by precipitation. And, considering that the probationary period allowed by the Act had expired, that it must sooner or later be obeyed, and that they were even then liable to have a flood of litigation opened upon them by aggrieved parties, they advised the committee to decide in favour of Mr. Hawksley's scheme. The Town Council by a large majority, adopted that course, and in the early part of 1878 a Local Government Board inquiry was held respecting the matter. The troubles of the Walsall Corporation, however, had only then really commenced.

The Local Government Board, while not absolutely refusing sanction to Mr. Hawksley's scheme, expressed doubt whether it would afford an effluent sufficiently pure for discharge into the river; in which case, as was pointed out to them, some other system would have to be provided. The committee naturally shrank from the expenditure of forty or fifty thousand pounds upon an experiment which might have such a result, and a pause took place in the proceedings. They were not allowed to rest long, for on May 15 came a letter from the Town Clerk of Birmingham asking what steps the Walsall Corporation were taking in the matter. This aroused the committee to the necessity for further action, and they determined to throw the matter of preparing a suitable and efficient scheme open to public competition, offering premiums of one hundred guineas each for the best two schemes. Nine civil engineers responded, and sent in plans and schemes, upon which the borough surveyor, Mr. William J. Boys, reported. The result was the rejection of the lot, and the giving of an instruction to Mr. Boys to try his hand. Mr. Boys did so, and prepared a scheme in which he estimated the daily average quantity of sewage to be disposed of at forty gallons per head, reckoning the average rainfall at Walsall during the decade ending 1877 at 33.55 inches per annum, or 0.68 inch per week. In his scheme he proposed to divide the borough into two districts, viz., the towns of Walsall and Bloxwich, dealing with each separately by gravitation, without chemical treatment. The sewage of Walsall, he suggested, would fall by gravitation to Brockhairst Farm and land adjoining, where he proposed to deal with it in two ways. A portion of the sewage, which was largely diluted with subsoil and waste-tap water, and contained a quantity of trade refuse of various kinds from tan-yards, curriers, and other places where dyes were used, and which was of a particularly offensive nature, he proposed to discharge into subsidence tanks; but the sewage of a more domestic nature would be taken direct to the land, where the whole would be treated by a combination of subsidence and of intermittent downward filtration. The sewage from the Bloxwich district, being entirely of a domestic character, would be treated by the filtration system alone.

For carrying out the scheme he recommended a series of tanks 200 feet long by 100 feet wide, all or any part of which could be worked at the same time, and the bottoms being so arranged that all the deposit accumulating therein, with the exception of road detritus, could be pumped out and deposited on the adjoining land. The clarified sewage from the tanks would be purified by intermittent filtration on about seventy acres of land, and the other sewage would be purified by absorption on land planted with osiers. The cost of the land and works for the Walsall district he estimated at 47,686*l.* 5*s.* 6*d.*, and for Bloxwich 3,693*l.* 18*s.* 7*d.*; being a total of 51,380*l.* 4*s.* 1*d.* There would be three outfall sewers, costing 14,657*l.* 1*s.* 3*d.*, and the branch sewers were estimated to cost 5,576*l.* 11*s.* 5*d.*; making a total, with an allowance of 10 per cent. for contingencies, of 78,775*l.* 4*s.* 5*d.*, of which 61,898*l.* 16*s.* 9*d.* (apart from contingency allowance) was apportioned to Walsall, and 9,715*l.* to Bloxwich. This outlay he considered would provide for a population of 80,000, while the working expenses would be more than repaid by the crops and other produce of the sewage farm. Into the merits of this scheme Captain Hildyard held an inquiry on behalf of the Local Government Board on April 14, 1881. Opposition was made to the scheme by the neighbouring town of Wednesbury, on the ground that they too were about considering a sewerage scheme, and that the Walsall Corporation were seeking to appropriate for the purposes of a sewage farm land which the Wednesbury Local Board might themselves require, and were really taking more than they required. Point was given to the opposition by the fact that most of the land required by Walsall to carry out Mr. Boys' scheme was in the parish of Wednesbury, and, as was advanced on behalf of the latter, was the only available land suitable for their own use. A proposition was then made that the Wednesbury Local Board should unite with the Walsall Corporation in a joint sewerage scheme. With this phase of the question, however, we must deal in another paper.

VENTILATION OF PUBLIC BUILDINGS.—Messrs. Robert Boyle & Son, 64 Holborn Viaduct and Glasgow, are at present applying and have applied their self-acting air-pump ventilators and system of ventilation to New Residential Chambers, Park Lane, under the direction of Mr. Alfred Waterhouse, A.R.A.; Small-pox Ship *Endymion*, Long Reach, under the direction of the Metropolitan Asylums Board; New Shoe Factory, Starch Green, under the direction of T. Chatfield Clarke & Son; London Salvage Corps Station, Commercial Road; New Conference Hall, Stratford, E.; Victoria Central Electric Light Station, S.W.; New Hospital, Llandudno; Sanitary Hospital, Bournemouth; New Bodega, Birmingham; Liberal Club, Colchester; Female Penitentiary, Stoke Newington; and to the residences of the following noblemen and gentlemen:—Duke of Westminster, Bishop of Bristol, Earl of Northbrook, Earl of Breadalbane, Earl of Kenmare, Earl of Shrewsbury, Earl of Coventry, Earl of Cawdor, Sir Thomas Brassey, Sir Philip Rose, Sir Henry Elliott, Sir Frederick Leighton, Sir William Foster, Sir William Humphry, Sir Richard Bulky, Sir Jones Ramsden, Sir John St. Aubyn, Sir Charles Trevelyan, and Sir Charles Brooke.

IN consequence of the strong representations of the medical officers, the governors of the Newcastle Infirmary have resolved to remove that institution to a new and more eligible site. It is at present surrounded by the cattle market and railways.

HOUSING THE EAST END POOR. SINGLE-ROOM TENEMENTS.

By H. M. MAVOR.

IN the SANITARY RECORD, of December last, attention was directed to the advance of this question in the East End of London, concerning those of the lower degree in the non-progressive scale of humanity; and going farther eastward, and following somewhat the same lines, further progress may be noticed in some buildings which have been recently started on the estate of Lord Strathmore at Shadwell. The class being catered for here consists principally of dock labourers, and such as are earning the fugitive and fitful fifteen shillings a week. These are mostly residents in the neighbourhood; that is to say, they are not of the migratory class who try to find work of varying kinds at varying periods and places, and for whom it has been recently stated, by no less an authority than Lord Shaftesbury in his evidence before the Royal Commission, that nothing can be done. Nothing short of an entire revision of the social scale can affect this last unfortunate and, it is to be presumed, unhappy class; but the fact that the monopoly of misery should be accredited to these beings in particular may possibly be doubted by many of another class whose anxieties are not of the physical heed of the morrow. However, this social revision (it would necessarily also be periodical) is too distant even to contemplate, and we turn again to the practical side of the question, so far as it is brought to date, and by the courtesy of Mr. George Drew, the architect to the estate, we learn much which may tend to its elucidation, and again we may derive wisdom from the East.

The principal point about the first block which is brought to notice is that it consists of single-room tenements, as these tenants would inevitably subtler any space not actually occupied. There are more than fifty of these rooms, reached by two staircases, and a gallery or verandah on each floor, an unusual and useful feature being double doors for the sake of warmth and privacy. Unlike the high buildings of seven floors to which we are accustomed, we here find but four, one advantage of this lessened height being that the cost of building is more than correspondingly reduced by the reduction in the requisite thickness of the walls, and a further saving is effected in scaffolding and labour pertaining to building at a great height. Where a more or less heavy ground-rent exists, which is often the case, it is necessary that a number of upper floors should bear a proportionate part of the expense, but in the case of freehold property such as the one under consideration this proviso is not called for. Upon looking at the plans one cannot fail to notice the marked liberality in the size of the rooms, which contain generally between 190 and 200 superficial feet, or, put in another form, say about 15 feet by 13 feet. To this may be added the unaccustomed height of the room, viz., 9 feet 6 inches, this being 6 inches more than is generally found in the large blocks in more central positions. This is another advantage of the omission of the top stories referred to, otherwise the addition of 6 inches to each of seven floors is a matter of consideration when the walls range about 70 feet in height.

Elementary as the culinary arrangements of these dwellings must undoubtedly be, it might be supposed

at first sight that any special provision in this respect would be unnecessary, but it must be remembered that the expenditure of a penny or two to create a fire and produce hot water is an item of importance if it be repeated often, to say nothing of the delay in so doing. A common kitchen has therefore been provided, with numerous ovens and facilities for meeting the limited but frequent requirements of a class much given to irregularity. Hot water may thus be obtained immediately at all reasonable hours, and the great advantage of getting hot water at the sink on each floor is also to be noted, and the moderate charge of sixpence per week is added to the rent of the room to pay the cost of a convenience which is often denied to the residents of a middle-class house. A club-room at the top of the building, to be furnished by the landlord, is again to be tried here, although, as has previously been pointed out, such a feature meets with no support. The reason for this probably lies in the fact that, managed in the way it has hitherto been done, it savours too much of patronage and discipline, which, being freely translated, would appear to be interference with the habits and customs of men who, by reason of their early training (or want of it), are wont to place greater reliance upon their own opinions than is warranted by the soundness of their views. It would, then, appear to be the best plan to allow them to manage or mismanage their affairs their own way; but we are then met with the insuperable difficulty of class distinction, which exists to a surprising degree even here. Gregarious they may be, but sociable—never. The architect of the Peabody Dwellings, speaking upon this subject some ten years ago, pointed out 'that the distinction created by wages is sufficiently important to justify its acceptance as a standard by which to divide the industrious poor into sections; and that no attempt should be made to mix up the interests of one section with another, nor should the hope be entertained that friendly intercourse will be encouraged between various sections by providing different classes of dwellings or accommodation in the same building or group of buildings intended for their use. Experiments have been made with this view, and opportunities have been given to the lower sections to associate more frequently with the upper, in the expectation that their manners and habits would become softened and improved under better influence. Shops have been provided as part of the buildings in thoroughfares where they were most likely to answer; workrooms have been added to the tenements of those engaged on piecework at home; reading-rooms and libraries have been supplied and furnished for the use of the better educated, and co-operative clubs have been supported to help the more provident; but none of these have answered. Those who consider that their wages entitle them to a superiority which their poorer fellow-workmen cannot claim, will not compromise their dignity by any condescension towards familiarity, and hold themselves aloof from them as if they were socially inferior; and these in their turn, though they may resent this exclusiveness, acknowledge their disadvantage, and do not care to leave the retirement which shelters their poverty, and saves it from exposure to neighbours who would grant it no pity. Very frequently they prefer to remain comparatively hidden in out-of-the-way courts and alleys, than to incur the risk of exposing their mean clothing and general wretchedness in open thoroughfares, where

they might have better accommodation at the same rent. Can sociability be evolved from the elements of never-ceasing discontent? Can a man be philosophical when the wherewithal to pay the next week's rent is problematic? Is not philosophy another name for indifference? The extension of club life, however, in better London is but of comparatively recent date, and it would be premature to say that clubs for the poor must ever be a failure.

Experience has proved that in buildings of this description it is more than ever necessary that a caretaker or superintendent should be provided, and in the large blocks of the representative companies the proportionate expense is very little; but where the rooms are limited in number it affects the rental appreciably, and in this case the rent is increased thereby from 2s. 6d. to 3s. 3d. Notwithstanding this, the rent is sensibly lower than equal accommodation (when it can be found) elsewhere, and this may be attributed to economy in building. All the work is done by the 'estate,' and, being in good hands, a considerable saving against contractors' prices is effected in labour and material. In consequence, we find that this is about the cheapest rate of building which has yet been attained for this class of work—in fact, it has reached the minimum compatible with soundness.

The wants of the tenants have been carefully recognised and studied throughout, and every opportunity is given them for comfort and cleanliness, ample fittings are supplied to the rooms, and a liberal laundry is provided on the roof, which, as usual, is flat, and affords the customary drying and playground. Last, but not least, the sanitary arrangements have been attended to on 'recognised principles,' there being two manhole inspection chambers between the building and the sewer, and a ventilated syphon trap between the sewer and the last inspection chamber.

Experiments of this kind mark a departure, and deserve to succeed on their merits; and if this work answers, as it may well be expected to do, it is the intention of Lord Strathmore to extend the field of operations: the limits of the field are practically unknown, and there is ample scope for movement.

The following *à propos* perversion of Pope is taken from the *Pall Mall Gazette*:—

From his sludgy bed
Old Father Thames dredged up his slimy head;
Deep in his mud the dirt-born brothers stood,
Who swell with sewage affluent his flood,
First authors of his stench as well as name,
The sluggish Isis and the turbid Thame;
The Kennet foul, where fungoid growths abound,
The Loddon slow, a sewer above ground;
Colne, whose dark stream his truthfulness just saves;
And chalky Wey, that's black how'er Pope raves;
The Wandle, famed for every hue and stench;
The putrid Lea, thought fit our thirst to quench;
The honest Mole his own filtration tries,
And Darent stained with new impurities.'

A GAS COMPANY FINED.—The Newcastle and Gateshead Gas Company were summoned at the Newcastle Police-court on the 24th ult., for supplying gas with 28·98 grains of sulphur per 100 cubic feet, being 8·98 above the maximum allowed by the company's Act. The prosecution was the result of a resolution of the City Council in consequence of repeated complaints as to the quality of the gas, which it was suggested arose from causes which could be prevented—viz., defective purifying apparatus at the works. A fine of 10*l.* and costs was inflicted.

TYPHOID FEVER FROM DEFECTIVE WORKMANSHIP.

By ARTHUR NEWSHOLME, M.D. Lond.

Medical Officer of Health for Clapham.

THE following case is interesting as showing the evil results that may be produced by bad workmanship in sanitary matters.

In conjunction with Mr. Hobson, of Adam Street, Adelphi, I recently visited a public establishment, in which the caretaker's child was suffering from an attack of typhoid fever. The building had been erected within the last three years, and the proprietors of the establishment had since that time gone to considerable expense in order to make its sanitary condition perfect. It was consequently difficult to understand how or why typhoid fever should appear.

The child had not been away from home; an importation of the disease in this way was therefore out of the question. The milk supplied to the establishment had not proved deleterious in any other known cases. Finally, the overflow-pipe of the cistern was perfectly disconnected from the drain; there was no bath-room in the house; and the closets were in good condition, well flushed with water by separate service-boxes, and provided with a ventilating shaft in the shape of the rain-water pipe, the upper end of which was not near any window. This, although not the best method of soil-pipe ventilation, was held to be sufficient to clear the closets from the stigma of producing disease.

By a process of exclusion, we were therefore led to examine the drainage in the basement more carefully. Here was a lavatory containing several basins, and on entering this room (which had been closed for a day or two), a distinctly foetid odour was perceptible, quite different from the smell which frequently arises from decomposing soap in waste-pipes. The common waste-pipe from these basins led, without the intervention of a syphon bend, into a Mansergh's trap, just under the floor of an underground passage outside the basement rooms.

Mansergh's trap, as is well known, is a double-sealed trap, consisting of three compartments, in the first of which the waste-pipe dips under water, while the second compartment communicates with the external air by a grating, and is separated from the third by a partition reaching from the top of the trap and dipping below the level of the water in these compartments. The third compartment is provided with two openings, one leading to the drain, and the other intended for the attachment of a ventilating pipe to be carried up above the eaves of the house (see fig. p. 352).

In this instance, an unskilled workman had evidently fixed the trap, as the orifice intended for a ventilating pipe had been connected with the waste-pipe from the lavatory, and the water in its passage to the drain thus avoided the two first compartments of the trap. Similarly sewer-gases avoided the two water-seals of the trap, and found a ready entrance into the basement rooms, which were constantly occupied by the caretaker's family.

The case emphasises, if it were requisite, the urgent necessity for skilled instruction and registration of plumbers, as advocated by Mr. Ernest Hart, at the Health Exhibition. The only thing that can be said in mitigation of the plumber's ignorant work-

manship, is that Mansergh's trap is somewhat complicated in structure (and, we may add, cannot easily be cleaned out); but such ignorance would have been avoided if the plumber had received technical instruction concerning the appliances among which his work was to lie.

SECTION OF MANSERGH'S TRAP.

Dotted lines show improper connection of ventilating pipe with waste-pipe, and consequent direct communication of lavatory with drain.

ARTISANS' DWELLINGS.—PETTICOAT SQUARE.

By H. M. MAVOR.

ALTHOUGH the work of demolition of condemned buildings has proceeded at a greater rate than rebuilding, many efforts to provide superior accommodation are everywhere visible, and the least observant of those who run may readily read, and realise the fact that strenuous efforts are being made to supply an ever-increasing demand for one of the first requirements of mankind, viz, shelter. The extent of the clearly defined nuisance of overcrowding led to such stringent measures being taken, that the local authorities have frequently found that the powers which were conferred upon them became compulsory obligations; and this being so, the question of compensation to the owner becomes of serious import to a district which by its very nature is ill-prepared to incur heavy liabilities. It is easy to condemn and destroy a large number of houses, but the many vacant sites to be seen further prove how difficult it is to erect substantial buildings in the manner desired; not that the return upon the outlay is likely to be unremunerative, but the money for the necessary outlay cannot of course be found at any time or place, and this consideration did not receive sufficient attention when the Acts and their more stringent amendments were framed. When dealing with an *unhealthy area*, which perforce contains narrow courts and byways, the *building area* is reduced by reason of the increased width of the new courts which become roadways or improved courts of an appreciable width; thus an increased price per foot must be apportioned upon the land which is used for strict residential purposes. Were it not for the efforts of outside individuals and companies to take over the land from the local authorities, these latter would find themselves often irre-

trievably overburdened with a difficulty of their own raising; consequently the authorities are empowered to use their discretion, and offer every inducement to others to take the immediate responsibility. Contracts are thus entered into with trustees, companies, or individuals, to carry out the whole or part of the desired scheme upon such terms as prudence may dictate, or as may be found expedient; and in addition the Public Works Loans Commissioners may lend money for this purpose, such loans to be repaid with interest at not less than $3\frac{1}{2}$ per cent in fifteen years. By parity of reasoning the vestries are inclined to take a favourable line of action, and make a reduction in the rateable value; or, in other words, the rates are generally compounded—i.e. the owner becomes responsible at an agreed and lower figure whether the tenements are occupied or not; thus the house-to-house inquiry is avoided by the vestry, and loss on 'empties' or defaulters is fully made up by means of the regularity and certainty which is attained by having a responsible quarter to look to. Although in such cases the *gross* parochial income is apparently reduced to nearly one-half, the net return pays the authorities, and, indeed, induces them to acquiesce to a give-and-take arrangement beneficial to givers and receivers.

Among the foremost in the general movement may be instanced the Commissioners of Sewers in London, who have recently opened a large number of buildings in Petticoat Square. And this work is remarkable of its kind. Between the years 1877 and 1879 the site was cleared; one hundred and sixty-four tenements were demolished, including a large number of courts and alleys, and in consequence of this a number of poor Jewish families were turned adrift, the cost of clearing generally being over 120,000*l.* A proper system of sewers was constructed, and tenders were obtained for the erection of the intended dwellings, but as the value of the new buildings was deemed by the committee to be inadequate they were declined. The ground was again offered in 1880 without success, and in the following year the Commissioners themselves proceeded to undertake the work. They have been built within twelve months, at an inclusive cost of 78,000*l.*, being the most expensive work of its kind yet attempted. The buildings, which are in five large parallel blocks, have shops on the ground-floor, and otherwise contain 539 rooms, which will accommodate nearly 1,000 persons. The staircases, which are many, are lined with white glazed bricks, which are from six to eight times the price of good sound ordinary bricks, but the advantages of cleanliness and durability are undoubted; the handrail (which is sometimes omitted with fatal results (see *SANITARY RECORD*, October 1884, p. 154), is a special made brick sunk into the wall, but is not so effective in use as the ordinary 'gas-pipe' handrail, this latter having also the advantage of cheapness. The fittings and finishings of the interior are unusually good and liberal, fireproof construction (which is now general) throughout is used, and every attention paid to sanitation and general spaces where dirt is usually harboured. One, two, or three roomed tenements can be obtained, but the rentals are not yet fixed, and it is difficult to see how any reasonable return can be expected, as everything has been carried out on such an expensive scale, but this is a point which the tenants will benefit by, as in no case will they pay an appreciably higher rent than do their neighbours for less desirable quarters. A working man's

requirements are not fixed by his ideas of life ; he can afford but a certain sum per week, be the advantages offered him great or not. Buildings of this class offer a useful standard to maintain a good level, and prevent any deterioration in the quality of present and future enterprise of such description. It must be left to time to prove whether the work has been done wisely or too well.

THE REGISTRAR-GENERAL'S LAST QUARTERLY RETURN.

By J. HAMPDEN SHOVELLER.

THE quarterly return of marriages, births, and deaths in England and Wales has just been issued by the Registrar-General. The statistics relating to marriages are for the third or summer quarter of 1884, and those relating to births and deaths are for the three months ending December last. The marriage-rate showed a marked decline from that recorded in the corresponding period of the previous year ; the birth-rate and the death-rate were below the average. The mean temperature at the Royal Observatory, Greenwich, was $44^{\circ}1$, and slightly exceeded the average for the corresponding periods of 112 years. The rainfall amounted to 4.57 inches, which was more than $2\frac{1}{2}$ inches below the average amount.

During the third quarter of 1884 the marriages of 100,550 persons were registered in England and Wales, equal to an annual rate of 14.7 per 1,000 of the population, estimated by the Registrar-General to be rather more than twenty-seven millions of persons. This marriage-rate was 0.8 below the rate recorded in the third quarter of 1883, and 0.6 below the average rate in the corresponding periods of the ten years 1874-83.

The births of 227,277 children were registered in England and Wales during the last quarter of 1884, equal to an annual rate of 33.2 per 1,000 of the estimated population. This birth-rate exceeded by 1.4 the rate in the corresponding quarter of the preceding year, but was below the mean rate in the fourth quarter of the ten years 1874-83. In the several counties the birth-rates ranged from 27.3 in Huntingdonshire, 27.5 in Rutlandshire, and 27.6 in Westmorland, to 37.4 in Nottinghamshire, 38.3 in Monmouthshire, and 38.4 in Durham. The 227,277 births registered in England and Wales during the last three months of 1884 exceeded the deaths by 90,047 ; this represents the *natural* increase of the population. From the Board of Trade returns it appears that 50,958 emigrants embarked during last quarter from the various ports of the United Kingdom at which emigration officers are stationed. Distributing those whose nationality was undistinguished, and excluding foreigners, the emigrants of British origin were 42,854, including 30,135 English, 3,804 Scotch, and 8,915 Irish. The proportions of British emigrants to a million of the respective populations of the three divisions of the United Kingdom were 1,111 from England, 984 from Scotland, and 1,800 from Ireland. Compared with recent corresponding quarters, the proportion of emigration last quarter showed a decline in each of the three divisions of the United Kingdom.

From returns published by the Local Government Board it appears that the average number of paupers relieved on the last day of each week in the

quarter ending December last was 700,587, of whom 181,776 received in-door and 518,811 out-door relief. The proportion of the population in receipt of pauper relief was 25.8 per 1,000, and showed a further decline from that recorded in the corresponding quarters of either of the two preceding years.

The deaths registered in England and Wales during the fourth quarter of 1884 were 137,230, corresponding to an annual rate of 20.1 per 1,000 of the estimated population. This death-rate, although 1.0 per 1,000 in excess of the rate in the last quarter of the preceding year, was below the mean rate in the corresponding quarters of the ten years 1874-83. In the various counties the death-rates ranged from 14.5 in Westmorland, 15.8 in Herefordshire, and 16.2 in the extra-metropolitan portion of Surrey and in Rutlandshire, to 21.8 in Nottinghamshire, 22.5 in the East Riding of Yorkshire, and 23.5 in Lancashire. In the principal urban districts, comprising the chief towns, and containing an estimated population of more than sixteen millions of persons, the death-rate last quarter averaged 21.7 per 1,000 ; in the remaining and chiefly rural population of about ten millions and three-quarters of persons, the rate of mortality did not exceed 17.6 per 1,000. These urban and rural rates were respectively 0.9 and 0.2 per 1,000 below the average rates in the ten preceding corresponding quarters.

In twenty-eight of the largest English towns, including London, and having an estimated population of more than eight millions and three-quarters of persons, the death-rate during the quarter under notice was equal to 21.7 per 1,000, and corresponded to the general urban rate. While the death-rate in London did not exceed 20.2, it averaged 22.9 per 1,000 in the twenty-seven provincial towns, among which it ranged from 17.8 in Portsmouth, 19.1 in Brighton, and 19.5 in Birkenhead, to 25.3 in Liverpool, 25.8 in Manchester, 26.5 in Cardiff, and 29.9 in Preston. The rates of mortality at different ages in these towns varied considerably. It may be noted that the death-rates among infants, measured by the proportion of deaths under one year of age to 1,000 births registered, ranged from 107 in Portsmouth to 213 in Bolton ; that among persons aged between one and sixty years the rate of mortality did not exceed 10.0 in Brighton, whereas it was equal to 17.5 in Preston ; and that among persons aged upwards of sixty years the death-rate ranged from 61.8 in Birkenhead to 111.0 in Blackburn.

The 137,230 deaths in England and Wales last quarter included 32,290 of infants under one year of age, 68,152 of children and adults aged between one and sixty years, and 36,788 of persons aged sixty years and upwards. Infant mortality was equal to 142 per 1,000 births, and was slightly below the average of the ten preceding corresponding quarters. In the twenty-eight great towns the proportion of infant mortality averaged 156 per 1,000 births ; it did not exceed 136 in London, but averaged 172 in the twenty-seven provincial towns, among which it ranged from 107 in Portsmouth, 125 in Brighton, and 136 in Plymouth, to 199 in Leicester and in Cardiff, 206 in Preston, and 213 in Bolton. Among persons aged between one and sixty years the rate of mortality last quarter was below the average, while among elderly persons it showed an excess.

The deaths registered in England and Wales during the last quarter of 1884 included 3,203 which resulted from diarrhoea, 2,793 from measles, 2,540 from scarlet fever, 2,234 from 'fever' (including

typhus, enteric fever, simple and ill-defined forms of continued fever), 1,974 from whooping-cough, 1,475 from diphtheria, and 844 from small-pox; in all, 15,063 deaths were referred to these principal zymotic diseases, equal to an annual rate of 2.20 per 1,000, against an average rate of 2.78 in the ten preceding corresponding quarters. In the twenty-eight great towns this zymotic rate last quarter averaged 2.41 per 1,000, and ranged from 0.99 in Plymouth, and 1.03 in Brighton and in Portsmouth, to 4.00 in Bolton, 5.28 in Preston, and 6.54 in Cardiff. In fifty other considerable towns this zymotic death-rate averaged 2.68 per 1,000 and was higher than in the twenty-eight towns, while in the remaining or rural portion of the country it did not exceed 1.99 per 1,000.

Diarrhoea was by far the most fatal zymotic disease in England and Wales during the quarter ending December last, though the rate of mortality from this disease was slightly below the average. The 2,793 deaths referred to measles were equal to an annual rate of 0.41 per 1,000, which somewhat exceeded the average rate in the ten preceding December quarters. The highest rates from measles in the twenty-eight towns were recorded in Hull, Leicester, Bolton, and Cardiff. Among the fifty other towns the death-rate from this disease was proportionally highest in Warrington, Newport, and St. Helens. The 2,540 fatal cases of scarlet fever were equal to an annual rate of 0.37 per 1,000, which was less than half the average rate in the corresponding quarter of the ten preceding years. In the twenty-eight large towns the highest scarlet-fever rates were recorded in Cardiff, Sheffield, and Newcastle-upon-Tyne: among the fifty other towns the rates were excessive in York, Southport, Rotherham, and Ystradyfodwg. The death-

rate from 'fever,' which had averaged 0.45 in the fourth quarter of the ten years 1874-83, did not exceed 0.33 in the last three months of 1884. In the twenty-eight large towns the rate of mortality from fever averaged 0.34, but showed an excess in Salford, Leeds, and Derby. Among the fifty other large towns the highest fever death-rates were recorded in Ystradyfodwg, St. Helens, and York. The rate of mortality from whooping-cough was 0.29 per 1,000, and considerably below the average; among the large towns this disease showed fatal prevalence in Oldham, Leeds, Preston, Middlesbrough, Wigan, and South Shields. The death-rate from diphtheria considerably exceeded the average; the highest death-rates from this disease were returned in Cardiff, London, and Norwich. Of the 844 fatal cases of small-pox registered in England and Wales during last quarter, 676 belonged to greater London (including those of London residents recorded in hospitals situated outside Registration London), 10 to Birkenhead, 6 to Sunderland, 5 to Liverpool, 2 to Hull, and 2 to Cardiff, while 143 were registered in the rest of England and Wales.

The causes of 125,011, or 91.1 per cent. of the total deaths in England and Wales last quarter were certified by registered medical practitioners; and 7,200, or 5.2 per cent., by coroners in inquest cases. The causes of the remaining 5,019 or 3.7 per cent. were not certified; this proportion differed but slightly from those in recent quarters. The proportion of uncertified deaths in London was only 1.3 per cent., whereas in the rest of England and Wales it averaged 4.1. In the twenty-seven large provincial towns the proportion of uncertified deaths averaged 3.3 per cent., and showed the largest excess in Sheffield, Liverpool, Oldham, and Hull.

Analysis of the Vital and Mortal Statistics of the Twenty-eight Great Towns, dealt with in the Registrar-General's Weekly Returns, for the Fourth Quarter of 1884.

Towns.	Estimated Population middle of 1884.	Births.	Deaths.	Annual Rate per 1,000 Living.			Deaths from Principal Zymotic Diseases.	Small-pox.	Measles.	Scarlet Fever.	Diphtheria.	Whooping-cough. THE SANITARY RECORD.

FEBRUARY 16, 1885.

For will be glad to receive, with a view to publication, announcements of meetings, reports of meetings, and abstracts or originals of papers before the members of any sanitary or kindred association.

Authorities throughout the country confer a favour on the EDITOR of the SANITARY RECORD by forwarding to him all communications relative to Water-supply, Sanitation, and other matters generally, which come under his notice. He would also be glad to receive communications from Engineers of Waterworks, Sewerage, and Domestic Drainage Improvements, and to comment, and illustration.

CUTTING OFF WATER SUPPLY FOR NONPAYMENT OF RATES.

In our last issue we called attention to the evils which might follow from the exercise of the powers which water companies possess, of cutting off the supply where the rates they demand are not paid. We have since been favoured with a report published by Dr. Orme Dudfield to the Kensington Vestry with reference to the action of the Grand

Water Company in his district. This shows that at the time we wrote, the evils were pointed out as probable were actually in place. Hayden's Mews, Notting Hill, is entirely occupied by Mr. Newman, an omnivorous proprietor, and he sublets the rooms over the heads of his own, who pay him weekly which cover the cost of their supply of water. Mr. Newman is the person to whom the company demand their water-rates. Owing to a dispute

Mr. Newman and his landlord, Mr. Newman, as to the proportion of the water-rate for the premises chargeable on the part occupied by Mr. Newman, and possibly, also, in consequence of a sum charged for water-rate having grown suddenly, the water-rates demanded of Mr. Newman were not paid. The company exercised legal powers, and on Dec. 15 cut off the supply. Not only Mr. Newman's omnibus horses were deprived of water, but also his tenants, and in all, who had no share in the disputes, came somehow to the knowledge of Dr. Orme Dudfield, the Medical Officer of Health for Kensington. He brought them before the notice of the vestry and of the secretary of the water company. On December 18 the vestry sent a letter asking the company to receive a deputation on the subject, and also caused notices to be served on the occupiers in the mews requiring the occupiers to provide a proper supply of water. In the afternoon of the same day the company put up a standpipe in the mews, by means of which the inhabitants

were enabled to get some water for a short time every day. On January 6 orders to procure a proper supply of water, in accordance with the notices of the vestry, were duly made by justices, and compliance with those orders would infer the payment of all sums due to the water company, for on no other terms could the tenants get the communication pipes restored. Up to January 19 the water had not been laid on, and we do not know whether it has been done since. The supply from the standpipe has been all that the tenants have had since December 18—for the four days previously there was not even that—and this supply may be discontinued whenever the company get tired of giving it. Fifteen tenements inhabited by eighty-one persons, situated in a densely populated neighbourhood, are thus at present with a very insufficient water supply, and may at any time be deprived even of that, without any default on the part of the actual tenants. There is no doubt that such a state of things might easily be productive of a nuisance most dangerous to the health both of the inhabitants of the mews and of the neighbourhood generally. As we have repeatedly pointed out, the water companies are within their legal rights when they cut off the supply in such cases, and as they find that this is the readiest means of enforcing payment of the rates they demand, it is too much to expect them to sue for their money instead. In the present case, Dr. Dudfield fortunately became aware of the action of the company very soon after the water had been cut off, and (possibly in consequence of his prompt remonstrance) the company were kind enough to provide the stand-pipe, before any serious nuisance had been caused. But there is no security that this would always be the case. As Dr. Dudfield points out, water companies may cut off the supply because they are dissatisfied with the fittings in a house; but, if they do, they must give notice to the local authority of the district; when, however, they cut off the supply for non-payment of rates, they are under no obligation to give such a notice. The nuisance which may be caused is in both cases the same, and the local authority, whose duty it is to prevent and get rid of nuisances in the district, ought equally in either case to be apprised of the facts which are likely to cause the nuisance. As the action of the local authority in requiring a water supply to be provided is often a potent means of securing to the companies payment of the arrears of water rates, we should have thought they would have found it desirable to give an intimation to the local authority whenever the water supply is to be cut off from a house; but, as a fact, such notices are not usually given. While the law remains as it is, we must trust to the vigilance of medical officers of health and nuisance inspectors to protect their districts from unnecessary water famines, and hope that they may always be as successful as Dr. Dudfield seems to have been with reference to Hayden's Mews. When Parliament can spare time to attend to practical matters, we hope that the arbitrary powers, which purveyors of water now possess, will be curtailed; and that the right of cutting off the supply will be restricted to cases where payment of sums properly due cannot be enforced in any other way. It should not be possible, as it is now, to cut off the water as a means of enforcing a demand as to which there is a *bonâ fide* dispute. The powers at present possessed by the companies may no doubt be convenient to

them, but they are oppressive to that class of the community who can least help themselves, and are opposed to the sanitary welfare of every one.

PRIVATE BILL LEGISLATION.

FOR years we have been crying out in the wilderness for a reform in our present system of Private Bill legislation. The agitation was thought by some people to be fussy and ridiculous; by others to be academic and impracticable. Recent discussions in the House of Commons showed, however, that the leaven of reform was working, and it has now so far permeated the Parliamentary mind that two reviews of the first class devote this month a considerable portion of their space to a discussion of the question in all its bearings. So that we take fresh heart, and, having secured the aid of such powerful allies, may press forward to assured victory. We have, unfortunately, no space available for discussing at length the two papers, both in their way admirable, which appear in the current numbers of the *Edinburgh Review* and the *Nineteenth Century*. The pages devoted to the subject in our revered blue and yellow contemporary are, it must be confessed, a little heavy reading. The writer evidently escapes with difficulty from the dignity, solemnity, and, if we may so say, prosiness which would seem to be accepted ingredients in an *Edinburgh Review* article, though he relieves his soul by an occasional witticism of a somewhat sepulchral habit. Mr. Craig Sellar, in the *Nineteenth Century*, is brisker and more readable, though the trail of a second-reading speech is over his paper nevertheless.

Both articles run on very much the same lines: incompetency of a chance committee of four members of Parliament to decide questions of grave importance to the district concerned; hideously extravagant cost to promoters; uncertainty and inconsistency of decisions arrived at. And both make in effect the same recommendation, that the Houses should retain all the power which they at present possess over these Private Bills, but should delegate what is now the committee stage to judges. It is suggested that these judges should be on a level with ordinary Common Law judges, and should report to both Houses upon the evidence brought before them, stating whether the case was proved to their satisfaction or not, and giving reasons—which the present committees are careful not to do—for their decisions. Perhaps on balance this would be the best way out of the difficulty. But it is proper to observe that what such a judge would have to try would be not a question of law, but one of expediency. Is the legal mind quite attuned to this sort of work? Would there not be a danger of technical points upsetting a proposal that was otherwise unobjectionable?

For our own part, and so far as regards the sanitary schemes which inspire our chief interest in Private Bill legislation, we are strongly in favour of a generous extension of the system of provisional orders. The merits and demerits of a scheme are then examined on the spot by an expert, who gives every one a chance at a public inquiry of making known his objections; whilst Parliament still retains the power of rejecting or modifying the provisional order at any stage of the Bill in which it is enshrined. Railway Bills and

the like would probably require somewhat different treatment, into the details of which we cannot now go. But it is difficult to imagine any plan which could be more unsatisfactory and extravagant than the present system—if such a word can be applied to the chaos and jumble that are the characteristics of the Private Bill work of the Houses of Parliament. Mr. Craig Sellar's description in the *Nineteenth Century* of the life history of a Private Bill is excellently conceived and absolutely true. If we are asked to find fault with it, we should say that it was too soberly coloured. With Scotch caution, however, the young member for the Haddington burghs omits mention of the grosser absurdities and incongruities of the committee rooms, preferring, perhaps, to consider these as excrescences rather than as necessary parts of the system. But, even on his very temperate showing, Private Bill legislation, as at present practised, is a delusion and a snare, and must be reformed from the bottom without further delay.

NOTES OF THE MONTH.

WHITE-LEAD POISONING.

AN application was recently made to the magistrate at Worship Street by a man of middle age, who said he wished to know whether he could proceed against his late employer for damages under the following circumstances. He was employed at a white-lead manufactory in the district for four months, and at the end of that time he became so inoculated with the poisonous particles arising from the white-lead that he was unable to use his limbs, and was obliged to give up at once, and had done no work since. He would like to proceed for damages against the proprietor of the factory, because he had not taken the proper precautions to prevent injury to his *employés*. In the first place he had not secured the attendance of a doctor to visit and examine the workmen twice a week, as was the custom in all similar factories; and secondly, he had not provided the men with respirators to prevent poisonous matter from entering the throat. The magistrate referred to the sections of the Factory and Workshops Act affecting the case, and said that children were specially provided for as to their health and protection, but he could not find that the Act so protected grown men in factories where unhealthy trades were carried on. He was not himself empowered to grant any process, but he believed that if any complaint could be preferred against the employer at that court, or if damages could be obtained, the inspector under the Factories Act would be the person to prosecute. Truly 'a very pretty quarrel as it stands,' and an amicable settlement will probably be difficult to arrange, as the legal aspect is the least satisfactory of any in this respect, there being no direct or absolute legislation upon the subject. Mr. Lakeman, the senior metropolitan inspector, has stated that a short time since it seemed to be impossible to improve the system under which the white-lead was made, either in dispensing with the old stack method or in mitigating the consequences of handling the converted substance. The process is to subject pigs of lead to the action of acetic acid placed in earthenware pots arranged in rows in a large chamber called a stack, each row covered with tan; in this way layer after layer is laid,

until the stack, a floorless chamber, is full. The lead remains here for about three months, when carbonic acid gas is evolved, which escapes through ventilators in the chamber; during the evolution the lead 'grows,' *i.e.* fantastic crowns of white-lead, or carbonate of lead, are formed from the pigs. The removal of this white-lead to the washing-tanks, and from the grinding-pits to the stove-rooms where it is dried, and from there to the packing-room, are the three stages in the process which prove so injurious to women, who always do this work. Rules for cleanliness were laid down, but whether for want of strict supervision, or from carelessness of workers, no great advantage would seem to have accrued therefrom, for the evils, both external and internal, such as colic, palsy, paralysis, and death from absorption of the lead fumes, were not reduced, nor were any means found to be effective in abating them. No general rules were laid down or carried out, everything being left to the manufacturers, who, however, did provide necessities as to clothing and cleanliness for the good of male and female workers. Influence and persuasion were all that could be used to lead men up to the true intent and meaning of the sanitary clause, which contained no special reference to such trades as this; and manufacturers could not generally be said to pay sufficient attention to free the employment from the serious evils which carelessness and ignorance of the workers were sure to entail. Regulations were laid down by Mr. Redgrave enabling occupiers to frame rules which should render workpeople amenable to law from disobedience to them. The Factory Act of 1878 forbade anyone under 18 from working in white-lead works, as at this age it is evident ignorance and carelessness would certainly prevail. There is a system apparently little known, according to the inspector's words, called the 'Gardner process' of manufacture, in operation at Deptford, and which would appear to offer the very great advantage of securing perfect freedom from injury to health during the conversion of the lead to its ultimate stage of completion. This method of manufacturing white-lead is fully described in the *SANITARY RECORD* of Oct. 15, 1883, p. 224. The dubious state in which this industry is regarded by the law is summarised as follows. 'Therefore, under so rigid a system, first by legal restriction upon masters, and then by adherence to rules for workpeople, it is fair to assume that so deadly a trade may in the future be carried on under more healthy conditions, even if perfect immunity cannot be obtained.' There is, however, a want of completeness in the powers vested in the authorities, which calls imperatively for a clearer definition.

WORKSHOP SANITATION.

A BOOKBINDER of Queenhithe was summoned at the Guildhall for not having his workshop properly limewashed, and for employing three children under the age of fourteen without the requisite medical certificate as to their fitness. The defendant urged that it was purely an oversight; but the Lord Mayor imposed a penalty of 4*l.* and costs. Although the limewashing of *factories* has been enforced for over eighty years, even when more important sanitary considerations have been legislatively neglected, it was not until 1871 that *workshops* were included in the comprehensive measures at present in force, and it is now the duty of the Government inspectors, and

not that of the local authority, to assume jurisdiction over and draw no distinction between the large and small employers of handicraft. This, of course, is very necessary, as there are so many occupations carried on in what may be termed private workshops which compete with the extensive operations in specially designed buildings, and in which the evils complained of are erroneously supposed to be in proportion to the number of people employed. The reverse of this, however, is the truth, for, as a rule, the more important the building, the more perfect is the organisation, partly from business principles, and partly from the greater publicity which is given to the procedure, and the facility with which the place can be inspected. We have said that limewashing has been of paramount importance in the eye of the law; but, according to recently published testimony, exemption in this respect was allowed to certain trades in 1867, and it was by the Act referred to, viz., 1871, 'that the wide sphere of usefulness was opened wherein all that was in violation of sanitary law in every place of industry in Great Britain was entrusted to H.M. inspectors of factories to remove;' and the good results of their active prosecution are constantly visible.

THE SEIZURE OF HORSEFLESH IN BIRMINGHAM.

IN the December number of the *SANITARY RECORD* the seizure of a large quantity of horseflesh on premises in Broad Street, Birmingham, occupied by a butcher, was reported. The inspector had watched the conveyance of a barrel and hamper containing the horseflesh from one of the railway stations to the shop, and had seized it and summoned the occupier of the premises for having in his possession meat unfit for human food. The case came before Mr. Kynnersley, the stipendiary magistrate, who declined to convict, on the grounds that the defendant had not opened the packages, and was not aware the meat was unfit for human food; nor had it been shown that he intended offering it for sale as such. This decision was appealed against by the market superintendent at the recent Birmingham Quarter Sessions, on the following grounds. 1. That the defendant was guilty of the offence. 2. That the dismissal of the information and complaint was contrary to evidence. 3. That the defendant did not prove that the meat was not in his possession, or that it was not intended for food of man. The appeal, it was stated, was taken under the 116th and 117th sections of the Public Health Act, which set forth that whenever any unfit article was found on premises, presumably for the food of man, the onus of proof that the article was not so intended rested on the persons charged. For the appellant it was stated that the respondent, Richard Pearson, carried on business as a butcher, and had for some time past been in the habit of receiving consignments of horseflesh, carefully packed, from Liverpool. On October 2 he received 3½ cwt., on the 9th 1½ cwt., and on the 18th 1½ cwt. The consignments were not in his own name, but in the name of Leeson, his son-in-law. On November 22, the date respecting which he had been summoned, he was seen by William Latham, inspector of nuisances, in the employ of the Corporation, to fetch a barrel and hamper from the railway station. The contents smelt very offensively, and shortly after they had been deposited in the respondent's shop, Latham called

there, had the packages opened, and found them to contain thirty-five pieces of horseflesh, salted and unsalted, in such a state of decomposition that they were condemned and destroyed. The meat was boned and cut up in pieces, as though for sausage manufacture, and it was suggested it would have been so used had the inspector not discovered it. On behalf of the respondent it was contended that there was no proof that Pearson knew what was the condition of the meat until it was exposed by Latham opening the packages. It was openly consigned as horseflesh, with regard to the eating of which there was a good deal of false sentiment existing; and had Pearson known it to be bad, it was scarcely likely he would have placed it in the shop within sight and reach of everyone entering it. The Recorder (Mr. J. T. Dugdale, Q.C.), in giving judgment, remarked upon the importance of the case to the public, also upon the fact that the respondent could not go into the witness-box to prove the article was not intended for human food, or for what purpose it had been consigned to him. The fact that there had been previous consignments did not carry the case much further, there being no proof that they were intended for human food. The case rested mainly upon the evidence of the witness Latham, 'who did not seem animated with very benevolent feelings in the matter,' and the respondent was not in a position to contradict him. Pearson had been a respectable tradesman at Bilston for a number of years, and had a clean record. There was no concealment of the meat, nor was any other meat of the kind found upon the premises. He (the Recorder) considered it obvious Pearson did not know the meat was unfit for food, and, in his opinion, when he discovered that to be the case it would have been destroyed. He therefore dismissed the appeal with costs.

In another case, however, in which a pork butcher and general dealer named William Hodges, carrying on business at 30 New Canal Street, was summoned before the Birmingham magistrates for having in his possession a quantity of pork and ten tins of potted pork unfit for human food, and in which the defence set up was that the meat was to be boiled for the pigs, a fine of 15*l.* was imposed.

EXPERIMENT WITH WATER SUPPLY FOR FIRE-EXTINGUISHING PURPOSES AT GLASGOW.

CAPTAIN WILLIAM PATERSON, of the Glasgow Fire Brigade; Mr. Langmuir, assistant to Mr. Gale; and Mr. William M'Onie, son of the Lord Provost, and others met recently in a district of the city which at present has the water supply regulated by one of Key's six-inch equilibrium pressure-reducing valves, described and figured in the *SANITARY RECORD* of Jan. 15, for the purpose of putting it to a test, and to see for themselves that which the inventor claims for his apparatus—namely, the facility that it affords for the instantaneous application of high pressure to the district required. The reducing valve was fixed on Dec. 25; since then it has continuously regulated the water supply of the district. The cover of the road-box has not been lifted since the valve was set, and there have been no complaints from the 2,100 inhabitants in the district as to their water supply. The pressure-registering gauge was attached to a fire-plug some distance from Key's valve. Mr. Paterson had a hose-pipe attached, and a detach-

ment of men, in case of an emergency, and on a signal by whistle a man proceeded to lift the road-box cover, and put on the full pressure. This was accomplished in the space of seven seconds from the sounding of the whistle. This proof of the adaptability of the valve for the reduction of pressure and facility for obtaining high pressure for fire-extinguishing was highly commended by all present. Mr. Paterson made further satisfactory experiments with his hose-pipes, the object being to test the capabilities of the valve to deliver large volumes suddenly withdrawn from the mains; this it did as if no valve had been there. The regulated pressure was found to be at 35 lbs. per square inch, and when the high pressure was let on the gauge indicated 53 lbs. per square inch. For some time before this invention was applied to the district the waterworks engineer had been taking a series of diagrams, by means of a waste-water meter, to ascertain the hourly delivery of water by day as well as by night, and since Key's equilibrium valve has been fixed these records have been continued; and although in many towns much higher pressures exist, and where a much lower standard could be fixed than in Glasgow, yet the results from the application of the apparatus to this district show as near as possible that there is a saving in the daytime deliveries of one-third of the water formerly used, and during night a saving of one-third of the water reckoned as leakage passing through the pipes in the small hours of the morning. Thus the day deliveries have been reduced from a rate of 49 gallons per head per day to 33 gallons, and the night leakage from 20 to 24 gallons per head per day to 15.3 gallons. In the Glasgow area of water supply there are 400 times the number of inhabitants that are in this district under trial; and allowing for high levels that do not need the pressures reduced, if one-fourth of the daily delivery of water was saved by the general adoption of this instrument, the water required would be 30 million gallons per day in place of 40 millions as at present, and 10 millions per day saved would, at trade rates, give a saving of water of the value of 60,833*l.* per annum.

OVERTIME IN FACTORIES.

STRINGENT as are the regulations of the Factory Acts, more particularly as affecting the helpless sections of the community, viz., the young persons and children, it is by no means uncommon to find that the regulations are sometimes evaded. It is, therefore, satisfactory to note that recently the transgressors have been reminded of their delinquencies. A firm in Moorfields was summoned at the Guildhall for having employed hands for a longer time than permitted by the law. There were eleven summonses relating to women and young people so employed in a textile factory, at which, amongst other things, window-blinds for railway carriages were made. According to the Act, one of the conditions of their employment was that the hours should be from six in the morning to six in the evening, or from seven to seven. On the occasion referred to the employés were kept until within a few minutes of nine o'clock. The senior metropolitan inspector, however, thought it due to the defendants to say that they had thrown no obstacles in the way of his inquiry; but, at the same time, when they transgressed the Act, they must have done so knowingly, as the requirements of the Act

sted up in their office. It was stated on the defendants that they were desirous of it in the spirit of the law, and they thought the cold dark mornings the hands might be eight to eight, instead of from seven to eight on one particular night, when they were to get some work finished, the hands continue work until nine o'clock. Under these circumstances the magistrate inflicted a fine of five pounds and costs in each case, amounting in all to five pounds.

Although it is highly necessary that even in this respect should be duly retorted must be borne in mind that there were many parties to the contract, and the temptation to a small extra pay is at all times an inducement to both young and old; it is not to be wondered at that 'just one more' is often accepted rather readily than otherwise the majority; and this applies elsewhere in factories. Owing to the way in which the laws are enforced, there is little danger of being carried to any extent; and the present offers a wonderful contrast to the good old days when George III. was king, when, owing to excessive hours of labour and the general condition of the buildings, a marked physical deterioration of the employés was fast becoming

the first Factory Act was passed in 1802, for the preservation of the health and morals of apprentices and others employed in cotton and other manufactures, it was parental in its intention, and even provided for the clothing of the apprentices; to have a new complete suit once at least every year. Attention was also enjoined to their condition, inasmuch as instruction in the tenets of the Christian religion was to be given to them four days at least, on every Sunday, by a legally appointed person. This Act, which is repealed, was not sufficient to cope with the evils attendant upon the increase and extension of manufacture, and in 1833 a second Act passed for the regulation of 'the labour of men and young persons (not apprentices) in mines and factories of the United Kingdom,' in which nightwork was abolished for those under twelve years of age, and they were not to work for more than twelve hours a day; children under nine to work at all, and those between eleven and sixteen were not to work for more than eight hours a day. During the next forty-one years eleven Acts were passed, dealing more or less with the subject, and extending the provisions to new trades and more general restrictions on operatives, and by this time the multiplicity of various regulations was such that it was necessary to appoint a Royal Commission to inquire into the whole series, the result being that the Factory and Workshop Act, 1878, was passed, which is included in the sanitary provisions applicable to buildings, these latter provisions having been introduced from time to time as occasion required. The work has been done so effectually that there is now no opportunity for any serious evasion.

PRIVILEGES AND THEIR OWNERS.

In this case, illustrative of privileges paid for and enjoyed, has been brought to light by the Metropolitan Public Garden, Boulevard, and Play Association. Lord Brabazon, on behalf of

the association, asked the Vestry of St. Pancras to acquire possession of and throw open to the public the small, well-kept enclosure in Camden Street, called Camden Garden, and offered, if it were desired, to appoint and maintain a caretaker for the first six months. Both the suggestion and the offer were refused. The Vestry Clerk stated that the ground was laid out some years ago by the Vestry with money obtained from the North London Railway Company in consideration of their being allowed to cross it; that it had since then been managed by a local committee and maintained by a rate levied upon the inhabitants of the neighbourhood, who have not the power of entering it. The ownership of many such London gardens is very doubtful. Bartholomew Square, a small enclosure in the crowded district of Old Street, E.C., is the property of the trustees of St. Bartholomew's Hospital, but is leased with a neighbouring public-house, whose tenant is supposed to keep the ground in good order. He has the right of using the garden, while the children of the narrow streets play on the stone-paved road outside. The publican does not appear to enjoy his privilege, for the ground is deserted, neglected, and untidy; and yet, strange to say, the trustees have refused to hand it over to a body willing to maintain it as a public garden.

THE BIRMINGHAM BOROUGH GAOL.

SPECIAL attention has been directed to the sanitary condition and other arrangements of the Birmingham Borough Gaol at Winson Green, in consequence of a report presented by the visiting justices and complaints made as to the 'unwise and inexpedient' provisions of the Prisons Act of 1877. Mr. Alderman Manton, J.P., chairman of the Visiting Committee, complained especially that without consultation with a magistrate or any official of the prison, the whole of the sanitary arrangements had been revolutionised, and in a most unfavourable manner. An experiment, as the committee were aware, had been made with regard to the closet accommodation in the basement cells. To his astonishment he found, on recently visiting the prison, that the whole of the closets in those cells had been ordered to be removed, and all connection with the outside sewerage to be severed. In lieu of the closets a small pan-bucket was provided for service at night, and in the morning those buckets (some 400 in number) had to be brought out of the cells, carried through the corridors, and emptied into twelve central closets. The stench arising from the process must be unbearable. During the day it was necessary for a prisoner to ring for the warder to let him out of the cell when he wanted to visit the closet. The alterations were not yet completed, and he suggested that the justices should make a strong protest against the closet system, which had been in vogue for some years, being superseded by one of so unpleasant and offensive a character. Complaints were also made as to the absence of any information as to the results of the administration of the prison affairs by the Prison Commissioners, whether the new system was cheaper or more expensive or more beneficial than the old one. One J.P. considered the Government were simply trifling with the magistrates, and that they ought not to submit to so unsatisfactory a condition of things without a strong protest. The Visiting Committee might as well be dissolved if they had

no voice or power in the administration of the prison affairs. A hope was expressed that the state of things with regard to the sanitary arrangements of the prison as described by Mr. Alderman Manton was not intended to be permanent, but that some better system was intended to be substituted than the old one of having the closets in the cells.

DEFECTIVE SEWERAGE ARRANGEMENTS AT MOSELEY.

IN consequence of the supposed death of a lady at Moseley, a residential district near Birmingham, through inhaling poisonous gases from the sewers, the attention of the sanitary authorities of the King's Norton Union has been directed to the whole question of the condition and arrangement of the sewerage system in that place. The medical officer (Mr. Hollinshead), at a recent meeting of the authority, attributed the death to other causes, but with reference to the sewerage question considered it a matter for consideration whether the ventilation was sufficient. A memorial was presented from a number of the residents calling attention to the 'pestilential gases' which escaped from the man-holes, to which a large amount of sickness was attributed, and suggesting an improvement in the flushing apparatus. The surveyor reported as to the levels of the sewers, and the difficulty there existed in the erection of ventilating shafts on private property, but said a ventilating shaft could be erected at a cost of 150*l.* at the junction of three roads, the sewers in which were most complained of, by which arrangement also three dead-ends would be abolished, and a number of openings might be closed. The authority have resolved to have a thorough and exhaustive examination of the drainage system of the district made by a skilled expert, with instructions to report what is necessary to be done to put the system into effective working order, both as to the running capacity and the ventilation, and have appointed a special committee to deal with the subject. The death-rate for the four weeks ending Jan. 24 was 23.95 per 1,000, which, though below the general death-rate, is nearly double what it was last year.

ADULTERATION.

IT is proverbially easy for a person who knows how to do it, 'to drive a coach and four through an Act of Parliament.' Those who read the newspapers know that the Adulteration Acts form no exception to this, but, on the contrary, that in many instances ways have been found of avoiding the intended stringency of their enactments. The last case which has come under our notice was one in which the Hampstead bench of magistrates had to consider a charge brought against a milkman of refusing to sell milk to an inspector who wanted to analyse it. The 'Sale of Food and Drugs Act 1875' by sect. 13 provides that 'any medical officer of health, inspector of nuisances, or inspector of weights and measures, or any inspector of a market, or police constable charged with the execution of the Act,' may procure any sample of food or drugs for the purpose of analysis. And sect. 17 of the same Act imposes a penalty of 10*l.* on the person exposing for sale any article of food or drug who refuses to sell it to such officers. The summons in question was taken out under the above section. It was proved

that the milkman was going round with milk to private houses, when the inspector applied to him for some of the milk and was refused. The defendant asserted, though according to the report the assertion was not supported by evidence, that the milk 'was being taken round in order to supply the customers under a contract, and consequently that it was not exposed for sale and he had committed no offence in not selling it to the inspector. He admitted that he had more milk with him than had been ordered, so as to be able to supply any customers who might want an extra quantity; and it seems difficult to understand how this extra quantity, at any rate, was not exposed for sale. The Bench, however, thought otherwise, and dismissed the summons. The decisions of one bench of magistrates are not binding on others, or even on themselves on subsequent occasions, and consequently the dismissal of this summons is of no great importance. It shows, however, a difficulty which may be met with whenever a sample of food is wanted for analysis and the suspected article is not in the shop. In the case of milk, the amending Act of 1879 gives power to 'procure at the place of delivery any sample of any milk in the course of delivery to the purchaser or consignee, in pursuance of any contract for its sale to such purchaser or consignee;' and imposes the penalty on the seller or consigner, or person entrusted by him with the charge of the milk, if he shall refuse to allow the sample to be taken. The summons in question should, in order to avoid difficulties, have been taken out under the latter Act instead of under the Act of 1875; and, if it had been, the defence which prevailed would not have been admissible. This section of the Act of 1879, however, applies only to milk, and it seems that a dealer in other articles of food which may be adulterated is practically safe as long as they are not found in his shop. What is there exposed for sale he must sell to the inspector who wants it for analysis; but if he keeps pure articles on his counter, and sends out others which are adulterated to his customers, the difficulty of proving a case against him will be greatly increased. Whether the milk in the Hampstead case was or was not exposed for sale, there can be no doubt that articles really in course of delivery are not so exposed. The decision in question is useful as calling attention to an omission in the Adulteration Acts which must interfere with their efficiency, and which can only be remedied by legislation.

PENNY DINNERS.

THE Central Council for promoting self-supporting penny dinners in London have recently issued circulars to the managers of all the elementary schools in the metropolis, both board and voluntary, urging an extension of the movement, the benefits of which are pointed out, and offering pecuniary assistance under certain conditions. Grants have already been sent to five dinner centres, and other applications are under consideration. The council will shortly publish a pamphlet containing suggestions for establishing and carrying on penny dinners, and also numerous dinner recipes. H. R. Williams, Esq., has joined the council as the nominee of the Ragged School Union, and Lord Colchester and F. S. Powell, Esq., have been nominated as representatives by the National Society. Miss Ewbank and W. M. Wilkinson, Esq., have also been added to the council.

THE PUBLIC HEALTH DURING JANUARY 1885.

mean temperature during the month of January at the Royal Observatory, Greenwich, was $36^{\circ}6$; it slightly exceeded the average January temperature in one hundred out was considerably below that recorded in the first of any year since 1881. An excess of temperature occurred on nine days of the month, while on the other twenty days it was below the average. The warmest of the month was the 29th, when the mean was as $50^{\circ}1$, and $9^{\circ}9$ above the average; the coldest was the 31st, when the mean was only $28^{\circ}1$, and below the average. Rain was measured at Greenwich fifteen days during the month, to the aggregate of 1.4 inches, which was half an inch below the January rainfall in sixty-one years, and was below recorded in the corresponding month of either of the preceding years. The sun was above the horizon 259.1 hours in January, but only 16.9 hours of sunshine were recorded at Greenwich; this amount is considerably below the average of the first month of the preceding years, though it slightly exceeded that of January 1884. The wind was very variable about the month.

In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, which have a total population of nearly nine millions of persons, 16,662 births and 16,662 deaths were registered during the four weeks ending the 31st ult. The annual birth-rate, which had declined in the three preceding months from 33.7 per 1,000, rose again to 36.4 during January, exceeded by 1.5 the rate recorded in the corresponding month of 1884. In these twenty-eight towns the lowest of the last month were 28.0 in Brighton, and in 31.1 in Bradford, and 31.4 in Plymouth; in the towns the rates ranged upwards to 42.3 in Wolverhampton, 34.5 in Preston, and 48.3 in Cardiff. The rate in London last month was equal to 35.8 per 1,000, while it averaged 36.8 in the twenty-seven provincial

towns, the annual death-rate in the twenty-eight towns, had been 20.5, 21.7, and 22.8 per 1,000 in the preceding months, further rose to 24.4 during January. The rate considerably exceeded that recorded in the corresponding periods of the two preceding years 1883 and 1884, were 22.7 and 21.0 per 1,000 respectively. The rate of mortality last month in these towns was Brighton and in Derby. The rates in the other ranged in order from the lowest, were as follow:—0.5; Bradford, 21.0; Birkenhead, 21.6; Salford, Sheffield, 22.1; Leeds, 22.4; Nottingham, Newcastle-upon-Tyne, 23.4; Huddersfield, 23.9; Bolton, 24.1; Oldham, 24.2; Blackburn, Portsmouth, 24.6; Halifax, 24.6; Sunderland, Birmingham, 25.2; Bristol, 25.6; Leicester, 25.8; Manchester, 26.8; Plymouth, 29.3; Southampton, 30.5; Norwich, 31.2; Preston, 31.6; the highest rate during the month, 36.2 in Cardiff. The death-rate in London, as above stated, was 24.0 per 1,000, it averaged 24.8 in the twenty-seven provincial

The 16,662 deaths from all causes in the twenty-eight towns during the four weeks of January included which were referred to the principal zymotic diseases, of which 452 resulted from whooping-cough, 213 from measles, 213 from scarlet fever, 163 from small-pox, 143 from 'fever' (principally enteric), 143 from cholera, and 180 from diarrhoea. These 1,510 deaths equal to 9.0 per cent. of the total deaths, and to a rate of 2.21 per 1,000. This zymotic rate was a slight further decline from those in recent years, and was below that recorded in the corresponding period of either of the two preceding years 1883-84, when 2.4 and 2.6 per 1,000 respectively. The zymotic rate in London during January was equal to 2.1 per 1,000; in the twenty-seven provincial towns it

averaged 2.3, and ranged from 0.7 in Brighton and in Birkenhead, and 0.9 in Oldham, to 3.6 in Preston and in Sunderland, 3.9 in Leicester, and 11.2 in Cardiff.

Whooping-cough was the most fatal zymotic disease in the twenty-eight towns during January. The rate of mortality from this disease in these towns, which had been 0.30, 0.37 and 0.48 per 1,000 in the three preceding months, further rose during January to 0.66, but was slightly below the rate recorded in the corresponding month of 1884. In London the death-rate from whooping-cough was 0.60 per 1,000, whereas in the twenty-seven provincial towns it averaged 0.72 per 1,000, and showed the highest proportional fatality in Bradford, Preston, and Birmingham. The death-rate from measles, which had increased in the last three months of 1884 from 0.27 to 0.48 per 1,000, declined to 0.42 in January; in London the mortality from this disease did not exceed 0.25 per 1,000, whereas it averaged 0.57 in the twenty-seven provincial towns, among which the highest rates were recorded in Newcastle-upon-Tyne, Sunderland, Leicester, and Cardiff. The rate of mortality from scarlet fever, which had been 0.45 and 0.38 per 1,000 in the two previous months, further declined to 0.31 in the month under notice. The scarlet fever death-rate in London was equal to 0.24 per 1,000, while among the twenty-seven provincial towns it averaged 0.38, and showed the highest proportional fatality in Leeds, Newcastle-upon-Tyne, and Halifax. The rate of mortality from 'fever,' which had declined from 0.41 to 0.27 per 1,000 in the last three months of 1884, further fell to 0.21 during January, the lowest rate recorded in any month since July 1881. The 'fever' death-rate in London was last month equal to 0.16 per 1,000, while it averaged 0.26 in the twenty-seven provincial towns, among which the highest rates were recorded in Newcastle-upon-Tyne, Sheffield, Derby, and Norwich. The mortality from diarrhoeal diseases was below the average for the corresponding period of recent years. The death-rate from diphtheria was equal to 0.22 per 1,000, and showed a slight decline from that recorded in the preceding month; the rate of mortality from this disease in London last month corresponded with that in the aggregate of the provincial towns. During the four weeks of January 163 fatal cases of small-pox were recorded in the twenty-eight towns; the fatality of this disease showed a slight decline from that in December. Of these 163 deaths, 143 occurred in London, 6 in Liverpool, 2 in Birmingham, 1 in Bolton, and 1 in Newcastle-upon-Tyne. Judged by the returns of the Metropolitan Asylum Hospitals, the prevalence of small-pox in London showed a further increase during January. The number of small-pox patients under treatment in these hospitals, which had been 536, 834, and 1,076 at the end of the three preceding months, further rose to 1,147 at the end of January. The average weekly number of new patients admitted to these hospitals, which had steadily increased from 73 to 217 in the four preceding months, further rose to 243 during January.

The rate of infant mortality in the twenty-eight towns, measured by the proportion of deaths under one year of age to births registered, was equal to 138 per 1,000 during January, against 136 in the corresponding periods of the two preceding years, 1883 and 1884. While the rate of infant mortality did not exceed 129 per 1,000 in London, it averaged 145 in the twenty-seven provincial towns, among which it ranged from 99 and 110 in Hull and Portsmouth, to 164 in Preston, 180 in Plymouth, 184 in Cardiff, and 227 in Huddersfield.

The death-rate from diseases of the respiratory organs, judged by the metropolitan returns, considerably exceeded the average during January. The weekly number of deaths referred to these diseases in London averaged 558, and the annual death-rate was equal to 7.1 per 1,000. In Liverpool the annual rate of mortality from these diseases was last month equal to 7.7 per 1,000.

The causes of 404 of the 16,662 deaths recorded in the twenty-eight towns during the four weeks of January

were not certified, either by registered medical practitioners or by coroners. These uncertified deaths were equal to 2·4 per cent. of the total deaths, which showed a slight decline from the proportion in recent months. In London the proportion of uncertified deaths did not exceed 1·5 per cent., while it averaged 3·2 in the twenty-seven provincial towns, ranging from 0·5 in Bristol and Bolton, and 0·6 in Plymouth, to 6·7 in Sheffield, 8·1 in Huddersfield, and 10·3 in Oldham.

Among the population living in the outer ring of suburban districts around London, estimated at rather more than 1,000,000 persons, the annual death-rate during January from all causes was equal to 20·7 per 1,000, against 16·5 and 17·1 in the corresponding periods of 1883 and 1884. During the four weeks ending the 31st ult., 94 fatal cases of small-pox, 36 of 'fever,' 27 of measles, 27 of diphtheria, 15 of 'fever,' 12 of scarlet fever, and 10 of diarrhoea, were recorded in the outer ring. These 221 deaths were equal to an annual rate of 2·6 per 1,000, which considerably exceeded that recorded in the corresponding month of either of the two preceding years. The fatality of scarlet fever and of 'fever' showed a marked decline, while that of diphtheria and of whooping-cough showed an increase. Of the 94 deaths from small-pox recorded in the outer ring during January, 78 occurred in West Ham district (including 19 of London residents registered in the Metropolitan Asylum Hospital at Plaistow), 7 in Edmonton, 7 in Croydon, 1 in Barking Town, and 1 in Hornsey. Of the 27 fatal cases of diphtheria, 5 were returned in Hornsey sub-district, and 3 in the sub-district of Willesden.

NOTIFICATION OF INFECTIOUS DISEASES.

THE table on page 363 contains uniform statistics relating to sickness and mortality in thirty-one of the thirty-nine urban sanitary districts of England and Scotland in which the notification of infectious diseases is compulsory. The population of the thirty-one towns for which we are enabled to publish complete statistics for the month of January is estimated at upwards of two-and-a-half millions of persons. The annual death-rate from all causes during the first month of this year in these thirty-one towns averaged 24·12 per 1,000 persons estimated to be living therein, showing a further increase upon the rates recorded in the three preceding months, which had been 20·51, 21·91, and 24·00 per 1,000 respectively. The rate of mortality in the twenty-eight towns dealt with by the Registrar-General in his weekly returns was 24·40 during January, and was, therefore, slightly above the rate in the thirty-one towns in the accompanying table. The death-rates last month were considerably below the average in Barrow-in-Furness, Burton-upon-Trent, Leek, Macclesfield, Reading, and Salford; while they showed an excess in Burnley, Dundee, Preston, Stalybridge, and Warrington. The death-rate from the eight infectious diseases dealt with in the table averaged 0·70 per 1,000, showing a slight further decline from the rates recorded in the three preceding months, which had been 0·98, 0·91, and 0·71 per 1,000 respectively. No death from any of these infectious diseases was recorded last month in Jarrow, Leek, Stalybridge, and Warrington; while in the other towns the rates ranged upwards to 1·11 in Reading, 1·14 in Bury, 1·29 in Preston, 1·65 in Rotherham, and 1·68 in Halifax. One death was referred to small-pox in Bolton; scarlet fever was proportionally most fatal in Halifax and Rotherham; enteric fever in Edinburgh, Bury, and Preston; and diphtheria in Portsmouth and Reading. Two deaths from typhus were recorded in Edinburgh, and 4 from puerperal fever in Manchester, 2 in Dundee, and 2 in Greenock. With regard to the notified cases of infectious disease in these thirty-one towns, it appears that the proportion of persons reported to be suffering from one or other of the

eight diseases specified in the table was 4·88 per 1,000, against 7·92, 6·71, and 5·24 in the three preceding months. While the proportion did not exceed 0·46 in Warrington, 1·16 in Stalybridge, 1·30 in Jarrow, and 1·56 in Macclesfield, it ranged upwards in the other towns to 5·55 in Reading, 6·04 in Leicester, 7·05 in Bradford, 10·53 in Edinburgh, and 14·13 in Barrow-in-Furness. The excessive rates recorded in all the last-mentioned towns were due to the epidemic prevalence of scarlet fever. Seven cases of small-pox were notified in Birkenhead during January, against 30 in each of the two preceding months; scarlet fever showed the greatest proportional prevalence in Halifax, Burnley, Bradford, Edinburgh, Leicester, and Barrow-in-Furness; enteric fever in Portsmouth, Greenock, Aberdeen, and Edinburgh; and diphtheria in Portsmouth, Reading, Dundee, and Barrow-in-Furness. Four more cases of puerperal fever were notified in Salford during last month (against 3 in each of the two previous months), 3 in Manchester, 2 in Dundee, and 2 in Greenock.

SPECIAL REPORTS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

At a meeting of this society, held at 1 Adam Street, Adelphi, on January 16, 1885, Dr. T. O. Duddfield, President, in the chair, the Council presented a report recommending the adoption of a new code of by-laws of the society, which was approved after slight modification.

The Council deferred reporting upon other subjects referred to it.

Dr. B. A. Whitelegge, medical officer of health to the borough of Nottingham, was elected a member of the society.

Mr. William Eassie, C.E., was elected an associate of the society.

Papers, of which the following are abstracts, were read on the subject:—

ARE SMALL-POX HOSPITALS NECESSARILY (*per se*) A SOURCE OF DANGER TO THE SURROUNDING POPULATION?

By E. T. Wilson, M.D., physician to the Cheltenham General Hospital; J. W. Tripe, M.D., medical officer of health to Hackney; and E. Gwynn, M.D., medical officer of health to Hampstead.

Dr. Wilson stated that the occasional spread of small-pox in the immediate neighbourhood of small-pox hospitals in the metropolis seems to be an acknowledged fact. At the same time it is clear from Dr. Thorne Thorne's exhaustive inquiry that no such extension of the disease has ever been known to take place in even the largest provincial towns. How is a difference so remarkable to be explained? Are the ordinary channels of small-pox spread acting under the altered conditions of a dense population sufficient to account for the facts, or are we driven to seek for some altogether new factor peculiar, it may be, to the metropolitan area? The answer is important, as on it would seem to hang the very existence of isolation hospitals for small-pox in London, even in their present modified form. Those who hold that no new element has been introduced would point to the exceptional facilities which have existed up to a very recent period, perhaps exist even now, for the extension of small-pox around the isolation hospitals. Defects of site and of construction; ingoings and outgoings with but slight precautions; abuse of the ambulance system; convergence of friends upon the hospitals, and of patients who often walk through the streets; surroundings generally of the poorest; cases treated at home or concealed; these and other causes too numerous to mention are, it is maintained, sufficient to account for any undue spread of the

disease in the neighbourhood of small-pox hospitals. There are others, however, notably Mr. Power, Dr. Tripe, and Dr. Gwynn, who have felt themselves compelled to the conclusion that, whatever may be the case elsewhere in London, the infectious matter from small-pox hospitals is carried through the air for distances of a mile or a mile and a half. The evidence for this remarkable theory, first propounded by Mr. Power in 1881, rests on statistics chiefly, and on facts which certainly admit of more than one interpretation. Much stress is laid for instance on a graduated intensity in the number of houses invaded round small-pox hospitals, although in some cases the houses and population have been so varied in character as to render any comparison between districts useless; and in others the intensity has been shown to result from a convergence of disease, commencing at a distance, and not from any divergence springing from the hospital as a centre.

Such contradictions cannot but give rise to the suspicion that neither the atmosphere nor the numbers in hospital are concerned in the spread round these buildings, especially when it is found that the waves of intensity during an epidemic period are synchronous to a very remarkable extent around the various small-pox hospitals and in the metropolis as a whole; that, moreover, whole streets and buildings with susceptible individuals in the closest vicinity to small-pox hospitals often enjoy an immunity from the disease, quite unaccountable on any theory of distant aerial spread of the infection. The distribution of cases also, in both time and space, especially in Mr. Power's investigation, point to some causes acting continuously within the district rather than to any emanation from the hospital itself. On these grounds, and in view of the known causes of small-pox spread, giving rise to thirty or even fifty cases from a single one, it is contended that there is no need of a hypothetical aerial spread of infection to account for cases whose origin cannot be traced; and that a small-pox hospital *per se*, and independently of its intercourse with the neighbourhood, is not necessarily a source of danger to the surrounding population.

Dr. Edmund Gwynn read a paper dealing with the question—

COULD A SMALL-POX HOSPITAL, LIMITED TO THIRTY OR FORTY BEDS, BE MAINTAINED IN A CROWDED NEIGHBOURHOOD WITHOUT DANGER TO THE SURROUNDING INHABITANTS?

Abundant proof, he said, had already accumulated that in former epidemics small-pox had increased largely in the neighbourhood of great hospitals. In Hampstead, for instance, all houses lying between the hospital and Haverstock Hill in the epidemic of 1872 were attacked, and in the epidemic of 1877 there was a great concentration of disease in houses adjoining the hospital; but in the epidemic of 1881, when the hospital was closed, the houses and streets in the vicinity were almost entirely free from small-pox. The Hampstead Hospital was again opened for small-pox cases on April 6, 1884, the largest number of admissions in any week being forty-four, and in some weeks the numbers in hospital fell to seven and five. Three or four weeks after the opening of the hospital a large increase in the number of cases in Hampstead occurred. The houses near the hospital were not the first attacked, the chief outbreak being in the district of Belsize. These latter houses were distant from the hospital from one quarter to half a mile, and during the period they received their infection the wind blew steadily from the direction of the hospital on to them. After the first week in June the number of houses invaded within a quarter of a mile radius from the hospital continued to rise steadily, in proportion to the other houses in the parish, until at the end of eight months out of 310 houses in the special area 62 had been attacked, against 134 out of a total of 6,870 houses contained in all the parish.

In the experience of 1881, the special area containing

267 houses contributed only 4, against 36 in the parish. Thus, with the hospital open, the incidence of disease in the special area had increased to 20·5 per cent. with the hospital closed. But an area round the workhouse showed only an increase of 5·7. The deaths from small-pox per 1,000 had risen from 2·1 in 1881 to 15·3 in the present year. The author asked, if the various explanations offered account for the spread of disease in the neighbourhood of the hospital by concealed cases, by overcrowding, by the natural march of the epidemic from east to west or to north, are to be accepted when the hospital was why did the disease almost absent itself from the central quarter during a severe epidemic when the hospital was closed? The entrance to the hospital was on the west side, yet disease in former epidemics started itself on the east side, where ambulances only remote cases by reason of a barrier erected in Fleet

In the present case the barrier had been removed the entrance was now in Fleet Road, yet the disease appeared on the west side. There appeared to be a spread of small-pox on the line of sewer above the hospital. The author believed the danger from the disease to arise from its action being continuous, where outbreaks in other quarters could be effectually dealt with by disinfection and removal of cases.

Dr. Tripe began his paper by stating that he admitted that the infectious matter of small-pox could be carried at a distance, say of 20 yards, and this is allowed by the authorities, he cannot understand why under favourable circumstances it cannot infect at a greater distance, especially as no one assumes that the poison can be destroyed by the air in a few minutes. He then referred to the difficulty of ascertaining the precise source of infection in most cases, and therefore of assigning aerial infection means by which the disease is spread. That this is especially the case as regards the Homerton Hospital, the visitors and tradespeople going to the small-pox fever hospitals enter and come out by the same gate where the wards are much too near the street. In describing the position and the hospital as regards streets and open country, he brought forward statistics showing that in all the epidemics since that of 1870, the inhabitants of the streets near the hospital had suffered more than those at a distance from it; that the high incidence diminished as the distance from the hospital increased and that although other outbreaks nearly as severe from time to time occurred in other parts of the district yet they had not occurred in every epidemic as was the case with the streets near the hospital. He specified the statistics of the 1883-84 epidemic in which the percentage of cases within the quarter-mile radius was 33·6, and of deaths 33·6, out of the total cases reported; deaths registered amongst the inhabitants. These included all those occurring at Highgate, at the Regent's Park, and at Darenth. Between the quarter and half mile radii the cases were 33·9 per cent., the deaths 35·2, and between the half-mile and one-mile radii the cases were 14·7 per cent. of the whole, making 56·8 per cent. of cases, 68·8 per cent. of deaths amongst the residents within 20·8 per cent. of all the houses in the district. In the between the half-mile and one-mile radii there were 17·6 per cent. of cases and 16·8 per cent. of deaths, but only 17·6 per cent. of cases and 14·5 per cent. of deaths amongst the inhabitants of the district (above one mile outside the mile radius. As regards the proposition that the disease is spread by aerial infection, he stated that in March 1884 an outbreak of 67 cases in 6 days occurred in a part of the district (to the south-west of the hospital), where there had not been but two cases a night before, and where it was, in his opinion, impossible that the disease could have been caused by the ordinary modes of infection. In this instance the disease veered three times all round the compass from S.W. to N.W. on each occasion for some time in a direction E.N. or N.E. from the hospital. That there was almost a change on two occasions, the wind blowing about 3 miles

hour; on the other occasion it had the low velocity of from 6 to 8 miles an hour. Also that the air was unusually moist for March. That outbreaks occurred all round the hospital on several occasions when the wind was nearly calm, and had blown from the hospital towards the infected places. He again expressed his belief, which he had stated when examined before the Royal Commission on hospitals for infectious diseases, that the infection may be carried over a high building, and gave what he considered to be reasonable proof of this assumption. A large number of maps and some tables and other statistics were given to support the various propositions.

The President, in thanking the readers of the papers in the name of the society, commented on the importance of the subject which was before the meeting, and invited a discussion on the influence of small-pox hospitals in the metropolis.

Dr. Gibbon thought that the theory of aerial transmission of infection is a fallacy, and that the special incidence of small-pox upon the quarter-mile radius round the hospital was likely to be due to traffic. It was a mere assumption that the poison is particulate. Since the special small-pox hospitals had been constructed, the mortality had been three times as great as in any previous epidemic; this he attributed to the transmission of persons suffering from small-pox through the streets.

Dr. Iliff was of opinion that no definite conclusion could yet be come to as to how the infection had been spread, or, indeed, as to the fact whether small-pox hospitals were a cause of as much disease as had been stated. There was no small-pox hospital in his district, but there had been local outbreaks which would have been attributed to a hospital had they been in its locality. He was surprised at the number of unvaccinated persons which had been found during a recent epidemic prevalence of small-pox in his district.

Dr. Pringle gave an account of his experience of small-pox in India, and of the difficulty he had had in combating the custom of inoculation. He thought the small-pox crust was well adapted for disseminating the poison by the air. He thought that patients in the convalescent stage were more likely to be a source of danger than in the acute.

The meeting was then adjourned.

At the adjourned meeting on January 26, Dr. Roberts, in opening the discussion, said that the hospital at Deptford until four or five years ago was surrounded by market gardens, but now houses were built upon them and small-pox was always prevalent there. During the year 1884 there had been forty-one cases in that portion of the quarter of a mile radius which was in his parish, there were twenty-seven within the mile, and seventy-eight in the district beyond the mile. Most of the houses were newly built and many of the servants of the hospital lived within them, but before they were built, the proprietor of a market garden had observed a fact that every person he put on to plough the land had small-pox.

Dr. Corner stated that from May 1881 to May 1882, the Plaistow hospital was made use of by the Poplar Board, and there were never more than twenty cases within it. From May 1884 this hospital had been used by the Metropolitan Asylums Board, and he was quite convinced that it was a centre for the spread of infection.

The President said he had invited medical officers of health acting in districts which had small-pox hospitals in or near them to favour the Society with their experience of small-pox prevalence. He could speak with regard to the Fulham Hospital. The disease was prevalent in the parish long before the hospital was opened, but it increased considerably for a short time immediately after the hospital was opened, for in two weeks 26 cases occurred in South Kensington, 22 cases being infected in five days; 4 in the central circle; 5, 3, and 3 in the three outer rings; and 7 outside the special area. Altogether, during 1884, 177 cases of small-pox were recorded, 76 in the north, and 101 in the south. He did not know

the population of the Kensington part of the special area, but no doubt the cases had been relatively more numerous in the special area than in the remainder of South Kensington; especially would this be true in regard to the inner circle, if percentages of houses newly invaded were taken after Mr. Power's method. The Fulham Hospital was opened on May 17, so that any influence it might have had on the special area would not come into operation until the end of May. Prior to June 1 there had been 23 cases of small-pox in Kensington, of which two were in the special area; in the remainder of the year, the hospital being opened, there were 154 cases, of which 58 were in the special area.

Dr. Bridges expressed the opinion that the evidence adduced before the Royal Commission showed that small-pox hospitals have inflicted an appreciable damage upon their immediate neighbourhoods, but it was difficult to say whether the benefit afforded by them was not a sufficient compensation. He thought Dr. Tripe's figures very accurate, and that they showed that the quarter-mile radius had suffered excessively, and at Homerton more so than at Stockwell or Hampstead. There was a good deal of evidence pointing to the conclusion that the present system was much more satisfactory than the former. He had a table showing the admissions into the hospitals of the Asylums Board from July to December 1884, from the different districts. Of these there were ten which were contiguous to small-pox hospitals; of these, five sent more than the average, and five sent less. Hampstead sent as many as St. George's-in-the-East, and it was interesting that although the area round the Hampstead Hospital was affected in 1871 it was enormously less so than in 1884. That alone was enough to make them doubt whether the spread can possibly be connected with the existence of the 25 cases. He was not prepared to accept Mr. Power's opinion as to how small-pox was spread.

Dr. Squire fully agreed with Dr. Wilson as to the way in which small-pox spread. After discussing the nature of the poison, he expressed his disapproval of the manner in which persons suffering from small-pox were now conveyed from place to place in the metropolis.

Mr. Shirley Murphy pointed out that the distribution of cases in St. Pancras, the northern district of the parish, which had on its borders two small-pox hospitals, had during the earlier part of last year suffered much more severely than any other part, but during December small-pox had very considerably increased in the southern part of the parish.

Dr. Butterfield had not yet formed an opinion whether the dissemination of the disease was aerial. The Bradford Hospital was occasionally used for small-pox, but in only one instance did the disease spread to other wards, and then it was conveyed by the nurse. His experience led him to think that small-pox did not go up the chimney, out of the window, or jump over the walls, but it went through the gates.

Dr. Wilson said Cheltenham was perhaps the worst town in England in which to study the mode of spread of small-pox; a few cases were imported, but the disease never spread beyond the house where it was first known. He thought the discussion had rather wandered. The question was whether by the careful management of small-pox hospitals, by the control of the ambulance arrangements, small-pox hospitals might be made harmless. Mr. Power's report was reasonable from the premises laid down, but he did not think the premises were correct. In the case cited by Dr. Tripe they found an extraordinary exception in the City of London Workhouse, where the infection passed over the inmates in a most marvellous manner. The question of conveyance by wind was one worthy of inquiry; he was inclined to think, from certain buildings having been exempt, that the theory of aerial dissemination of small-pox could not yet be accepted.

The society then adjourned until February 9, when the subject will be further discussed.

YORKSHIRE ASSOCIATION OF MEDICAL OFFICERS OF HEALTH.

ANNUAL MEETING AT YORK.

ON the 27th ult. the annual meeting of the Yorkshire Association of the Medical Officers of Health was held in the Council Chamber of the Guildhall, York. Mr. S. W. North, of York, occupied the chair, and there were also present Dr. Riddings, Calverley; Dr. Hime, Bradford; Dr. J. M. Wilson, Doncaster; Dr. Burman, Wath; Dr. Bruce Low, Helmsley; Dr. Deville, Harrogate; Dr. Muil, Kirbymoorside; Mr. H. E. Spencer, York; Mr. H. C. Shann, York; and Mr. Joseph Wilkinson, the Town Clerk of York. Dr. Wilson, hon. secretary, read the following

REPORT OF THE COMMITTEE FOR THE YEAR 1884.

The Association has now completed its ninth year. It is undoubtedly advancing in usefulness and importance. The number of members is fifty-six, an increase of two since last year. The Association has lost two members by death—Dr. Taylerson, of Whitby, and Dr. Muscroft, of Pontefract. Three members have resigned on vacating their appointments. There have been three meetings during the year. The first was held at Leeds in March, when G. Goldie, Esq. (Leeds), read a paper on 'Our Epidemic Diseases, and how they are Spread,' which provoked a lively discussion. Dr. Giddings then gave 'An Account of the Sanitary Work done at Calverley during the last Ten Years.' The second meeting was held at Halifax in May, in conjunction with the North-Western Association of Medical Officers of Health. Dr. Britton introduced the subject of 'The Working of the Factory and Workshops Act (Retail Bakehouses), 1883, in rural and semi-rural districts.' A very interesting discussion followed, in which Mr. Walton, Town Clerk of Halifax, took part. Dr. Hime (Bradford) then gave an address on 'Poisoning by Coal Gas.' Dr. Vacher (Birkenhead) read a paper on the 'The Dress of Women and Children,' illustrated by diagrams and specimens of clothing approved by the National Dress Association. Dr. Kenyon (Chester) introduced a discussion on 'Water Analysis,' in which several of the members took part. The third meeting was at Hull in October, where, after paying several interesting visits, the Mayor (Alderman Rollit, D.C.L., LL.D.) entertained the members at luncheon in the Town Hall. The papers were read by Dr. Mason (Hull) on 'The Sanitary History of Hull,' and by Dr. Bruce Low (Helmsley) on 'Rural Sanitation.' Considering the value and importance of many of the discussions, it is to be regretted that so few of the members avail themselves of the opportunities which these meetings afford of mutual instruction and encouragement in the vital principles of public health and sanitary science. There are many members who are never seen at these meetings, although every endeavour is made to suit their convenience by fixing the place of meeting in various localities from time to time in succession. Will not those apathetic members make an effort to attend at least one meeting in the year to show their interest in the Association and their approval of its aims? A good work is undoubtedly being done in encouraging the medical officers of health in their difficult duties. The Association, too, through the press is doing a great work in guiding and developing public opinion on the great health topics of the day. The office-bearers of the Association look to the members to support them in their efforts for the general good. A far larger number might contribute papers than do so at present. 'The willing horses are doing all the work.' Besides attendance at meetings and the reading of papers the apathetic members should remember their small annual subscription (5s., due Jan. 1), which the treasurer complains is collected with difficulty. The secretary will be glad to receive promises of papers for the coming year; and will also be glad to receive the names of any Yorkshire medical officers of health who have not as yet joined the

Association. The committee regret that no one was given during the ordinary session of Parliament year to present the memorial on the need for the out of the Dairies and Milk-shops Orders being to the sanitary authorities. The experience of outbreaks of disease, coincident with milk strengthens the arguments which can be offered of this change. The supervision of bakehouse again transferred to the sanitary authorities, and the out of the Canal Boats Act has been extended to few sanitary authorities first selected as authorities to every sanitary authority whose dis upon any navigable water. It may finally be granted that these changes, all imposing greater liability upon medical officers of health as the sanitary authorities, are evidence of greater confidence in the principles of local government, and also of confidence in local officers as custodians of the public health.

ELECTION OF OFFICERS.

The following gentlemen were elected the officers of the Association for the ensuing year:—President, 1 North (York), re-elected; vice-presidents, (Bradford), Dr. W. S. Giddings. Comm Arbuckle (Thorne), Dr. T. Britton (Halifax), Goldie (Leeds), Dr. Hardcastle, F.R.C.S. (R Mr. A. Roberts (Keighley), and Dr. Mason (H secretary, Dr. Wilson (Doncaster); and treasurer Bruce Low (Helmsley). Dr. Honeyburne, of elected a member of the Association.

THE PRESIDENT'S ADDRESS.

The President then said that it became his for the eighth or ninth time to thank the members of the Association for the honour they had done him in him to the position of president. Looking back somewhat lengthened period, he could say that things in which he had taken an active interest him more sincere gratification than the formation of a society. He believed that the institution of the Association had done much to encourage a spirit of confidence and kindness amongst the various medical officers throughout that great county, which would otherwise have been scarcely possible. He thought, further, that the Association had done a great deal to encourage and spirit of mutual confidence and respect between authorities and their officers, thereby doing great good to the cause of sanitary science. Again, eminent had resulted from the reports of the Association in the public press, and on behalf of the Association returned grateful thanks to the various newspapers which had given reports of their proceedings. Having reasonable excuse for the meagre attendance at the meeting—viz., this being the busy season of the medical officers of health—he said that there were two matters which he thought that the Association fairly consider. The first and foremost was that which a memorial was already prepared and was forwarded to the Legislature—viz., legislation with regard to the sale of milk. During the past ten years there have been accumulating an overwhelming amount of evidence to show that serious outbreaks of typhoid fever were over again traceable to the sale of infected milk. It seemed to him somewhat marvellous that the Legislature had not seen its way clear to adopt some measure by which the sale of milk might be placed under more immediate and constant control. The number of lives which had been lost, and the amount of time which had been lost, and the trouble that had been created by the unmistakable outbreaks of typhoid fever arising from infected milk were such that those who had taken the trouble to compare the results of the Association aimed at was that legislation on the subject, which was very meagre at present, should be entirely on the same lines as the Public Health Act, 1875, and the administration of all the regulations in regard to shops and dairies should be taken from the hands

police, as it now existed in the counties, and placed under the sanitary authorities of each district; and the supervision of those places should be primarily placed in charge of the medical officers of health of the respective districts. They were of opinion that visitation and inspection of the premises by the sanitary authorities should be allowed, and that all milk-sellers throughout the length and breadth of the land should be licensed, one condition of the licence being the satisfactory condition of the premises where they kept food. There was another subject which excited much attention. It was the question of over-pressure in education. He took a very wide view of the functions of medical officers of health, and he thought it was incumbent upon them that they should inform themselves what were the facts of that question. A great deal was written that was evidently absurd, and a great deal said that was obviously and grossly misleading. There had been a want of logical separation of what was due to social conditions and to education, and he was of opinion that no body of men probably were better fitted to guide the public on that question than officers of health, because it was given to them to know more particularly about the conditions of health of the people in all parts of the town or district in which they exercised their functions. They ought to be able to inform School Boards and local educational authorities what were the districts in which poverty, misery, and bad health prevailed, and to what extent it should influence the action of schools. They ought to educate public opinion to understand how much of that trouble was the result of disease and misery and poverty, and how much, if any—which he thought was an open question—was due to our educational system. He thought they would then contribute greatly to promote that which every right-minded man desired, *viz.*, that there should be full and careful study of the location of the people combined with a minute and careful study of the physical health conditions of the people.

It could be demonstrated that physical health was sacrificed by education, it would be an open question whether they had not better forego education and maintain physical health; but if it was, as he was very strongly persuaded, that education had nothing to do with the impaired physical health of the people, it would be their duty to point out to the people what those other and extraneous causes of that impaired health were, in order that legislation might provide remedies which were compatible with the welfare of the State. There was another topic which he believed would become in the near future more important than it was at present, *viz.*, legislation as to the hospital care and treatment of infectious diseases. He was perfectly satisfied that if sanitary work was to be done thoroughly it must be more or less in accordance with the general knowledge and sentiments of the medical profession, and he believed that any great advance in provisions for the health of the public, taken apart from the opinions and views of the medical profession, would be almost certain to end in failure. He believed that the better treatment of infectious diseases, and the prevention of epidemics, was essentially a medical question, and one which should not be adopted by any officer of health apart from the combined expression of the medical opinion of the neighbourhood in which he lived. He thought that medical officers of health should not allow that important question to grow without having made up their minds as to what was the right course to pursue in order that those hospitals might be brought into harmony with the medical profession at large. He believed all other methods and efforts to stem infectious disease and prevent epidemics were absolutely useless unless they were coupled with the provision of larger hospital accommodation, into which all cases of the community might be willing to seek admission.

THE GERM THEORY OF DISEASE.

Dr. Hime read a paper on 'The Germ Theory of Disease.' He said that his paper was intended to show the basis of belief for what is known as the germ theory of

disease, to trace out the leading events in the history of the theory, and to show the position in which it stands at the present time as a scientific theory fully verified by facts. It was about two hundred years since Robert Boyle first referred to fermentation as being the process strictly analogous to fever; and the same belief had become permanent amongst us, as indicated by the use of the word *zymotic* as applied to fevers, which really meant fermentative diseases. In more modern times Henle had, entirely on theoretical grounds, established the theory of germ disease before anything was known of the actual existence of germs; but it was to Pasteur and Koch that the theory was indebted for its present scientific aspect. It was not a little remarkable that Pasteur's early work had nothing whatever to do with disease. It was entirely concerned with fermentation proper, and it was he who first proved that what we know as ordinary fermentation was a process which was distinctly the outcome of the vitality and energy of the yeast plant, and not (as was taught by Liebig) a result of the development of the yeast plant. One remarkable characteristic of ferments was the great disproportion between the results which it was capable of producing when placed in a suitable medium and the exceedingly small quantity of material which could produce those results. It might be compared to the multiplication of infectious material, such as vaccine, when inoculated on the body. In further studies Pasteur ascertained that while some ferments required air to enable them to live and flourish, others were killed by its action. Hence he divided all ferments into two great classes—those which did not require air, or *anaerobes*, and those which did require air, *aerobes*. Subsequent investigations into another process—the idea of which even was disgusting, *viz.*, putrefaction—convinced Pasteur that it, like ordinary fermentations, was due to a specific ferment, which did not require air for its development, and which alone produced the phenomena of putrefaction: a process strictly analogous to fermentation, the two differing only in one circumstance—that in putrefaction offensive smelling gases were given off. The important bearing of putrefaction upon the organic matter of the world was illimitable, the ultimate fate of all animal and vegetable matter being the same—*viz.*, its restoration to the air, effected by the three omnipotent processes of fermentation, putrefaction, and slow combustion. The first great work which Pasteur was engaged in was the state of the wine disease, the remedy of which he discovered as well as the cause. He was next engaged in the investigation of the silkworm disease. Next Pasteur was engaged on the state of the disease affecting vinegar and beer, and this also he proved to be due to a specific minute fungus. When this was excluded the liquor remained unaffected. The central point of investigation—the application of the germ theory to the higher animals—was then mentioned, and the strict analogy between the process of fermentation and certain kinds of disease (such as fevers) was described. It was, however, in surgical practice that the truth of the germ theory first bore its fruits, and to England, in the person of Sir Joseph Lister, was due the glory of having established a method of surgical practice which had not only rendered familiar operations free from danger, but had rendered possible operations which, a few years ago, it would have been considered criminal to attempt. What was known as the antiseptic system of surgery was practised by the leading surgeons in every country in the world, and Sir Joseph Lister was recognised throughout the civilised world as one of the greatest benefactors of humanity. The first actual disease of animals to which Pasteur devoted his attention was anthrax, or malignant pustule. In 1850 it was discovered that the blood of animals affected with disease contained a number of little hair-like bodies, but it was not until some thirteen years later Dr. Devine, in the light of Pasteur's researches, bethought him that possibly these little bodies might be ferments which caused disease. He discovered by numerous experiments

that these little germs were inseparably connected with the disease, and the following remarkable sequence of facts established the necessary connection between the germ and the disease. In the first place, these minute bodies were found in the blood of infected animals, but never in healthy blood. In the next place, the inoculation of healthy animals with these minute bodies caused the unaffected animals to become affected with the same disease, and the blood to swarm with identically minute germs. Thirdly, blood taken from the infected animals after infection, but before the appearance of these minute bodies, and inoculated on healthy animals, failed to produce disease. Fourthly, healthy blood inoculated on healthy animals never produced disease. Fifthly, blood might be disinfected or even filtered and thus freed from the germs, and then when inoculated would be quite harmless. The method which Pasteur devised, and experimentally tested, was simply beautiful and conclusive. The essayist then described the 'flask experiment.' Pasteur also discovered that it was possible by proper methods of culture to deprive infectious germs of a portion of their virulence, and that in their debilitated condition they may be propagated from generation to generation, and reproduce themselves. He further learnt that these attenuated or weakened bacilli might be inoculated upon an animal, giving it a mild form of disease, which, however, would protect it from contracting a disease in its most severe form. The protective inoculation against anthrax was not, unfortunately, permanent. Pasteur's researches into chicken cholera and various other diseases were referred to, and the remarkable induction by which Pasteur obtained an attenuated protective virus by which this disease could be avoided, was also alluded to. The greatest experiment which Pasteur ever performed was that to test the efficacy of his protective virus on anthrax, and this experiment was lucidly detailed. In conclusion, Dr. Hime said that the bearing of that important theory upon public health was of very wide extent, and opened up to them an horizon, the extent of which exceeded anything ever dreamt of. If they really had ascertained the specific cause of consumption, anthrax, pneumonia, diphtheria, typhoid fever, and a number of other of the greatest plagues of humanity, more than the first step had been taken towards successfully combating those diseases. But they could not hope for rapid progress in this country while they were hampered by measures which entirely prevented the possibility of scientific research, and which, while it rendered perfectly legal the killing of rats and other vermin with the wanton intention of merely getting rid of them, rendered it a penal crime to inoculate a rat or a mouse with the object of saving human life.

In a short discussion which followed, Dr. Low alluded to the large contributions of Germany to the discussion of the germ theory as compared with that given by England. This he attributed to the circumstance that in England the Government suppressed science so far as it could by its legal enactments. He described the instruction the German Government afforded to country practitioners on the question of epidemic diseases, and he considered that at the recent Health Exhibition the English Government might have given similar facilities. Mr. H. E. Spencer dealt with the question of the germ theory in its bearing on the doctrine of evolution. In concluding his remarks he said that it did seem singular that they should find such a considerable amount of failure on the part of other observers to produce the results attained by Pasteur. Dr. Deville spoke of the investigations of Dr. William Budd, of Bristol, who was one of the first to experiment on the germ theory, and commended his researches to consideration nowadays. The President said that, if further research should confirm the germ theory of infectious disease the power placed in the hands of those who had to deal with the prevention of disease would be scarcely credible. He thought that that theory, taken side by side with Pettenkofer's views with regard to the

nature of the soil, might and probably did afford a rational explanation of localised outbreaks of typhoid fever, &c. In conclusion, he condemned that fanaticism which would deny scientific investigation which, by a few experiments, might save the lives of thousands of their fellow-men. Dr. Hime having replied, the meeting closed with an inspection of several microscopic specimens of the germs of various diseases exhibited by the writer of the paper.

BIRMINGHAM AND MIDLAND ASSOCIATION OF MEDICAL OFFICERS OF HEALTH.

THE tenth annual meeting of the Birmingham and Midland Association of Medical Officers of Health was held at the Council House, Birmingham, on Jan. 1. There were present Dr. Clark (Lichfield), Dr. Alfred Hill (Birmingham), Dr. Bostock Hill (Birmingham), Dr. Page (Redditch), Mr. C. Perks (Burton-on-Trent), and Mr. Henry May (Birmingham). Mr. Perks was appointed president for the ensuing year in the place of Dr. Strange (of Worcester), the retiring president, to whom a vote of thanks was passed. Drs. Page and Bostock Hill were elected vice-presidents for the ensuing year; and the hon. secretary, Mr. Henry May, was re-elected. The annual report, which was adopted, stated that there had been no change of importance during the past year. The number of members had decreased, owing partly to resignations and partly to deaths, Dr. Hickbotham, Dr. Rodin, and Mr. Darwin having died since the issue of the last report. Mr. Perks then read a paper on 'Sanitation,' which will be published in the SANITARY RECORD of March 15.

THE NATIONAL HEALTH SOCIETY.

THE annual general meeting of the society was held at 44 Berners Street on Feb. 3. Mr. Ernest Hart presided, and there was a large attendance of members. Additions were made to the lists of patronesses and vice-president, and Sir Joseph Fayrer and Sir Spencer Wells were elected upon the council. Valuable suggestions were brought forward as to the way in which the efforts of the society could be directed during the coming year, and the chairman urged upon the members the importance of making useful work known to their friends so as to secure new subscribers, increased funds being much needed. The annual report, with the balance-sheet, was laid before the members, who were pleased to learn that the stall offered to the National Health Society, for the sale of its publications, at the International Health Exhibition had been very successful,—an average of no less than 1,500 pamphlets and leaflets having been sold weekly. The meeting closed with votes of thanks to the chairman and officers of the society, including Mr. Richard Eve, barrister-at-law, who had kindly procured the Act of Incorporation.

THE WATER SUPPLY OF LINCOLN.

OUR contemporaries, the *Lincolnshire Chronicle* and the *Lincoln Gazette*, have furnished us with the following facts connected with the water supply of Lincoln.

On Nov. 18 last, two samples of the drinking water supplied to Lincoln were sent to Dr. A. Dupré for analysis. He reported that the water was a 'second-class drinking water,' and showed 'strong indications of pollution by sewage or surface drainage.'

Professor Wanklyn next analysed the water and described it as a 'second-class water,' 'fairly pure, but cannot be said to be excellent.'

Dr. C. Harrison says: 'Although this water contains an excess of organic matter, making it only a second-class water, I am of opinion there are no strong indications of "pollution by sewage," as stated in Dr. Dupré's report.'

Mr. Fisher is of opinion that the water 'is entirely satisfactory in quality for a town supply.'

It may be as well to mention that in essential particulars

the results obtained by the four analysts are fairly concordant, so that the discrepancy lies only in the conclusions drawn from them.

In a letter to Precentor Venables, of Lincoln, which was published by that gentleman in the *Lincolnshire Chronicle* for Dec. 12, 1884, Dr. Dupré complains that Dr. Harrison misquotes his conclusion. Dr. Dupré stated that the water showed indications of pollution by sewage or surface drainage, and, as he very truly states, it is rarely possible to decide by analysis alone from which of these two sources the polluting matter comes. 'This can only be decided,' he continues, 'by careful inspection;' and to these words we would draw the attention of the Water-works Committee and Corporation of Lincoln.

Dr. Harrison agrees with Dr. Dupré that the water contains an 'excess of organic matter.' This organic matter must have a source. Chemical analysis has shown that, unless a natural water is unduly fed with organic matter, the quantity found in solution in water does not exceed a very small amount, the normal limits of which are fairly well defined and recognised. If the quantity of organic matter exceeds this normal limit, we examine as to its nature, whether it be vegetable or animal. There are certain distinctions between the two which are well known to chemists. Dr. Dupré satisfied himself that the organic matter in the Lincoln water was of animal origin; and he was therefore justified in expressing the opinion which he did as to its pollution by sewage or surface drainage. Chemistry having indicated the existence of the excess of organic matter over normal amounts, the nature of the organic matter, animal or vegetable, and in very rare cases the source of the animal organic matter—e.g. where there is large contamination with sewage, has done all in its power. Armed with the information obtained from the chemist, the sanitary engineer should complete the work by the 'careful inspection' mentioned by Dr. Dupré. The whole course of the stream, watercourse, or conveying-pipes, through which the water passes, should be carefully inspected with special reference to the discovery of the source of contamination indicated by the chemical analysis. Any sewage contamination in particular must be immediately arrested, and the water deemed unfit for drinking as long as it exists. This cannot be too strongly insisted on. The water draining off manured land must also be viewed with suspicion, but of course it is the existence of human excreta in drinking water which must be more particularly condemned, owing to the great risk there is that such organic matter may contain germs of infectious disease.

Perhaps, therefore, it may be a little too soon to attempt to 'calm the fears of the most timid,' and to show that 'there is no ground for the "scare"' attempted to be raised'; it will be a grateful task to do that after the careful inspection has been made, and when the absence of polluting agencies has been proved.

Meanwhile, we may be certain that the population of Lincoln will be less injured by a little wholesome agitation of the mental kind than by an epidemic of typhoid or dysentery, which we hope they will not experience; and the final expenditure of public money will be far less if the drinking water is purified than if some insidious source of contamination is allowed to continue and perhaps increase until it becomes productive of serious results upon the public health.

THE TYPHOID EPIDEMIC AT KIDDERMINSTER.

THE report of Dr. Parsons, the Local Government Board inspector, who was deputed to investigate the causes of the widespread and alarming epidemic of enteric fever which wrought such havoc in the town of Kidderminster from the beginning of August till about the end of November last, has just been issued, and was brought before the consideration of the Town Council there on the 4th inst. It is a lengthy document, and, though not satisfactorily

accounting for the outbreak, contains a number of recommendations calculated to remedy various evils and defects in the sanitary system and water supply of the town, and to prevent a recurrence of a similar calamity. The report points out that from August 1 to August 15 there were 20 cases of fever. During the next fortnight there were 141, in 110 households. At the time of his visit to the town, in October, the number had increased to 620, and up to November 14 reached a total of 1,200; the number of deaths from August 25 to that date having been 89. One curious fact is that women suffered in greater proportion than men, out of 1,106 cases in which the sex of the patients was recorded there being 627 females to 479 males. The epidemic was from the first generally distributed over the whole of the borough, and no noteworthy difference was observable in the prevalence of the fever where there were water-closets or where midden-prives were in use. From the sudden and general character of the outbreak it was evident that the cause must be sought in some condition or association of conditions, in the first place common to the whole town, and secondly, coming into operation about the beginning of August. As to the probable causes, Dr. Parsons puts on one side the milk supply, and, although stating that 'no words of condemnation can be too strong for the system of midden-prives in Kidderminster,' says that does not explain the sudden outbreak. There was no doubt, he says, that both the sewers and house-drains throughout the town were seriously defective; some of the manholes had bottoms below the invert of the sewer, and thus retained putrefying sediments; large quantities of heated liquids from the factories ran into the sewers, raising the temperature of the sewage, promoting decomposition, and increasing the tension of the air; no provision was made for preventing the forcible ascent of air from the main sewer to the branches on higher levels; the flushing had been defective during the previous dry summer, and the sewers were of comparatively small size, and not water-tight. But these defects, together with those in the house-drains, had previously existed, and typhoid excreta had passed through them without causing an outbreak. Dr. Parsons next deals with the water supply, and criticises at length the surroundings of the supply obtained from what is known as the lower well, near the sewage-pumping station, which was so much talked about at the time, and was fully described in the *SANITARY RECORD*. After considering the possibilities—1st, of a contamination of the water supply at its source; secondly, of local contamination through reflux of foul matter into the terminal branches, Dr. Parsons cites a number of circumstances which favour the former hypothesis, such as the universal distribution of the fever over the area supplied from the Kidderminster mains, the dangerous proximity of the lower well to the sewage works, the large incidence of the fever upon water drinkers, and indications of the impurity of the water on certain occasions. The heated state of the sewage, with deficient access of air, would lead to a close imitation of the conditions under which the contagium multiplies in the human intestine. If, therefore, at the time when enteric excreta were entering the sewers, any portion of the sewage had got into the water supply, the danger might have been as great as if the sewage had actually come from a fever patient. While obviously inclining to the cause of the outbreak being traceable to contamination of the water supply of the town, Dr. Parsons comes to the ultimate conclusion that the cause of the outbreak cannot with certainty be assigned.

It is a somewhat interesting feature to note that at the sewage farm, which lies outside the borough boundary, not a single case of fever occurred among the persons subject to the influence of the effluvia therefrom, although the excreta of the typhoid patients was there treated—a striking proof of the deodorising and purifying power of earth. Dr. Parsons then makes a number of practical recommendations for the prevention of future outbreaks.

The Town Council also had before them a report from Mr. E. Pritchard, C.E., and Mr. Comber, the borough surveyor, as to the works necessary to be carried out. They propose sinking a new well, providing machinery to raise 1,250 gallons per minute, and a covered reservoir to hold 1,500,000 gallons, also to institute various alterations of the sewerage system; the total cost being estimated at 25,000/. It was resolved to hold a special meeting of the Council for the consideration of the whole subject.

BUILDING MATERIAL AND MANUFACTURERS' EXHIBITION AT LEEDS.

DURING the past month an exhibition has been held in the Coloured Cloth Hall, Leeds, of a similar character to the Building Exhibitions annually held at the Agricultural Hall, Islington. Mr. Philip Shrapnel, of Agricultural Hall, was secretary and manager of the Exhibition, and carried it out in the most satisfactory manner. The Exhibition was the largest and best yet promoted by private enterprise in the provinces; the exhibits were of a varied character, but the good largely preponderated, and, if a large number of them presented no new features, they were none the less interesting to the inhabitants of the large district of which Leeds is the centre.

Messrs. Doulton & Co., Lambeth, had a good representative exhibit of all their newest specialities, and of their celebrated Doulton ware, all of which were explained in detail in our WEEKLY EXHIBITION RECORD. It is now an acknowledged fact that Messrs. Doulton's sanitary appliances are amongst the best and those most to be relied upon manufactured at the present time.

Moule's Earth-closet Company were present with an excellent assortment of their famed earth-closets, with models showing arrangements for fixing, and a model showing an upstairs earth-closet and the easy manner by which it can be attended to from the ground floor. They also exhibited the model shown by them at the International Health Exhibition (where they obtained a gold medal), illustrating the manner in which a range of earth-closets can be set up for a school or large establishment.

Mr. Heaps, of Greenheys, Manchester, exhibited through his local agent the earth-closets that have so long and successfully been manufactured by him, and which have been described in the SANITARY RECORD on previous occasions. They are in large and increasing demand, and have received high commendation.

Mr. Henry Wainwright, Alfred Street, Boar Lane, Leeds, exhibited two new water-waste preventing cisterns recently patented by him. One of them is on the syphon principle, fixed in a wood cistern lined with lead. It has two compartments, one for ball-cock, the other to regulate the supply by the syphon. This is charged by means of a cylinder in which a plunger works, and that being

pressed down forces the water into the charging pipe against a foot valve (which then closes), and so into the pipe over the side of the cistern. This syphon differs

from many others, in so far that the discharge pipe is carried to the outside of the cistern, and there are no openings below the water-mark for water to escape. From the opportunity afforded to the writer of testing it, it appeared unerring in its action and simple in construction, and it is claimed that this water-waste preventer can be produced at a lower price than any syphon action in the market. The other (which we illustrate) is on the double valve principle, and has also two compartments. It is made of wood lined with lead, a mode that seems to find favour in Yorkshire. It is a water-waste preventer in the strict sense of the term. When the handle is pulled, the main valve in the large compartment, which is of the ordinary kind, of course opens and discharges the regulation quantity of water, but at the same time the valve in the smaller compartment closes, and remains so as long as the handle is held; and as this is the one in which the water first enters to refill, no further quantity can be discharged until it is again full. It likewise prevents another form of waste. It appears to be a common practice in the northern parts of the kingdom, where the cold is more severe, and frosts of more frequent occurrence, for householders to slightly open the valve of the closet water-cistern at night to allow a small stream of water to run continuously, so as to prevent the contents of the pipes freezing. In Mr. Wainwright's cistern this is prevented, for, as we have remarked, when the discharge valve is opened the smaller or side one in the other compartment closes, and so arrests the supply. Water companies will, no doubt, appreciate Mr. Wainwright's efforts to prevent this waste of their commodity. This is a cistern that may be introduced with advantage into the London market.

Messrs. Hodgkinson & Clarke, Limited, Canada Works, Small Heath, Birmingham, made an extensive display of their specialities. A prominent feature was the collection of school furniture, which has been fully described in the columns of the SANITARY RECORD. To say that the firm have introduced many commendable features into scholastic appliances is the smallest testimony that can be borne to their enterprise. They have also given the means of furnishing the school-room with cheerful and comparatively inexpensive adjuncts, alike pleasing to pupil and teacher.

Messrs. Illingworth, Ingham, & Co., of Leeds, also exhibited some very good school furniture, and a commendable collection of joinery work, of which they are extensive manufacturers. This collection included a variety of machine-made wood mouldings, wood-turnery, and Swedish doors.

Washing and laundry appliances were exhibited by Messrs. Bradford & Co., of Manchester and London, and comprised the principal inventions which have rendered their name so popular.

Messrs. Kenworthy & Co., Alpha Works, Oldham, were well represented by their noted Paragon Washing Machines, which have secured a large amount of popular favour. Illustrations of this machine, with a somewhat recent addition of a patent automatic plunger, are appended. It works up and down in the tub, and is without doubt a valuable addition to the cleansing process. At the International Health Exhibition a silver medal was awarded to this machine, being the highest award granted to any special hand-power washing machine. The plunger in question is made to perform the work of the well-known 'Dolly' or 'Peggy,' which is in almost universal use in the Midland and Northern counties, and which was in existence long before washing machinery was introduced. By turning the hand-wheel, which actuates the plunger it is moved upwards and downwards in the washer about sixty times per minute. It is constructed of several cones, one inside the other, leaving spaces between each. In working, these spaces receive a volume of compressed air, acting as a cushion, and unspherically forcing the water and soap through the clothes, which rapidly loosens the grease and dirt, and removes it

injury to the most delicate fabric. The plunger has a spring, so that, should a larger quantity of linen be put in the machine than could conveniently be

at one time, the spring yields, preventing damage to the machine or contents. The Paragon Machine, mounted on castors, can be fitted either with a wringer or a wringer attached to the top. The Canadian Washer,

utensil shown by the firm, partakes of the character of the plunger above described, as used with the

Paragon Washer; but, as will be seen by the illustration, is intended to be used entirely by hand, and with the deep round tub in general use in the north by those who do not possess a washing machine. The description given of the plunger in the Paragon Machine applies equally to the Canadian Washer, which amounts to a larger example of the same appliance. It is made either of tin or copper, and of the former material can be sold retail at 3s. 6d. Although it has not been very long introduced, it is said by the makers that over 100,000 of these washers have already been sold. The plunger is bound to take the place of the old-fashioned 'Dolly,' not on account of its cheapness only, but by the ease and marvellous amount of work it accomplishes when compared with the old type it is intended to supersede. Londoners and residents in the southern and western part of the kingdom are not much acquainted with the mode of washing generally adopted in the north, but so much interest was taken in this appliance when shown at the International Health Exhibition (where a large number were sold) that this system of washing will probably be extensively adopted amongst householders not hitherto acquainted with its advantages.

Messrs. C. Kite & Co., Chalton Street, London, N.W., while exhibiting their general system of ventilation for both buildings, drains, &c., showed some artistic designs in the form of brackets, small cabinets, &c.; while being useful for the purposes indicated by their form, were made to act as inlet ventilators, on the plan introduced by Messrs. Kite, for admitting fresh air into rooms. Their exhaust chimney-breast ventilator, which acts without making any unpleasant noise, and has received high commendation and awards, was a prominent article in the display.

Mr. James Edward Ellison, Victoria Square, Leeds, made an imposing display of his ventilating appliances, all of which have been described in these columns on several occasions. Amongst his improvements we may, however, mention one in connection with his ventilating tubes for the admission of fresh air into apartments, which are now made with expanding tops, that have the effect of spreading the air over an extended area, and so preventing draught. The principle on which these tubes are constructed is the same as that of his patent conical ventilators, of which an immense number have been fixed, and that have gained him not only a gold but silver and bronze medals and numerous certificates. The exhibit also comprised a variety of glass, louver, and other ventilators, fanlight openers, &c. Mr. Ellison's abilities as a ventilating engineer are well known and appreciated by a large number of architects, under whose specifications he has carried out a large number of important works.

Messrs. Verity Brothers, Call Lane, Leeds, who have from time to time introduced many commendable inventions in connection with windows, fanlight-openers, &c., exhibited a new reversible sash window for enabling sashes to be reversed, so that they can be cleaned from the inside, and for opening them at any angle, &c. Although not the first invention of the kind introduced by this firm, it is of a more solid and durable character, combined with simplicity of action, than has come under the cognisance of the reporter. The most important part in the reversible system is the pivot on which the sash revolves, and it is the only one on which a doubt as to the safety of the invention has occurred to him, for, should one of the pivots break, the sash would in all probability fall into the street, to the imminent danger of life. In their new sash, Messrs. Verity Brothers have evidently been impressed with this idea, for it is made of exceptional strength, and is carried further into the sides of the framework than in others we have seen, and will, we believe, entirely satisfy the critical examination of any architect. A new window blind action of an inexpensive character was also shown, that may be termed simplicity itself, and for which we anticipate a wide demand.

Mr. R. Adams, of Great Dover Street, London, S.E.,

made a somewhat similar display to that we are accustomed to see of his varied specialities in connection with windows, doors, locks, &c. A new heavy door spring hinge was exhibited named the Victor, intended to resist heavy winds in exposed positions, this end being accomplished by simply reversing the springs, of which there are two of unequal strengths, to opposite positions. The removal of the springs is effected by turning the set screws with the ordinary screw driver, or spanner, and can be done without removing the door. An improved mode of fixing the simple mechanism to his fanlight opener was also shown, which is now made to simply screw on to the framework, instead of having to be let in as heretofore.

In connection with ventilation an exhibit of considerable interest was that of the Harding Ventilator Company, East Parade, Leeds, of which some illustrations are appended. For the past four or five years the Harding mode of ventilation has been extensively adopted in the Midland and Northern counties for all kinds of buildings, including schools, churches, factories, private dwellings, &c. The proprietors, however, do not appear to have made any permanent arrangements for its introduction into the metropolis, where its advent should be appreciated. The inlet ventilators are framed upon a somewhat different principle to any other, and have the advantage, now considered almost indispensable in all ventilating appliances,

of being adaptable to different kinds of ornamental structures, where the actual use may be virtually concealed, and the mode of introducing fresh air be utilised for holding pottery, statuettes, or other ornaments. The first illustration represents in section and elevation an ordinary inlet ventilator without the additions above named, but which is the basis as regards the arrangements on which all are constructed. It will be seen that it consists of a lower box surmounted with a conical or semi-pyramidal structure. This is fixed against the wall, communicating

with the outer atmosphere, a grating being fixed over the opening. The air entering first passes through a filter formed of frames covered with a very fine silk gauze, such as is used in milling machinery for sifting the finest flour, and which is capable of arresting the very small particles

of dirt and soot with which the air of most towns is laden. It then rises and passes into the room through the apertures shown, which, it will be observed, taper off to a single one at the top. These apertures are not merely holes on the face of the ventilator, but are tubes of a certain length, and in passing through these the air is naturally compressed, but expands as it is set free, and the currents are, so to speak, broken up and diffused in all directions, so that no draught or chilly sensation can be felt. The 'air diffuser' is placed about 7 feet 6 inches from the ground, and the tubes stand at an angle of about 30° with the wall. Our next illustration represents a design for ventilating a church by means of the window. It will be seen that the pyramidal form of inlet, which is the ruling feature in the Harding system, is here maintained, and the tubes in this case are of glass. The air enters from an opening at the bottom from the window, and in all cases a valve is attached to regulate the admission of the air. In connection with church ventilation, Messrs. Harding have—by order of the Dean of York—applied their system to Archbishop Zouche's Chapel in York Minster, and for this a special design was made. The work has proved so successful that the firm have received a most complimentary letter from the dean. As regards exhausts, for ordinary rooms a suitable one is made by the firm, or they do not object to any well-known one of other makers being used; but for carrying off the vitiated air from large buildings, or wherever it is collected in a dwelling-house into a main shaft, their Patent Air Extractor is recommended. This is of the fixed order, and is perhaps the cheapest of its kind. Our illustration depicts the elevation, and the interior contains the tube shown at the bottom carried to a certain height, where it is capped with a cone, open of course around the sides. In use, the air impinging upon

the outer cones becomes deflected, creating an induced upward current in the tube; and the small inner cone acts as a deterrent to the admission of rain, snow, &c., which we are assured cannot possibly enter. The extractors can be placed within an ornamental turret of any style of architecture, which does not affect their action. The Harding mode of ventilation possesses considerable merits and deserves all that has been said in its favour by those who have adopted it.

Messrs. Billington Brothers, Hope Street, Liverpool, were present with an assortment of their Patent Metallic Spring Mattresses for hospital and domestic use. These have been fully described in the *SANITARY RECORD* on previous occasions.

Mr. J. A. Somerset, St. Nicholas Buildings, Newcastle-upon-Tyne, exhibited a mode of ventilating rooms and buildings (Connell's patent). In one of the arrange-

ments double windows are utilised, the space between the two receiving the fresh air from the outside and admitting it into the apartment through a kind of fanlight-valve. Means of warming the air in cold weather by a jet of gas are also provided. The same plan was also shown by means of a ventilating tube built in the wall, and by others fixed on the wall of the room itself; but as on a future occasion the system will be fully illustrated in the *SANITARY RECORD*, a detailed account is reserved for that occasion. Specimens of dormer windows called the 'Combination' were also shown, which contained notable improvements. Description of these, also, is deferred until illustrations of them are laid before our readers.

Messrs. H. Thompson & Co., Merrow Street, Waiworth Road, S.E., had an attractive display of their Magnetic Iron Oxide Paint, especially adapted for damp walls. As a proof of its worth for this particular purpose, it was the only damp wall paint to which was awarded a gold medal at the late Health Exhibition. These paints are also well suited for coating iron in exposed situations, possessing good body, and drying quickly. A notable example of the value of this paint for damp walls was shown by a course of damp brick-work covered with it, demonstrating the inability of water or damp to penetrate through it.

Mr. James B. Petter, of Yeovil, drew considerable attention, as usual, to his popular Nautilus Grate, which was originally noticed and illustrated in connection with the Smoke Abatement Exhibition. It unquestionably maintains its pre-eminence as the most unique open fire-grate of the day.

Messrs. James Nelson & Sons, Briggate, Leeds, made an imposing display of Grates, Mantelpieces, and other furniture connected with the fireplace. A notable feature in the exhibit were the patent fuel economising and smoke consuming grates, manufactured by the firm upon the principle advocated by Mr. Pridgin Teale, of Leeds, whose exertions in this direction are worthy of all praise. The grate in question was described in our issue of Feb. 15, 1884, but the importance of the questions involved justify a repetition of that description. The grate, as this illustration shows, is an open one. The whole of the fire basket, with the exception of the front bars, is of fire-clay of solid pro-

and, amongst the recent orders received by the firm, was one from Prof. Tyndall, F.R.S., who has had his house entirely fitted with this form of grate. Great heat, with a small consumption of fuel, are its leading characteristics.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

'Something attempted, something done.'

BACUP.—The fatal prevalence of typhoid fever here in 1883 is naturally a subject to which Mr. J. Brown, in his annual report, draws prominent attention. For the most part the cases were first brought to notice by the Registrar's returns, so that the information came too late for any useful preventive measures to be taken. In almost every house in which the disease appeared there were sanitary defects, the most common being untrapped slop-stones and drains. Indeed, as a rule, the health officer found the slop-stone pipe connected directly with the drain, which practically ventilated into the house. Mr. Brown animadverted upon this deplorable state of things, and recommends that all slop-stone pipes should be effectually disconnected, a recommendation which the authority now properly insist upon being carried out in all new buildings. Eleven out of the 26 deaths referred to zymotic causes were attributed to infantile diarrhoea, and occurred principally in delicate and badly-fed infants. Whooping-cough, which prevailed with short intermissions during the whole of the year, destroyed the lives of five children. From all causes the deaths numbered 452, being equivalent to an annual death-rate of 17.72 per 1,000 of population, the lowest registered in the district since 1877. During the year many houses were connected with the main sewer, and a number of privies on the old midden and tank principle were converted to the pail system. Some extension was also made in the drainage, and a satisfactory arrangement arrived at for the disposal of refuse.

portions. The principal peculiarity is in the shape of the back, which projects prominently forward, while that portion of the fire basket beneath it recedes, giving it somewhat of the character of a retort, causing an intense heat to be generated, which produces more perfect combustion, and causes the hydrocarbons to be more effectually consumed, reducing smoke in a corresponding ratio. Mr. Pridgin Teale's economiser is attached to the bottom of the bars in front, which, by means of a ventilating slide, enables a quick draught or slow combustion fire to be obtained at will. This grate has been extensively adopted since its introduction,

BARNESLEY URBAN.—No great schemes of improvement were carried out in Barnesley during 1882, but much good work of an unpretending character was accomplished. Thus, 185 of the old-fashioned conveniences with open ashpits were pulled down and replaced, whilst 43 others were altered. Some progress was made in the ventilation of the sewers, but the question of an improved system of refuse removal has been postponed. In referring to the past work of the authority, Dr. Sadler finds some cause for congratulation in the fact that the death-rate amongst infants and amongst children was, with one exception, below any registered in the borough during the last fifteen

years, that the mortality from continued fever has diminished, and that the influence of a pure water supply was discernible in a lessened fatality from diarrhoea. The total number of deaths due to the town was 646, which, based upon a population of 29,789, was equal to a death-rate of 21·68 per 1,000. The zymotic mortality arose exclusively from four diseases—scarlatina, whooping-cough, diarrhoea, and fever, with a death-roll of 87, or about 3·0 per 1,000 of the population. The outbreak of diarrhoea was confined principally to August and September, scarlatina to September and October, and whooping-cough to November and December. Chest affections were also very fatal during the last two months of the year, when 41 per cent. of the total number of deaths occurred. The past year was marked by a widespread epidemic of measles, which accounted for no fewer than 45 deaths out of a total referred to the principal zymotic diseases. With but four exceptions all the sufferers were children under five, and the infantile death-rate was, in consequence, much higher than usual. The general rate of mortality (23·53 per 1,000) exceeded any recorded since 1875, although it was below the average of the preceding ten years.

BRANDON AND BYSHOTTLES.—The circular issued last year by the Local Government Board in view of the prevalence of cholera in Egypt, and of the possibility of the disease reaching these shores, seems to have produced, at any rate in this district, excellent results. Referring to the subject in his last report, Mr. Blackett observes 'the Order of the Central Board has been attended to, and everything done to put the district into as wholesome a condition as times and circumstances allow. Your Board and the officers are amply rewarded for the trouble by having a death-rate of 16·31 per 1,000.' The district seems to have been thoroughly and systematically inspected, and to this the health-officer attributes the absence of fatal sickness, disease, and mortality. From the principal zymotic causes the deaths numbered 29, equivalent to a rate of 2·29 per 1,000, no fewer than 18 being referred to fever of an enteric type. For the most part Mr. Blackett was unable satisfactorily to account for this serious mortality from a disease so intimately associated with filthy surroundings. He notes, however, that death generally happened 21 days after the attack. Measles and scarlatina together accounted for six deaths, 'which, with a migratory population, may be expected,' and diarrhoea for a similar number.

BUILTH RURAL.—A considerable portion of Mr. John F. Herring's interesting report is occupied in examining the circumstances attending a widespread and fatal outbreak of whooping-cough and a less destructive epidemic of scarlet fever. In the spring and summer of 1883 whooping-cough was universally prevalent throughout the district. Where it began, or from what source it originated, Mr. Herring cannot say, a large number of cases having occurred before he heard of the outbreak. Of the eleven deaths registered from this cause, three happened in one family, the disease proving fatal within seven days. There was nothing particular about the cottage inhabited by these people except perhaps that its surroundings were more than usually damp; and Mr. Herring asks whether it may not be that such accompaniments, as in the case of diphtheria, assist in the development and propagation of the disease. In connection with the outbreak of scarlet fever, the health-officer notes that whilst there were numerous cases all over the district, and in a neighbouring village forty sufferers, no fatalities were registered except in the village of Howey, which furnished all the four deaths from the disease. In 1882 the authority were at some pains and expense to provide a small scheme of drainage for the village, and at the same time closed four cottages which were unfit for habitation. Inquiries were made as to the water supply, which was found to be of good quality and of sufficient quantity, the only drawback being, occasionally, a difficulty of access. Altogether the village has had more than its quota of sanitary supervision,

yet in an epidemic of seventeen cases, four, or 23·5 per cent., proved fatal. Mr. Herring is at a loss to account for this, but he points out that the village is badly situated, and the houses, which are of a very low class, naturally damp. The death-rate from zymotic diseases was equivalent to 2·21 per 1,000, and from all causes to 20·12.

CAMBRIDGE URBAN.—For obvious reasons, the sanitary circumstances of Cambridge possess more than local interest. Much progress of a general kind has undoubtedly been made of late, but the Council have still ample work before them. In his report for 1882, Dr. Anningson spoke of the condition of one locality as follows: 'As to Romsey town, only little improvement has at present been effected; indeed, until some combined public measures are adopted, any great improvement is difficult of accomplishment. Here are a number of dwellings approaching to 200, built without any better means of excrement disposal than leaky or overflowing cesspools and "guzzle" holes, with no surface drainage, and with roads that are at times nothing better than quagmires.' The only happy circumstance in this locality is the opportunity of getting a good supply of wholesome water from the company's mains. The defective sanitary condition of Romsey town, has attracted the attention of the Local Government Board, whose inspector, Major Tulloch, has recently visited the place and reported it to be in a most shocking and disgusting condition. There was an exceptionally fatal epidemic of measles in 1883, and scarlatina maintained the fecundescence which commenced in 1881. The mortality from whooping-cough and typhoid fever was below the average, and neither diphtheria nor small-pox was fatal in any one case. The general death-rate was equivalent to 18·0 per 1,000 of population, comparing with 16·2 per 1,000 in 1882. We trust that the public attention recently directed to the abominably unsanitary condition of the Cam will not be lost upon the Corporation.

CARLISLE.—Mr. William Brown, successor to the veteran Dr. Elliot, has lost no time in bringing into prominence the many defects in the sanitary condition of his district. Especial attention is drawn to the danger which threatens its water supply by sewage contamination. The sanitary authority should bear in mind the terrible consequences that have followed the consumption of polluted water, and should not relax their efforts to secure improvement until the slightest possibility of contamination has been removed. The condition of the slaughter-houses is scarcely of less importance. It is quite common, Mr. Brown writes, to find water-closets and ashpits in close proximity to the slaughter-houses, and manure heaps upon which blood and other refuse putrefy and pollute the surrounding air are inseparable from slaughter-houses of this description. Such conditions cannot fail to lower the health of the inhabitants, who are by circumstances compelled to live within their immediate vicinity, to say nothing of the serious dangers arising therefrom during the prevalence of zymotic disease. This state of things has practically obtained for the past forty years, despite the constant appeals of the late health-officer to secure the erection of an abattoir. This, indeed, is the only remedy, and it would, if adopted, put an end to the present extensive traffic in diseased and unwholesome meat. It is not remarkable that the 'trade' should object to the erection of a central slaughter-house, but the time has arrived when, in the interests of the public health, such considerations should be put aside. From every point of view the health of the town in 1883 was much better than of late years. Zymotic diseases accounted for 67 deaths (with a death-rate of 1·8 per 1,000), against 189 in the previous year. An epidemic of scarlatina, fatal to 23 children, demonstrated very forcibly the influence of schools in spreading infection, and the occurrence of a few cases of typhus showed the value of immediate isolation and disinfection. Each case of typhoid fever, from which eight deaths were registered, was carefully investigated, but in the majority of instances the cause was not ascertainable. The general death-rate,

equivalent to 21.0 per 1,000, was 3.7 below the average for the last nine years.

CHESTER.—Dr. Kenyon reports that steady progress has been made in effecting structural alterations in the drainage of houses by the substitution of glazed earthenware pipes, with proper fall, for old and unsatisfactory arrangements. In all cases the new drains are efficiently ventilated, and waste-pipes disconnected. The ventilation of the sewers, which was completed in 1878, has exercised a marked influence on the mortality from typhoid fever, the deaths from this disease during the five years ending 1883 being exactly half as many as in the five previous years. An examination of the tables of cases of infectious disease coming to the knowledge of the health-officer shows more strikingly the same decrease. During the five years ending 1878, 227 cases of measles were reported; during the five subsequent years 97. With regard to scarlet fever the numbers are respectively 332 and 120; of typhus 25 and 4; of typhoid 216 and 129. Although, as Dr. Kenyon points out, other agencies have been at work, he thinks that the ventilation of the sewers has clearly been followed by a great improvement in the public health. There was a remarkable diminution in the mortality amongst children, and there was also a slight reduction in the deaths of persons at the other end of life. From all causes the deaths numbered 708, being equivalent to a rate of 18.43 per 1,000. But little trouble was caused by zymotic complaints, none of which were present in an epidemic form.

DERBY.—A noteworthy feature of Mr. Iliffe's reports is an exhaustive account of the working of a Local Act, requiring the compulsory notification of infectious disease; but, as this was referred to at some length in our notice on his report for 1881, the subject may now be passed over. The death-rate registered in 1882 (18.7 per 1,000), was the lowest ever chronicled up to that date, whilst that for 1883 (18.2 per 1,000) was even lower, and was less by 1.6 than the average for the previous six years. Scarlet fever was the most prevalent and fatal of the zymotic diseases during 1882, causing, amongst some 770 cases, 63 deaths. In 110 instances the patients were removed to the infirmary, many others being refused admittance for want of space. This reflects a state of things by no means creditable to the Town Council, who seem to possess but one hospital, which is restricted to cases of small-pox. Scarlet fever is an eminently infectious and dangerous disease, and, while the borough remains in its present unprotected state, so long will the task of limiting the spread of infection be next to hopeless. Mr. Iliffe properly draws attention to the subject, and it is to be hoped that his recommendation for further hospital provision will receive practical recognition. The zymotic death-rate of 1883 was the smallest ever recorded. Whooping-cough was very prevalent, and there was an increase in the number of deaths from diarrhoea, but the mortality from typhoid exhibited a marked decrease as compared with 1882.

DONCASTER COMBINATION.—In an interesting report for 1883, Dr. Mitchell Wilson observed that an active prosecution of sanitary works in the rural districts has done much towards lowering the death-rate. There is, however, a danger lest the full benefits of such works should not follow them for want of clearly understanding the purpose desired in carrying out, say, the protection of drinking water, in sinking wells, in the disconnection and ventilation of house-drains and in the reconstruction of privies, ashpits, &c. Country workmen have as yet a great deal to learn about such matters, and it is to be regretted that they so seldom avail themselves beforehand of the advice readily afforded by sanitary officers. Bad workmanship is disappointing both to him that pays, and also in its beneficial effects, and it would be of interest to all alike if a plan or description of such works and alterations had first to be submitted to the sanitary authorities. The average death-rate of the four rural districts

was equivalent to 19.2 per 1,000, and in the three urban districts to 18.1 per 1,000. The zymotic rate ranged from 1.1 at Selby to 3.7 at Goole.

DURHAM RURAL.—Sanitary work was rapidly pushed on in this district during 1883. Badly-constructed drains were amended, sewers on an extensive scale were constructed, and nuisances abated as promptly as the circumstances of the various colliery villages would permit. Much still remains to be done, notably as regards improving the water supply and the removal of refuse. Mr. Blackett states that, except in cases where the owners of collieries employ their own workmen and carts to remove the contents of privies and ashpits, there is considerable difficulty in getting them removed as often as necessary. The remedy for this is the adoption of sec. 42 of the Public Health Act, which confers upon sanitary authorities the power of themselves undertaking or contracting for the removal of house refuse. Small-pox caused much trouble and anxiety during the year, the spread of the disease being largely assisted by the gossiping habits of the people, and a general aversion to, and neglect of, vaccination. The infection was first imported into Tudhoe by a woman, who was attended by an unqualified practitioner. In consequence of the cause of death being incorrectly stated, the health-officer did not hear of the case until fifteen days afterwards. During this interval the real nature of the disease had been concealed, and on making examination of the houses in the same street and elsewhere Mr. Blackett found six other cases. Precautionary measures were at once adopted, and in about a month the infection seemed to be stamped out, not, however, before it had been carried to several adjoining townships. There was little prevalence of other zymotic disease, which may account, perhaps, for the summary manner in which the health statistics are discussed. The death-rate from all causes represented a rate of 19.39 per 1,000 of population.

GUISBOROUGH, LOFTUS, SKELTON, AND BROTTON.—Dr. Stainthorpe did not succeed to the health-officership of this combined district until 1882 was well advanced. A maiden report should not be judged too narrowly, but in future statements Dr. Stainthorpe will do well to give the result of his recommendations for improvement, in addition to a record of his own personal work. The reports might also be prefaced with advantage by some general remarks, taking the five districts as a whole, and giving in a brief form the history of the year. This plan is usually adopted by health-officers serving a number of districts which, as in the present instance, have been combined by an order of the Local Government Board; and although the plan is not actually prescribed by that body, it is almost universally carried out. Scarlet fever, whooping-cough, and enteric fever seem to have caused most trouble during the year 1882. In commenting on the peculiarities of this last disorder, Dr. Stainthorpe is strongly of opinion that the ordinary privy acts more frequently than is supposed as a channel for the spread of the disease. Very often there is no other receptacle for the excreta of enteric fever patients than the common ashpit, and the complete emptying and disinfecting of these places is not easy. For this reason, amongst others, he advises the use of the pan-closet, which minimises the amount of excreta stored at any time upon the premises, and ensures its speedy removal, permits of the more easy disinfection of the closet and its contents, and prevents the soil from becoming soaked with sewage. With the exception of the fatality amongst children, which was alarmingly high, representing in one district as much as 60.0 per cent. of the total deaths, the general death-rates were fairly satisfactory, regard being had to the occupation of the inhabitants. In his report for 1883 Dr. Stainthorpe states that, 'believing it would prove advantageous, I have combined into one the reports for the four urban and one rural sanitary authorities forming the Guisborough combined district,' though the individual reports for each district are not forthcoming. From all causes the deaths numbered

631, of which 294 occurred in children under five, yielding a percentage of 46.0 per cent. In connection with the prevalence of infectious disease, Dr. Stainthorpe notes that for some months a voluntary system of notification has been in force, and has so far been of considerable service. The results of the sanitary inspections conducted during the year are carefully set out in a tabular form, which, however, requires further elucidation and comment.

HARTSMERE RURAL.—In his last report Dr. Barnes has been at some pains to compare the mortality statistics of Melis with those registered in the remaining portion of the district. This parish, which contains a population of 471 inhabitants, is situated on a soil of stiff clay overlaid by a thin layer of boggy soil, and is peculiarly liable to outbreaks of diphtheria, together with a high general rate of mortality. During 1883 five cases of diphtheria occurred here in three houses. These outbreaks were independent of each other, so far as Dr. Barnes's observation extended. In one case no sanitary defects were discovered; in another, the farm buildings joined the back of the house; and in the third, the water supply was contaminated. The average annual death rate for the past twenty-four years has been 32.0 per 1,000, the mean rate for rural districts in England being 19.4. The mortality amongst infants under one year shows a still more striking excess, the percentage of such deaths to the total deaths being 26.9; that of the entire district being 20.7. The death-rate from zymotic, lung, and tubercular disease is also above the average; and Dr. Barnes is inclined to attribute this generally to excessive dampness of the soil, which in the case of diphtheria requires little verification. In the other portions of the district the health statistics present few points of interest. The general death-rate, which is estimated at 14.2 per 1,000, is considerably below the average; and there was also a decrease in the mortality from zymotic causes.

HASTINGS.—The opening of the Filsham waterworks, which Mr. Knox Shaw describes as 'the great and memorable event of the year,' was naturally an occurrence of much importance. These works, consisting of a well, pumping station, reservoir containing over 500,000 gallons, and two filter-beds, are situated in the west-end of the town. The well, bored through white sand and brown sandstone principally, yields an abundant supply of bright good water, and is capable of yielding 500,000 gallons a day, if necessary. Now that the Town Council have provided their district with a plentiful supply of water, they might well set about the adoption of some better plan for the removal of house refuse. At present the dustbins are not emptied often enough; and the method of depositing their contents at various places about the borough, even though there may not be habitations near, is most unsatisfactory. 'There is at present,' the health-officer states, 'a large collection of dry refuse and decaying vegetable matter, offensive alike to the eye and nose, situated on the borders of our beautiful public park.' Obviously, the best plan to be adopted by a district circumstanced like Hastings would be the erection of a 'Destructor,' of a kind generally used in large towns. Mr. Knox Shaw also directs the serious attention of his authority to the objectionable position of the slaughter-houses, and urges them to proceed with the erection of a public abattoir. The mortality statistics registered during 1883 were of a most satisfactory nature. The death-rate from all causes represented 15.85 per 1,000, so low a rate having only occurred twice during the past nine years. The death-rate from zymotic causes (0.76) was even more satisfactory, being 0.71 below the annual average for a similar period.

KING'S NORTON RURAL.—Mr. Hollinshead, in a concise and practical report, demonstrates to his authority the beneficial influences of improved drainage, water supply, the removal of house refuse, and the provision of means for dealing with infectious disease. The general death-rate registered in 1883 (11.77 per 1,000) is the lowest

on record, and although a considerable number of cases of zymotic diseases came under observation, the majority were of a mild type, and were attended with but a slight mortality. These diseases are more or less dependent on insanitary conditions for their development and propagation, and consequently the more cleanly the district is kept, both as regards the interior of dwellings as well as the exterior, the greater immunity will the inhabitants enjoy from sickness. Mr. Hollinshead deplores that so much ignorance is continually displayed in the matter of healthy dwellings, the poor especially neglecting the simplest laws of health. He admits, however, that year by year they are becoming more and more improved, and that there is good in all the improvements that are being carried out, and hopes for greater help from them in future. Taking the district as a whole, the sanitary authority has, under the guidance of their able health-officer, been active in the discharge of their important functions. Much, however, still remains to be done. The system of refuse removal is not of the best, and the state of many of the roads is capable of great improvement. But few deaths properly due to King's Norton were registered from zymotic causes in 1883. A number of cases of diphtheria (two fatal) occurred, and were dependent upon local insanitary conditions, the removal of which arrested the spread of the disease. No deaths were registered from typhoid fever, although 14 persons were reported as suffering from it, inquiry into the circumstances always revealing either defective drainage or polluted water supply. Mr. Hollinshead draws special attention to the freedom which the district enjoyed from invasions of small-pox, notwithstanding the prevalence of the disease in adjoining towns, and looks to the rigorous adoption of vaccination, and the provision of means of isolation, as an explanation of this satisfactory immunity.

LIVERPOOL PORT.—The number of vessels entering this port in 1883 is put down by Dr. Taylor, in his annual report, as 31,452. Of these, 4,750 were inspected by officers of the Health Department, with a result that 283 cases the sanitary arrangements were regarded as defective, viz.:—In 147 vessels the fore-castles, ports, deck-houses, and cabins required thoroughly cleaning out, and painting, or limewashing—in some cases partially refitting; in 28, the bulkheads were faulty; in 54, there were defective ventilators; in 42, insanitary closets; and in 12, the decks over the quarters occupied by the crew required caulking. An improvement was noticeable in the general state of the coasting and short voyage regular traders. There appears to be considerable room for amelioration in the condition of the French, Spanish, Italian, Russian, and Greek vessels; on the other hand, the state of the German, Danish, Belgian, Dutch, Norwegian, and Swedish vessels is satisfactory. Dr. Taylor states that the American vessels retain their excellent character, and that the Liverpool-owned ships are all that can be desired. This is especially true of the Atlantic liners, the sanitary arrangements of which are described as being 'complete,' the light, height, and ventilation of the steerage decks being in every way satisfactory. On one line, there are permanent, well-fitted rooms with mirrors in the steerage for families, the whole being lighted by electricity.

MIDDLETON AND TONGE.—The year 1883 was the healthiest that this district has enjoyed since 1874. Dr. Graham states that a great deal remains to be done in the way of sanitary reform. The time, he thinks, has arrived, when all old middens should be abolished, and a better system provided for the removal of night soil. Several houses are unfit for habitation, and should be condemned, while many of the streets require better paving, and putting in repair. The principal sanitary work during the past year appears to have been the conversion of 103 privies into pail closets, and the tapping and making good of the drains of 120 old cottages. From all diseases, the death-rate was nearly 20 per 1,000, and from zymotic diseases, 0.89.

ROM.—Amongst other circumstances which make Kingston's task in reporting on the health of this far from congenial, are the enormous mortality of infants, and the fatal prevalence of consumption. The heated atmosphere in which the cotton operatives and their working hours renders them very susceptible to sudden chills, and it has also the effect of them to keep closed the doors, windows, and doors of their sleeping rooms, with the result of im-ventilation and a tainted air essentially favourable to the growth of the seeds of consumption. Moreover, the warm climate, it tends to the precocious development of the young, early marriages, and a weakly offspring.

As regards its rate of infantile mortality the enjoys an unenviable reputation, the deaths of under one year representing nearly a third of the total. The causes to which much of this fatality is clearly point to the absence of that maternal care to the welfare of infant life, and to the defec-tions which surround the dwellings of the lower classes. The general death-rate was as high as 1,000 in 1882 and 23.79 in 1883. The prevalence of typhoid fever amongst the mill operatives, and the influence of drain air has already been to in these columns (*see* SANITARY RECORD, 3, p. 22). With the exception of small-pox, all other diseases were present in a more or less severe form in 1883, the most notable outbreak being that of which caused no fewer than 220 deaths.

NG. The sanitary work which has been carried out in this borough during the ten years 1874-83, is capitulated in Dr. Shea's report for 1883. It is referred to, a complete system of sewers, and a water pumping station have been constructed. The borough has been provided with new surface water drains, and 8,000 houses have been connected with the same. Fresh waterworks have been built, nearly all the wells in the borough have been closed, and the water has been laid on instead. A sanatorium for infectious cases has been supplied, and additional provisions have been made for isolating paupers. Such are the chief improvements which have been effected in the last ten years, and which furnish ample justification for the statement that Reading has made great strides in the way of sanitary reform. That the work accomplished is good fruit, we have a sure proof in the decline of the death-rate from 1884, in the five years 1874-78, to the five years 1879-83. With regard to the year 1883, there is but little to mention, except that the sanitary rally was a very healthy one. The ordinary death-rate was as low as 15.90 per 1,000, while the death-rate was only 2.1. Measles and whooping-cough were again the chief causes of zymotic mortality. As amongst infants were equivalent to 10.8 per 1,000 children born.

TYNE PORT.—The sanitary work accomplished by the local authority in 1883 was greatly in advance of that of any previous year. The number of deaths expected was 11,572, or nearly twice as many as which itself was far in advance of any of its pre-

Mr. Armstrong attributes the increased work to the facility afforded for visiting vessels, and to the amount of crew space provided. Lighting, heating, and drainage were, however, frequently defective. The water-closet was often insufficiently separated from the fore-cabin, and not always efficiently

flushed. The condition of coasting steamers was, generally speaking, satisfactory. The cases of sickness numbered 98, 11 of which were of an infectious nature. The need of extended and permanent hospital accommodation was shown very forcibly during the year, and the authority would do well to give the subject their immediate and earnest consideration.

TORQUAY.—Among other incidents, the year 1883 was marked, in this district, by the completion of the Sanatorium, the arrangements of which appear to have met with general approval. Mr. Karkeek has something to say with reference to the scale of charges which has been drawn up, and which, in his opinion, requires some modification. In the case of the labouring classes, he advocates free admission to the institution, for, as he properly argues, the building has been provided, not so much for the treatment of infectious disease, as to prevent its spread; and if, in addition to overcoming the great natural antipathy which the poor have to parting with their children, there is also a payment asked for this treatment, the one chance of really stopping an epidemic, viz., that of isolating the first few cases, will be lost, and the utility of the Sanatorium greatly restricted. The deaths during the year, 414, or 16.9 per 1,000, were above the average. To zymotic diseases, 33 deaths were attributed, nearly half of which resulted from whooping-cough. But the disease attended with most interest was typhoid, of which 11 cases were reported to the medical officer. In most instances the disease seems to have occurred after an exceptionally heavy rainfall—1½ inches in 2 hours. From these cases, Mr. Karkeek draws several valuable deductions, of which, perhaps, the most noteworthy is, that the inhabitants of some houses appear to become fever-proof. Another case tended strongly to show that typhoid is an infectious disease—a fact which is not always recognised.

ILLUSTRATED SANITARY PATENTS.

ENGLISH.

38. (1884). IMPROVEMENTS IN SANITARY TRAPS. W. HENMAN, Architect, Birmingham. [4d.]—The improvement is in the form of traps for water-closets and for bath, lavatory, sink, and urinal wastes, by which security is obtained from the inflow of sewer-gas to buildings. The outer arm of the trap is funnel-shaped, and is made in one piece with or jointed to a short length of vertical pipe, by which connection is to be made with the soil-pipe below,

and with the ventilating-pipe or soil-pipe above. The inner arm or arms are placed at about an angle of 45° to receive the connecting-pipe from the water-closets, baths, &c. The trap may be of any suitable dimensions, and be made of glazed earthenware, or stoneware, or cast iron, either plain, glazed, or galvanised, of lead or other metal.

U U

657. (1884.) IMPROVED MEANS OF CONNECTING SUPPLY APPARATUS WITH WATER-CLOSET BASINS. T. W. TWYFORD, Hanley, Staffordshire, Manufacturer. [4d.]—The patentee claims for an improved means for connecting the supply apparatus with water-closet basins. A is the basin, and B is the projecting arm on the said basin. D is the supply or flushing-pipe, which may be of

lead or other material; C is the connecting-piece or ring, which may be of either India-rubber or other elastic or flexible material. It will be noticed that the ring C has a large surface to bear upon the pipe, D, and also that the branch or arm, B, is embraced by the joint, C, on both the outside and the inside, as it rests in the annular recess, C'. There is thus a pressure on every surface, the action and reaction of the joint all tending to keep the required surfaces tight.

1046. (1884.) IMPROVEMENTS IN WATER-CLOSETS AND APPARATUS CONNECTED THEREWITH. H. SUTCLIFFE, Halifax. [6d.]—The patentee constructs the trap and bowl or basin with an extended chamber, on the same level as top and bottom of the basin. The chamber is so constructed as to receive a suitable tipping or swinging vessel, which is supplied from a cistern provided with a skeleton valve for the rapid discharge of water into the said tank, which when full immediately discharges itself with full force in one volume into the said basin, thereby perfectly cleansing it out. He also constructs the said trap and bowl or basin to work with a ball-cock, which are

so fixed in said chamber and so constructed as to wash the basin and supply the tank at the same time; when full, and the handle of closet is lifted, the whole quantity of water in the tank is discharged in one volume into the basin, thereby perfectly cleansing it out. Another construction is to supply the basin with extended chamber by a continuous stream of water.

2,184. (1884.) IMPROVEMENTS IN COLLECTING, &c., OF EXCRETA, &c., AND IN APPARATUS THEREFOR. CONWAY SCOTT, C.E., Belfast, Ireland. [6d.]—This invention is to provide a convenient place and means for depositing and collecting the excreta and other refuse of dwelling and other houses in order that the injurious and offensive stenches and gases emanating from such matter and the receptacles therefor may be rapidly carried away into the higher atmosphere, and that the matter itself may be frequently removed and the receptacles for it emptied and cleansed, and also to prevent sewer or other gas generated by the decomposition of such matter from enter-

ing the dwelling or other houses. The above is a ground plan of a house and tower or shaft, with a connecting gangway or passage, and showing the pit or chamber for the reception and collection of refuse matter with the vertical pipes and ventilators, the ports or doors for throwing matter into and discharging same from the pit or chamber, the ventilating chimney and flue, the overflow into the sewer, and the pipe from the sewer into the ventilating shaft.

2,524. (1884.) IMPROVEMENTS IN INSPECTION-PIPE, FOR DRAINS, &c. G. C. DAVIES, Clerk of Works. [4d.]

The novelty of this inspection-pipe consists in making the cover over inspection aperture gas-tight, by means of a groove and tongue joint, this joint being stuffed with India-rubber, or such like stuffing; or for ordinary purposes white lead mixed with a little tallow, or any other suitable mixture will do, the said cover being secured to the pipe by screws, so as to prevent any escape of gas, or

FIG. 1

FIG. 2

the joint being broken. The cover over the aperture requires no skilled labour in fixing or unfixing, it being only necessary when fixing the cover to notice that the parts forming the joints are kept clear of dirt and that the groove in the cover is properly filled with the stuffing material, the cover being then placed in position and screwed down. Fig. 1 is a plan of this improved inspection or access pipe, A, being the movable cover over the

inspection aperture. B, H, metal screws for securing same to pipe. C, C, eyes (when necessary) for lifting the cover. Fig. 2 is a transverse section (enlarged scale) through the centre of pipe showing the joint of cover and the method of maintaining the inside form or bore of pipe.

4,357. (1884.) IMPROVED JOINT FOR WATER AND OTHER PIPES. W. HASSALL, agent, Beeston, Notts. [4d.]

This invention consists in an improved method of making the joint between two lengths of any suitable material, of any suitable section, and can be employed for conducting water, sewage, gas, compressed air, or other liquids or fluids, &c., &c. The sketch shows as part section:—One end of the pipe A is provided with a socket B of an extra depth, at the extreme inner end of which the body of the pipe is made with a shoulder C, and at the

inner end and adjoining the shoulder C a ring D of suitable material is cast in from a mould the face of which is perfectly cylindrical. A ring E of suitable material is also cast in the mouth of the socket. Between these two rings there is an annular space F in the socket, and through the socket into this space an opening G is made through which to run in the filling-in material, such as Portland cement. The spigot end of the pipe A' which enters the socket B is thickened and made perfectly cylindrical by casting two rings of suitable material, H, I, on the same in such positions as brings them exactly opposite to the two rings, D, E, in the socket when the pipes are driven together, and which rings keep the invert of the pipes in true line.

6,306. (1884.) IMPROVED GREASE-INTERCEPTING GULLY-TRAP FOR SINKS. E. PAGE, Architect, Forest Gate, Essex. [4d.]

This gully trap would be constructed of glazed stoneware in one piece, with a central division forming trap, rebated round top to receive a combined galvanised cast-iron grating and cover. The portion over compartment taking waste from sink would be hinged to

open. The gully trap would have an inlet and outlet opening cast on each end with socket for connecting to waste from sink and to drain respectively. The compartment taking the waste from sink is provided with a moveable galvanised wirework grease receiver which will allow the passage of the water while it intercepts the grease and other foreign matter, and so prevents the same passing the trap and so stopping the drain.

10,460. (1884.) IMPROVED TRAP FOR WATER-CLOSETS, &c. E. NEWTON, Hitchin, Engineer, Herts. [4d.]

The object of this invention is to afford a ready, cheap,

and effectual means for ventilating water-closets and other sanitary appliances, and for preventing syphonage from the traps. Fig. 1 of the accompanying drawings is a vertical section through a P-shaped trap cast in lead, and having

the upright foul air or gas outlet shank A between the trap part B and the outlet part C. To this shank A a ventilating pipe is readily connected by soldering or otherwise. Fig. 2 shows an S-shaped trap having the shank A similarly applied. Fig. 3 shows an overflow trap-pipe having the shank A applied in a similar manner.

AMERICAN.

298,091. DEODORISING AND ANTISEPTIC WATER-CLOSET COVER: FREDERICK H. HUBBARD, Brooklyn N.Y. Issued May 6, 1884.

Claim.—1. The combination, with a hinged water-closet cover made in box form, of a non-corrosive vessel arranged in said cover and provided with a number of fine perforations in its bottom. 2. The combination, with the hinged hollow water-closet cover C, having an opening F, in its lower surface, of the non-corrosive vessel D, arranged in said cover and provided with the fine perforations G in its bottom over the opening of the cover. 3. The combination, with the hinged hollow cover C, provided with the opening F in its lower surface, and the vessel D, arranged in said cover and provided with perforations G over the opening of the cover, of the flap H, hinged to the cover, near the forward edge of its opening. 4. In a water-closet cover, the non-corrosive interior vessel D, with its rear part closed at the top, and fine perforations in its bottom, whereby the liquid contents of the said vessel will be allowed to drip when the said cover is closed, and the dripping will be prevented and the said contents kept from being spilled when the cover is opened.

298,804. ADJUSTABLE SUPPORT FOR WATER-CLOSET BASINS: HENRY CORY WEEDEN, Boston, Mass. Issued May 20, 1884.

Claim.—1. In combination with the basin of a water-

closet, a supporting-standard, having supports of adjustable length adapted to carry said basin and support it at the desired height. 2. In combination with a basin of a water-closet, a supporting or levelling standard, having supports of independently variable length, adapted to carry the said basin and support it at the desired height and on the desired level. 3. The improved adjustable support for water-closet basins, consisting of a cross-bar *x*, connected with vertical extensible standards *y*, provided with means for securing the standards in place at any desired height. 4. The improved support for water-closet basins described, consisting of a cross-bar *x*, carried by extensible standards *y*, provided with means whereby the length of the standards may be regulated, and also with means whereby the cross-bar may be attached to the standard at a varying height thereon.

298,841. TRAP FOR SINKS, &c. : HENRY FRIEDRICH,
East Port Chester, Conn. Issued May 20, 1884.

Claim.—1. The sink *a*, having dish *δ*, upward extending outlet *c*, and ventilating-channel *e*, in combination with strainer *h*, having flange *k*, and wings *i*. 2. The combination, in a basin-trap, of an annular dish around the waste-pipe, a ventilating-pipe, a removable strainer-plate, having a depending flange and wings at the under side, such strainer-plate having an irregular form at its edges, so that it can only be entered one way into its recess around the dish.

300,130. SINK. CHARLES T. REGAN, Brooklyn,
N. Y. Issued June 10, 1884.

Claim.—1. The combination, with a sink, of a compartment for the reception of sewer-gas, arranged within the sink, and a pipe or passage for conducting away the gas which may arise within the chamber. 2. The combination, in a sink, of a cap or cover *a* at one end, and a slide or door for separating the sink into an open and a closed compartment, the closed compartment being provided with exit-pipes for the discharge of water and gas respectively. 3. The combination, in a sink having outlet *C*, of a ledge or cover *a*, and a slide, having serrations or perforations, as described, whereby a closed chamber or compartment for the reception of sewer-gas is produced, and the matter which passes from the open to the closed compartment is strained.

300,367. FILTER. BENJAMIN HOLLAND, JR., Providence, R.I. Issued June 17, 1884.

Brief.—The part E is composed of felt.

Claims.—The combination and arrangement, substantially as shown and described, in a filter, of the shell A, having the internal foraminous shelf D cast therewith, and

forming chambers above and below the shelf, the top cap or cover G, screw-threaded to engage a screw-thread in the shelf to connect the two, and of felt or textile filtering substance E, supporting said shelf, and held in place by the said cap screwed down upon it.

300,075. HEATING AND VENTILATING DEVICES IN BUILDINGS. AMANDA M. HICKE, CLINTON, MO. ALONZO DISHMAN, Paducah, Ky. Issued June

Claim.—The combination of the stove *K* with *F* on the lower floor *A* of a building, one or more drums *G* on the floor or floors above, pipes connecting the upper portion of each under drum lower portion of the drum on the next floor above escape-pipe *c* for the gaseous products of combustion chimney *D* of the building, and the independent pipes *H*, arranged one above the other within the

and through the chimney to the external atmosphere open at their upper or inner ends to the rooms containing the drums, as shown and described, and for the purpose set forth.

297,643. SEWER : THOMAS L. STARK, Chic
Issued April 29, 1884.

Brief.—A basin or well, into which empties the lake.

drain and gutter-pipes, has a manhole and cover, and overflow-pipe connecting with the street-gutter, and a discharge-pipe emptying into the main sewer. A valve applied to the mouth of the house-drain pipe is operated by a rod secured in raised or lowered position.

Claim.—1. The combination of the well, the house-pipe H, entering the said well or basin, the pipe F, entering the said basin and communicating with the main sewer, a valve or door applied to the discharging end of the pipe H, and means for opening and closing the said valve. 2. The combination of the basin D, the pipes H and F, the valve I, the rod J, and means for retaining it in its raised and lowered positions, the pipe or duct E, the hole or opening C and its cover, and the roof-gutter pipe, all arranged substantially, as shown.

296,320. GAS-BURNER FOR HEATING AND LIGHTING ROOMS: BENJAMIN F. ENOCH, Philadelphia, Pa. Issued April 8, 1884.

Claim.—1. The combination of a gas-burner, a globe or shade therefor, and a tube inclosing burner below the shade or globe and hanging pendent therefrom. 2. In combination with a gas-burner, a globe, a balcony for the globe inclosing the burner, and a flexible tube supported thereby and depending therefrom to near the floor of the apartment wherein such fixtures are located for use. 3. The tube, U, having a slot, d', and provided with means for attaching it to a gas-burner, and a beaded or flaring edge d, in combination with pipe or hose E, and means for attaching it to said tube. 4. In a heating attachment for gas-burners, the combination of a tube, D, provided with means for attaching it to a gas-burner, a flexible pipe, E, and means for contracting the lower opening of said pipe.

NEW INVENTIONS.

HOT-AIR CHAMBER FOR WARMING ROOMS AND OFFICES.

At a recent meeting of the Royal Scottish Society of Arts, Glasgow, Mr. W. G. Black pointed out that the heat given off by a stove in a room for the purpose of warming it is first afforded by radiation from the surface of the iron plates towards the walls of the apartment, and secondly by convection of heat by the charged air rising from the outside of the stove to the ceilings. The apparatus figured on page 381 now affords a third method of warming by heating the cooler air in an enclosed chamber over the fire of the stove, like water in a kettle, and discharging it in a hot stream by an effluent pipe into the body of the apartment. It consists of a boiler of iron plate 19 inches long by

9 inches deep, and 8 inches broad, fitted on to the top of a Queen Stove No. 7, and is double lined to admit the heat of the fire below all round the sides of the inner box.

Scale about 2 inches to 18 inches.

- A. Hot-air box, double lined.
- B. Stove, Queen's.
- C. Smoke flue.
- D. Upcast tube.
- E. Downcast tube.

From the top proceeds upwards an effluent tube 3 inches in diameter and 20 inches long, through which passes the hot air from the heated box into the room, and again downwards an effluent tube into the inside of the box, 3 inches in diameter and 5 inches long, through which pass the supplies of cold air from the outside. The cold air of the room thus enters the box by the downcast tube, gets heated in the boiler, and makes its way rapidly up by the upcast tube into the room, raised many degrees in temperature, and its dampness volatilised.

If the air of the room in winter be supposed to enter the downcast tube at a temperature of 50° F., it may be heated up to 225° F. in the chamber, and then will emerge in a rapid stream out of the upcast tube at a temperature of 220° F. into the apartment. The relative humidity may also be lowered from 83° outside to 66° inside the room, and the difference between the dry and wet bulb thermometer be raised from 2° outside to 7° inside the room.

The extent of increase of heating the room will be limited by the ventilation afforded by the fireplace, and the admission of extra outside air by doors and windows, more or less opened during the use of the apartment—a temperature of 60° F. is found to be sufficiently useful, and this may be easily attained in the winter in the course of one to two hours after lighting the fire in a room. The rate of warming a room well also probably increases as the temperature gradually rises, as the warmer the air entered the downcast tube, the less heat would be required to raise it to that required for comfort by the indweller.

The temperature of the bottom of the interior of the box, or rather that of the layer of air lying on it, proves to be on trial about 5° to 10° more than that of the effluent air, at any greater or less temperature experimented on.

This apparatus is suggested as being suitable for rooms needing little outside draught or external moisture, such as ship cabins, observatories, laboratories, libraries, museums, &c.

The production and cessation of the warming is readily effected by removing the air-box, or returning it to its position on the top of the stove or fireplace.

Some discussion followed, in which Dr. Macadam said he did not see that the apparatus could provide for the ventilation of a room; but as far as the heating of the air was concerned, he had no doubt it would have that effect. Mr. Cay asked whether air treated as proposed would be left with the proper amount of moisture. Mr. Peebles suggested that it would be an improvement to introduce air from the outside into the heating chamber. Mr. Reid remarked that as to ventilation he had found it an effective plan to introduce ventilators into the flues as close as possible to the cornice. Mr. Black, in reply, said that the question of ventilation had not been contemplated in his contrivance. The communication was referred to a committee.

MARCH'S PATENT STREET SWEEPER AND ELEVATOR.

On the 23rd ult. an opportunity was afforded to the writer of this report of witnessing March's Patent Street Sweeper

and Elevator in action, and, from the way in which it did its work, he is convinced that Mr. March has introduced

collected by means of a chain of brushes so geared that varying pressure can be applied according to the nature and quality of the road or material to be operated on, and that they may be brought down to their work as they wear away. The material collected then passes into the elevator case and by means of an endless chain of buckets is discharged through the shoot into the cart. The machine is by no means cumbersome, and requires no more skill to manage than does the one revolving brush machine, now commonly used, there being only two hand levers to work to put Messrs. March's machine in and out of gear, which is done as it proceeds along the road. It is also claimed that, going at the rate of three miles an hour, the machine will sweep thoroughly 1,200 square feet a minute of any road, and at the same time load the cart or waggon without noise or splash. It is obvious that the latter qualification alone would be deemed by foot passengers as a sufficient reason for its use, and it is to be hoped that the metropolitan authorities will see their way to its general adoption, as one or two of the large towns in the north are about to do.

Last, but by no means least, among the advantages pertaining to this machine—horses drawing it will be two to four times longer, as there is no constant stopping and starting with tons weight to draw, thereby straining the fetlocks and ruining the animals.

SPONG'S PATENT HOUSE GUARD.

MESSRS. SPONG & Co., 226 High Holborn, who have from time to time introduced a variety of ingenious domestic and other appliances, have recently patented a notable invention, which may be termed a burglar alarm. It is of simple construction, consisting of a long, shallow, tin bellows, as shown in our illustration, which can be placed under a door-mat, or even under the carpet of a room inside the window, provided an incision is made in the boards to receive it. Attached to it is an India-rubber tube which in turn is connected to a range of composition tubing carried along the ground or walls into any room in the house (kitchen or bedrooms for instance), where an

an apparatus which will prove a boon to those surveyors and local authorities who are responsible for keeping clean our streets and highways. The idea of a machine to sweep and collect mud or refuse at one operation is by no means new, having been conceived by more than one firm of engineers, but to Mr. March the credit is due for having put the conception into a workable form. Illustrations of each of the two forms in which the machine is made are appended. The first cut shows it as intended for attaching to existing carts or waggons, while the other shows it in permanent combination with a cart. The working parts are the same in both, the difference being merely in the application of the principle. The mud, slop, or refuse is

alarm is required to be heard, and a whistle is attached to the end of the tubing. Immediately as one treads upon the mat, or wherever a guard is concealed, the bellows being compressed, a loud whistle is heard, and the approach of friend or foe is thus heralded. A great advantage with this house-guard is that it is entirely automatic, requiring no attention whatever, as the bellows refills itself with air the moment the feet are removed from it; and in this respect is preferable to electric apparatus, besides being far less costly. It can also be put out of 'gear' by the inmates of a house, if not considered to be required, as during the day, for instance, by merely withdrawing the India-rubber tube

the metal tube. The invention may be utilised with advantage in a variety of cases, and presents no unsightly appearance in connection with the fittings.

thoroughly sound in what they say concerning the various methods of domestic heating, and they give examples of objectionable and recommendable appliances and surround-

THE 'EXCELSIOR' HOME GYMNASIUM.

Following up the description of this unique apparatus, given in the SANITARY RECORD of Jan. 15, illustrations of a few more of the exercises attainable by its use are added. They by no means exhaust the list, for, as stated in the general description, about one hundred different exercises can be practised, each presenting some new feature and bringing in turn all the muscles of

ings. They very justly say that the professional advisers in respect of building new houses have not given this matter the great consideration which it most certainly deserves, and we are of this opinion also—more particularly when we know that during the severe frost of January 1881 some forty explosions of domestic boilers could be perused in the various newspapers. These disasters can only be obviated by choosing the proper system of heating, and dealing with firms who will not perpetrate 'jerry' work for any consideration whatsoever.

body into play. The back and stomach roller, one of the attachments sold with the apparatus, is perhaps the most unique feature in these illustrations. The makers of 'Excelsior' Home Gymnasium are the Chadborn & Iwell Manufacturing Company, Upper Thames Street, E.C.

REVIEWS.

Water Engineering: A Practical Treatment of Household Boilers and Domestic Hot Water Appliances. By FREDERICK MILAN and JOSEPH SHAW. Second Edition. Huddersfield: Broadbent & Co.

Authors of this work are consulting hot water engineers, and this treatise is intended to prove of practical use to all who have to deal with the heating of water. It is well known that boilers of too cheap a character are subject to explosion by over-pressure, and the remarks by our authors on the responsibility which entails professional advisers or builders who make use of weak material is very deserved. The authors are

Sutton & Sons' Amateur's Guide in Horticulture for 1885.

THIS admirably arranged work for the present year is now in course of distribution, and is as complete as the most exacting could expect it to be. The efforts made of late years by such firms as Messrs. Sutton & Sons, by means of works like the one now before us, to educate the people in the art of gardening, have borne good fruit, and, while promoting the practice of an interesting occupation, have helped to improve the health of those who have time to devote to the culture of flowers and vegetables. The advances, too, that have been made in the development, as regards size and quality, of all vegetables, in which Messrs. Sutton & Sons have borne a conspicuous part, is a matter of almost infinite importance to the inhabitants of these islands; and the number of new plants and flowers that are constantly being introduced into our gardens shows how bounteous floral nature becomes when aided by scientific cultivation. In the work in question considerable space is devoted to the culture of vegetables, the instructions being simple and lucid, and a large number of illustrations are given. Turning to flowers, the information is of the most comprehensive character, and there are two beautifully coloured plates from nature, of new varieties. How to obtain flowers all the year round, and the names of those capable of easy cultivation, are clearly set forth. After supplying Her Majesty for thirty years, Messrs. Sutton & Sons have now been appointed seedsmen to the Queen and H.R.H. the Prince of Wales, being the first seed house to which this honour has been accorded.

Soils and Sites. By ARTHUR RANSOME, M.A., M.D., F.R.S., Manchester and Salford Sanitary Association. London and Manchester: John Heywood. Illustrated.

THIS pamphlet is the first of the eighth series of the Manchester Health Lectures for the People, and the people of Manchester and elsewhere may derive considerable advantage by a study of the series if this be a sample of the general idea. Though published in a small form and of corresponding price, it treats of a big subject in a thorough manner, as we find that not only Europe, but America and Africa are drawn upon for data to enable comparisons to be made and facts and theories to be contrasted. Comparisons, we know, are odious, and Dr. Ransome admits that Manchester shows up somewhat badly at times when home comparisons are made, where the by-laws relating to buildings and soils are concerned. Starting with the question of aspect, so much has already been said that the lecturer evidently concludes that it will be more useful to proceed to further conditions which are less generally known; and the next subject, *drainage*,

i.e. surface drainage, is mentioned, and instances are given of re-acting cause and effect of malaria and fever in places which are as ill-drained as they are well known. We are reminded of the action of the industrious monks of La Trappe in draining a portion of the notoriously unhealthy Roman Campagna, 'a work that has baffled all the governments from Romulus to Victor Emanuel or King Umberto. Lately they have tried, with success, a most remarkable experiment. They have bored the tufa at different distances, a metre and a half deep (about 5 feet); in these holes they have placed dynamite, and by electric conductors have exploded the volcanic strata. A dull rumbling is heard, a little elevation of the ground is seen, in some places the earth is thrown out a short distance. In eight days' time they found a subsoil for a large space of ground, and made it both susceptible to culture and healthy.' To understand the importance of this statement we cannot do better than give the reason for it. 'The soil of the Campagna has but little depth; under it lies a stratum of tufa, in some places two metres (over two yards) in depth. Under this tufa is other volcanic material equally hurtful to vegetation. Thus there is no subsoil, and no chance for circulation of water and air. When the heavy rains fall the water rests on the tufa, and generates unhealthy mists.' The efficacy of eucalyptus raising had already been proved here and elsewhere, notably in Algeria, and further instances have come under our notice in the mining districts of Spain, where trees of any kind are few and far between; not that they were at any time plentiful, but of late years the few have been ruthlessly cut down by the ever-content but improvident natives. It is, however, owing to private enterprise that the rapid-growing eucalyptus has been introduced, and the beneficial results regarding the diminution of fever are very marked. The ill-effects of *ground air* are well known, and the lecturer has deserved well in calling attention to the fact that in such air, at a depth of a few yards, the oxygen diminishes in some cases to 15 per cent., and the carbonic acid may rise to as much as 8 per cent., or 200 times more than in atmospheric air. It will be readily seen how important it is to keep such noxious air out of the house, and the ordinary remedies are suggested, viz. (1), by putting a thick layer of concrete under the cellar floor; (2), by having a cavity under this floor communicating with the kitchen flue (by the way, would it not be better to have a separate flue for this purpose?); and (3), by building the house entirely above ground without any cellar, and supported upon arches, as recommended by Dr. Richardson in his 'City of Hygeia.' This last idea is of course impossible on a general scale, owing to the expense which, roughly speaking, means an additional 10 or 15 per cent. to the cost of building an ordinary house, and then where is the builder's profit? Occupiers will not pay for it, especially as it also means a difficulty about disposing of the servants and offices, and in a town house putting the drawing-room up one floor higher, and the drawing-room, as a rule, knows little and cares less for sanitation. The first-mentioned remedy, viz., putting a layer of concrete over the entire area of the house, is indeed compulsory by the Metropolitan Building Act, and generally also where the rules of the various local boards are in force; it is fairly effective and very cheap, no slight recommendation. *Ground water* is necessarily noticed, and leads to the next heading, *The Relation between Soil and Disease*, and in reference to these the words of the late Isaac Taylor are quoted: 'When people talk about going from home for change of air, what they really mean is change of earth.' The idea may be a little far-fetched, but there is undoubtedly a substratum of truth in it. *Malarial fevers, diarrhoea, dysentery, typhoid fever, and cholera* have their due relationship shown to the action of earth and water as media for their propagation, and that terrible scourge *consumption* is likewise considered. Disquieting statistics are referred to in connection with Swindon, old and new, much to the disadvantage of the latter, which is built on Kimmeridge clay, about 100 feet

below the old town, and when we come to the end of the lecture we begin to think it is impossible to find a reasonably healthy soil or site, as some drawback is sure to be found to 'suit all circumstances.' These lectures, all applying to the house in some form, will probably open fresh trains of thought, and we look to their continuance with interest.

Overwork from the Teacher's Point of View, with Special Reference to the Work in Schools for Girls. By MRS. S. BRYANT, D.Sc. London: Hodgson, 89 Farringdon Street. 1885.

A LECTURE delivered at the College of Preceptors by the mathematical teacher at the Camden Road High School for Girls, touching however but one small part of the subject, and, like other apologies, not in the most satisfactory manner. Mrs. (or Dr.) Bryant divides girls into six classes, which we may call the normal, the over-energetic, the over-studious, the athletic, the indolent, and the emotional. The few cases of true overwork, the existence of which she admits, are, in her opinion, furnished by the over-studious girls, who would pore over their books day and night, and who need merely to be checked; but the vast majority of the alleged cases are, she maintains, those of thoroughly indolent or excessively emotional girls, for whom the proper treatment is *well-regulated work—mental and bodily*. She asserts that doctors through ignorance, carelessness, or obsequiousness to the parents, instead of pointing out the moral character of the complainant, prescribing healthy exercise of brain and muscle, and putting a veto on dissipation and reading of an enervating kind, order relaxation and rest, which only aggravate the physical disorder. This may be true in some instances, but it is little short of a libel on the profession to ignore all that medical men have written on the subject of hysteria and its causes in aversion to the exercise of volitional, intellectual, and physical powers, and in undue attention to and excitement of the emotions. She fails to recognise the fact that those who are normally constituted both mentally and physically are properly divisible into what Mr. Teale calls hares and tortoises, that the latter are not the miserable abnormalities she represents, and that they may suffer from being forced onwards during the period of half a dozen years within which nearly the whole development of the female is compressed. This physiological aspect of the question she entirely ignores.

Her school is probably one of the best regulated of its kind, but we remember the case of a rapidly-growing girl who was certainly neither indolent nor emotional, but who suffered from headache, loss of appetite, &c., traceable, in our opinion, to the ill-directed work of one of the girls' public schools, where the subjects taught were far too high, but the method of learning enforced involved the maximum of distasteful labour. Three months' rest and change of scene, followed by a year at another school, which sends the most successful students to Gorton and Newnham, and where cricket and football are among the recreations, worked wonders.

CUTTING OFF THE WATER SUPPLY.—On the 16th inst., a man, said to be employed by the sanitary authority, cut off the water supply from the inhabitants of Burradale, a colliery village near Newcastle. It has also been stopped at the neighbouring colliery of Westmoor. The reason alleged for this proceeding is that the authorities up to the present have failed to obtain the water-rate due from the owners of property to which water is supplied. The authorities would appear to be determined to *leave the water-rate from the occupier instead of the owner* as decided in the Queen's Bench Division a short time ago. It is, however, dangerous policy to imperil the public health on any grounds whatsoever.

It will be seen from the drawings which I annex that the shape of the rocket has passed through very rapid changes; and Mr. Pain has also changed the composition several times, chiefly with a view to reducing its cost, and now tells me that he can supply the rockets—if ordered in considerable quantities—at the rate of one penny an inch, *i.e.* sixpence for a six-inch rocket (which burns for ten minutes, and is large enough for testing an average-sized house), and so on.

The drawings which I append are—

No. 1.—Longitudinal section of smoke rocket, as made December 15, 1884.

No. 2.—Longitudinal section of smoke rocket, as made February 15, 1885.

No. 3.—Plan of the above rocket, showing the cross-sticks which are attached to it for the purpose of forming a bridge inside the drain-pipe on which the rocket rests, clear of any sewage which may be in the bottom of the pipe.

No. 4.—Longitudinal section of a metal tube, which it is found advantageous to affix to the rocket to kill the flame and make it smoke. It will occur to everyone that the tube may be lengthened and bent into any shape to facilitate the introduction of the smoke.

No. 5.—Three views of a 'drain-plug,' which it is sometimes, but by no means always, found advantageous to use with the smoke-rocket. It will also be found very useful in applying the water-test. It is made and sold by Mr. Botting, of 6 Baker Street.

Believing that the 'smoke-rocket' is correct in principle, though by no means perfect in its details, and

that, even in its present form, it will be found useful by sanitary engineers, I venture to send you the above description of it, and shall probably write to you again in two or three months, describing the improvements that have been made in it in that time, and if any of your readers who tries it is able to suggest any improvements, either to me or Mr. Pain, he will find me very grateful, and Mr. Pain both grateful and willing to carry out the improvements in practice.

The demand for the 'rocket' appears likely to be very large, for our engineers find it so useful that they use two or three a day each, and as there are four of them, that indicates a consumption of eight or ten per day for our association alone, and as there is an association equal to ours in Edinburgh, and others not much smaller in Glasgow, Dublin, Liverpool, Bradford, Newcastle, and a dozen other towns, not to speak of all the sanitary engineers in private practice, I tell Mr. Pain that if he can make the things cheap enough, and working quite smoothly and certainly, he will sell many thousands in the year.

COSMO INNES, M. Inst. C.E.,

Sec. Lond. San. Protec. Assoc.

1 Adam Street, Adelphi, W.C.

A NEW DEPARTURE IN HOUSE DRAINAGE.

Will you permit me to reply to the letters of Messrs. Alexander, A. Kyd, and H. Masters, printed in the last number of the SANITARY RECORD.

I have not had the advantage of seeing the diagram of 'the double check system of house drainage,' referred to by Mr. Masters, but, judging of the system by the account which he has sent to you, I think it is clear that his arrangement differs materially from that which I have described.

I have to thank Mr. Kyd for the friendly tone of his letter. As to the model by-laws which he refers to, the Local Government Board allow the arrangement (b) only where another arrangement (a) is impracticable. And this arrangement (b) is suggested, as expressly stated in the annotated edition of the by-laws, 'to meet cases where the building actually abuts upon the street in front, and consequently has no forecourt or area of any kind.'

By the arrangement (b) an untrapped opening at the upper end of the drains is required. I suppose most persons will agree with me that this is a most undesirable thing; it is not found in my arrangement, and to my mind constitutes by itself a very important difference between the two systems.

It is required also by (b) that the soil-pipe should connect with the drains without the intervention of any trap, and it is permitted that the soil-pipe may, if of suitable size, &c., take the place of the front ventilating pipe. In my arrangement the foul air of the drains is allowed to ascend the soil-pipe past the connection of the w.c. This is clearly shown in Mr. Rogers Field's illustration (Jan. 20) to the annotated edition of the model by-laws.

Now this is the exact opposite of what I advocate; instead of laying on foul air to the house I drive it away from it. I think then that the arrangement (b) which is only permitted in certain cases is but a feeble and half-hearted step in the direction of my suggestion, and is, if I may say so, a very undesirable arrangement, halting as it does between two systems.

As to trapped wastes joining the soil-pipe, I did not think it necessary to disconnect them, and for the following reasons. I applied the severest tests I could by means of the w.c., and utterly failed in the attempt to syphon out the waste-traps; and I was convinced that if the traps were emptied there would always be a current of air passing from the house down the waste-pipe. The inspection holes which Mr. Kyd refers to added but little to the expenditure, and personally I think they are worth their cost. An engineer may design an admirable arrangement of drains, &c., may see them properly carried out and leave them in excellent working order; but, nevertheless,

it still remain to some extent at the mercy of careless, or mischievous servants, and therefore desirable that, as modern drains once laid are immovable, there should be means provided for them readily at all important points.
1885. D. J. EBBETTS.

December number there is an interesting article by J. Ebbetts on 'A New Departure in House Drainage' and I should like to try the plan, but find that the heights of the inlet pipes at the outlet or extract flue compare, that is, he does not say how high he carries the soil-pipe on the north side, simply up to the gutter or higher? Is there any advantage in covering to the soil-pipe? In a case where the water-cistern is not available, for want of waterworks, what is the answer? If the author will kindly clear matters he will confer a favour on
F. P. GRANDIN.

gent Road, Jersey, Jan. 16.

experiments made I should say that the relative heights of the soil-pipe and ventilation-pipe are of no importance so long as the ventilation-pipe is slightly above the soil-pipe.

ventilating or fitting on the soil-pipe would be of any use unless it were an 'inlet cowl,' and there is really no need of one.

A flushing cistern is of less necessity with the system I described than with any other system, but they are valuable in keeping the drains clean. Wherever a flushing cistern is used, surely a flushing cistern can also be used as a thirty-gallon cistern, discharging once in every twenty-four hours, would be sufficient for most houses, and can be fed by a rain-water pipe, or better, a small cistern, with a branch from the water-closet to be used in dry weather.—D. J. EBBETTS.]

The plan of trapping and ventilating house-drains described by Mr. D. J. Ebbetts in your December issue is neither a first-class style. I look upon it, done it, as a second-rate way of executing the plan. The plan will be seen illustrated in fig. 22 of my March 22, 1883, while Mr. Beattie, plumber, of Edinburgh, also published the plan several years ago. Professor Fleming Jenkin also published a plan in 1878 in which the foul air would blow off at a height when the closets were let off.

However, always looked upon direct communication between the soil-pipe and the drain as an inferior thing in the work; hence, in my Patent of July 9, 1868, the house drain is shown ventilated by high-level and high-level outlet quite independent of the soil-pipe.

In some cases the ventilating-pipe for the trap at the soil-pipe may be carried as high as the roof, it is seldom that is needed. When both pipes are on the roof it matters little which is the inlet and which is the outlet, and if the soil-pipe is inside the house and the ventilating-pipe outside, then, when there is no wind, the air will go up the soil-pipe, except during the time the water-closet is running.

Mr. Ebbetts' 'new departure' is not a new idea, neither an improvement upon the best style of work as carried out by various plumbers for years back.—I am, &c.,
W. P. BUCHAN.
Feb. 7, 1885.

VENTILATION OF PUBLIC SEWERS.

Much has been said and written upon this subject, but it is little difficult to find sufficient unity of opinion to agree upon one to say that such and such is the most approved method. A very large number of towns ventilate their sewers by open gratings in the centre of the roadways, and it is very doubtful whether this is a very safe practice.

In some localities, by arrangement with property owners, ventilating shafts from the sewers are carried up by the chimney stacks of the adjoining houses. On one estate with which I am acquainted, by arrangement with the landholders, no gratings are to be placed in the streets, but ventilating flues connected with the sewers are to be built into the chimney stacks of the houses. Now I should be very glad if you, or some of your correspondents, can give an authoritative utterance on this vexed question. The points of importance are:—1. To what extent is there danger to the health of the inhabitants in the sewer air which escapes from the ventilating gratings in the public roads. 2. Is there not considerable danger to the occupants of any house having a ventilating shaft from the sewer, carried up near a chimney flue, from the sewer air being blown down into the rooms through the chimney flue.—Yours, &c.,
C. BOND.

PATENT CAST-IRON INSPECTION OR ACCESS-PIPES FOR HOUSE-DRAINS.

In your current issue I notice a letter from Mr. W. P. Buchan in reference to the above. It is unnecessary to trespass on your valuable space in reply further than to say that Mr. Buchan's device is in fire-clay, whereas my device is in cast-iron, and of a totally different construction. There appears to have been some little misapprehension, which I suppose must account for the letter in question.

G. C. DAVIES.

65 Lausanne Road, London, S.E.,
Jan. 31, 1885.

SANITARY JOTTINGS.

SEASONAL MORTALITY.—Some interesting details with regard to the rate of mortality in Scotland at various periods of the year are given in the last annual report of Dr. Cunynghame to the Registrar-General. Among children under five years of age the greatest mortality during the year was in the months of January and March. Among those between five years and twenty years of age the most fatal months were March, May, and June. Adults succumbed most numerous during January, in which month the death-rate reached its highest point for the year. The lowest death-rate was in September.

DISEASED MEAT.—Edward Ascough, a butcher, was charged before the stipendiary magistrate at Middlesbrough on the 26th ult. with having exposed for sale at the market place, Middlesbrough, on January 3, sixty-eight pieces of meat which were unfit for human food. From evidence in support of the charge, it appeared that the animal had suffered from wasting or lung disease which rendered the flesh unwholesome. The defendant was fined in the mitigated penalty of 15s., or, in default, six weeks' imprisonment.

THE INSPECTION OF DAIRIES.—At the Northumberland quarter sessions, held at Newcastle on February 5, the inspector reported that a dairyman's byre at Scotswood was found to be in an unsatisfactory state. It had in 1879 been licensed for four cows, but there had always been ten cows kept in it. Typhoid fever prevailed in the district; and in no less than eleven of the cases the patients received their milk from the dairy in question. The committee suggested that the chief constable should be instructed to co-operate with the local authorities in such matters as the cleansing of dairies and the punishment of offenders.

PERNICIOUS IGNORANCE.—As exemplifying one of the many instances that could be adduced, where sanitary officers meet with opposition where they may reasonably expect support; at the last meeting of the Darlington Rural Sanitary Authority a member sagely delivered his

views on the uselessness of drainage generally, and stated his candid opinion—that if there had not been any system of draining inaugurated in this country it would have been as healthy as it is now. This gentleman would, doubtless, have approved of the lodgings where the landlady received complaints of bad smells, by the assurance that it could not be the drains, for there were not any.

M. Fordoz gives in *Cosmos* a very simple and useful method for detecting lead in the tinning of culinary utensils. The vessel being carefully cleaned to remove grease, a drop of nitric acid is applied to any part, and a gentle heat is used to dry the spot. A drop of solution of iodide of potassium is applied to the spot, and if lead be present a yellow iodide of lead is formed.

WATER SUPPLY.

THE NEW WATERWORKS AT KENILWORTH—Some years ago a scheme for providing the town of Kenilworth with a good unlimited water supply was started by a company in London, and shortly afterwards was taken up by local directors, who then carried the scheme out. The works, which were opened early in the year, are situated on the road leading from Coventry to Kenilworth. The water supply is obtained from a sandstone hill, into which an adit (5 feet in width and 16 feet deep) was driven for a distance of 275 feet. Underground chambers have been constructed for the storage of the water, and a pumping station erected, which contains two 12 horse-power gas engines. The supply is estimated at from 12,000 to 16,000 gallons per hour; and the water is raised to the top of a tower on Tentor's Hill, from which the town is supplied by gravitation. This tower is some 60 feet in height, and has at the top a storage-tank capable of holding 27,000 gallons. The town is fed by means of four and three inch mains, connected with which are seventy-five hydrants and seven fountains, in addition to stand-posts, &c., for general supply. The total cost is stated to be 8,500*l*.

In consequence of the unsatisfactory character of the water supply to Newcastle and Gateshead, a project has been mooted for the Corporations of these towns to purchase the interests of the present water company in order that the ratepayers may be able to deal more effectually with this important question.

At the last meeting of the York Rural Sanitary Authority, Mr. J. F. Marshall, the medical officer of health, presented an exhaustive report relative to the water supply of Bishopthorpe, to which the attention of the board had been forcibly drawn at a previous meeting. It appears that the water-supply of the village is almost wholly derived from wells, of which a large number were contaminated in a greater or less degree by the percolation of impure surface water and sewage matter. Thirty-two samples of water were analysed, and it was found that the better-class houses had the best water, from the general cleanliness of their surroundings; but, without exception, the whole of the cottagers' wells were polluted, and gave a very undesirable supply, whilst some are positively dangerous to health. The report is accompanied by an interesting tabular analysis of the quality of various samples of water examined.

SEWERAGE.

MAIN DRAINAGE WORK IN THE BIRMINGHAM DISTRICT.—The report of the work done by the Birmingham Tame and Rea District Drainage Board last year, presented at the annual meeting held a short time since, shows they are making satisfactory progress with the important and extensive operations under their control. Their expenditure last year was close upon 30,000*l*., bringing the total sum expended by them on drainage works which affect the boroughs of Birmingham, Aston Manor, Balsall Heath, Smethwick, Harborne, Handsworth, and Salfley Local Board districts, &c., to 386,000*l*. This represents a capital outlay of something like 13*s*. per head of the population embraced by their operations. The

work is not yet completed, however, and will by that time have cost something like 400,000*l*. They have, however, 900 acres of freehold land, which is increasing in value for sewage farms and other purposes, and above 10,000*l*. worth of live stock. The chairman (Mr. Alderman Avery) claims that the purification works and system employed by the Board are entirely successful in operation. They are now engaged in carrying out the recommendations of the Birmingham Sewage Inquiry Commission of 1871, viz. that the sewage should be precipitated in tanks and the acids neutralised by means of lime, its ultimate purification being effected by means of land irrigation. The advantage of this combination was found to be that one acre of land after precipitation was found to be as effective as six or eight acres without it. In July last the late Dr. Voelcker, in giving evidence before the Lower Thames Valley Sewage Board, said, respecting the scheme carried out in the Birmingham district, that 'the construction of the tanks, the precipitating agents used, and the whole care with which the process of precipitation and purification is carried out, are so perfect that even dealing with this mass of sewage, not the slightest inconvenience is felt, and no complaint, to my knowledge, has been made since the construction of the precipitating works.'

The Royal Commission on Metropolitan Sewage Discharge, of which Lord Granville was chairman, had also reported respecting the Birmingham scheme that 'On the whole we consider this plan offers one of the most feasible means of solving the difficulty.' At the Salfley Sewage Farm a daily produce of milk is realised, amounting to 135 gallons, which, it is estimated, will shortly be increased to 200 gallons, and there are six silos in operation. The quality of the ensilage has not yet been ascertained.

THE HOUSING OF THE WORKING CLASSES.

*'How best to help the slender store,
How mend the dwellings of the poor?'*

IN his evidence before the Royal Commission on the Housing of the Labouring Classes, the Earl of Shaftesbury stated his opinion that the Labouring Classes' Lodging-houses Act of 1851 would meet almost everything that is required at the present moment, whereas, as a point of fact, it has been a dead letter. But the Commons Lodging-houses Act of the same year has been very largely applied all over England, and is very largely in operation in the metropolis. Lord Shaftesbury estimates that every night in London there are from 20,000 to 30,000 people sleeping in houses under that Act; and both in the metropolis and in the other great towns the physical and moral benefits have been most satisfactory. A very large proportion of the population of London live in single rooms. The evil of overcrowding has increased very much of late years, owing to the large displacement of the population for the making of new streets, and the Thames Embankment and the Law Courts, and all the general improvements throughout London. The population were overcrowded before, but now they have become overcrowded to an extent never before known. When, for instance, the rookeries which were on the site of New Oxford Street were cleared away, the population flowed over into Church Lane and the adjacent streets, and the houses, which were then overcrowded, became crowded to such an extent that it was impossible for the people to live in them with any hope of health or decency. Then, again, when the clearances took place at Westminster in the year 1866 the overcrowding became excessive, and it was very hard indeed for the poor people. Lord Shaftesbury explained to the Royal Commission that he went over the houses himself, and had the statement from the occupants' own lips that many of them living in

men were compelled by their landlords to take one room, and to pay exactly the same rent for the one room that they had formerly paid for the two rooms. A great many are driven across the river, but that involved very serious families to the poor people who had to live such a distance from their work, or form new relations of labour in the districts to which they fled. Besides the evil of the crowding of poor families in single rooms, his lordship stated that he had known many cases where lodgers were taken well. He saw once four distinct families in one room, each occupying a corner. The state of the houses thus occupied may be gathered from the fact that when the workmen began to pull down parts of the houses in Tyndall's Buildings, Gray's Inn Road, the swarms of vermin were so great that there was a strike; and the workmen, though accustomed to their task, would not return until fire-engines had been introduced, charged with water, which destroyed the animals and pumped them out of existence. Lord Shaftesbury's experience of the lives of the very poor in London has been extensive and peculiar, and he has furnished the Royal Commission with many striking and painful incidents. Speaking of Frying-Alley, a famous purlieu of Holborn, his lordship says:—"In the first house I turned into there was a single room. The window was very small, and the light came through the door. I saw a young woman there, and I asked her if she had been there some little time. 'Yes,' he said, 'my husband goes out to work, and is obliged to come here to be near his work.' She added, 'I am miserable.' 'What is it?' I asked. 'Look there,' she replied, 'at that great hole. The landlord will not mend it. I have to sit up every night and watch, or my husband does so, because that hole is over a common sewer, and the rats come up, sometimes twenty at a time, and if we did not watch for them they would eat the baby up.'" Speaking of a visit to a low cellar in Tyndall's Buildings, his lordship says:—"There was not so much wood in it as would make a faggot. There were a woman and two children there, and from a hole in the ceiling there came a long open wooden trough, supported by props, and from that flowed all the filth of the house above into the common sewer. Nobody paid the least attention to it." The evidence taken by the Royal Commission on the Housing of the Working Classes points to a considerable change in the prejudices of the housing population of the metropolis in relation to tenement dwellings. Lord Shaftesbury stated to the commission that those classes would now go as readily to the great blocks of houses as into small houses. For long time there was the greatest desire in London and her large towns that every man should have in his own house his own castle. But in London this is impossible, and now so far from there being reluctance to go to the large blocks Lord Shaftesbury says he has found a model lodging-house people will pay 1s. more a week to get a little higher up in order that they may get a better air and a better view. He has no doubt that if many of these houses were constructed in many stories in order to save land, the people would enter them most readily. In reply to Sir Richard Cross, Lord Shaftesbury said that while there were a great number of people who live in the worst houses on account of the need to be near their work, there were a great number who might just as well live elsewhere. Many more might, and would, go into the suburbs were railways a little more rapid and more convenient in their running of trains. And how he would deal with the very lowest class—the pauper class—in London and in other great towns, his lordship admitted that he had never been able to see any mode, except by a complete alteration of the state of society, in which they could be benefited. They were always moving about from place to place in search of work, rarely remained more than three months in the same place. This was not a class of people who could afford to go into the Improved Dwellings, and if they went there their habits were such that they would make the buildings

as bad as the places they had left. Asked whether he could make any suggestion to the Commissioners as to the best way of dealing with that lowest class, his lordship replied that he had not a notion what to do with them.

NEW ARTISANS' DWELLINGS IN LAMBETH.—A block of buildings for the industrial classes has just been erected in Walnut Tree Walk, off Kennington Road, Lambeth. The buildings, which are in two blocks, have a frontage to Walnut Tree Walk 40 ft. in length, and extend to a depth of 100 ft. They contain four floors, and are 50 ft. in height. The elevation is faced with white Suffolk brick, and the frontage is ornamented with moulded and cut brick panels by Mr. James Brown, of Finsbury. The keystones, copings, and finials are in Portland stone. Each floor contains four sets of apartments, in suites of three rooms each, consisting of living-room, bedroom, and kitchen, with separate water-closets to each suite. The living-rooms are fitted with two cupboards, and there is one in each of the bedrooms, whilst the kitchens, in addition to dressers and cupboards, are supplied with coppers, sink, and coal bunker. There are stone staircases from the ground to the upper floor. The open flat roof, which is intended for both drying and recreation purposes, is constructed of concrete slabs and cement, and enclosed by a parapet wall 4 ft. in height. Messrs. Stock, Page, & Stock, of Duke Street, London Bridge, are the architects, and Messrs. J. Ford & Sons, of Denmark Hill, are the contractors. The cost of the buildings, which have been erected for Mr. Mackenzie, is 4,000l.

Prof. Felix Adler recently delivered a lecture on 'The Tenement-House Question,' at Chickering Hall, New York, U.S.A., in which he said that the greatest evil was overcrowding, and that he knew where a man lives with his wife, children, and nine boarders in two small rooms. He said that the law which allows 600 cubic feet of air to every human being is persistently violated. He thought that steps should be taken in New York, similar to those in London, where 12,000,000 dollars were being collected for the purpose of erecting houses for 50,000 human beings on 42 acres, and that the public baths should be kept open during the winter.

OVERCROWDING IN NEW YORK.—A medical commissioner of the *New York Tribune* is publishing in that journal the results of examinations he has made into the condition and dwellings of the poor of New York. In a recent article he refers to the extraordinary growth of tenement-houses. Although the first tenement was erected about 1838, by the year 1865, when a sanitary census was taken, there were 15,309 tenements on Manhattan Island. In 1879 their number had increased to 21,163, and in 1883 to 25,663, including apartment houses and flats. The average number of inmates in each tenement in 1864 was 35; but in 1884 houses inspected last summer by the Tenement-house Commission there were 8,811 families and 37,114 persons, or an average of 40 tenants to each house. In 1864 it was estimated that half a million persons lived in tenements; now the number is not far short of a million. But there are also hundreds of small buildings which possess all the attributes of tenements, and which are lacking in sanitary needs. There are 17,615 wooden buildings on Manhattan Island occupied as dwellings or as lodging-houses, and there are 29,000 buildings used partly for business purposes and partly as residences. Striking a comparison between the number of houses and population, it appears that the average number of inmates per house in the principal American cities is as follows: Philadelphia, 6; Brooklyn, 9; St. Louis, 8; Chicago, 8½; Baltimore, 6½; Boston, 8½; and New York, 16½. But other facts show an unexampled crowding of population in New York. Of the total number of dwellings in that city, 10,314 contain one family, or six persons, including domestics; 16,982 houses or flats contain one family on a floor, or 25 persons; while 18,966 tenements accommodate 50 persons each on an average, or almost 1,000,000 persons. Moreover, large sections of the city

are covered with houses standing so close to each other as hardly to permit air or light to gain access to the lower rooms. There are no fewer than 2,500 rear tenements separated by yards rarely more than twelve or fifteen feet from the front houses, while in many cases the space is not half that amount. Only radical measures can remedy the evil. There were 720 rear tenements examined, which abutted directly upon each other, and in these dwellings there were not less than 20,000 persons, bereft of sunlight and air.

A resident in the Barn-close district, Gateshead, was recently removed to the Gateshead Fever Hospital suffering from a very severe attack of typhus. When the medical officer was investigating the cause of the outbreak in this locality he found that the patients had been living in the basement of a house belonging to a paid servant of the Gateshead Corporation, and on removing a portion of the floor he discovered a mass of stagnant sewage matter, which had leaked from defective drains. Unfortunately horrors of this kind are by no means uncommon, and are not always so promptly discovered and rectified.

PARKS AND OPEN SPACES.

*The law condemns both man and woman
Who steals the goose from off the common;
But lets the greater felon loose,
Who steals the common from the goose.*

THE Parks Committee of the Newcastle Corporation have recommended the purchase of 12½ acres of land adjoining the present Elswick Park for extending the same. The committee suggest that a considerable portion of the purchase-money could be recouped by the sale of a small portion of the site for building purposes.

The Paving and Drainage Committee of the Tunbridge Wells Local Board and Urban Sanitary Authority reported at the last meeting of the board that they had received a most generous offer to present to the town, free of cost, a piece of land containing not less than four acres, on condition that a piece of land adjoining and belonging to the board should, together with the above-named four acres, be devoted entirely for a public recreation ground. The offer was accepted.

NOTICES OF MEETINGS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

T. O. DUDFIELD, M.D., President.

THE next meeting will be held on Friday, Feb. 20, at 7.30 P.M. A paper will be read on 'Sewer Ventilation and House Sanitation,' by Mr. William Weaver, A.M.I.C.E., Surveyor to the Vestry of Kensington.

SHIRLEY F. MURPHY,

C. E. SAUNDERS, M.D.,

Hon. Secretaries.

1 Adam Street, Adelphi, London.

VACCINATION OFFICERS' ASSOCIATION.

THE special and annual meeting of members of this Association will be held on Saturday, Feb. 21, at 2.30 P.M., at the Charing Cross Hospital Medical School, 62 Chandos Street, Strand, W.C. Business:—1. To read minutes of last meeting. 2. Correspondence. 3. Report of Committee, re insusceptibility. 4. Election of members and honorary members. 5. To submit annual report and balance sheet. 6. To consider the alteration of rules. 7. To elect executive officers and committee for the ensuing year.

C. P. ELKERTON, hon. secretary,
20 Clarendon Street, Pimlico, London, S.W.

WE understand that amongst the recent additional medical inspectors appointed by the Government, is Mr. R. J. R. Sweeting, of the Western Fever Hospital, Fulham, who is at present making inquiry into the prevalence of fever and diphtheria at Normanton and other places in Yorkshire.

APPOINTMENTS.

MEDICAL OFFICERS OF HEALTH.

- ATKINSON, Thomas Reuel, M.R.C.S.Eng., L.S.A.Lond., has re-appointed Medical Officer of Health for the Madley D of the Dore Rural Sanitary District, Herefordshire, at one year, *vice* Lane, resigned.
- BERESFORD, Robert de la Poer, M.D.Univ.Glasg., L.R.C.P. has been re-appointed Medical Officer of Health for the O Urban Sanitary District, at £25 for one year.
- CARROLL, Dr. Joseph, has been appointed Medical Officer of for the Ilkeston Urban Sanitary District, at £30 per annum Cooper, deceased.
- CURTIS, Albert, M.R.C.S.Eng., L.S.A.Lond., has been re-ap Medical Officer of Health for the Staines Urban Sanitary I at £25 for one year.
- EVANS, Thomas, M.D.Univ.Edin., L.R.C.S.Edin., has b appointed Medical Officer of Health for the New Quay Sanitary District, Cardiganshire, at £5 for one year.
- FREER, John Henry, L.R.C.P.Lond., M.R.C.S.Eng., ha re-appointed Medical Officer of Health for the Rugeley Sanitary District, at £20 per annum for three years.
- LE TALL, Frederick Tindall, M.R.C.S.Eng., L.S.A.Lond., h re-appointed Medical Officer of Health for the Hand Urban Sanitary District, Yorkshire, at £20 for one year.
- LLOYD, William Howell, M.R.C.S.Eng., L.S.A.Lond., ha re-appointed Medical Officer of Health for the Llandilo Sanitary District, Carmarthenshire, at £10 for one year.
- LOWE, Alexander, M.B., C.M.Univ.Glasg., has been app Medical Officer of Health for the Llanelli Division of the howel Rural Sanitary District, at £20 per annum, *vice* shire, resigned.
- MONTGOMERY, Samuel, L.R.C.P.Edin., L.R.C.S.Edin., ha appointed Medical Officer of Health for the Ovenden Sanitary District, Yorkshire, at £25 per annum for five from March 25, 1885.
- PAGET, Charles Edward, L.R.C.P.Lond., M.R.C.S.Eng Medical Officer of Health for the combined Sanitary De has been appointed Medical Officer of Health for the formed Ambleside Urban Sanitary District, at £16 per annu
- POWELL, John, L.S.A.Lond., has been re-appointed Medical of Health for the Kentschurch Division of the Dore Rural tary District, at £17 for one year.
- RENDALL, John, L.R.C.P.Lond., F.R.C.S.Eng., L.S.A.Lond been re-appointed Medical Officer of Health for the Llys Urban Sanitary District, at £30 for one year.
- ROCH, Sampson, M.R.C.S.Eng., has been appointed Medical of Health for the Cheltenham Urban Sanitary District, at per annum, *vice* Wright, deceased.
- SAUNDERS, William Sedgwick, M.D., L.R.C.P.Edin., has bee appointed Medical Officer of Health and Public Analyst City of London, for one year.
- SCOTT, Thomas, M.D.Univ.Edin., L.R.C.S.Edin., has bee appointed Medical Officer of Health for the Ilkley Urban tary District, at £30 for one year.
- THAIN, Leslie Lachlan, M.R.C.S.Eng., L.S.A.Lond., has bee appointed Medical Officer of Health for the Longtown Di of the Dore Rural Sanitary District, at £17 for one year.
- TODD, George, L.R.C.P.Edin. and L.M., L.R.C.S.Edin., ha appointed Medical Officer of Health for the Ilrig Sanitary District, at £10 per annum, *vice* Palmer, resigned
- WALKER, John Davidson, L.R.C.P.Edin., L.R.C.S.Edin been re-appointed Medical Officer of Health for the Ki Urban Sanitary district, at £30 for one year.
- WARTENBERG, Victor Adolph, L.R.C.P.Edin., M.R.C.S L.S.A.Lond., has been re-appointed Medical Officer of for the St. Anne's-on-the-Sea Urban Sanitary district, at one year.
- WILLIAMS, William, M.D.Univ.St.And., M.R.C.S.Eng., Lond., has been re-appointed Medical Officer of Health Mold Urban Sanitary District, at £25 for one year.
- WRIGHT, Alfred, M.R.C.S.Eng., L.S.A.Lond., has been re-ap Medical Officer of Health for the Romford Rural Sanita trict at £100, and for the Romford Urban Sanitary Dis £25, both for one year.

SURVEYORS, CLERKS TO GUARDIANS, INSPECT NUISANCES, &c.

- AINGE, Mr. Thomas Styles, has been appointed an additi spector of Nuisances for the Bristol Urban Sanitary Dis 35s. per week.
- ASHCROFT, Mr. Thomas, has been appointed Inspector of N for the Preston Rural Sanitary District, at £100 for one y School Attendance Officer, at £50 per annum, from year *vice* Chadwick, whose appointment has expired.
- BALDWIN, Mr. Edmund Chaplin, has been appointed a Coll the Brighton Town Council and Urban Sanitary Auth £150 per annum, *vice* Smithers.
- BEALE, Mr. F., has been elected a Member of the Barking Local Board and Urban Sanitary Authority, *vice* I resigned.
- BELLAMY, Mr. James William (the Clerk), has been appoint veyor to the Rawmarsh Local Board and Urban Sanitary rity, Yorkshire, *vice* Train, resigned.

Ernest Frederick, has been appointed a Collector to the Town Council and Urban Sanitary Authority, at £150 *per annum*, *vice* Merris.

Mr. William Henry, has been appointed Surveyor to the Town Council and Urban Sanitary Authority of Bolton, at £100 *per annum*, with office and assistants, *vice* Proctor.

W. H. M., has been elected a member of the Sherborne Local Board and Urban Sanitary Authority, *vice* Miller.

Mr. William, has been re-appointed Inspector of Nuisances to the Wootton Bassett Urban Sanitary District, Yorkshire, at £10 *per annum*.

Ambrose Wootton, the surveyor to the Loughborough Local Board and Urban Sanitary Authority, has been appointed Surveyor to the Canal Boats Act, 1877.

Thomas, has been re-appointed Inspector of Nuisances to the Quays Urban Sanitary District, Cardiganshire, at £10 *per annum*.

J. T. Branch, Manager of the London and Provincial Assurance Corporation, has been appointed Treasurer to the Woolwich Local Board and Urban Sanitary Authority, *vice* Morgan.

Mr. Daniel, has been re-appointed Inspector of Nuisances to the Llandudno Urban Sanitary District, at £80 for the year ending March 25, 1886.

William Berry, has been appointed Town Clerk and the Urban Sanitary Authority of Maidenhead, *vice* deceased.

George, has been appointed Clerk to the newly formed Local Board and Urban Sanitary Authority, at £30 *per annum*.

Mr. William, has been appointed Collector to the Sandwell Local Board and Urban Sanitary Authority, at £40 *per annum*, *vice* Brickman.

Mr. Joseph, has been appointed Surveyor and Inspector of Nuisances to the Loominster Urban Sanitary Authority, at £50 for two years, *vice* Cox, deceased.

Henry, has been appointed an additional Inspector of Nuisances to the Bristol Urban Sanitary District, at 35s. *per annum*.

Mr. John, M. A., has been appointed Clerk to the Hard-ward Rural Sanitary Authority, Northamptonshire, at £80 *per annum* as Clerk to the Guardians, and such remuneration as Clerk to the Rural Sanitary Authority, Assessment Committee, and to the School Attendance Committee, as may be fixed annually, and fees as Returning Officer, *vice* Jeffery, resigned.

William, has been re-appointed Inspector of Nuisances to the Llandudno Urban Sanitary District, at £17 for one year.

Mr. William, has been appointed Collector to the Swindon Local Board and Urban Sanitary Authority, at £30 *per annum*, until March 25 next, *vice* Mr. John William Jolliffe.

Frank Maude Taylor, J.P., has been elected Chairman of the newly formed Ambleside Local Board and Urban Sanitary Authority, at £100 *per annum*.

Mr. Joseph, has been re-appointed Inspector of Nuisances to the Urban Sanitary District, at 25s. for one year.

Thomas Joseph, has been appointed Collector to the Local Board and Urban Sanitary Authority, at £115 *per annum*, *vice* Wager, deceased.

Mr. Henry, has been re-appointed Inspector of Nuisances to the Henley Urban Sanitary District, at £60 *per annum* for three years.

Tom K., has been appointed Assistant Inspector of Nuisances to the Halifax Urban Sanitary District, at 35s. *per annum*, in uniform.

Mr. George Somers, has been re-appointed Surveyor and Inspector of Nuisances to the Dorking Local Board and Urban Sanitary Authority, at a joint salary of £190 *per annum*, for three years.

Mr. Joseph, has been re-appointed Inspector of Nuisances to the Wenden Urban Sanitary District, at £30 *per annum*, for one year, from March 25, 1885.

A. E. has been elected a member of the Ysk Local Board and Urban Sanitary Authority, *vice* Hart, deceased.

Mr. John, has been appointed Surveyor of Buildings and Inspector of Nuisances to the Wavertree Urban Sanitary District, at £120 *per annum*, *vice* Witts, appointed Surveyor and Inspector of Nuisances to the Skelton and Brothos Local Board and Urban Sanitary Authority.

K. F. B. has been elected a Member of the Hadleigh Local Board and Urban Sanitary Authority, *vice* Hart, deceased.

Mr. John Henry, has been appointed Inspector of Nuisances to the Lexden and Winstree Rural Sanitary District, at £125 *per annum*, from year to year, *vice* Cockrell.

John has been elected Chairman of the Depwade Local Board and Rural Sanitary Authority, Norfolk, *vice* King.

R. has been appointed Treasurer to the Aberystwith Local Board and Urban Sanitary Authority, *vice* Jones, deceased.

William, has been re-appointed Inspector of Nuisances to the Arkham Urban Sanitary District, at £20 for one year.

Hugh, has been appointed an additional Inspector of Nuisances to the Bristol Urban Sanitary District, at 35s. *per annum*.

Mr. William Henry, has been appointed Inspector of Nuisances to the Pottersbury Rural Sanitary District, Northamptonshire, at £50 *per annum*, *vice* Gilkes, deceased.

SMITH, Mr. J. Campbell, has been appointed Surveyor to the Town Council and Urban Sanitary Authority of Bury St. Edmunds, at £250 *per annum*, *vice* Hague, who was appointed, but continues as Surveyor to the Buxton Local Board and Urban Sanitary Authority, at an increased salary.

SUTCLIFFE, Mr. Alfred, has been appointed Surveyor and Inspector of Nuisances, for the Thornton Urban Sanitary District, at £78 *per annum*, *vice* Howard, deceased.

TICHTHURST, Mr. Frederic Gorham, has been appointed Clerk to the Battle Guardians and Rural Sanitary Authority, at £125 *per annum* as Clerk to the Guardians, £40 *per annum* as Clerk to the Rural Sanitary Authority, £50 *per annum* as Clerk to the Assessment Committee, £40 *per annum* as Clerk to the School Attendance Committee, and fees as Superintendent Registrar of Births, &c., and Returning Officer, *vice* Mr. Francis William Tichhurst, resigned.

TYRER, Mr. J., has been elected a Member of the Malvern Local Board and Urban Sanitary Authority, *vice* Smith, resigned.

WAKEFIELD, CREWSON, & Co., Messrs., Bankers, have been appointed Treasurers to the newly formed Ambleside Local Board and Urban Sanitary Authority.

WILLIS, Mr. Thomas Price, Solicitor, has been appointed Clerk to the Winslow Guardians and Rural Sanitary Authority, at £70 *per annum* as Clerk to the Guardians, £20 *per annum* as Clerk to the Rural Sanitary Authority, £10 *per annum* as Clerk to the Assessment Committee, such salary as Clerk to the School Attendance Committee as may be fixed from time to time, and fees as Superintendent Registrar of Births, &c., and Returning Officer, *vice* Mr. David Thomas Willis, deceased.

PUBLIC ANALYSTS.

BERINGER, Mr. John Jacob, has been re-appointed Public Analyst for the borough of Penryn for one year.

EMERY, Mr. George, has been appointed Public Analyst for the county of Gloucester at £100 *per annum*, and £15 for chemicals and a laboratory (subject to confirmation at the Easter Quarter Session) *vice* Hensley, resigned.

JONES, Mr. E. W. T., has been re-appointed Public Analyst for the Borough of Walsall, at £50 for one year, and £2 *per day* when required to give evidence.

YOUNG, Mr. W. C., has been re-appointed Public Analyst for the Whitechapel District, for one year.

VACANCIES.

MEDICAL OFFICER OF HEALTH for the Lowestoft Urban and Port Sanitary Districts: £110 *per annum*. Application to the Clerk to the Improvement Commissioners.

MEDICAL OFFICER OF HEALTH for the Mutford and Loughland Rural Sanitary District: £60 *per annum*. Application to the Clerk to the Guardians, Lowestoft.

MEDICAL OFFICER OF HEALTH for the Hursley Rural Sanitary District: £45 *per annum* (in addition to £100 *per annum* and fees as Poor-law Medical Officer, if the same person should be appointed, as hitherto). Application, 17th inst., to Rev. J. F. Moore, Ampfield Vicarage, Romsey, Chairman of the Board of Guardians.

TOWN CLERK and CLERK to the Urban Sanitary Authority of Huddersfield (a Solicitor): £800 *per annum* clear, with offices and clerks. Application, 18th inst., to G. Lewis Bailey, Town Clerk *pro tem*.

CLERK to the Rotherham Guardians and Rural Sanitary Authority. SURVEYOR to the Hendon Local Board and Urban Sanitary Authority: £150 *per annum*. Application, 21st inst., to Samuel Tilley, Clerk.

SURVEYOR and INSPECTOR OF NUISANCES for the Wilton Rural Sanitary District: £105 and £50 *per annum*. Application, 19th inst., to George M. Wilson, Clerk to the Authority, 12 Bridge Street, Salisbury.

SURVEYOR to the Ambleside Local Board and Urban Sanitary Authority. Application to Mr. George Gatey, Clerk.

INSPECTOR OF NUISANCES for the Newbury Rural Sanitary District. COLLECTOR to the Ambleside Local Board and Urban Sanitary Authority.

LOCAL INTELLIGENCE.

Dr. A. Bostock Hill, Public Analyst for Coventry, in his last report stated that the Sale of Food and Drugs Act had almost fallen in abeyance in that city. Only one sample of milk had been submitted to him for analysis during the quarter, and that was found to be genuine.

The Rev. John Mackie, Rector of Fynton, in his New Year's address to the congregation, stated that the last death in the parish, with a population of about 300, was that of a person aged upwards of eighty, in June 1883.

Mr. E. B. Ellice Clark, M.I.C.E., Engineer and Surveyor to the Hove Improvement Commissioners and Urban Sanitary Authority, has been appointed County Surveyor for West Sussex.

At the meeting of the Town Council and Urban Sanitary Authority of Warwick, Dr. A. Bostock Hill, Borough Analyst, reported that during the quarter ending Dec. 31, five samples of milk were sub-

mitted to him for analysis by Inspector Treppe. Of these one was adulterated with 11 per cent. of added water, while another had been deprived of its cream to the extent of 25 per cent. The three other samples were genuine, and of good quality. The Mayor, in answer to Alderman Moore, said that in the first two cases there had been convictions, a fine of £5 being imposed in one instance.

Dr Edward Jeffery, the Medical Officer of Health for the Lowestoft Urban Sanitary District, was seized with a fit on Saturday, Jan. 17, and expired almost immediately.

The extraordinary number of 354 applications were made for the appointment of Assistant Sanitary Inspector for the Halden Urban Sanitary District, at 350 per week, with a suit of uniform.

Mr Joseph Hagar, upon being appointed Surveyor to the Town Council and Urban Sanitary Authority of Bury St. Edmunds, as mentioned in p. 343, sent in his resignation to the Boston Local Board and Urban Sanitary Authority, who the latter, stimulated by memorials from the ratepayers, offered to increase his salary £200 per annum, if he would remain for three years, which he agreed to do.

The Todmorden Local Board and Urban Sanitary Authority have increased the salary of the Surveyor from £100 to £125 per annum.

The Local Government Board have declared the 90th section of the Public Health Act, relating to the making of by-laws as to houses let in lodgings, to be in force within the Local Government District of Pinstrip.

The Heston Town Council and Urban Sanitary Authority, at a special meeting, Mr. J. C. Macaulay, the Mayor, presiding, unanimously passed the following resolution, upon the motion of Mr. Mellor, seconded by Mr. Wood: 'That the Council record their sense of the activity of their late sanitary inspector (Mr. James Summers Plackett) in endeavouring to stop the spread of small pox in Heston, and to express their deep regret that in discharging such duties he should have succumbed to the disease; and that the Mayor be requested to forward, on behalf of the Council, a copy of the resolution to Mrs. Plackett, and to express fully the deep sympathy of the Council for her in the sudden and sad bereavement.'

Mr Matthew A. Adams, the public analyst for the county of Kent, reported to the Epiphany Court of Quarter Session that 113 samples of food had been received for analysis during the last quarter, of this number 18, or 15.8 per cent., were found to be adulterated.

The Finance and General Purposes Committee of the Justices of Kent, in their report to the Epiphany Court of Quarter Session, stated that with regard to the carrying out of the Food and Drugs Act the total expense amounted to 38s. 10s. 6d. The fines amounted to 9s. They again felt compelled to appeal to the Court for that assistance and support in carrying out the requirements of an Act of Parliament of the greatest importance, which can only be given by Justices at petty sessions systematically inflicting penalties in some measure commensurate to the cases as proved.

At a special meeting of the Chesterfield Rural Sanitary Authority on Thursday, Jan. 14, Mr. F. Barber presiding, it was stated that the term for which Dr Macintosh was appointed medical officer of health would expire on March 31, and Mr. Croucher moved that he be re-appointed for three years from that date, at his present salary of £400 per annum. This was seconded by Mr. Jackson, J.P. As an amendment, the chairman proposed that he be appointed at a salary of £300 per annum, subject to the sanction of the Local Government Board and the repayment of half the amount by the Treasury, and that, in the event of the Local Government Board refusing their sanction, he be appointed at a salary of £200, with liberty to hold any other public appointments, but not to engage in private practice. The amendment was seconded by Mr. Berry, and on being put to the meeting was carried by seven votes against six.

The Rugeley Local Board and Urban Sanitary Authority, at their last meeting, received and read a letter from the Local Government Board complaining that an Inspector under 'The Sale of Food and Drugs Act' had not been appointed, upon which a member remarked that, as they had done without such an officer for ten years, he thought they might do so a little longer, and the other members concurred, so that the Act of Parliament is there, as in many other places, a dead letter.

The Dorking Local Board and Urban Sanitary Authority have increased the salary of Mr. George S. Mathews, the Surveyor, from £400 to £450 per annum.

The Gainsborough Local Board and Urban Sanitary Authority have increased the salary of Mr. T. M. Cooper, the Collector, from £70 to £80 per annum.

At the Monthly Meeting of the Lincoln Urban Sanitary Authority on Tuesday, the 12th inst., the following Resolution was, upon the motion of Alderman Mahby, seconded by Mr. Bourne, unanimously passed:—'That the Mayor, Aldermen, and citizens of the city of Lincoln, acting in pursuance of the Public Health Act 1875, and being the Urban Sanitary Authority for the said city, do in the next Session of Parliament promote a Bill to enable the said Mayor, Aldermen, and citizens of the said city of Lincoln, as such Urban Sanitary Authority, to acquire the undertaking of the Lincoln Gas-light and Coke Company, and to extend the gas limits, and for other purposes; and that the costs and expenses incurred, or to be incurred in, or in relation to the applying for, preparing and promoting such Bill, and the putting the same into an Act, shall be charged on the general district rate, if not otherwise provided in the said Bill, in case it becomes an Act.'

A meeting of owners and ratepayers of the parish of Llantrisant, Glamorganshire, has been convened by the churchwardens, pursuant to a requisition signed by twenty owners and ratepayers, resident in no much of the parish as is within the Pinstrip rural sanitary district, and will be held on Monday the 16th inst., at the Parish Office, for the purpose of considering and passing a resolution that it is expedient that so much of the said parish as is not comprised in any urban sanitary district, should be constituted a Local Government district.

The Lancaster Guardians and Rural Sanitary Authority last meeting, reconsidered the terms upon which they employ Mr. J. Jowett, Inspector of nuisances and surveyor, as in our last, and, after some discussion, passed a resolution to the effect that the salary of £105 per year only, instead of £120, be paid to Mr. Jowett for one year only, instead of five.

The Huntingdon Town Council and Urban Sanitary Authority have increased the salary of the surveyor from £80 to £100 per annum.

The Farnham Guardians and Rural Sanitary Authority, under Sect. 46 of the Health Act, so far as it relates to the erection of a built sewer, under so much of Sect. 44 as is not already in force, Sects. 137 and 138, within the contributory place of Farnham.

The Medical Officer of Health for the Bristol Urban District, in his report to the Authority at the meeting recommended that the house-to-house visitation, hitherto to houses occupied by the working classes, should be to those of every class throughout the district, and that three Inspectors of Nuisances should be appointed for that purpose. Some discussion the recommendations were adopted, and motions issued which resulted in 107 applications, from a very careful consideration, Messrs. Angus, Hamill, and I have been appointed. Mr. Angus has the diploma of the Sanitary of Great Britain, and a bronze medal for sanitary plumb. Mr. Hamill is a practical plumber of great experience in sanitary work, and was, up to the time of his appointment, employ of a leading firm at Bristol, and Mr. Howe has been by the London Sanitary Protection Association, and testimonials.

The recommendation of the Health Committee of the Improvement Commissioners and Urban Sanitary Authority appointment of a Medical Officer of Health for the Urban Sanitary District, vacant by the death of Dr. Jeffery, should be made jointly, that the salary for the former should be from £90 to £100 per annum, and that the terms and conditions of the former appointment should be unaltered, came on for vote on the 9th inst. After some discussion, a resolution was proposed to increase the salary for the Urban District was eleven votes against seven, and the remainder of the meeting was adopted.

NOTES AND QUERIES.

Having for some time back been in the receipt of Queries relating strictly to sanitary work, and which it would be easy to without having to refer our correspondent to competent professional advisers, we have opened a column in which to register such Queries, and as can fairly be expected from us, and our readers are invited to make such use of this column as to benefit themselves and the community. Both Queries and will, however, be subjected, if unnecessarily long, to a strict edit.

143. HOW TO VENTILATE A SCHOOLROOM.

Will you be so good as to let me know in your Notes and what is the best method of ventilating a large schoolroom, the roof, and without any ceiling?

[It is impossible for any person to give a detailed plan of fitting any room without seeing it, and knowing all the details of the system of ventilation should include arrangements for fresh air, and exhausting the vitiated, but the best advice that must be dependent to some extent on the surrounding building. Consult one of the ventilating engineers about the SANITARY RECORD.—Ed.]

144. DEATHS FROM ZYMOTIC DISEASE.

Could you inform me what was the number of deaths in 1883 or 1884 from zymotic diseases? How many of these were of children under five years of age?

[The number of deaths from the principal zymotic diseases in England and Wales during 1883 was 45,536, of which 717 of children under five years of age. The deaths in London 1884 from the principal zymotic diseases were 13,606 of 10,540 were of children under five years of age.—Ed.]

145. SEWERAGE SYSTEMS.

The board of guardians of a rural union contemplate the sale of their parish, and have appointed a committee to enquire into the best system of 'precipitation' or of otherwise treat sewage as introduced at different places. They are all anxious to obtain the best information they can upon the subject, and ventured to think that you might assist them a little by letting them where any system has been most successfully carried out by giving them any general further information upon the subject that you may think desirable.

[You ask a question which would occupy a considerable order to formulate a reply. It is quite an engineer's job, and cannot possibly be gone into in our columns. Before it could be given any data are required as to population, nature of soil, &c. You might consult Professor Roberts, Minister Chambers, London, E.W., with advantage, or Mr. works, which bear upon the subject and go through in various columns.—Ed.]

ORIGINAL PAPERS.

RIVER POLLUTION.*

By Professor HENRY ROBINSON, C.E.

IN bringing the subject of the pollution of rivers before the Parkes Museum I do not propose to confine my remarks to the sanitary aspect of the case, as I think the purpose we all have in view, namely, the amelioration of the existing intolerable pollution of our streams will be best served by combining all the interests which are favourable to the cause of reform, whether they be piscatorial or commercial, sentimental or material.

Many of my hearers are doubtless aware of the efforts which have been made for years past by zealous reformers to obtain further and better legislation for the protection of our rivers, and I am justified in saying that all who have given serious attention to the subject have arrived at a sufficient agreement on main points to enable further action now to be taken.

One of the most earnest workers in this cause—the late Frank Buckland—gave expression to his views in an address to the Sanitary Institute of Great Britain in 1878, and I would quote his words when speaking of the injury occasioned to fishing interests:—‘If the pollution mentioned in this my address were by law kept out of the rivers within Her Majesty’s realms, I feel sure, and I say it most advisedly, that the fisheries would vastly increase in their salmon-producing powers in a very few years. It is, therefore, most lamentable to think that at the present time, when there are so many mouths to be fed and so many rivers comparatively salmonless, manufactures and mineowners (who form a relatively small portion of Her Majesty’s subjects) should be allowed to inflict, directly and indirectly, such a vast evil on the public in general.’

As far back as 1863 Lord Palmerston’s attention was directed to the serious pollution of the rivers of the country, and since then many efforts at legislation have been made to which it may be interesting to make a brief reference.

1864. ‘The Rivers Pollution (Scotland) Bill, to prevent the discharge of impure water from manufactories in rivers in Scotland.’ This did not pass the Commons.

1865. ‘The River Waters Protection Bill, to amend and better to administer the laws for the protection of waters in rivers and streams in England.’ This did not pass the Commons.

1865. A Royal Commission was issued to inquire into the best means of ‘preventing the pollution of rivers.’

1866. First report of Royal Commissioners (relating to River Thames) was presented.

1867. Another report, relating to Rivers Aire and Calder.

1868. A second Royal Commission issued.

1870. Two reports of the Royal Commissioners were presented, one on the A B C process, and the other relating to the Mersey and Ribble Basins.

1871. A third report was presented, ‘relating to pollution arising from the woollen manufactories and processes connected therewith.’

1872. A fourth report was presented relating to the rivers of Scotland.

1873. A Bill was introduced by the Earl of Shaftesbury. The preamble recited ‘that the pollution of rivers had of late so increased as to become a national evil.’ This passed the Lords, but was withdrawn.

1874. Fifth report, *re* pollution from mining ‘operations and metal manufactories.’

1875. A Bill was introduced in the Lords, ‘for the better prevention of the pollution of rivers,’ and providing for the constitution of a Conservancy Authority. This passed the Lords, but did not proceed beyond the second reading in the Commons.

1876. The Rivers Pollution Prevention Act passed.

1877. The Lords appointed a Select Committee ‘to consider by what means Conservancy Boards could be more conveniently and inexpensively constituted.’ The Committee reported in favour of constituting Conservancy Boards ‘to execute the powers for the prevention of the pollution of rivers conferred on local authorities by the Rivers Pollution Prevention Act.’

1879. The Rivers Conservancy Bill was introduced in the Lords, ‘for the conservancy of rivers and water-courses and the mitigation of floods within their districts.’ This passed the Lords, but was sacrificed in the Commons.

1881. The ‘Rivers Floods Prevention Bill’ was introduced in the Commons, ‘to make provision for the better prevention of floods and for the conservancy of rivers.’ The Lords also had a Bill, namely ‘The Rivers Conservancy and Floods Prevention Bill.’ This soon passed the Lords, and was sent to the Commons, where the Commons’ own Bill had been read a second time. The two Bills were referred to the same Select Committee, which reported in favour of the Lords’ Bill with amendments. Both, however, were lost.

1882. The ‘River Conservancy and Floods Prevention Bill’ was introduced by Mr. Dodson. This was substantially the Bill of the Lords of 1881, with, however, the omission of the important clause empowering the Conservancy Boards to enforce the provisions of the Rivers Pollution Prevention Act of 1876. This was withdrawn.

1883. A similar Bill was introduced, but was dropped.

1884–85. A Bill is now before Parliament for the ‘Prevention of the Pollution of Rivers.’

The risk of seriously interfering with manufacturing interests has often been alleged as a reason for avoiding drastic remedies. This danger has, I believe, been exaggerated, as will be seen by reference to the opinions of those most capable of giving a fair and impartial judgment.

In referring to manufacturing pollution, the Royal Commissioners in one of their reports stated that ‘the remedies for the nuisances which these refuse liquids create have been carefully examined, and after prolonged inquiry and research we have been able to report that in every case efficient remedies exist and are available, so that the present use of rivers and running waters for the purpose of carrying off the sewage of towns and populous places, and the refuse arising from industrial processes and manufactories, can be prevented without risk to the public health or serious injury to such processes or manufactories.’

Sir Lyon Playfair said, in giving evidence before a House of Lords Committee, that ‘if you force us to purify the water which we discharge fouled in

* Address delivered at the Parkes Museum of Hygiene, Feb. 26, 1885.

this way, before long we shall find efficient modes of doing it. At the present moment we have not efficient modes of doing it, and yet, as one of the largest polluters of water in the kingdom, from this very thing I advocate that you should make me purify the water before I discharge it.

The Royal Commissioners recommended the imposition of 'adequate penalties' where 'gross pollution' was continued; also the appointment of officers to whom should 'be committed the duty of detecting and proving offences against the law, and of procuring the conviction of offenders.'

I cannot attempt to quote from the various reports of Royal Commissioners, or from the evidence adduced before them, a tithe of the strong opinion which was put on record against that which still exists in spite of the Act of 1876. Men of the highest eminence and authority, whose views command respect, urged the necessity for remedying these evils years ago. There was no uncertain note sounded in any of the reports. Just let me quote a paragraph from the Fourth Report of the Second Commission, 1872. 'Methods have been described in our reports, involving no excessive expenditure, by which the foulest liquid waste from manufactories can be adequately cleansed. We believe that the adoption of none of them will inflict any injury at all upon manufacturers; indeed, we have every reason to conclude that their adoption will save the manufacturers of this country from inflicting considerable injury upon themselves, whilst, by preserving the whole course of rivers in a comparatively clean and useful condition, they will tend powerfully to the extension of manufactories upon their banks. One of the most crying evils in manufacturing districts is the want of clean water, and therefore every successful effort to make dirty water again usable is a gain to manufacturers.'

It is generally admitted that the Act of 1876 has been practically inoperative, and has failed to accomplish the objects for which it was passed. To show that this is the case, I will mention that in 1883 the Duke of Northumberland moved for a return of 'all proceedings instituted in the county courts in England and Wales for the prevention of the pollution of rivers under the Rivers Pollution Prevention Act, 1876.'

There appear from this return to have been only fifty-three cases. Of these only twenty-seven resulted in Orders being obtained to desist from pollution, and some (I believe the majority) of these Orders have never been acted upon at all.

Although the Rivers Pollution Prevention Act of 1876 has not accomplished as much as was anticipated, it is necessary, in justice to those who framed it, to remember that the general assumption on which it was based was that the local authorities were, under the local-government system, the right and sole machinery to put the Act into operation. They, however, have not done so; and the power which was vested in them has not been exercised, so that it may be confidently asserted that local self-government, as exhibited in relation to the enforcement of the provisions of this Act, has proved a failure.

Under the Act an aggrieved person failing to put in motion the sanitary authority to abate an evil can, under Section 6, appeal to the Local Government Board, and that Board, if on inquiry it is satisfied that the sanitary authority should take proceedings, can direct it to do so. Those experienced in the

ways of local boards will appreciate the zeal and energy with which proceedings commenced by them under these circumstances will be followed up, and the remote prospect the aggrieved person has of getting redress for his wrongs.

Before the passing of this Act it was an offence at common law to pollute a river with refuse. The Act has not improved matters, as ambiguity of language and subtle distinctions have been imported into it which ought to have been avoided. In Sections 2, 3, and 4 the words 'knowingly,' 'solid,' and 'liquid' afford a wide opening for contention, which would not be the case if the first word 'knowingly' were omitted, and the latter words 'solids and liquids' were changed for the word 'matter,' so that it would be clearly understood that any polluting matter whatever discharging into a stream constituted an offence under the Act.

The words 'poisonous,' 'noxious,' or 'polluting' solid or liquid matter fail to define that which causes injury to fish. The late Frank Buckland objected to these words in considering the way that polluting matter affected fish, and he pointed out that a fish is influenced by pollution more through the medium of the gills than through the stomach. An animal destroyed by prussic acid may be said to be poisoned, but fish are destroyed more by suffocation, the gills being always found to be the structure most affected. He noticed that a fish poisoned by pollution, generally speaking, died with the gills and mouth widely extended, as if it was gasping for breath, the gills being the mechanism by which oxygen is absorbed from the water.

It is well known that some fish feed upon part of the suspended matter in sewage, and that a form of plant-life is developed by it which serves as food for fish or for organisms which fish assimilate. These organisms and plants may be regarded as serving to remove the normal pollution to which any river may be subjected, and ought not to be claimed as factors in removing the abnormal pollution to which our rivers are exposed. I think there is a danger that the knowledge which has of late years been acquired with reference to the chemical and biological changes which go on in a river will be used to justify, or at all events to minimise, the mischief arising from sewage pollution. In several great pollution cases which have been tried great pains have been taken to prove that pollution is inappreciable at a certain distance from its origin.

I may instance as confirmatory of this the well-known cases of the pollution of the Rivers Thames, Lea, Wey, and other rivers. In the former case, the Metropolitan Board of Works (the authority) has for years defied public opinion, and refused to recognise the pollution of the Thames at the Barking and Crossness Outfalls. It has required two prolonged inquiries and reports of Royal Commissioners to convince this authority of the existence of the evil. In the other instances several cases have been the subject of litigation, but in all of them it has been the same story—namely, the local authority resisting the allegation that the pollution existed. The reluctance of some boards to act is largely due to the presence of a group of economic members, who consider it to be their duty to the ratepayers to oppose everything which involves an expenditure out of the rates. It is right to record, as my experience of local boards, that a very different class of men to those who are chiefly responsible for the policy of

inaction are found upon most boards, but they too often are in a minority.

As regards sewage pollution, no difficulty can be reasonably alleged now about the process or method which should be adopted with reference to any particular place. Data are now available to guide all who are capable of being influenced by facts; and if those who have to exercise judicial functions in dealing with questions of sewage disposal will disregard prejudice, and decide on the evidence of facts as distinguished from crotchety opinions, not a fractional part of the trouble and expense would arise out of sewage inquiries. At all events, I am sure that no justification exists now for strife and contention about this source of pollution compared to that which was fairly permissible ten years or so ago.

Much of the difficulty which attends the prevention of sewage pollution to a river arises from the outfall sewer being made use of to convey also the whole of the rainfall from the populated area draining into the sewerage system. This ought not to be the case, as the separation of the rainfall, or, at all events, of a considerable part of it, enables the sewers to be more efficient and self-cleansing, and causes the sewage which is removed by them to be brought to the point of discharge in a fresher state than is possible where the sewers are calculated to convey the larger volume. They then inevitably become sewers of deposit in dry weather, and give off dangerous gases. In wet weather the decomposing sewage is flushed away to the outfall in a state which is unsuitable for utilisation on land and is destructive to fish, by exhausting the oxygen from the river.

The law should be precise that no polluting matter whatever should be passed into a river. If a small amount does no harm, or even admit that it does good, to fishes, it is better to prevent them altogether from having this alternative diet than to run the risk of their having far too much, with the certainty of nuisance and of interference with the enjoyment of the river. The following letter, which appeared in the *Times* last autumn, is interesting, and serves to show the danger of leaving in doubt the permissibility of discharging sewage into a river:

'Sir,—It is a remarkable fact that at the meeting of the Severn conservators recently at Worcester the report stated that the salmon disease had entirely disappeared during the late summer. The past season has been the longest, warmest, and driest known in this country for many years, and as the Severn was correspondingly low, and therefore must have been more than usually polluted (in proportion to the small quantity of water), yet the fish disease disappeared! I am also informed by fishermen that some sorts of fish are so well known to congregate near the mouths of sewers that anglers and others make it a rule to seek and find them there. This seems to imply that diluted sewage is attractive to these fish, either as an alternative in their diet or medicinally, and otherwise grateful to the piscine stomach. These facts no doubt confuse, if they do not reverse, our ideas as to the destruction of fish by the pollution of rivers. Where chemicals or other pungent refuse from manufactories are introduced into our streams there can be no question as to their baneful effects on fish-life, but that the sewage of towns is not objectionable to these creatures is a fact which ought to be taken into account in any future Pollution of Rivers Act.

The argument hitherto urged, and unanimously accepted, that the discharging of sewage into our streams tended to the destruction of the fisheries would seem to be no longer tenable.

'Yours, &c.

'J. NOAKE,

'Worcester.'

'Severn Conservator.'

Although I hold that ultimately no pollution of a river should be allowed, yet where a stream has been employed to carry off polluting matter from manufactories, the remedy that has to be provided requires to be enforced carefully and, perhaps, slowly at first, with a view to prevent sudden injury to trading interests which might lead to a discontinuance of the trade, and a consequent loss both to the manufacturer and to the poorer classes in the district. A considerable part of the polluting matter now passing into streams is capable of being removed by subsidence or mechanical straining without chemicals. As tanks are required in any system of sewage treatment, they could be made a *sine quâ non* even at the outset, and their provision could be made absolutely compulsory under the Act to commence with. The size of the tanks was considered by the Rivers Pollution Prevention Commissioners, and they proposed that the flow for six hours should be impounded. This, however, admits of variation by constructing the tank in duplicate with an upward straining-frame, by which the suspended matter would be arrested and flushed or pumped out at intervals, the fluid passing continuously.

The distinction that is made between a channel constructed before the passing of the Act of 1876 and one made since seems undesirable. If discretionary power is vested in those who have to enforce the Act, I think this distinction could be safely done away with.

The Rivers Pollution Commissioners in their fifth Report recommend the condemnation of liquids which did not comply with the following standards:—

(a) Any liquid which has not been subjected to perfect rest in subsidence ponds of sufficient size for a period of at least six hours, or which, having been so subjected to subsidence, contains in suspension more than one part by weight of dry organic matter in 100,000 parts by weight of the liquid, or which, not having been so subjected to subsidence, contains in suspension more than three parts by weight of dry mineral matter, or one part by weight of dry organic matter in 100,000 parts by weight of the liquid.

(b) Any liquid containing, in solution, more than two parts by weight of organic carbon, or .3 part by weight of organic nitrogen in 100,000 parts by weight.

(c) Any liquid which shall exhibit by daylight a distinct colour when a stratum of it, one inch deep, is placed in a white porcelain or earthenware vessel.

(d) Any liquid which contains, in solution, in 100,000 parts by weight, more than two parts by weight of any metal except calcium, magnesium, potassium, and sodium.

(e) Any liquid which, in 100,000 parts by weight, contains, whether in solution or suspension, in chemical combination or otherwise, more than .05 part by weight of metallic arsenic.

(f) Any liquid which, after acidification with sulphuric acid, contains, in 100,000 parts by weight, more than one part by weight of free chlorine.

(g) Any liquid which contains, in 100,000 parts by weight, more than one part by weight of sulphur.

in the condition either of sulphuretted hydrogen or of a soluble sulphuret.

(h) Any liquid possessing an acidity greater than that which is produced by adding two parts by weight of real muriatic acid to 1,000 parts by weight of distilled water.

(i) Any liquid possessing an alkalinity greater than that produced by adding one part by weight of dry caustic soda to 1,000 parts by weight of distilled water.

(k) Any liquid exhibiting a film of petroleum or hydrocarbon oil upon its surface, or containing, in suspension, in 100,000 parts, more than .05 part of such oil.

It is a question whether these standards should be incorporated in any Act, as it is most important that it should be free from the risk of having standards inelastic or of an arbitrary character without reference to the varying conditions of the cases to be dealt with.

I brought the question of River Pollution before the Congress of the Sanitary Institute of Great Britain at Glasgow in the year 1883 (*see* SANITARY RECORD, vol. xv., page 165), the late Dr. Angus Smith presiding over the section in which my paper was read. I expressed the opinion that the Rivers Pollution Prevention Act was practically a dead letter, but Dr. Angus Smith (who was one of the Inspectors under the Act) thought it had not been inoperative, although he had uniformly refused to give a certificate under section 12 of the Act, owing to the wording of it, which is as follows:—'That the means used for rendering harmless any sewage matter or poisonous, noxious, or polluting solid or liquid matter, falling or flowing or carried into any stream, are the best or only practical and available means under the circumstances of the particular case.' Dr. Angus Smith said that he felt justified in refusing his certificate unless the best means were used, and he expressed an opinion that these words were too stringent.

In lieu of standards of purity being inserted in a modified Act, some have suggested that the coefficient of purity required should rise or fall with the state of purity of the river at the point of discharge. This, I think, is an undesirable system to adopt. It is well known that the mischievous effects produced by foul organic matter passing into a stream will continue to operate in a short or long distance, according to whether the stream has or has not the oxygenating power to cleanse itself of these impurities. A river in a foul state has its recuperative powers severely taxed, and is less able to deal with pollution than if it is in a clean state. The pollution added to a foul stream will remain pollution for a long distance, whereas, if it were added to a stream having power to oxygenate it, the injurious effects would be felt for only a short distance. The purifying capacity of a river can be ascertained by the use of Schutzenberger's apparatus for the determination of the dissolved oxygen in water, the basis upon which the system is founded being the great affinity of hyposulphite of soda for oxygen. By ascertaining the amount of free oxygen that a known volume of water yields to a known volume of hyposulphite of soda, the power of the stream to oxidise impurities can be defined.

It will have been noticed that the recent efforts to legislate on the question of rivers have been more in the direction of dealing with the matter on a wide basis, and not confining it to pollution. This has

been due to the necessity having been recognised for taking measures to extend the scope of local administration by the creation of Conservancy or County Boards, having jurisdiction over large areas, and being charged with all duties of local government intermediate between the existing authorities and the Local Government Board. The extent of the powers vested in such Boards, and the way in which those powers are to be enforced, still require much consideration. There is no doubt that the recommendation of the Select Committee of the Lords in 1877 will be adopted, by which Conservancy or County Boards would put into operation the powers of the Act of 1876, and would be responsible for the purity of the rivers.

If such a new authority were constituted, it would be a step in the direction of local government or home rule, which would relieve the central department and enable much-needed sanitary work to be accomplished which is now untouched. In creating such an authority, so far as dealing with rivers is concerned, it is a question whether the physical features or watershed of a district should constitute the proper boundary, or whether the populations and towns on or near to it should be included, so that the Board would be formed with reference to the drainage area, at the same time without undue interference (for statistical purposes) with the sanitary and registration districts. In dealing with a river, two or more neighbouring Boards would have, in some cases, to form a joint committee, as the river basin would be in more than one area.

A Bill is now before Parliament for the amendment of the Rivers Pollution Prevention Act of 1876. It has been drafted by Mr. Willis-Bund, Chairman of the Severn Fishery Board, aided by Mr. William Burchell, and has been brought in by Mr. Hastings, Earl Percy, and Colonel Walrond, all of whom have taken a deep interest in this subject. The Bill removes many of the defects of the existing Act, and even if it is not perfect, it is capable of being amended. The standards of purity recommended by the Commissioners have been adopted in this Bill, and it is on this point that I think the most difference of opinion exists. I have already said that I think great elasticity should be given in respect of standards.

One good feature about this Bill is that it improves the machinery for enforcing its provisions, as any injured person can go to the nearest court, and this tribunal has the power vested in it to order a scientific inquiry, and to decide what shall be done if it finds that the complaint is well founded.

Under this Bill there would doubtless always be the possibility of an aggrieved person being actuated by vindictive or foolish motives, and some have regarded this as a reason for complicating the machinery which had to be put in motion. I do not agree with this, as I would prefer to see a frivolous and senseless person occasionally giving trouble without sufficient reason, and with little expense to himself, if sensible persons were able to carry their point quickly and cheaply when they took action.

'The National Society to secure effective legislation against River Pollution,' is now urging that this Bill should receive the support necessary to enable an Act to be obtained this Session. The 'National Association for the Promotion of Social Science' has invited the co-operation of the various sanitary societies to wait upon the President of the Local Government Board, with a view of securing legis-

Session. The 'Sanitary Institute of Great Britain' has appointed a committee to consider this. The council of the 'Parkes' Museum' are alive to the need of action, hence my saying to-day.

amendment of the Act of 1876 is taken independently of the other matters affecting the Government, I think that modifications can be made by which the optional provisions of the Act will be changed, and its effect made obligatory upon the local authorities. The other necessary amendments which are indicated in the foregoing remarks can, in my opinion, be easily drafted, and in terms which admit of no doubt. If the prospect of carrying out a measure of local government is remote, I am of the opinion that an effort should be made to pass the Bill which is now before Parliament so that it might pass this session, and so accomplish a great and increasing evil, upon which opinion has been unmistakably expressed. By asking the co-operation of all in the country it is now being made to prevent a continuation of the present pollution of the rivers of which has been truly characterised by Lord Salisbury as a 'national evil.' Their restoration to original purity will, I trust, be the result of sustained efforts on the part of those who are working earnestly in this cause.

LEWIS THOMAS, B.A., of Sidney Sussex College, Cambridge, and Lincoln's Inn, has been appointed officer of the Mansion House Council on the part of the People.

ALTHAM RESORT.—The parish of Presteign, in Wiltshire, and Radnor, is very remarkable for the health of its inhabitants. By the last census it contained 2,214 of these twelve now are in their seventieth year, seventy-first, three in seventy-second, two in seventy-third, one in seventy-fourth, six in seventy-fifth, twenty-sixth, eight in seventy-seventh, two in seventy-eighth, one in seventy-ninth, seven in eightieth, thirty-first, seven in eighty-second, four in eighty-third, one in eighty-fourth, one in eighty-fifth, one in eighty-sixth, one in eighty-seventh, and one in ninety-eighth year. This last year they gathered potatoes in their garden. One couple married fifty years, another fifty-three, another fifty-five. An aged person in indifferent health fifty years ago to the parish, and never since day's illness.

IMPROVEMENT IN NAAS.—We learn from the *Irish Times* on the recommendation of Dr. Smyth, medical officer of health for Naas, the guardians of the Union have adopted the 'pail' system as the most effectual for the present defective sanitary condition of the town. The medical officer stated that out of 500 houses to be in Naas, 400 were without sanitary arrangements of any kind, and that their owners would not adopt the 'pail' system, for the sake of economy. The proposed scheme would, in the opinion of Dr. Smyth, improve sanitary administration, and, in proportion to its efficiency, would, in a general way, raise the standard of health, and in a special way increase the resistance to contagion. It would, silently and surely, inculcate the lesson of cleanliness in their dwellers, and in their habits. It would bring the minds of many owners, probably for the first time, to the necessity as well as the advisability of improving their dwellings, and within, many of the present wretched tenements. It would also justify many an owner in his authority to enforce cleanliness, for an unclean tenement is a nuisance and a danger to the community.

THE DOGMATISM OF SANITARY REFORMERS.

By D. J. EBBETTS.

It seems to be the fate of all young sciences, in their earlier stages, to afford free scope to the dogmatism of their less cautious expounders.

The professor of a new science must possess considerable self-control and some modesty, if he does not fall a ready victim to the Nemesis of dogmatism in face of the occasional insecurity of his position. Otherwise the more insecure his position the more easily his fall.

We can easily see that the imperious utterances of an incautious exponent will prove their own Nemesis; for I suppose most of us are agreed that the only way to induce people to take an interest in sanitary science is by pointing out its momentous importance to all in simple language; and by persuading them that all we recommend is necessary to attain the desired end. Now there may be a few weak people here and there who will be content to accept a dictatorial assertion that such and such a thing is absolutely necessary, without further inquiry, but such persons are but poor supporters of any cause, for the first breath of adverse criticism will draw them away as readily as they were originally beguiled. On the other hand most people, I hope and believe, will require to be shown why such things are so necessary, and if their inquiries are only met by general assertions, will pay but little heed to their *quasi* instructors.

To render myself clear I will take a case in point, though in doing so I may probably shock a great many people.

You will find it often asserted in the most positive manner that a water-closet must *not* be supplied from the same cistern as the drinking water. Now if you look to see why this prohibition is imposed upon us you will find only a general statement that pollution of the drinking water is sure to follow upon such an arrangement. And anyone interested in the subject will remark that the exception is not taken to any particular arrangement of water supply, such, for instance, as a spindle valve with air-pipe in the cistern itself, but applies with charming impartiality to all arrangements alike.

In the annotated edition of the Model By-Laws, p. 105, after insisting upon the necessity of forbidding water-closets to be supplied direct from a rising water main—a necessity which for several reasons it is easy to admit—and after insisting on the closets being supplied from a cistern, the text continues, 'but even when such a cistern is provided, there still remains a tendency for the escape of foul air from the basin of the closet up the service pipe and through the body of water in the cistern itself, thus leading to contamination of the water.'

I suppose this authoritative statement ought to be sufficient for most men, but it will be noticed that it is not attempted to be shown how the foul gases could pass up into the cistern—it is simply stated that a tendency of that kind remains.

Now, leaving this subject for a moment, I suppose my experience has only been that of many others when I say that I have found great difficulty in persuading people in the occupation of old houses in towns, replete with every ingenious appliance for the conveyance of sewer-gas to the interior of their dwellings, to have even the most glaring and mis-

chievous errors in house drainage and plumbing rectified. The great cost of such work, when properly done, in proportion to the value of the house, in addition to the inconvenience necessarily incident to the presence of workmen in the building, prevents so many from undertaking work of this kind. Anything which tends, therefore, to increase unnecessarily the cost and disturbance of such work, serves materially towards preventing the necessary and pressing sanitary wants from being attended to.

The provision of an additional cistern and supply-pipes for closets only, in an existing building, is often a serious item. Very often it is difficult to find a suitable place for the cistern; it generally involves considerable disturbance of existing work of different kinds, and always results in a serious additional outlay. The small supply cistern fixed in the w.c. itself, so often used in connection with wash-out closets, is not free from these objections, and is subject to another which it is not necessary for me to enter into at present.

Feeling convinced, then, of the undesirability of insisting upon more disturbance of existing plumbers' work than was really imperative, I had the temerity some three or four years ago to ask a sanitary engineer whether it were not permissible to connect a valve w.c. direct from a drinking-water cistern.

Never shall I forget the look of professional pity with which he informed me that no one who had any knowledge of sanitary engineering would think for a moment of doing so, that it would result in tainting the water, typhoid fever, &c. Recovering what courage I could, I pressed him to tell me in what way the water would become tainted, but I could only extract the usual general statements that the pipe might be emptied, and so the water in the cistern would be in open connection with the closet.

I have, in fact, been unable to extract from any authority a clear statement of the manner in which the danger accrues.

Now, if we look into this question for ourselves, we shall find it not quite such a simple one as many would have us suppose. How can the water in the cistern be tainted? Let us assume that we have a good valve water-closet apparatus, with a $1\frac{1}{2}$ inch water-valve connected with the cistern. We will suppose that the closet has a P trap, with outgoing into a closed soil-pipe connected directly with a foul old drain. I am assuming this for the sake of argument, for of course no one with any knowledge of the subject would allow the soil-pipe or drain to remain in this state, whatever he proposed to do to the closet.

We will assume that the house has remained empty for some time, and the handle of the closet, by some curious coincidence, has been fixed up. As a consequence, the water from the cistern will soon empty itself down the soil-pipe; for we may as well assume, to complete our pleasant picture, that the water has been cut off at the rising main by an over-bearing or long-suffering water company. The foul gas, we must admit, will pour up freely from the soil-pipe, and, it is assumed, will find its way up the supply-pipe to the cistern. But why? What is to produce a strong draught up this $1\frac{1}{2}$ -inch pipe to suck in the foul air at one end through the narrow flushing rim and emit it at the other end into the cistern?

But supposing we admit—and, having admitted so much, we had better hesitate no longer—that the

pipe once empty, the foul gas would soon ascend it. Why, then, I would point out that the pipe is *not empty* yet. Anyone who looks at an apparatus with the usual water-valve will see that the centre of the water-valve is some nine inches *below* the centre of the inlet to the basin, so that the supply-pipe *descends* to the valve and *ascends* to the basin. It follows, therefore, that after emptying the cistern there still remains two or three feet of the $1\frac{1}{2}$ -inch pipe filled with water. This water will evaporate in time, no doubt; but how long do you think it will take to evaporate? There are only two small surfaces of water, neither of them exposed to draught or rapid movement of the air. I believe I am within the mark in saying that this water would not evaporate in our climate under six months.

A pertinacious opponent may contend that after the lapse of this time gas would ascend the pipe to the cistern, and, water being admitted to it by the relenting company upon the opportune arrival of a new tenant, the contents would be dangerously contaminated.

But bear in mind that the dreaded sewer-air has for six months or more been admitted in volume into the house night and day, it has filled every nook and corner of that ill-fated and far from desirable residence, and wherever the tank may be located sewer-gas has found its way to it from the house long before it has been able to reach it by the pipe, so that, had there been a separate cistern for household purposes, it would have been treated as badly as the other one.

Seriously, if a tenant were to take a house in such an unsavoury condition he would be forced to have it first of all thoroughly disinfected, and certainly would be obliged to have all the cisterns emptied and cleansed, so I fail to see what he would gain by a separate cistern.

In arranging a new house I should prefer as a matter of sentiment to supply even a proper valve w.c. from a separate cistern; but in old houses, where it is desirable not to increase the expense of sanitary work more than is absolutely necessary, I should not in my present state of ignorance think of doing so, and I venture to think that I have shown that it cannot be really necessary to do so.

There are several other dogmatic laws generally accredited to sanitary engineers that might be controverted with some success, but for the present I hope that I have justified my warning to all to be chary of encouraging dogmatism in this as well as in all other scientific work.

MESSRS. BANNER BROS., 11 Billiter Square, E.C., have been commissioned to entirely overhaul the sanitary arrangements of Herbert House, Belgravia, the town residence of Lady Herbert of Lea, and substitute the 'Banner system' throughout. The work is being carried out under the able superintendence of Mr. E. A. Hubert, Messrs. Banner's engineer. We learn also that Banner's fixed ventilators are being used on the new portable hospitals that are being sent out to the Soudan.

SANITARY inspectors are decidedly becoming awakes to the responsibilities of their calling. We note with pleasure and approbation that Mr. Joseph Lindley, Assistant Sanitary Inspector in the Sanitary Department, Leeds Corporation, has gained in the Science Examinations, held in Leeds in May last, certificates for Advanced Hygienic Elementary Animal Physiology and Advanced Building Construction. The practical advantage of an intelligent knowledge of the first and last of these subjects for a sanitary inspector, is incontestable.

IP WALLS IN DWELLINGS.

By G. H. BLAGROVE, A.R.I.B.A.

the many fruitful sources of ill health con- upon defective modes of building, damp certainly not the least formidable or most nedied. Unlike the offensive smells arising perfect drainage, damp in walls does not elf immediately evident to the senses, and a disregarded, while its baneful effects are in part to other causes. The difficulty and of remedying such an evil are sometimes able, and recourse is too often had to tem- pedients. Thus, when a room has been ed for some time, and the presence of damp t in its walls, it is thought sufficient to light by this means the signs of damp may be disappear from the walls, while it is still in the atmosphere, although in a rarefied uring the cold hours of the night, however, ous that condensation must ensue, and it is that the walls, having once been damp, a become so. More moisture will be ab- rom the external atmosphere, to be again and rarefied by heat, and again allowed to : itself upon the objects in the room or the of its occupants. Such is the process that e place in moist situations, in a greater or ee, according as the walls of a dwelling are less pervious to damp.

are a variety of ways in which a wall may impregnated with moisture, and it is im- hat these should be thoroughly understood medies are sought for or applied. Internal y absorb moisture from the ground beneath. liable to take place in proportion to the foundations, by which the tendency of ure to force its way upward is accelerated rease in the weight which presses upon it ve. Having once made its way into a wall, rises, partly by evaporation aided by capil- unction, and the wall becomes permanently An external wall may become damp from this ly, or from the far more serious one of being ct with the earth. It is quite clear that, the nature of the soil, the pressure of its ght must cause a large amount of moisture laterally, except in very dry weather, and h moisture is readily transmitted through nary thickness of walling, and must be a lly recurring source of danger to health. No oining such a wall should be permitted to or human habitation.

ernal wall may become damp through the driving rains, or from mere contact with a nosphere. The effects are similar to those l in a wall exposed to contact with the cept that they are less strongly marked. ess of moisture aided by wind force natu- es place most frequently upon those sides ilding which face in southerly directions. icide such local accidents as the bursting of er pipes, or the leaking or overflowing of tters, there is only one other cause of per- lampness in walls to be noticed, and this is ward soakage of water from the top of a from an off-set. In old walls, where the cement has suffered partial disintegration, modicum of rainfall is absorbed by the k or masonry, and, by gradually percolating

through the open joints, is transmitted from brick to brick, or from stone to stone, until the walls become damp, sometimes to the depth of the entire upper storey of a house. At off-sets, or where stone cills or balconies are built into a wall, there is always a danger that repeated falls of rain upon the upper surfaces of such projecting parts may drive a certain amount of water through the joints of the walling, from whence it will soak downwards, and sometimes upwards as well.

In adopting remedies against damp walls, pre- vention is better than cure. The customary pre- cautions followed in all sound building work are, of course, well known to architects and contractors, but the general public ought to be informed of their relative value and importance. To prevent moisture from soaking up into a wall from the ground below, it is usual to build in a damp-proof course through- out the entire thickness of every wall. This damp- proof course is a layer of some impervious material, and must be placed in the wall above the highest level of the earth with which it is in contact, and below any wall-plates or other timbers connected with the construction of the floor. A double course of slates set and bedded in cement, the upper course breaking joint with the lower, has often been used as a damp-proof course. It is economical, but as the slates are liable to fracture from any settlement in a building, it is not to be recommended. A single course of glazed pottery slabs is often used, the joints between the slabs being left empty, to prevent the damp from rising through them. This, though it forms an effectual damp-proof course, destroys the bond of the wall, and is therefore objectionable upon structural grounds. Sheet lead is efficacious, but will be found too expensive for general use. In some parts of the country, thin slabs of impervious stone have been used with satisfactory results, and there is no doubt that a double course of plain tiles in cement will answer well, and be less liable to fracture than slates. Various kinds of asphalte are manufactured for this purpose, and a thick layer of this material will form an effectual barrier to damp, and will not be subject to injury through settlements. Cases have been known when asphalte damp-proof courses have been eaten away by rats, and where such vermin exist it is therefore inadvisable to employ it.

When damp rises in a wall which has been built without a damp-proof course, the proper remedy consists in underpinning it, and inserting one. This involves considerable expense, but all other expedients are inferior to it. If the wall be only slightly damp, the room adjoining it may be kept tolerably dry by rendering the wall with Portland cement, or better still, with glazed tiles set in cement; but if there be much moisture present, it will be liable to evaporate under the floor, when the latter is boarded, and so to impregnate the atmosphere of the room.

To separate the underground portion of an external wall from contact with the earth, it is usual to build a dry area around it, extending to a depth below the damp-proof course, and being about 12 inches wide at that part. Sometimes the outer wall of the area is made of a sufficient thickness, and built at a sufficient slope, to act as an independent retaining wall against the earth, in which case the area is open at the top, and admits of a free circulation of air. The top of the outer wall should be above the level of the surrounding earth, to prevent any surface water from flowing into the

area, which must of course be drained with pipes properly trapped into the house drains. Sometimes the area wall is built parallel to the main wall, thus forming a portion of hollow walling, and the top of the cavity is covered with a stone slab. In this case means ought to be provided for connecting the cavity with the external air without admitting the rain. This may be done by carrying the double walling to a sufficient height to admit of the insertion of ventilation gratings above the ground, or by small tubes carried up inside the main wall, turned out, and bent down. The double walling should be bonded together, either with galvanised iron cramps, kinked so as to prevent moisture from travelling along them, or with special bond bricks contrived with drip channels underneath them for the same object. As a substitute for a dry area, a basement wall is sometimes rendered with Portland cement upon that part of its surface against which the earth rests. The cement rendering ought to be carried down to a level below the damp-proof course, to exclude damp effectually, and even then it is always open to the objection that the cement may crack and peel off, and that its condition cannot be observed without excavating large quantities of earth. A coating of asphalt is to be preferred, and this may be built into the walling as a damp-proof course, and carried up in one piece against the outside. The latter expedient is, perhaps, most to be recommended in dealing with an old wall that has been built without a dry area, and where it is necessary to spare expense as much as possible.

Hollow walls built in the manner described afford great protection against the ingress of moisture from the atmosphere. The thinner portion of the hollow wall should be built upon the outside, in order that the greater thickness may remain dry, and the cavity should always be ventilated and drained. When damp is found to penetrate through a solid wall, and considerations of economy preclude the building of an extra casing, so as to form a hollow wall, some kind of external covering may be adopted as a cheap substitute. A rendering of Portland cement, further protected by painting, will effectually exclude rain or mist. Hanging tiles or slates will also answer the purpose. They must be fixed with copper or galvanised iron nails, which are not liable to become brittle from corrosion. When moisture is found to soak in at the upper surfaces of stone eills or balconies, small aprons of lead should be pinned into the joints immediately above, and allowed to stand out a short space from the wall. A cement weathering may answer the purpose, but is less likely to be of lasting efficacy. Offsets should have weathered and throated stone strings or copings above them, or be weathered in cement. A double course of plain tiles in cement is sometimes used in such situations, but it does not effectually prevent moisture from soaking into the wall above, unless it is laid at a slope, in which case it is probably as good an expedient as any that can be devised. The best way to prevent the downward soakage into a wall from the top is to form the roof with overhanging eaves, having a cast-iron gutter affixed to a fascia board at the feet of the rafters. Such a method of finishing a roof is often adopted, especially in suburban dwellings, but there are practical objections to be urged against it, the principal one being that it allows of no access to the gutter, except by means of a ladder from outside, and it is customary to build parapet walls to fronts and backs of

most London houses. The top of a parapet wall, being much exposed to the action of the weather, should be protected by a weathered and throated coping of stone or terra-cotta. The objection to the ordinary brick coping is, that it has no throating or drip-channel under its projecting edges to prevent water from soaking into the joints below. The same is true of the common tile creasing, which is really nothing more than a damp-proof course, and affords insufficient protection in exposed situations.

We have endeavoured to point out the principal causes of dampness in walls, and the most efficacious means of preventing the evil. The would-be tenant of any house should satisfy himself, before becoming party to an agreement, that those precautions against damp which we have indicated as essential, have been complied with in the construction of his new dwelling. The existence of damp-proof courses is a matter for conjecture only, but the signs of damp in basement-walls can generally be detected. Sometimes, if not evident at first sight, they will show themselves after a fire has been lighted. It is well to be on guard against devices for concealing signs of damp, such as fixing match-boardings against a wall, or planting battens upon it to receive the lathing and plastering. Such expedients only suffice to save appearances, while the radical evil continues to be a source of discomfort and a menace to health.

MR. TORRENS'S Waterworks Clauses Act Amendment Bill has been blocked by Mr. Warton and Mr. Abernethy, and Mr. Coope intends to move that it be referred to a hybrid committee.

MR. F. H. TULLOCH, A.M.I.C.E., was appointed on the 16th ult. by the King's Norton Rural Sanitary Authority, as consulting engineer, to make an examination of their sewers and to advise the Board what steps should be taken to ensure more efficient ventilation.

MANY disastrous explosions of gas have lately been reported as resulting from searching for leaks in pipes with open lamps. We learn from *Sanitation* that these sad accidents are avoided in Paris by the use of an electric lamp, supplied by an accumulator, the use of such a light being enforced by the authorities.

THE Blackburn and East Lancashire Infirmary governors, at their recent annual meeting, took occasion to congratulate themselves on the completion of the new wing to the building, and on the satisfactory way in which this work, and the sanitary re-arrangements of the building generally had been accomplished under the superintendence of the architect, Mr. A. W. R. Simpson.

DR. DAVIES, from the Local Government Board, has visited Dartmouth to make inquiries as to the arrangements which have been made in the event of an outbreak of cholera or other infectious disease. Accompanied by the Mayor and several members of the Council, Dr. Davies proceeded to the proposed sites for the hospital, and was made aware of the difficulty that has been experienced by the local authority in finding a suitable site for the purpose. Dr. Davies suggested, as probably the best way to get out of the difficulty, that there should be provided a pavilion, with a hut on the deck, somewhat similar to a floating hospital of that kind upon the River Tyne.

COVENTRY SEWAGE.—The Town Council of Coventry have decided to considerably enlarge the sewage works of their city to meet increase in population, and have instructed Mr. Melliss, C.E., to carry out the work. The sewage of Coventry has been for the last ten years dealt with by a combined system of chemical precipitation with filtration through land, and the operations have given general satisfaction.

CALENDAR

March 16th to March 22nd

16	Monday	Building Exhibition, Agricultural Hall, opens.

22	Sunday	Fifth Sunday in Lent.

STAINS FOR WOOD FLOORS.

LIGHT OAK.

WALNUT.

MAHOGANY

DARK OAK.

Applied to ordinary Deal gives an exact imitation of Old Oak Polished Floors.

IMMENSE SAVING IN THEIR USE.

As no size or varnish is required, the application of one coat, only taking the place of two coats of size, one of stain, and one of varnish by the ordinary process.

INVALUABLE FOR THE BORDERS OF ROOMS.

As they do not scratch like ordinary varnished surfaces, and the cost of staining would be from 2d. to 4d. a square yard, as against 4s. or 5s. per square yard for carpet.

GREAT PREVENTIVE TO CONTAGIOUS DISEASES.

Dr. Koch, in a recent lecture on Cholera, stated that polishing and dry-rubbing floors was a greater protection than washing floors.

Prices, 10s. 6d. per gallon 6s. 6d. per half gallon, 4s. per quart. Half a gallon will do a three-foot border round a large room.

TORBAY PAINT COMPANY.

26, 27, AND 28 BILLITER STREET, LONDON, E.C.

PORTABLE COOKING STOVES.

COALS, 2d. per DAY.

Slow Combustion Stoves to burn all Night for Greenhouses, Halls, Bedrooms, &c.

Price Lists Free on application.

BROWN & GREEN, Limited,
Makers of the Gold Medal Register and other Sanitary Consuming Stoves.

LUTON: & 69 & 71 FINSBURY SQUARE
LONDON.

BOILING.

PATENT POTATO STEAMER

Honourable Mention at National Health Society's Exhibition,
JUNE 1883.

This invention is designed to meet an almost universal and daily want, viz., the means of cooking with certainty and precision all the various sorts of potatoes that are brought to consumers. Experience only teaches that some potatoes will only boil and not steam, and that others will steam and not boil. Experiments carefully conducted have failed to discover any sort of potato which cannot successfully be cooked by this new invention.

The inner lining, fitted with potatoes, is placed in the bottom of the vessel, with sufficient steam to well cover the potatoes, after boiling fifteen minutes, the lining is raised and fixed at the top, and in about twelve minutes, according to size, they are steamed to perfection.

To Cook 3 lbs., 5s.; 4 lbs., 6s.; 6 lbs., 7s. 6d.

To be had of any Ironmonger, and Wholesale of the Sole Manufacturers,

GROOM & CO., LIQUORPOND ST., LONDON, E.C.

POTTS'S PATENT EDINBURGH SEWER-TRAP.

Silver Medal, Brighton, 1881.
First Class Certificate, South Kensington, 1881.
GOLD MEDAL, HEALTH EXHIBITION, 1884.

The only Trap which gives entire disconnection between the house drains and the sewer.

The Birmingham Sanitary Association,
28 & 29 UPPER PRIORY (LATE 47 COLMORE ROW), BIRMINGHAM.

SILVER MEDAL, LONDON, 1884. THE HIGHEST ENGLISH AWARD.

NO WASTE. SAVING TIME AND MONEY.

CLARK'S OPTIMUS COFFEE EXTRACT

Makes in a moment a cup or any quantity of fine Aromatic Coffee, which cannot be spoilt in making. It is cheaper and better than Coffee made in the ordinary way; is pure, wholesome, and a valuable Non-Alcoholic Stimulant.

CLARK'S COFFEE EXTRACT

is prepared from the finest freshly Roasted Coffee, by a new and scientific process, whereby the aroma is retained unimpaired. It is absolutely free from Chicory, will keep in any climate, hot or cold, and is the BEST and CHEAPEST.

INSIST ON HAVING

CLARK'S OPTIMUS COFFEE EXTRACT.

In Bottles, 6d., 1s., and 2s. each.

CHAS. A. CAMERON, M.D., Vice-President and Professor of Chemistry and Hygiene, Royal College Surgeons, Ireland; Vice-President, Institute of Chemistry, Great Britain; Medical Officer of Health for Dublin, writes:—

'I have analysed a specimen of Extract of Coffee submitted to me by Messrs. F. CLARK & Co., of Queen's Road, Battersea, London. It is the best article of the kind which has come under my observation. It is free from Chicory and other adulterants; possesses an excellent flavour, and is a very concentrated preparation. I can strongly recommend this Extract, and intend to keep a supply of it in my house.'

THE 'HARDING' VENTILATING COMPANY,

30 EAST PARADE, LEEDS.

HARDINGS' PATENT AIR DIFFUSER, FOR VENTILATING ALL KINDS OF BUILDINGS.

Diffuser with Filter

Mr. T. PRIDGIN TEALE, F.R.C.S., M.A., Surgeon to the General Infirmary at Leeds, says of Hardings' Diffuser in his book called 'Dangers to Health':—'I am satisfied that by means of this apparatus we can secure in a town freshness of atmosphere, absence of draught, and exclusion of dirt.'

The fresh air is conducted through a grate and aperture in the wall, as shown on section, about 7 feet 6 inches above the floor level, it is then conveyed through the filter, and passed into the room through a series of small tubes placed at an angle of about 30 deg. with the wall.

By these means the currents of air rushing into the apartment are compressed whilst passing through the tubes. The currents of air, as soon as liberated, expand, cut into, and break each other up, and diffuse in all directions so effectually that no draught or chilly sensation can possibly be experienced by the occupants, and at the same time a large volume of pure air is constantly being admitted and dispensed evenly through the apartments.

SECTION

WALL

CHURCH WALL VENTILATOR.—As used in the ventilation of Archbishop Zouche's Chapel, York Minster. The DEAN OF YORK, with reference to the ventilating of Archbishop Zouche's Chapel at York Minster, says:—'I think the ventilation is perfectly successful, and all I have spoken to about it are well satisfied with it, and much pleased with the result.'

OUR PATENT EXTRACTOR is the best in the Market, and is supplied at a very much lower price than any other.

CHURCH WINDOW VENTILATOR.—These Ventilators are used for Churches, Chapels, and other Public Buildings where it is not desirable to have holes cut through the walls to admit air in the usual manner. The appearance is not more noticeable than the ordinary Hopper Ventilator so frequently seen.

'Armley, Leeds, Oct. 29, 1883.

'Gentlemen, I have pleasure in stating that in my opinion your system of ventilation, introduced in our Church this summer, is a decided success. Heretofore when the Church has been well filled at the Evening Service, I have been almost exhausted by the effort of speaking before I have got half through. On Sunday night, October 7, at our Harvest Thanksgiving, we had a very large congregation, and I preached without the least feeling of weariness or exhaustion. I shall be glad to hear that your Air Diffusers are being widely adopted. I am, yours truly, JOHN GREGORY, Minister of Oak Road Congregational Church, Leeds.'

These Ventilators are more suitable for Schools, Warehouses, and other Buildings where cheapness is an object. The result is precisely the same as in our other styles, at a very much smaller cost.

A reduction in price is made where a number of Diffusers is required. Estimates and further information given on application to the 'HARDING' VENTILATING COMPANY, 30 EAST PARADE, LEEDS.

Church Wall Ventilator

LESS FROM DEFECTIVE PLUMBING.

By MAURICE DAVIS, M.D.

membranous deposit on both tonsils, b-maxillary and cervical glands, rapid high temperature, induced close question at the drains. The answers evoked led nation, and this, in its turn, revealed the state of things, in a large house in one of central squares. There had been frequent from an offensive atmosphere, especially part of the house, and the chief sufferer sore throats was the cook. The children in number, before the present seizure experienced any alarming illnesses, and less than their share of measles and but the wife of the previous occupant, ten years ago, had died of scarlatina. Adding the presence of the patient, the commenced, for it seemed to involve less the leakage, and thoroughly dilute air the sewer-gas at its source, than to force its way through the numerous open defective system into nearly every room in the house. Before, however, anything the main drain of the house was disconnected the sewer by means of a syphon-trap. Whenever there is a bath in a house be suspected, and in this case that danger realised, for the waste water-pipe was with the trap of the upper closet, and was

but bell-traps had been used to break the direct connection of the sinks with the drains, and these were in the usual abortive state. The waste-pipes of the cisterns had been corrected some years ago, at the instance of the water company. Rats had, by their presence long ago, intimated serious defects, but as they did not enter the house in droves, but confined themselves chiefly to the area, their friendly warning was disregarded. The rain-water pipes were now surveyed, with little expectation of finding any glaring errors, as it was stated they had been recently examined, but expectation was sadly disappointed. At the back of the house was observed a large pipe, opening upon leads on the nursery floor.

This served a double purpose, for a little lower down at S, it was seen to enter the wall of the next house, where it did duty also as a soil-pipe. It is true it was ventilated at V, and this was probably the type of the recent correction above referred to; but this piece of $\frac{3}{4}$ -inch lead pipe discharged its gas just above the window of the bedroom at B, which had been, up to this time, occupied by the sick boy. On closer inspection the mouth M, intended to receive the rain-water from the roof, had been fitted with a bell-trap, but the bell had not been heard of within the memory of living man. Such being the present state, steps were hastily taken to correct it, and accordingly the two perforated soil-pipes were renewed and the new ones carried up with open extremities above the roof; the old brick drains were made to give place to glazed earthen pipes of 6 inches and 9 inches diameter, the cess-pool and saturated earth were removed, the water-pipe of the bath (itself ventilated above the roof) was

locked. The closets themselves were and the soil-pipes in both cases were in places throughout their course. That closet passed down the wall of the wine-cellar with its sewer-gas the bouquet of the contents, and finally discharged itself into an drain beneath the stones of the cellar. with wasted mortar, and therefore gaping between the bricks, passed into the area ed two sides of this corner house. A ver, formerly communicating with the house, was found full of decomposing a cesspool was discovered in the side to the door of the coal-cellar. Nothing

made to discharge itself into a gully beneath the pavement of the wine-cellar, and this spot, being the highest point of the drain, was ventilated by a 4-inch pipe continued to the height of the house. The sinks were all separated from the drain, and made to discharge into the open. The rain-water pipe was disconnected from the soil-pipe of the adjoining house, and, like the others, was carried upwards to the regulation height.

AN outbreak of small-pox has occurred at Alnwick, and the authorities are making preparations for the erection of a hospital, in order to procure the better isolation and proper treatment of patients.

A SIMPLE METHOD OF TESTING THE PURITY OF AIR.*

IN view of the well-known fact that breathing impure air tends to render even healthy and robust people liable to the attacks of disease, while undoubtedly it many times causes serious illness and death to those of a weak constitution, it seems extremely desirable to have some simple test by which, without the use of complicated chemical testing apparatus, a knowledge may be gained as to the degree of pollution by respiration and cutaneous perspiration of the air in living and sleeping rooms, as well as in offices, schools, factories, hospitals, &c. A test which could be easily made would also be of much service to architects and engineers, in order to ascertain the efficiency of systems of ventilation in buildings old and new. It would be of greatest importance to learn, by means of a chemical analysis, the amount of organic impurities in the atmosphere, for these have, by the investigations of physiologists, been demonstrated to be the principal vehicles of disease. Unfortunately, such a test is not available, and all we can do, at present, is to ascertain the amount of carbonic acid due to respiration; and, assuming that there is a certain fixed proportion between the latter amount and the organic impurities, make the carbonic acid present in the air the measure for its impurity. It is not difficult to find, by chemical analysis, the amount of carbonic acid contained in a given volume of air. Many such tests have established the fact that the atmosphere which we breathe contains, on an average, about 4 parts of carbonic acid in 10,000 parts of air. Perlenkofer and others ascertained that if the amount of carbonic acid exceeds 7 parts per 10,000 parts of air, the latter becomes too impure to be breathed any length of time without injury to health, not as explained above, on account of the increased carbonic acid impurity, but because, with the latter, the amount of exhaled organic impurities becomes too large.

A very simple apparatus for making this test is the one invented by Prof. Wolpert, of Kaiserslautern, Germany. Its essential parts are first a small cylindrical glass tube, A, 12 centimetres ($4\frac{1}{2}$ inches) long, and 1.2 centimetres ($\frac{1}{2}$ inch) in diameter, with a white bottom, on the inside of which is placed a black mark (the figures 1882). The cylinder has a mark (XX) on its side at a height from the bottom corresponding to just 3 cubic centimetres contents, which indicates the quantity of clear lime-water to be poured into the cylinder at each test. The other piece is a glass tube, C, firmly attached to a rubber handball, B, which has a capacity of 28 cubic centimetres, and which is used to press bubbles of air through the clear lime-water until the latter becomes so turbid that the mark at the bottom of the glass cylinder becomes invisible.

During this operation the cylinder is held in a small wooden foot-rest. Before passing any air through the lime-water, the rubber ball should be repeatedly squeezed, to make sure that it contains a fair sample of the air in the room to be examined. Upon inserting the small glass tube into the cylinder, care must be taken, lest in squeezing the rubber ball a portion of the lime-water is lost by running over the top of the cylinder. After each squeezing of the

ball, remove the tube from the cylinder, taking that no lime-water is sucked up by the ball, all

rubber ball to refill with the air to be tested repeat the operation until a marked turbidity lime-water is apparent. Each apparatus is to Professor Wolpert before being sold, and a table is furnished, in which is given, opposite number of squeezes of the rubber ball, the corresponding amount of carbonic acid in the air instance, if fifty squeezes are required, this is four parts of CO_2 ; if forty squeezes, five parts if thirty squeezes, 6.6 parts CO_2 ; if twenty ten parts CO_2 per 10,000 volumes of air, and

The table begins with one squeeze, corresponds to 200 parts CO_2 in 10,000 volumes of air extends up to sixty squeezes, corresponding parts CO_2 in 10,000 volumes of air.

The test can be very readily made by laymen gives information accurate enough to enable one to judge of the sufficiency or insufficiency with the air of a room is renewed. It would be of great value to have such an appliance as is described in all school-rooms and hospital wards be frequently used by the teachers and the respectively.

ISOLATION AND DISINFECTION.—Small-pox recently been very prevalent at Pudsey, near Bradford shire. At least a dozen cases have been sent to the Hospital, under the care of Dr. Hime. The Town of Bradford has written to the Secretary of the Local Board, pointing out the great danger which in that district from lack of proper means of patients and disinfecting clothing, &c. At a meeting of the Pudsey Local Board, it was agreed to cottages, near Swalewell Mill, for the purpose of a hospital, and also to erect a disinfecting apparatus at the same place.

THE SANITARY RECORD.

MARCH 16, 1885.

or will be glad to receive, with a view to publication, announcements of meetings, reports of proceedings, and abstracts or originals of papers before the members of any sanitary or kindred association.

Authorities throughout the country confer a favour on the EDITOR of the SANITARY RECORD by forwarding to him all matters relative to Water-supply, Sanitation, and matters generally, which come under notice. He would also be glad to receive from Engineers of Waterworks, Sewerage, and Domestic Drainage Improvements, comment, and illustration.

RAILWAY FACILITIES FOR ARTISANS.

deal has been said at recent half-yearly meetings of the great railway companies about the question of bad dividends with the shifting of second-class travellers into third-class. There is a grave question of public policy underlying cheap means of locomotion which perhaps present itself very forcibly to the directors compelled to meet its constituents with the announcement of a decreased dividend, which must be reckoned with nevertheless. Not only do we draw attention to the supreme importance of the future welfare of this huge and ever-metropolis that abundant facilities should be afforded to artisans for planting their homes in the suburbs of the town, away from the reeking and smoke-filled courts of central London. The Government has to a certain extent appreciated the importance of the matter by giving special prominence to the evidence taken before the Royal Commission on the housing of the working-classes, and offering a bonus in the shape of a reduction of income tax where cheap trains have been provided. But the railway companies of themselves have done little or nothing, although there appear to be obvious advantages to them in attracting colonies of artisans to the suburbs which they serve.

And many statistics are annually published about railways, but there appear to be none giving about third-class season-tickets. Season-tickets are usually lumped together, and there is no means of telling in what proportions the different classes avail themselves of this privilege. The growth of third-class traffic, taken as an index sufficiently accurate for our purpose, shows the extent to which railway travelling has become a necessity of the artisan as well as of the farmer. In the year 1873, when the new policy of third-class carriages on express trains had

just come into force, 32 millions of first-class passengers, 63 millions of second-class, and 306 millions of third-class, or 401 millions in all, travelled by railway in England and Wales. In 1883, 30 million first-class, 59 million second-class, and 523 million third-class passengers were carried. Thus, while the numbers of first and second-class were practically stationary, upwards of 200 million more third-class were carried. The receipts per mile of railway open were, in 1873, 324*l.* first, 303*l.* second, and 874*l.* third-class; and in 1883, 227*l.*, 216*l.*, and 1,113*l.* respectively. As compared with 1873, there was, for the whole kingdom, in 1883, a decrease of 703,000*l.* in the first-class receipts, and of 655,000*l.* in the second-class receipts; but an increase of 5,300,000*l.* in the third-class. The receipts from third-class traffic are now much more than double the receipts from first and second-class traffic combined, and in a very few years will be thrice that amount.

We have set out these figures, the relation of which to the housing of the poor may at first sight appear slender, with the object of showing that the third-class traveller is a personage whom the managers of railways must reckon with, and whom they must indeed bow their lordly necks to serve. A railway magnate's gorge may rise at the painful necessity of providing accommodation for the artisan and labourer; but where without the third-class receipts would be the dividends which it is the special object of the chairman's heart to keep at a respectable level? The days have gone by when it was possible to artificially drive people into higher-priced compartments, by making third-class trains the slowest and the most inconvenient that the general manager could devise. That company will thrive the best in the long run that adopts a policy of conciliation and of encouragement to its third-class constituents, and puts them on an equal level as regards privileges with the first and second-class travellers.

One of the chiefest of these privileges is the issue of third-class season-tickets. On what principles of justice can such be denied? When it is argued that the miserable squalor and overcrowding of the London poor could be relieved if the better class were to migrate to the suburbs, the natural question at once arises, How are such people to get to and from their work? London is pierced in all such directions by railways, and the conveyance of these suburban dwellers would be easy enough if the season-ticket system was fully extended to third-class passengers. Most people will be surprised to learn that this has been done on only one of the metropolitan lines. At present, excepting on the Midland Railway, the state of the case is this: if a third-class passenger, who is not in a position to avail himself of the workmen's trains that run at unearthly hours of the morning, travels daily to and fro between two stations, he pays at least as much by the end of the year as a first-class season-ticket holder. In our last reference to the subject we drew attention to the case of Noel Park, on the Great Northern Railway. It completes an argument, and there can be no harm, therefore, in citing it again. The Artisans, Labourers, and General Dwellings Company are building at Noel Park, ten minutes' walk from the Hornsey Station on the Great Northern line, 2,600 houses, 1,000 of which will be let at 6*s.* and 7*s.* 6*d.* per week. The 6*s.* house contains four good rooms and a scullery, has a front and

back garden, and the rent includes all rates, taxes, and water. There are also some double tenement houses in which a living room and two bedrooms, sufficient accommodation for a small family, can be had for 4s. 6d. a week. But the Great Northern Railway compels the poor man, unless he is willing to leave his house before five o'clock in the morning, to pay 4s. a week to get to this excellent home. It is needless to say that this price, which is 33 per cent. more than the cost per week of a first-class season-ticket, is prohibitive in most cases.

What is required is, in the words of Mr. Farrant, the Managing Director of the Artisans' Dwelling Company (than whom no one is more competent to express an opinion on the subject), the extension of the season-ticket system to the third-class passengers. Justice seems to demand this. No reason can be given why the poorest class of the community should be excluded from the benefits of a system of the conveniences of which they stand in far greater need than anyone else. If a season-ticket is a cheap luxury to a rich man, it may be said to be, from the 'Dwellings' point of view, a necessary of life to the poor man. The railway companies have it in their power to develop a traffic which could hardly fail to prove, at any rate eventually, very extensive and remunerative; while, at the same time, they would be doing more to solve the difficulty of housing the working man than could be done by any other step that could be mentioned.

That there is nothing impracticable in this suggestion here made is shown by the example of the Midland Railway. This line, as is well known, has no second class, but its first and third-class passengers are treated with perfect equality with regard to season-tickets. We sincerely trust that the Royal Commission will see their way to some strong expression of opinion on this very important question, and the draft report of the Commission, which has somehow slipped into the hands of the *Standard*, appears to give promise that such will be the case.

A YEAR'S WORK.

'THE diffusion of a knowledge of the laws of health amongst all classes,'—this is the purpose constantly kept in view in the working of that most useful body, the National Health Society, the twelfth annual report of which gives an interesting account of what was accomplished during the year 1884. It is impossible to estimate how much good is done by a single lecture, how many from the audience go home impressed with ideas of the responsibility of guarding their own health and that of their families and neighbours, or how large a proportion are led to take some practical steps towards carrying out the maxims that they have imbibed. If we could reckon the average results proceeding from one lecture we should have to multiply them a hundredfold in order to represent the benefit which has accrued from the work of the National Health Society in this direction. During the past year one hundred lectures upon simple sanitary subjects have been delivered by seven of the society's lecturers in thirty-two distinct parts of London and in eleven provincial towns. Large audiences of all kinds have been provided for, and the useful practical hints have been much appreciated.

With regard to the literary portion of the society's work, several popular penny books were published

during the year, of which large numbers have been sold and distributed. A pamphlet on 'How to Oppose and Prevent the Cholera' has been drawn up, and 27,000 copies sold. The society's stall at the International Health Exhibition was a decided success, about 1,500 of the small books and leaflets being sold weekly; and, in recognition of the value of its publications and general work, the council awarded to the society a diploma of honour. Another feature of the society's work at the Exhibition was the Conference on School Hygiene, which was arranged under its auspices and lasted six days. Several new corresponding members have joined the society during the year, and the sanitary associations in Hull and Keighley are now affiliated with it. Prizes have been awarded to four girls in the North London College for proficiency in a knowledge of the laws of health. The sub-committee for investigating arsenical and other poisons in domestic fabrics has also been actively at work. Thus the society is one that steadily works for the welfare of the people, and, while dealing with questions of great national interest, it goes into the home of the poorest citizen and there works wonders.

ELECTIONS TO BOARDS OF HEALTH.

ELECTIONS to Boards of Health will be held this year under new conditions. Most of the provisions of the Municipal Elections Corrupt and Illegal Practices Act of 1884, 47 & 48 Vict., c. 79, are applied to elections for local boards, and candidates and their supporters will do well to attend to those provisions. The mode of nomination, qualification of voters and number of votes to which they are entitled, and collection of votes by means of voting papers remain as before. The expenses of these elections also continue to be charged on the rates, and consequently the provisions of the new Act, which limit and regulate the expenses of a candidate (who is not supposed in an election for a local board to spend anything) are not applicable. Treating, undue influence, and bribery are now declared to be corrupt practices; and if a candidate is found to have been guilty of such practices by his agents he is rendered incapable of holding any corporate office in the district for three years; while if it is proved that bribery has gone on with his knowledge and consent, or that he has himself treated or used undue influence to any voter, he is disqualified for ever. The Public Health Act imposed a penalty of 20*l.* fine or three months' imprisonment on certain offences, such as fabricating voting papers, personating voters, or interfering with the collection or delivery of voting papers. These offences are now defined to be illegal practices, and certain other acts, such as voting when prohibited from doing so, publishing a false account of the withdrawal of a candidate, &c., are also defined to be illegal practices. The penalty for these practices is now 100*l.*, and the person convicted is further rendered incapable of voting at any election for five years from the date of his conviction. If a candidate is guilty of an illegal practice by himself or his agents, he is disqualified for holding any corporate office during the period for which he was originally elected; and if he is himself guilty of such practice, he is further liable to the penalties above stated. Payment or promise of payment in order to induce a candidate to withdraw is declared to be illegal; so is the

nt of more than a limited number of d those employed must not vote ; so also is a committee room, or for holding meetings licensed for the sale of intoxicating where such liquors are supplied to the of a club, society, or association. Any ily of an offence of illegal payment, em- or hiring, is liable to a fine of 100*l.* ; and ence is committed by or with the know- onsent of a candidate, he is guilty of an ctice. An election is liable to be declared a candidate to be disqualified from holding egal practices or offences of illegal payment, nt, or hiring have prevailed so extensively may reasonably be supposed to have in- he election, even though the candidate is not have connived at them in any way. Certain ivisions, such as that which requires every rd, or poster to bear the name and address rinter, also apply to elections for local ut the above *résumé* is sufficient to indi- nain points to which candidates and voters ct their attention.

ge of procedure which has been made by ay, however, influence the manner in which are held quite as much as the above to increased penalties. Hitherto it was difficult to question the return of members to have been elected on local boards. No achinery was provided, and a dissatisfied : had to apply to the Court of Queen's r a certiorari to quash the proceedings, or idamus to the returning officer to declare ted. Such proceedings were dilatory and s, and seldom succeeded, and consequently en rare for the reports of returning officers ously disputed. Now all this is changed, iries as to elections are to be commenced on and conducted locally before a barrister d to hold such inquiries, in the same way as into municipal elections are held. Such , of course, cost money, but the expense necessarily be very great, nor need it fall petitioner. Candidates who feel aggrieved ult of an election are much more likely to and so have everything inquired into, than e to apply to the Queen's Bench formerly. who are inclined to disregard the strict ents of the law are consequently not un- find those requirements enforced and s inflicted ; and the Act which imposes those enalties is much more likely to be effective former Act was, which only imposed minor s. Elections to local boards are now often ed on political lines, and the need for sub- tem to the same restrictions as other elections has consequently arisen. Ex- : only can show whether candidates or voters osed to conduct these elections in accord- h the new law ; but, if they do not, they may d their actions productive of serious conse-

: last meeting of the Association of Public Sani- sectors, Mr. G. B. Jerram presented, on behalf of ciation, a handsome purse to Mr. Samuel C. s honorary secretary of the Association, contain- eque for twenty guineas. In his reply Mr. Legg the members for the kind manner in which they eys received his efforts, and said that he valued ly the feelings which had prompted such a testi-

NOTES OF THE MONTH.

VACCINATION PROSECUTION BY WHOLESALE.

IT is a standing marvel how the good but obstinate people of Leicester manage to escape the epidemic of small-pox which appears to be their due for their wholesale disregard of vaccination. The guardians have been allowing the arrears to accumulate for years without making any effort to secure obedience to the Vaccination Acts ; and now that they are at last compelled to perform their duty, they find the task very much beyond their powers. For what is to be done when 5,000 separate people have to be prosecuted, and prosecuted at least twice each ? Their very number gives them strength and solidity to resist what they misguidedly believe to be a 'dangerous' operation ; so that people who—dealt with in detail—would have turned out to be merely dilatory and careless about vaccination, are now found to swell the enthusiastic ranks of the most ardent anti-vaccinators, and to be quite ready to endure a little cheap martyrdom in order to attract the admiration of their fellows. This vaccination prosecution in bulk is a sorry and distressing business, on which we shall not further comment. But there are one or two points in connection with the law on the subject which seem to be curiously misunderstood, and as to which, therefore, a few words of explanation may not be out of place.

The omission of a parent to secure the vaccination of his child was first made an offence by the Vaccination Act of 1853. But no officer was appointed by the Act whose business it was to set the law in motion, and the terms of the section relating to proceedings were such that it was held by the Court of Queen's Bench that a parent could not be convicted a second time for neglecting to have his child vaccinated. In the well-known case of *Pilcher v. Stafford*, tried on January 27, 1864, Lord Chief Justice Cockburn remarked that there was no provision for a second notice, and the Act did not meet the case of a continuance of neglect. The continuous omission might be as much within the mischief as the failure to have the child vaccinated within the prescribed time, but it was certainly not met by the statute. This, however, could only be remedied by fresh legislation. Parliament took its time, however, in correcting this anomaly ; and it was not until 1867 that a further Act was passed. By the Vaccination Act of 1867 the obligation is imposed upon the parents of all children in England of having them duly vaccinated within three months of birth (Section 16) ; or, in scattered districts, where public vaccination is performed at intervals of more than three months, when the opportunity of procuring public vaccination has been afforded (Section 12). Neglect to take the child for vaccination within this period is an 'offence' for which the parent can be proceeded against summarily, and for which he is liable to a penalty not exceeding twenty shillings (Section 29). It will be observed that this offence is complete at the end of the three months or other period, and as therefore it can only be committed once, only one penalty can be inflicted on account of it.

Under Section 31 of the same Act, however, an order for the vaccination of a child under fourteen years of age may be made by a justice of the peace if he sees fit upon the application of the vaccination

officer; and such order may be renewed or repeated again and again, as often as may be requisite, until the vaccination of the child is effected. This is not, it is true, said in so many words in the section, but it is the view of the clause which has invariably been held, and it has been distinctly confirmed by the Court of Queen's Bench. It was held by Lord Chief Justice Cockburn, in the case of *Allen v. Worthy*, that a person was rightly convicted for disobeying a second order, requiring him to have his child vaccinated, notwithstanding that he had been already convicted of disobedience to a previous order. He said: 'It is clear that, if Section 31 had not been introduced, the decision in *Pilcher v. Stafford* would have applied; but I think that that section makes all the difference as regards what may now be done with respect to a second offence and a second penalty. I think, therefore, that the power given by Section 31 is not confined to one notice, one order, and one conviction, but that the whole proceeding may be instituted *toties quoties*, so long as the disobedience continues.'

What is now being done at Leicester is to prosecute the 5,000 recalcitrants under Section 29, and if they disobey the order for vaccination to summon them again under Section 31.

Evidently the local vaccination officer and clerk of the guardians have their work cut out for them for some little time to come.

THE FALLACIES OF WATER ANALYSIS.

A REMARKABLE case claimed the attention of the Canterbury Bench of Magistrates a short time ago. A tradesman was summoned by the Town Council with a view to obtain an order for closing a well upon his premises alleged to be polluted. The city analyst appears to have reported last June that a sample of water taken from the well was contaminated, and an order to provide a proper supply was thereupon served. But the defendant astutely sent of his own accord a sample of the water to the analyst, in such a way that the latter was deceived as to its source, and in due course the sample was pronounced pure and suitable for drinking purposes. Dr. Dupré, the Government analyst, reported of the water that it contained a very high percentage of phosphoric acid, and showed signs of pollution by sewage or surface drainage, and might at any time become deleterious to health, though he refused to analyse a sample sent by the defendant, because the district from which it came was not stated. The city analyst, in examination, observed that, knowing as he now did that the water previously reported as pure came from a Canterbury source, he should consider it unsafe for drinking purposes, as liable to contamination; and thereupon the Bench ordered the well to be closed. There seems to be but little doubt that the water is, as a matter of fact, unfit to drink, but the defendant in the case may well have hesitated to obey the mandate of the local authority in view of the contradictory reports of the analyst. The common sense of the verdicts of water-analysts was well expressed a year or two ago by the medical officer of the Local Government Board in his comments on some analyses of water intentionally polluted under his direction, when he said that 'whilst we must ever be on the watch for the indications that chemistry affords of contaminating matters gaining access to our waters, we must go beyond the laboratory for evidence of any drinking-water

being free from dangerous organic pollution. If the chemist is well acquainted with the original liabilities of the water he is examining, he is justified in speaking of a water as "safe" or "unsafe" if it contain any trace whatever of organic matter; hardly, indeed, even if it contain absolutely none of such matter appreciable by his very delicate methods. The chemist can, in brief, tell us of purity and hazard, but not of purity and safety information about these we must go, with the chemist, to the conditions surrounding water supply and affecting water services.'

ARSENICAL FLOORS.

SIR EDMUND BECKETT calls attention in *Times* to the suggested application of a solution of arsenic to the woodwork of a floor to the ceiling of a church, and *this* time the critic's objections seem valid. The dangerous nature of such a preservative is so well known that it seems strange that its use should be countenanced by the architect, as it can hardly be supposed that a substance of so volatile a nature could be used without danger. In the first place a harmless agent, as creosote, could be used instead, but the question naturally arises, why use a preservative at all on timber in such a position? Natural ventilation of the floor should be sufficient to prevent 'dry rot'; the wood be primarily sound and dry as ordinarily understood, and if the timber be in such a position as to necessitate 'preserving' there is every chance of a fungoid growth being set up, arsenic notwithstanding; the danger then becomes greater, as 'rot' is a fungus flourishing in *damp* and stagnant air; consequently a greater chemical action must be brought about. If the church be heated by hot air or water, the volatile products of arsenic would find ample outlet through grates and apertures into the body of the edifice. The employment of such an objectionable substance, therefore, is unnecessary and wrong, and certainly not dreamt of in the philosophy of general architectural practice, and we are pleased to understand that timely notification has prevented any commission of the error.

MANSLAUGHTER BY NEGLECT.

HUMAN life, especially that of infants, is constantly exposed to danger by the neglect of persons from their position, are bound both morally and legally to be careful. Sometimes coroners find that a mother has been so culpably reckless in her conduct towards her infant that they return against her a verdict of manslaughter, or the child may in like manner be brought against a nurse who has charge of a bedridden patient, or against persons on whom a helpless relative is dependent. Lawyers have no doubt on the rule which is applicable in such cases. 'If a person has the custody of another who is helpless, and leaves that other without sufficient food' (or without necessary care, if in a position to give it), 'and so causes death, criminally responsible,' or, in other words, is guilty of the crime of manslaughter. But though the law is clear, its application to the circumstances of a particular case is not unattended with difficulty. It would be impossible to lay down any general rule as to the relationship between persons which is

always impose a duty of care or attention, or as to the degree of neglect where criminal culpability begins. Those are questions of fact to be determined with reference to the circumstances of each case. Our law imposes on those who institute a prosecution the duty of satisfying a jury that the person accused is guilty of the crime with which he is charged. In the case of a charge of manslaughter by neglect, the prosecution have consequently to satisfy the jury that death was caused by reason of the neglect of the prisoner to provide some sustenance or care for the deceased, which it was his duty to provide. Sometimes the prosecution fail to prove that the relative position of the parties was such as to impose a duty at all; more often they fail to satisfy the jury that the negligence of which the accused has been guilty was culpably reckless. It is excused as being perhaps the result merely of ignorance or thoughtlessness; the accused is given the 'benefit of the doubt,' and so is acquitted. From the above reasons and from others upon which we need not here enlarge, prosecutions for manslaughter by neglect are seldom successful; and, knowing this, coroners are often unwilling to have such prosecutions instituted, and dissuade their juries from returning verdicts of manslaughter unless the neglect is so culpable as almost to make it probable that it was intentional, in which case the crime committed is murder. But though trials for manslaughter by neglect, especially for manslaughter of infants, are rare; there can be no doubt that infant life is often sacrificed, and still more often endangered, by negligent conduct on the part of mothers and nurses, which is not only morally culpable, but would also be held to be criminally so if the facts were fully known. It is not likely that anyone will propose to alter the law as to criminal responsibility for neglect, and it is not desirable that it should be altered. The difficulty of proving any one guilty of manslaughter by neglect must remain a difficulty, which those who institute a prosecution must be prepared to meet. But at the same time, in spite of the risk of failure, we think it most desirable that, in what seem to be proper cases for investigation, prosecutions for manslaughter should be instituted. Even where they fail, they direct attention to the rule that no one may neglect helpless persons dependent upon him, and, by showing that serious criminal consequences may ensue, they act as a deterrent, not only on really criminal neglect, but also on merely careless conduct, which might still be productive of serious consequences if allowed to continue.

TURNING A DESTRUCTOR TO PROFIT.

THE problem of how to get rid of refuse from towns is, as every one knows, one of the most difficult of those which occupy public attention at the present day. Various methods, more or less successful, have been tried, but all of them have been expensive. An experiment, which is now being carried on by the Rugby Board of Health, makes it seem probable that under favourable circumstances solid refuse may be disposed of so as to produce a profit instead of a loss. Many towns have adopted some form of destructor or kiln in which solid refuse is burned, and so rendered innocuous. The Rugby Board thought of doing so likewise, and made inquiries at various places where destructors were at work. The result of these inquiries showed that the cost of

erecting an efficient destructor of the patterns already in use was more than the Rugby Board, representing a rather small district, felt justified in incurring. Mr. Seabroke, a member of the Board, and Mr. Stewart, the surveyor, who had inspected some destructors in actual operation, noticed that the one thing indispensable for their proper working was a chimney which would produce a good draught. They, accordingly, determined to try whether, when mixed with coal, the rubbish removed from dust bins would not burn in the furnace of the engine at the waterworks belonging to their town. At first the trial seemed successful, but soon the rubbish formed clinkers to such an extent as almost to put the fire out, and thus render the boiler useless. The fire space in the boilers was also too small, and only capable of burning a small part of the ashes which had to be got rid of. Messrs. Seabroke and Stewart, however, obtained permission from their Board to erect a kiln or oven of ordinary brick connected with the boilers and with the chimney of the engine. This was done at a cost of 20*l*. The kiln was found to burn the rubbish much more effectively than the boiler furnace had done, and satisfactorily disposed of what was put into it, leaving a residue of clinker and ashes which could be utilised for roads. But it was also found that the ashes when burned in the kiln were useful as fuel. The engine in question is used for pumping water from the waterworks, and is supplied by two boilers. One boiler hardly makes sufficient steam to do the work, and when only one is used it has to be liberally supplied with coal. The experiment was tried for some time of only using coal for one boiler, and of heating the other by the rubbish in the kiln; and the result was found to be that the consumption of coal requisite in the one boiler was much less than before, and the engine did its work satisfactorily. According to the report presented to the Board, the cost for fuel, when the engine was worked with one boiler fed with coal, was 79 of a penny per 1,000 gallons pumped, and when that boiler was aided by the steam from the other boiler, heated only by the refuse, the cost per 1,000 gallons was reduced to 61 of a penny. There was thus a very appreciable saving in the coal bill. The above calculation does not allow for the wages of the man employed to attend the destructor; and in the Rugby experiment these wages would add materially to the cost of getting rid of the rubbish, because one kiln did not fully occupy his time. But, if a second kiln were added, the expense for wages might remain the same, and double the quantity of rubbish be utilised. It must also be remembered that, however a town disposes of rubbish, some expense for labour is always necessarily incurred. The Rugby experiment seems to be a material step in the right direction, and to show that rubbish may be disposed of in a manner consistent with sanitary rules, and at the same time without loss to the rate-payers.

VENTILATION AT THE LAW COURTS.

IT is admittedly difficult to please everyone, and the question of ventilation appealing to various susceptibilities is rendered none the less easy when the occupants of a room are removed from time to time, as is the case at the New Law Courts, where much remonstrance has recently been occasioned by more than one judge. It appears that the ideas

in the judicial mind as to what constitute a pleasant temperature vary some ten degrees, and the officials of the 'office of works,' who have charge of the ventilating arrangements, are frequently called upon at short notice to raise or lower the temperature accordingly. The rule adopted for regulating the work is to know in the evening which (particular!) judge will sit in such and such a court on the following morning, and to arrange the necessary warmth to suit, but as the judges change courts during the day, a further alteration has to be made, hence the individual dissatisfaction. There are nineteen courts to be thus attended to, and the rapid displacement of air is expected to be brought about without draught or inconvenience, and accordingly the principle of the whole system is condemned, one judge going so far as to enjoin that the apertures should be pasted up, in the hope that it would disarrange the entire scheme, and that no attempt should be made to ventilate his court at all. This is an unfair tax upon science, or rather a hopeless attempt to make natural causes immediately subservient to several conditions at one time. The ventilating machinery is under control, and, given equitable and reasonable conditions, the resources of science are sufficient to cope with understood requirements, but in this case the requirements are changed so often that they do not appear to be understood even by the parties most interested, and from whom justice at least is expected.

HALFPENNY DINNERS FOR SCHOOL CHILDREN IN BIRMINGHAM.

WITH a view to meeting the difficulty experienced by the committee in reaching those children who are most in need, by means of the penny dinner scheme, experiments have been started in the direction of providing a mid-day meal, of a substantial and nourishing character, at a charge of one halfpenny. This experiment is being conducted at the Wycliffe School, St. Luke's Road, by the sub-committee which formerly had charge of one of the penny dinner centres, and eight schools are covered by the scheme of operations, namely, St. Jude's, St. Asaph's, St. Luke's, St. David's, and St. Alban's (all church schools), and the Bristol Street, Hope Street, and Rea Street Board schools. On the first day the halfpenny charge came into operation there were 303 present; on the next day the number had increased to 508; and on the following day to 566. The dietary at these halfpenny dinners is made up from the experience obtained in connection with the penny dinner scheme. It is found that there are some children who cannot eat a certain article of food, and two courses are therefore provided, one being a stew or bacon sandwiches, and the other bread and jam or bread and cheese. Seats are provided in the schoolroom for about 150 children, and as the average daily number to be fed is about 500, they have to be served in relays. As they enter, each child receives a bowl and a spoon, and it then passes to a lady to receive a portion of bread, and to other members of the committee or helpers for the stew, sandwiches, or whatever may be the article on the dietary table for the day. This only applies to the first course, the second being served as the children leave. The results so far show that there need not, with proper management, be any loss even at a charge of one halfpenny. In order to

encourage attendance at school the tickets are distributed in the respective schools by the teachers. It is considered that the movement can be made a powerful auxiliary to the School Board visitors. In a town like Birmingham there are hundreds of wretched children who wander about the streets and pick up food as best they can. They are under no parental control other than that which compels them to beg or steal, and it is found extremely difficult to bring these wanderers under educational influences. It is thought probable, however, that a goodly portion of them might be tempted to attend school if they were certain of a good meal during the day, and there is no doubt some philanthropic agency would be found to purchase the necessary tickets for distribution in such cases. The line between the free dinner, which means charity, and that for which a sufficient charge is made to enable the hunger of the recipient to be satisfied, has now been drawn about as finely as it can be. But as the halfpenny dinner undoubtedly reaches a class between those who cannot pay at all and those who can afford a penny or more, it is to be hoped the scheme will be found successful.

FIRES IN THEATRES.

THE entire destruction by fire of the Exeter Theatre calls further attention to a subject which is frequently brought to notice, and upon which many a homily has been written, so far, however, without any serious attempts being made to grapple resolutely with the grave danger. The Exeter Theatre was burnt down some eighty years ago; but this comparatively long immunity is no excuse for allowing these buildings to remain, as they mostly are, a trap for the thoughtless and ignorant, or a still larger class, the careless. The flames broke out fortunately when the building was empty, viz., at six o'clock in the morning, and in the course of an hour only the walls remained, these walls not being sufficient to protect the adjoining property, which became ignited, but happily the flames were extinguished before any great damage was done. The average life of a theatre has been shown to be twenty-three years, and when it is known that an average nightly attendance at 472 places of public amusement in London is recorded at over 300,000 people, the appreciable risk may be estimated by playgoers themselves, and an uncomfortable speculation may be pardonably and perhaps profitably indulged in as to which building may be next on the problematic list. According to the statement of the consulting engineer to the Metropolitan Fire Brigade, the loss of nearly 1,000 lives by the fire at the Ring Theatre at Vienna in 1881, caused the Metropolitan Board of Works to bestir themselves, and exercise the powers granted to them by Parliament in 1878, and Captain Shaw was instructed to draw a report showing the condition of theatres under their jurisdiction. It does not appear that this report was made public, presumably on account of its terrifying nature, and the pertinent question is put as to which is of greater importance, to alarm the public or to burn them alive? It is the Lord Chamberlain's business to prescribe regulations for preventing the blocking of the gangways, the working order of the fire-extinguishing appliances, the protection of stage and other lights, and general provisions for public safety, and the damaging statement is made that the duty is done by annually sending a gentleman, who has

no practical knowledge of fire appliances, to inspect the theatre in the daytime, and this, too, by appointment. The material precautions thus left to be taken against fire in the London theatres are such only as individual managers think fit to adopt, and the unsatisfactory state of the dissension amongst divided and interested opinions is shown by the fact of Sir William Vernon Harcourt recently stating in the House of Commons that 'he would give the Metropolitan Board of Works all the support he could, if they required any further powers.' One hundred and eighty-seven theatres have been totally destroyed by fire between the years 1861 and 1877, and thirteen have been destroyed by fire yearly since. Strong as the following statements appear to be, they are intensified by their non-contradiction. 'The burning of the scenery alone of any theatre would be sufficient to suffocate the audience, and if the building cannot be cleared in three minutes it is a death-trap, for no instance of stopping fire that has once got a hold in a theatre is known.' The rapidity of the direful work is intimated at the late Alhambra, which was a sheet of flame from foundation to roof in twelve minutes from the first alarm. It may well be asked if the following authorities over our theatres—the Metropolitan Board of Works, the Lord Chamberlain, the divisional magistrates, the magistrates of Middlesex and Surrey, the City of London, and the Home Secretary—are prepared to declare every theatre in London safe for public use, and to back the responsibility of such an assurance by the official report of Captain Shaw? or are the British public to be informed after another serious loss of life, 'that it will form the subject of strict inquiry?' The facts are sufficiently eloquent to require no further comment.

AN IRISH VILLAGE.

THE Medical Officer of Health of the Carlingford Dispensary District, co. Louth, in his report upon the state of the village of Whitestown, which, for the past twelve months has, very naturally, not been free from fever, says:—'The village is about 300 yards in length, about 300 yards in breadth, and almost equally divided on each side of county road. The north or inland end is occupied by farmhouses, with their accompanying stables, cow-houses, piggeries, manure-pits, &c., all promiscuously, and interspersed by a few habitations of the poor in back courts. The south or shore end is mostly occupied by the poor, the majority of the poor living in two rows of cabins, regularly placed together, one on each side of the road. The houses on each side of the road are recessed from the road, a distance of from 7 ft. to 15 ft. This space between houses and the road, in almost all cases, is occupied by the piggeries, oat houses, or ass house, but in all cases by the manure heaps. The liquid manure from the farm offices and manure heaps of the north end flows down past the doors of these cabins often ankle deep in the centre of the road, though the earthen floors of the houses, as a rule, are on a lower level than the road. I visited over twenty of these health-generating, and, as lately occurred, sometimes life-taking abodes of the poor, in each of which phoid fever raged, and it is my belief not one of them is fit for human habitation. They are on an average 10 ft. long by 12 ft. broad, up to 14 ft. by

16 ft., and contain only one apartment for sleeping and cooking. The front door (though I might not have called it front, as not one of them has a back door) is about 5 ft. high, the eave thatch about 6 ft. There are no back windows as well as doors. In a few there are openings about 1 ft. or 2 ft. square in the back wall. The greater number have no fire-places or chimneys, the door or a hole in the roof giving exit to the smoke. Their roofs are low, the walls old, and in some cases half mud. These miserable hovels are inhabited by families varying in number from two to ten. I cannot think that the abodes I have described could be by any repairs made habitable. The only method, in my opinion, is that they be entirely taken down, and if the site on which they are at present be selected for new cottages, more frontage with rear accommodation be given to each, and that each be connected with a system of main sewerage running through the village from end to end, which would carry towards the seashore that surface liquid manure which is so dangerous to health and life.' It would be interesting to know to what landed proprietor this village has the privilege of belonging.

THE BIRMINGHAM PENNY DINNER SCHEME.

THE chairman of the committee (Mr. Osmund Airy), which was organised for trying the experiment of penny dinners in connection with the school children of Birmingham, has published a letter, dated February 26, in which he states that they have been engaged at two centres—Summer Lane and Gooch Street—in the endeavour to deal with the difficulties which presented themselves in connection with the question of providing penny dinners for the children attending the elementary schools of Birmingham. One point they have settled conclusively, viz., that, with a room rent free, an average attendance of 150 to 200 children, and an energetic committee, dinners can be provided and the cook's wages paid at a cost of one penny per head. But they have also found that the number who can pay a penny and are willing to do so was continually lessening, and that if a charge of one penny was made they failed to reach the cases where help was most imperatively needed. It had consequently become evident to the committee that the programme with which they started—that the operations were not to be charitable, but business-like—could not be maintained. Recognising that fact, and being unwilling to give up work which, even on the limited scale adopted hitherto, had done much good, the committee had recently been experimenting in the direction of free dinners. At the Summer Lane centre, in addition to children who paid their pennies, about eighty per day had been provided for out of a fund privately collected by a lady (Mrs. Sargent), who had devoted herself to carrying on the work at that centre. At the Gooch Street centre the plan had been tried of inviting the various parochial agencies to purchase tickets from the committee for distribution among necessitous cases coming within their own experience, and this plan had been attended with considerable success. In conclusion, Mr. Airy asks for subscriptions to a sufficient extent to justify them in carrying on the work at the existing centres for a time, and also to enable other centres to be formed, should the committee consider it advisable.

THE PUBLIC HEALTH

DURING FEBRUARY 1885.

THE mean temperature during the month of February at the Royal Observatory, Greenwich, was $43^{\circ}9$; it was as much as $5^{\circ}4$ above the average February temperature in one hundred years, and exceeded that recorded in the corresponding month of any year since 1872, when it was $44^{\circ}8$. An excess of temperature prevailed on twenty-three days of the month, while on the other five days it was below the average. The mildest day of the month was the 24th, when the mean was $50^{\circ}3$, and as much as $10^{\circ}5$ above the average; the coldest day was the 21st, when the mean was only $34^{\circ}1$, and $5^{\circ}4$ below the average. Rain was measured at Greenwich on nineteen days during the month, to the aggregate amount of 2.4 inches, which exceeded by nearly an inch the average February rainfall in sixty-one years. During the first two months of this year the rainfall amounted to 3.8 inches, which was nearly half an inch above the average for the corresponding period in sixty-one years. The sun was above the horizon during 277.9 hours during February, but only 37.8 hours of bright sunshine were recorded at Greenwich; this amount was considerably below the average of the second month in the five preceding years. South-westerly winds prevailed almost throughout the month.

In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, which have an estimated population of nearly nine millions of persons, 24,329 births and 14,452 deaths were registered during the four weeks ending the 28th ult. The annual birth-rate, which had been 36.4 per 1,000 in the preceding month, declined to 35.6 during February, but exceeded that recorded in the corresponding month of 1884. The lowest birth-rates in these twenty-eight towns last month were 27.3 in Bradford, 31.7 in Brighton, and 32.0 in Halifax; in the other towns the rates ranged upwards to 40.1 in Norwich, 40.3 in Nottingham, and 48.1 in Cardiff. In London the birth-rate last month was 35.0 per 1,000, while in the twenty-seven provincial towns it averaged 36.2.

The annual death-rate in the twenty-eight towns, which had increased from 20.5 to 24.4 per 1,000 in the four preceding months, declined to 21.2 during February, but exceeded by 0.7 per 1,000 that recorded in the corresponding period of 1884, which was 20.5 per 1,000. The lowest annual rate of mortality last month in these towns was 16.1 in Birkenhead. The rates in the other towns, ranged in order from the lowest, were as follow:—Brighton, 18.5; Bradford, 18.6; Portsmouth, 18.8; Derby, 19.1; Hull, 19.3; London, 19.7; Leeds, 19.7; Salford, 19.7; Halifax, 19.7; Huddersfield, 19.9; Sheffield, 20.2; Leicester, 20.5; Blackburn, 20.9; Wolverhampton, 20.9; Birmingham, 21.2; Nottingham, 21.7; Oldham, 22.4; Plymouth, 22.6; Bolton, 23.5; Bristol, 24.0; Liverpool, 24.6; Manchester, 25.6; Norwich, 26.3; Newcastle-upon-Tyne, 26.7; Cardiff, 30.4; Sunderland, 31.6; and the highest rate during the month, 32.4 in Preston. While the death-rate in London during February, as above stated, did not exceed 19.7 per 1,000, it averaged 22.4 in the twenty-seven provincial towns. The 14,452 deaths from all causes in the twenty-eight towns during the four weeks of February included 1,515 which were referred to the seven principal zymotic diseases, of which 446 resulted from whooping-cough, 338 from measles, 195 from scarlet fever, 144 from small-pox, 143 from 'fever' (principally enteric), 128 from diphtheria, and 121 from diarrhoea. These 1,515 deaths were equal to 10.6 per cent. of the total deaths, and to an annual rate of 2.22 per 1,000, which almost corresponded with the rates recorded in the two preceding months, and was below that returned in the corresponding period of 1884, when it was 2.46 per 1,000. The death-rate in London from the principal zymotic diseases was equal to 2.0 per 1,000 during February, and was 0.4 below the average rate in the twenty-seven provincial towns, among

which the zymotic death-rates ranged from 0.6 and Brighton and Derby, to 4.5 in Preston, 4.6 in Norwich, 7.1 in Cardiff, and 11.4 in Sunderland.

Whooping-cough was the most fatal zymotic in the twenty-eight towns during February. The mortality from this disease, which had risen from 0.66 per 1,000 in the four preceding months, was last month, and below the rate recorded in the corresponding period of last year. In London the death-rate from this disease was equal to 0.57, whereas in the twenty-seven provincial towns it averaged 0.65 per 1,000, and showed the highest proportional fatality in Birmingham, Norwich, Bristol, and Preston. The death-rates from measles, which had been 0.48 and 0.42 in the two preceding months, rose again to 0.50 during February. This disease was proportionally nearly twice as fatal in the provincial towns as in London, for while the measles rate in the metropolis last month did not exceed 0.1,000, it averaged 0.63 in the twenty-seven provincial towns, among which the highest rates were recorded in Huddersfield, Cardiff, and Sunderland. In the mentioned town the rate of mortality last month from measles was so high as 9.2 per 1,000. The death-rate from scarlet fever, which had been 0.45, 0.38, and 0.37 per 1,000 in the three preceding months, further declined during February to 0.29. This disease showed the highest proportional fatality in Leicester, Sunderland, and Preston. The rate of mortality from 'fever' (principally enteric or typhoid), which had steadily declined in the four preceding months from 0.41 to 0.21 per 1,000, was again 0.21 last month; in London the death-rate from this disease was only 0.14 per 1,000, while in the twenty-seven provincial towns it averaged 0.27, and was highest in Norwich. The mortality from diphtheria also showed a further decline from the recorded in recent months; this disease was proportionally most fatal in Newcastle-upon-Tyne, Plymouth, and Liverpool. During the four weeks of February 144 deaths from small-pox were registered in the twenty-eight towns; the fatality of this disease showed a decline in London while it showed a further increase in the twenty-seven provincial towns. Of the 144 deaths from small-pox during February, 125 were registered in London, Birmingham, 4 in Liverpool, 2 in Sheffield, 2 in Cardiff, 1 in Brighton, 1 in Manchester, and 1 in Cardiff. Judged by the returns of the Metropolitan Asylum Hospitals, the prevalence of small-pox in London showed a slight decline during the latter part of February. The number of small-pox patients under treatment in hospitals, which had risen from 536 to 1,147 at the end of the four previous months, declined to 1,103 at the end of February. The average weekly number of new patients admitted to these hospitals, which had steadily increased from 72 to 248 in the five preceding months, fell to 144 during February.

The rate of infant mortality in the twenty-eight towns, measured by the proportion of deaths under one year of age to births registered, was equal to 132 per 1,000 in February, which was below that recorded in the corresponding period of either of the two preceding years, 1883 or 1884. In London the rate of infant mortality did not exceed 100 per 1,000, whereas in the twenty-seven provincial towns it averaged 142, and ranged from 86 in Brighton to 194 in Wolverhampton, to 196 in Cardiff, 198 in Sunderland, and 203 in Preston.

The death-rate from diseases of the respiratory organs, judged by the metropolitan returns, was considerably below the average during February. The weekly number of deaths referred to these diseases in London was 383, and the annual death-rate was equal to 4.9 per 1,000. In Liverpool the annual rate of mortality from these diseases was last month equal to 5.9 per 1,000.

The causes of 328 of the 14,452 deaths registered in the twenty-eight towns during the four weeks of February were not certified, either by registered medical practitioners or by coroners. These uncertified deaths

equal to 2·3 per cent. of the total deaths, which showed a slight decline from the proportion in the preceding month. In London the proportion of uncertified deaths was only 1·3 per cent., while in the twenty-seven provincial towns it averaged 3·0 per cent.; all the causes of death were duly certified during the month in Plymouth and Leicester, while the proportions of uncertified deaths were largest in Sheffield, Halifax, Hull, and Oldham.

Among the population living in the outer ring of suburban districts around London, estimated at rather more than 1,000,000 persons, the annual death-rate from all causes during February was equal to 18·2 per 1,000, against 17·1 and 16·7 in the corresponding periods of 1883 and 1884. During the four weeks ending the 28th ult., 96 fatal cases of small-pox, 37 of diphtheria, 36 of whooping-cough, 22 of measles, 19 of 'fever,' 15 of diarrhoea, and 9 of scarlet fever, were recorded in the outer ring. These 234 deaths were equal to an annual rate of 2·7 per 1,000, which showed a further increase upon the rates recorded in recent months. The fatality of diphtheria and of 'fever' showed an increase, while that of measles and scarlet fever declined. Of the 96 deaths from small-pox recorded in the outer ring during February, 82 occurred in West Ham district (including 17 of London residents registered in the Metropolitan Asylum Hospital at Plaistow), 8 in the district of Edmonton, 2 in Croydon, 1 in Tottenham, 1 in Enfield, and 1 in Chislehurst sub-districts. Of the 37 fatal cases of diphtheria, no less than 17 occurred in the district of Edmonton; and the 19 deaths referred to 'fever' included 4 which were recorded in Tottenham sub-district.

NOTIFICATION OF INFECTIOUS DISEASES.

IN a table on page 412 are published uniform statistics relating to sickness and mortality in thirty-three of the thirty-nine urban sanitary districts of England and Scotland in which the notification of infectious diseases is compulsory. The estimated population of the thirty-three districts for which we are enabled to publish complete statistics for the month of February is rather more than three millions of persons. The annual rate of mortality from all causes per 1,000 persons estimated to be living in these towns, which had risen from 20·51 to 24·12 in the four preceding months, declined again during February to 21·03. In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, the death-rate during February averaged 21·20 per 1,000, and was, therefore, slightly above the mean rate in the thirty-three towns in the accompanying table. The rates of mortality last month were considerably below the average in Birkenhead, Burton-upon-Trent, Edinburgh, Heywood, Jarrow, Lancaster, and Warrington; while they showed an excess in Dundee, Greenock, Macclesfield, Preston, and Stalybridge. The death-rate from the eight infectious diseases dealt with in the table averaged 0·67 per 1,000 in the thirty-two towns furnishing this information, showing a further decline from the rates recorded in the four preceding months, which had steadily fallen from 0·98 to 0·70 per 1,000. No death from any of these infectious diseases was recorded in Heywood, Leek, or Warrington, and but one fatal case in Accrington and Reading; while they caused the highest rates of mortality in Barrow-in-Furness, Hartlepool, Halifax, Jarrow, Lancaster, Preston, and Rotherham. Small-pox caused 1 death in Barrow-in-Furness, 1 in Manchester, and 1 in Jarrow; scarlet fever was proportionally most fatal in Halifax, Leicester, Preston, and Stalybridge; diphtheria in Burton-on-Trent and Edinburgh; and enteric fever in Burnley, Blackburn, and Bolton. Two deaths from puerperal fever were returned in Dundee, and 2 in Halifax. With reference to the notified cases of infectious diseases in the thirty-two towns, it appears that the proportion of the population reported to be suffering from one or other

of the eight diseases was 4·66 per 1,000, against 6·71, 5·24, and 4·88 in the three preceding months. The proportion did not exceed 2 per 1,000 in Leek, Macclesfield, Oldham, and Warrington; in the other towns it ranged upwards to 6·04 in Birkenhead, 6·39 in Halifax, 7·68 in Rotherham, 8·52 in Leicester, 8·63 in Edinburgh, and 9·91 in Barrow-in-Furness. The high rates in the three last-mentioned towns were due to the excessive prevalence of scarlet fever. Four cases of small-pox were notified in Manchester, 3 in Birkenhead, 2 in Bolton, and 2 in Barrow-in-Furness, during the month under notice; scarlet fever was proportionally most prevalent in Barrow-in-Furness, Edinburgh, Halifax, Leicester, and Rotherham; diphtheria in Burton-upon-Trent and Edinburgh; enteric fever in Burnley, Lancaster, and Portsmouth; and typhus in Dundee and Greenock. Two cases of puerperal fever were notified in Salford during February, against 3 and 4 in the two preceding months.

SPECIAL REPORTS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

T. O. DUDFIELD, M.D., President.

A MEETING of the Society of Medical Officers of Health was held on Feb. 20, 1885. The minutes of the last meeting were read.

The following gentleman was elected a member of the society:—Nominated by Dr. C. E. Saunders and Mr. Shirley Murphy—K. Bruce Lord, M.D. Edin., Medical Officer of Health to Helmsley, Yorkshire.

The following gentleman was elected an associate of the society:—Nominated by Dr. T. O. Dudfield and Mr. Shirley Murphy—W. R. Smith, M.D., of Bayshill Villa, Cheltenham.

Mr. William Weaver, C.E., Surveyor to the Vestry of Kensington, read a paper on 'SEWER VENTILATION AND HOUSE SANITATION,' of which the following is an abstract.

The author began with a description of the manner in which the present system of sewer ventilation and its attendant evils had arisen, and pointed out that the sewers were formerly ventilated by the drains entering them, all of which had untrapped outlets. The drains were brick barrels, those from the numerous street gullies generally being of large diameter and shooting direct into the sewers without any intervening trap; stoneware-pipe drains, with flap-trap outlets, next came into fashion, the increased duty of ventilation being thrown upon the untrapped gullies. In only a few cases has a drain-ventilator been carried up the front of the house, affording at the same time ventilation for the sewer. To alleviate the evils arising from the pressure on the sewer ventilators various efforts have been made. Patent charcoal ventilators have been fixed, a chamber has been formed in the ventilating shaft containing a frame from which was suspended numerous hanks of loose tow dipped in a solution of carbolic acid. Furnace shafts have also been suggested, and in some places the suggestion carried into effect. Mr. Weaver did not approve the adoption of lamp-post ventilation, and the provision of open grids has been attended with much complaint. After discussing the more recent method of disconnecting the house-drain from the sewer, and other points, the author laid down the following principles:—

1. That sewers and drains should be dealt with together as one system, the former depending upon the latter for ventilation, and the latter on the former for outlet. The open gratings in roads could then be abolished, except where left at intervals to serve as fresh-air inlets. The ventilating pipes should be kept as far as possible from windows and flues, and be governed by the same rules that apply to the latter when adjoining premises are increased in height. This proposed arrangement to apply to all new drains to be constructed after a certain date.

2. That spaces or gaps should be left at regular intervals in lines or rows of buildings, in order to promote circulation of air and admit of the construction of sewer-ventilating flues.

3. That dust-bins should be abolished, and, in lieu thereof, each house should provide a galvanised iron or other approved receptacle for the dust and ashes; such receptacle to be left in a certain position on an appointed day in each week for regular removal by the local authority. No vegetable or other burnable refuse to be placed in the said receptacle under penalty.

4. That the Metropolitan Board of Works, district boards, and vestries should be urged to co-operate in order to obtain powers to the effect set forth in the three preceding propositions.

The President, after complimenting the author on the practical character of his paper, called attention to the powers possessed by the Metropolitan Board of Works to make by-laws for regulating the dimensions, form, and mode of construction, and the keeping, and cleansing, and repairing of the pipes, drains, and other means of communicating with sewers, and urged that there should be no interference with the house-drain unless with the consent of the local authority.

Mr. Robins recollected in 1853 making a suggestion to local authority for the ventilation of sewers through the house-drains. A design was made by a member of the Board for forming pillars in the roads something like pillar letter-boxes, but fitted with shelves, over which the refuse passed, coming out perfectly innocuous.

Mr. Turner thought much good had come of a proper method of flushing sewers. He did not think any reliance could be placed upon the use of charcoal, intercepting chambers, or tanks of tow and carbolic acid for preventing nuisance.

Dr. Butterfield was very doubtful whether surface ventilation of sewers should be increased or diminished; he considered that the water supplied for the carriage of sewage need not be 'filtered.'

Mr. Southam described the methods adopted in Clapham for ventilation of sewers, and stated that, where there was a dead end to a sewer, they had put ventilators against the houses and carried them up three feet above the roof.

Mr. Mineard spoke of the necessity for preventing particles of gravel and sand from entering the sewers; he thought that, where possible, sewers should be ventilated by pipes carried up houses.

Dr. Alfred Carpenter said that, whatever tended to oppose the flow of sewage downwards or the current of air upwards, was not a proper system. Sewers and drains were expensive on account of imperfect work. He approved a system of ventilating the sewers through the soil-pipes.

Mr. Armstrong was of opinion that sewer-air should not be permitted to enter house-drains. He thought it was a vast waste to destroy organic matter by fire when it might be used for manure, and it was a waste to allow sewage to go into the sea.

Mr. Mark Judge thought that any proposal to take ventilating pipes from sewers through private houses could be opposed to the utmost.

Dr. Bate had examined 162 ventilators, and in 82 per cent. there was an up-current; in 49 cases the smell was offensive. He objected to the ventilating pipe going into the house.

The Society then adjourned.

THE Home Secretary has appointed Mr. E. Pearson, one of the inspectors of the Local Government Board, to be an inspector under the Home Office, for the purpose of examining the provisions of Railway and Canal Improvement Bills before Parliament. He will also hold all inquiries as to the expediency of the provisions of the Bills as are unopposed, where the schemes involve the demolition of dwellings occupied by the artisan and working classes.

ARCHITECTURAL AND BUILDING TRADES EXHIBITION.

THIS Exhibition, held in the Floral Hall, Covent Garden, under the auspices of the Society of Architects, was opened on Monday, the 2nd inst. Amongst objects of special sanitary interest may be mentioned the stoves of Mr. Harry Hunt, Warming and Sanitary Engineer, Palace Stove Works, Newington Green, London, N. These stoves, to be seen at Stands Nos. 1A and 121, received Prize Medals at the International Health Exhibition in 1884, at the Smoke Abatement Exhibition in 1882, and at the Sanitary and Medical Exhibitions in 1881. The Hygiene Ventilating Hall Stoves are intended to be kept continuously burning, and require feeding every thirty-six hours with coke or other smokeless fuel. They are provided with mica doors, through which the fire may be seen. The mica is not liable to crack, and intercepts heat less than glass. The Crown Jewel American Gas-Burning Stove burns the Anthracite Smokeless Coal, is self-feeding, and is said to be very economical. The Argus and Victoria are stoves upon the Base Burner principle, and the Fairy is a smaller kind of American stove. All these stoves are provided with pipes for carrying off the products of combustion.

Stoves are exhibited at Stands Nos. 54 and 55 by Messrs. George Wright & Co., 155 Queen Victoria Street, E.C., and 238 Upper Thames Street, E.C. The 'Interchangeable Grate' offers facilities for regulating the rate of combustion. The back and part of the bottom are of fire-brick, the other part being fitted with a movable fire-brick bottom, or with an open grating, at pleasure. When the grating is used, the draught may be further increased by drawing out the ashpans. The 'Patent Bivalve' enables the smoke outlet to be regulated.

A Double Oven Kitchen, with registered self-acting cone ventilator, is exhibited at Stand No. 83 by Messrs. Steven Bros. & Co., 35 and 36 Upper Thames Street, E.C. Stoves and Ranges are exhibited at Stand No. 86 by Messrs. Chambers, Monnerney, & Co., 41 Bishopsgate Street Without, E.C.

At Stand No. 75, Mr. J. Grundy, 30 Duncan Terrace, City Road, N., exhibits his Patent Warm Air Ventilating Fire Grate, which affords a larger heating surface than an ordinary grate, the chimney for some distance being utilised as a hot-air chamber for supplying the apartment.

Amongst various household and other sanitary appliances, are the Self-Cleansing Latrines of Messrs. Bowes, Scott, & Read, Broadway Chambers, Westminster, S.W. The same firm exhibits a water-closet, as adopted by the London School Board, and a Patent Annular Syphon Flushing Chamber, at Stand No. 4. In this cistern the longer limb of the syphon dips about $\frac{1}{2}$ inch into water below the tank, which is kept at the proper level by a weir. When the water rises to the top of this longer limb, instead of running down the sides, it is guided by a lip and descends in the middle, thereby displacing a quantity of air, and gradually forming a vacuum in the discharging limb, so that the tank is rapidly emptied. By this arrangement a tank that may take a day or two in being filled by a small flow of water, is automatically emptied in a few minutes. These flushing chambers are adaptable to sewers where only a slight fall is attainable. The annular syphon can also be used for irrigation, the sewage being allowed to collect in tanks and discharged at stated periods on to the land by means of carriers. Super-saturation is thus avoided, as the land is enabled to take up one lot of sewage before another is discharged upon it.

At Stand No. 5, Messrs. J. Sessions & Sons, Gloucester, exhibit enamelled slate urinal compartments, some with earthen urinals, and some without the latter, having the lower part of the slate back set sloping and enamelled of a dark colour. Also a housemaid's sink and lavatory, with lift-up lid and separate receiver for slops, and an 'Unitas' water-closet and fittings, with flushing cistern and lift-up seat, so as to serve as slop receiver and urinal.

This water-closet is without the usual wood casing and apparatus. (See SANITARY RECORD, Jan. 15, p. 305.)

At Stand No. 6, Messrs. Ewart & Son, 346 Euston Road, N.W., exhibit the 'Challenger' bath, in iron, tinned and japanned, with fittings complete, no wood casing being necessary. Water-heaters are provided, to burn gas, by which boiling water can be readily obtained. This firm also exhibits the 'Empress' copper revolving ventilators; smoke curers, revolving and stationary; and Tobin tubes, with V-shaped canvas purifiers for cleansing the air.

At Stands Nos. 7 and 8, Messrs. George Farmiloe & Sons, 34 St. John Street, E.C., exhibit their Elastic Valve Closets, in which the supply can be regulated by means of a tap. Also the 'Eos' Closet, with trap in one piece, and above the floor line; and the Patent Waste Preventing Cistern, which gives the full contents without the handle being held. The same firm exhibits the 'Gibson' Pump, with a vacuum chamber arranged to secure easy working with an equal flow; the Benner Lever Gas and Back Water Trap, in which an India-rubber ball closes the mouth of a pipe when empty, or is floated up by the water when it rushes in; and several closets, urinals, &c.

At Stand No. 9, Mr. C. G. Roberts, Haslemere, Surrey, exhibits the Patent Automatic Rain-water Separator, which took a Silver Medal at the International Health Exhibition. The separator is made of zinc upon an iron frame. It is self-acting, and directs into a waste-pipe or foul-water tank the first portion of the rainfall that washes off and brings down from the roofs soot and other impurities. After the rain has been falling for a certain time, which can be regulated, the separator cants and turns the remainder of the water into the storage tank.

At Stand No. 10, Messrs. Shanks & Co., 46 Cannon Street, E.C., exhibit iron baths with porcelain enamel, and the Tubal Closet, without wood casings; also waste preventers bearing the stamp of the New River Company, to which a Gold Medal was awarded at the Health Exhibition.

At Stand No. 11, Mr. Milton Syer has the Patent Pneumatic Valve and Syphon Cistern, to supersede the ordinary water-closet apparatus. By pressing and releasing a small 'push' button, a supply of water is obtained, which is stopped by an automatic valve. These 'push' buttons can be fixed under a pedal in front of an urinal, or under the self-action water-closet seat, so that the water may flow after use.

At Stands Nos. 14 and 15, Messrs. Banner Bros., 11 Billiter Square, E.C., show models and drawings of their system of drainage, to which a Gold Medal was awarded at the Health Exhibition; also Patent Exhaust Ventilators (veering or fixed); Traps for Drains, in stone-ware and rustless iron; and Manhole Iron Covers, with imperishable air-tight joint made with sand. These three preceding specialties gained Silver Medals at the Health Exhibition. The Banner Water-closet is also exhibited here. It is formed in parts, to be used as urinal, slop-receiver, or water-closet.

At Stand No. 17, Messrs. Robert Boyle & Son, 64 Holborn Viaduct, exhibit their well-known ventilating appliances, with plans illustrating their system of ventilation, as applied to ships, workmen's houses, ordinary dwelling-houses, and prisons. Messrs. F. Braby & Co., 356 to 362 Euston Road, N.W., also exhibit ventilators, besides other sanitary appliances, at Stand No. 18.

At Stand No. 20, Messrs. Hayward Bros. & Eckstein, Union Street, Borough, E., exhibit their Sheringham Ventilator, to be regulated by means of a cord; their improved Mica Outlet, for the discharge of vitiated air from rooms into a smoke-flue; and their Fresh Air Mica Inlet Valves, in galvanised iron, for ventilating drains. The valves are formed with hinged flaps of mica. In the Silk-flap Ventilator, for prevention of down-draught in air-extraction shafts, the valves are formed with oiled silk, and operate without noise. The same firm exhibits the Air-tight Inspection Cover, for drains.

At Stands Nos. 22 and 23, Messrs. C. Kite & Co.,

Christopher Works, Chalton Street, N.W., exhibit Wall Inlet Ventilators. They are hinged at the bottom, have net screens inside for cleansing the air, and can be closed flat against the wall. They can be concealed by means of mirrors, pictures, or small hanging cabinets. The same firm exhibit a Silent Automatic Outlet Chimney-breast Ventilator, to be fitted into smoke-flues near the ceiling. It protrudes inside the flue to the extent of 2 inches. There are also the Roof Outlet Ventilators, for fixing upon roofs, with hinged valves regulated by cords; the ornamental Turret Ventilators; and the Registered Drain Ventilators, with induced current outlets and down-cast inlets. This firm also exhibits a model house, illustrating the application of Kite's Ventilators to ordinary dwellings. They have gained the Gold Medal (highest award) for Induced-current Ventilators, and the Silver Medal for Drain Ventilators, at the Health Exhibition.

At Stand No. 24, Messrs. J. M. Lamb & Co., 119 Finchley Road, N.W., show their Prize Medal Air-propelling Fans, and Air-warming Apparatus, for connection with vertical air-tubes, for the supply of warm fresh air. It can also be used as a stove, or for cold air supply in summer time. The same firm exhibit various ventilators, chimney cowls, and other appliances.

At Stand No. 51, Messrs. Broad & Co., 2 and 4 South Wharf, Paddington, W., exhibit various sanitary specialties, which have secured a Silver Medal at the Health Exhibition; amongst which may be mentioned the Reducing Syphon and Channel Pipe, for increasing the velocity of sewage by a gradual diminution of the diameter of the drain; and the Air Inlet, for use where air is admitted to a drain from the ground level. It has a cast-iron ventilating cover with a hanging receptacle below, to receive any solid matter that would otherwise fall into the drain. The white-enamelled channel drain-pipes of this firm deserve special notice. There are also several white-enamelled cisterns, sinks, and other appliances, which have received the Silver Medal award.

At Stand No. 67, Messrs. Quirk, Barton, & Co., 61 Gracechurch Street, E.C., exhibit their Patent Tin-lined Lead Piping and Sheet Lead, for security against lead-poisoning in water, beer, and other liquids. The piping is said to cost about double the price of ordinary lead-piping; but, as the strength of the tin lining enables about half the weight of metal per foot run to be used, the actual difference of cost is very trifling. The same firm exhibit Laminated Lead, for damp-proof courses, and for lining damp walls. The cost of this is about 17s. per cwt., one cwt. being sufficient to cover an area of 400 superficial feet. Wall-paper can be pasted over it if desired. This firm have been awarded the Gold and Silver Medals at the Health Exhibition, and the Awards of Merit at the International Medical and Sanitary Exhibitions in 1881.

At Stand No. 69, Messrs. James Stiff & Sons, London Pottery, Lambeth, exhibit their Weatherley Traps, Ventilating Damp-proof Courses, and other specialties.

Mr. C. D. Phillips, Embyn Works, Newport, Mon., exhibits, at Stand No. 72, his Patent Lockjaw Roofing Tiles. They interlock on both sides, top and bottom, with a groove and tenon joint, and only require the same timber as slates. They are manufactured under great pressure, in order to be non-porous and exclude all damp.

At Stand No. 74, Messrs. E. Aldous & Son, 2 Elmham, Upton Lane, Upton, E., exhibit Roof Exhaust Ventilators, Ceiling Ventilators, for single rooms, House Ventilators, for ventilating several rooms upon the Trunk system, by means of one exhaust; and several other appliances.

At Stand No. 78, Mr. J. A. Somerset, St. Nicholas Iron Works, Newcastle-upon-Tyne, exhibits his 'Upson' Wall Ventilator, and 'Draughtless' Window Ventilator and Air Warmer. In the former, fresh air is introduced at the rate of 4,500 cubic feet per hour, and is warmed by passing over a number of thin copper plates heated by means of gas-burners. The fumes of the gas are condensed in tubes and chambers. It is calculated that the air thus warmed is increased 30° in temperature. The

nightless' Window Ventilator has a double-glazed top. The air is admitted between the glazing, being cooled by contact with a row of gas jets. An extractor carries off the products of combustion.

At Stand No. 80, Moule's Patent Earth Closet Company (limited), 5A Garrick Street, W.C., exhibit several specimens of their well-known earth closets, some of which have self-action seats.

At Stand No. 81, Mr. W. White, Great Western Works, Weymouth, exhibits his patent 'Hygeian Rock' Building Composition. It is adapted for damp-proof courses in walls, and, as a preservative against damp, for coating the surfaces of walls, or filling in between double thicknesses of lining.

At Stand No. 82, Mr. J. B. Papier, 34 Church Road, Weymouth, N., exhibits Patent Exhaust Ventilators, for dwelling-houses, public buildings, drains, soil-pipes, &c. reversing it, it can be used as a fresh air injector. A patent Fresh Air Wall Filter, to be fixed at from 5 to 10 ft from the floor, is also exhibited.

At Stands Nos. 84 and 85, Messrs. T. Bradford & Co., 10 to 143 High Holborn, W.C., exhibit a model of their Patent Disinfecting Apparatus, portable or fixed, for effecting linen. It consists of a wrought-iron base, divided into three compartments, the central being the drying chamber, and the two side chambers being for filtration, which is regulated through them, into the fire chamber, by a series of horizontal and vertical slide-valves. The linen is placed above upon galvanised iron frames, and dried with a lifting box during fumigation.

At Stand No. 96, Mr. R. Lowe, Britannia Works, Weymouth, near Bolton, exhibits various samples of wood-block flooring. The wood blocks, after being carefully selected and seasoned, are laid upon a hard dry surface of concrete, and fastened by means of Lowe's Patent Composition, which is said to prevent dry rot and dampness.

At Stand No. 100, the North of England School Fitting Company (Limited), 121 Newgate Street, E.C., exhibit, amongst other fittings, Glendenning's Patent Adjustable Desk, with Dr. Roth's Hygienic Air. The desk and seat admit of instant adjustment, the desk having a further sliding horizontal movement, to prevent the necessity of stooping at study.

At Stand No. 102, Messrs. Tunstall & Co., St. Paul's Church, Leeds, exhibit specimens of their Roofing Cloth, 3 feet wide, and 1d. per square foot. This is a waterproof material, and may be fastened upon roofs by means of a solution, thus dispensing with nail holes. It is adapted for internally covering damp walls, and may be painted or papered. It can also be used for damp-proof courses.

At Stands Nos. 108 and 109, Morell's Sanitary Appliance Company, 4 St. Anne's Square, Manchester, exhibit models of their Patent House Ashes and Earth Closet Apparatus. The sifted cinders are delivered at the foot of a collection for re-burning, and on each use of the apparatus, which is provided with a self-action seat, a dose of dust is delivered near the soil, which arrests decomposition. Dried earth may be added. This invention has won a Gold Medal at the Health Exhibition. Other apparatuses are exhibited here, including a patent receptacle for cleansing liquid refuse, and a portable closet for chamber use.

The use of non-poisonous materials in decoration is displayed in several designs exhibited at Stands Nos. 37 and 38, where Messrs. W. Woollams & Co., 110 High Street, Weymouth, display some specimens of non-arsenical wall papers, some of which have been designed by eminent artists.

At Stands Nos. 39 and 40, Messrs. Jeffrey & Co., 64 Essex Road, N., also exhibit several hand-painted and printed wall papers, entirely free from arsenic.

At Stand No. 76, Messrs. F. Walton & Co. display specimens of their well-known 'Lincrusta-Walton' decorative material, which is non-absorbent, and can be painted. It has been awarded thirteen Prize Medals,

amongst which is the Gold Medal of the Health Exhibition.

At Stand No. 43, Messrs. H. Thompson & Co. show specimens of their non-poisonous and damp-proof oxide of iron paints, which can be painted or papered over if desired.

Messrs. Verity Brothers, of Call Lane, Leeds, and High Holborn, London, at Stands Nos. 26 and 27, made a similar display of their specialities in 'window gearing' (which are of a meritorious character) to those mentioned in the report of the Leeds Exhibition in the February number of the SANITARY RECORD. They also exhibited Crabtree's Patent Kitchen Range, for which they are the sole London agents. This range was exhibited last year at the Health Exhibition at South Kensington, where it was awarded a Gold Medal, and was described by us in the SANITARY RECORD report of the Exhibition published at the time.

CHEMICAL FACTS CONNECTED WITH PLUMBING.

THE interesting lecture, of which the following is an authentic abstract, was recently delivered to the members of the Dundee Society of Architects by Professor Carnelley, of University College, Dundee.

The object of the paper was to give a brief *résumé* of our present knowledge of the action of water on the metals most commonly used in plumbing. For it is considered to be highly important from a sanitary point of view that plumbers and others interested should have a general knowledge of this subject. The present paper was limited in the main to a discussion of the corrosive action of various kinds of water on lead, copper, and zinc.

Copper.—As copper exerts a very poisonous action on the human system, it is important to know what solvent action different waters have on this metal, especially as copper is frequently used in the construction of vessels for culinary purposes and of cisterns for storing water. That most waters do take up a perceptible quantity of this metal was proved by the statement of several cases in which very injurious effects were known to have resulted from the use of copper for culinary purposes and for the storage and conveyance of water. This fact was further proved by numerous experiments which had been made by the essayist some years ago, some of which were shown at the meeting last evening. Even perfectly pure water has a distinct action on copper, although it may only have been in contact with the metal for a single hour, and this action is considerably increased when the water contains mineral matters dissolved in it, more especially chlorides (as common salt) and ammonia compounds. Water contaminated with sewage, and therefore, as a rule, containing comparatively large quantities of ammoniacal salts and chlorides in solution, is especially objectionable, not only on account of its actual composition, but also because, where copper pipes, vessels, &c., are used, its action on the metal is much increased by the presence of these substances in the water; for the same reason it was shown that such water is less suitable for use in generating steam, where brass taps and machinery fittings are exposed to its action, or to that of the steam from it. The corrosive action of sea-water on copper and metals containing copper is due to the dissolved salt.

Lead.—The surface of a piece of lead, when freshly cut, presents a high metallic lustre, but it soon tarnishes on exposure to the air, owing to the formation of a thin film of oxide, which to a great extent protects it from further change. Lead undergoes no alteration in perfectly dry air, or in water free from air, but is subject to a powerful corrosion under the combined influence of air and water; this applies more or less to all metals which are corroded by water. Thus, when ships' sheeting is corroded, the water line is the part which suffers most. The rapid corrosion of lead cisterns which sometimes takes place is due

to their being repeatedly emptied and refilled from a jet with a heavy fall of water. Cisterns should always be arranged so that the water is maintained at a constant height; whilst leaden covers should never be used, especially for hot-water cisterns, for the aqueous vapour condenses thereon, and, together with the combined action of the air, rapidly attacks the lead, and on dropping back into the cistern carries with it considerable quantities of lead. Hot water especially has a marked action on lead, and particularly when distilled through leaden pipes. The use of water drawn from a hot-water cistern should therefore always be avoided for drinking and culinary purposes. The action of water on lead is greatly influenced by the nature of the dissolved impurities, even when the latter amounts to no more than 3 or 4 grains per gallon. The purer kinds of water, such as rain-water, are generally very corrosive, this corrosive action being still further increased by the presence of nitrates, nitrites, and ammoniacal salts. The corrosive action, however, is very greatly diminished by the presence of sulphates, phosphates, carbonates, and especially carbonate of lime held in solution by carbonic acid. The reason, in fact, why so few natural waters act on lead to any dangerous extent is due to their almost always containing more or less of this compound in solution, which causes a thin film of an insoluble basic carbonate of lead to be formed on the surface of the metal, which is thus in most cases protected from the further action of the water. The action of aerated waters on lead was also referred to. Cisterns should always be soldered autogeneously, for by the use of a solder containing metals different from that composing the cistern the corrosive action is considerably increased, owing to a galvanic action being set up. For this reason, composition lead-piping, consisting of an alloy of lead and antimony, should never be used for water connections, being fraught with considerable danger to the health of those using the water for drinking or cooking. Attention was also drawn to certain defects in tin-lined lead-pipes, which are so largely used in beer-shops for connecting the beer cask with the pumps on the counter. Though the action of water on lead has in many cases been considerably exaggerated, yet it is nevertheless important that all risk of corrosive action (which under certain conditions may be very considerable and highly dangerous) should be as far as possible avoided.

Zinc.—It has long been known that zinc dissolves in water at ordinary temperatures. Distilled water and rain-water corrode zinc more readily than hard waters, especially those which are rich in carbonate of lime. Indeed, the action of the latter is but slight, since the zinc soon becomes coated with an insoluble layer of a hydro-carbonate of zinc, which protects it in great measure from further action; but still a portion of the hydrate of zinc remains suspended, rendering the water opalescent, whilst a smaller quantity is dissolved. Thus all kinds of vessels in domestic use, whether made of zinc or galvanised iron, impart to water a certain quantity of zinc. Now, though both copper and lead are highly poisonous, there seems to be some difference of opinion as regards the action of zinc on the human system. Some authorities believe that it is not injurious, except when taken in doses much larger than are ever likely to occur in drinking water, and that it is not cumulative. Other authorities, however, have attributed very grave effects to the use of water stored in zinc or galvanised iron vessels. A French Government Commission, which inquired into this subject, decided that the use of such water was injurious to health; and it is stated that, in the construction of water-tanks for the French Navy, zinc is especially avoided.

Engineers should bear in mind this corrosive action of water, and particularly rain-water, on zinc and galvanised iron, which is used so largely in connection with roofing and for carrying off rain-water. From a careful consideration of the whole subject, Professor Carnelley believes that for cold, and for all but very soft water, lead is the best metal for use in the storage and conveyance of water;

whilst for hot, and for very soft water, copper (or, better, well-tinned copper) is attended with least risk to health.

SANITARY MATTERS IN AMERICA.

(FROM OUR OWN CORRESPONDENT.)

NATIONAL BOARD OF HEALTH.

IN my last communication, printed in your January issue, I gave a brief synopsis of a Bill to provide a National Board of Health, which had been prepared by representatives from the various state and city boards of health throughout the country. This Bill was introduced into the House of Representatives, and, for a time, seemed really to be the solution of the whole vexing question. Even Dr. J. B. Hamilton, surgeon-general of the United States Marine Hospital Service, assured friends of the Bill that he would give it his hearty support. His friendship for the Bill was supposed to be a great aid, for it has been by his open antagonism and charges of incompetency that the old National Board of Health has been so badly worsted in its fight for re-instatement. The Bill, however, will die in the hands of the Committee on Public Health, which reported to the house that, owing to the lateness of the session, it would be impossible to secure any new legislation, and recommended that an appropriation of 25,000 dollars be made for the old National Board of Health, and 500,000 dollars to be set aside as an epidemic fund, to be used at the discretion of the President. These items will probably be attached to the Sundry Civil Service Bill, which will come up next week, and may be stricken out. In the Senate, a Bill prepared by Dr. O. W. Wight, Health Officer of Detroit, Michigan, has been presented by Senator Palmer. In many respects the Palmer Bill is superior to any other. It provides for a commissioner of health, who shall be an attaché to the Treasury Department, and who shall have plenty of assistants in the shape of inspectors of ventilation, plumbing, &c. This Bill is fully in line with Dr. Wight's personal views, as he advocates 'one-man power' with no division of responsibility. As the Palmer Bill is the only one which has recognised the plumbers as an auxiliary sanitary class, it has called out a card from Mr. Andrew Young, President of the National Association of Master Plumbers, who commends the Bill, and asks all the local associations to pass resolutions urging the passage of the Bill. But I confidently expect that, before these lines will have been published, Congress will have adjourned without granting any sanitary recognition. It may create an epidemic fund of 500,000 dollars, but as it cannot be used to prevent the introduction of cholera or yellow fever, but only to prevent its spread after its appearance, it will be seen that it will be a one-legged provision.

NATIONAL ASSOCIATION OF MASTER PLUMBERS.

Speaking of the National Association of Master Plumbers reminds me that the titles for the essays to be presented at the third annual convention in St. Louis, in June next, have been assigned. The essays will treat on 'Trade Interests'; 'Should the Architect direct the Plumber?' 'Is the Plumbing Work the Most Essential Part of the Building?' 'The Qualifications for Conducting the Plumbing Business'; 'The Proper Education of the Craft'; 'International Associations'; 'Is Lead Detrimental to Health as a Conduit for Water?' 'How to Promote the Unity of Associations'; 'National Legislation for Sanitary Advancement'; 'Apprenticeship and Trade Schools'; 'The Manufacturer and the Plumber—Are their Interests Mutual?' 'Is Arbitration between the Employer and Employé conducive to Mutual Benefit?' 'The Householder *versus* the Plumber'; 'What are the Relative Advantages of Imported and Domestic Plumber Material?' 'Practical Plumbers as Sanitary Experts'; 'To what extent has the Plumber contributed to the Invention of Sanitary Appliances?' 'The Waste of Water

and How to Prevent It; 'The Plumber of Should Sanitary Legislation be Initiated by the Profession?' 'The Proper Ventilation of House' 'What Can the Plumber Do to Prevent Cholera?' Some of these subjects have an international and I would respectfully suggest to Mr. Buchanan, Mr. J. F. Clarke, and other leaders in the ranks in Great Britain that they prepare some and send them to the secretary to be read at the convention. He may be addressed at 537 W. Street, Chicago.

DISPOSAL OF SEWAGE IN CHICAGO.

Of the most important sanitary engineering reports issued in this country has just been made public. It reports of Mr. Gray, city engineer of Providence, Rhode Island, upon the disposal of the sewage for that city. The City Council sent Mr. Gray abroad, with his assistant, studied the Pail, Liernur, Berliet, Combined, and Separate systems, as they are used in different cities. His summary of the action systems is very valuable as a record for reference. Recommendations for sewage disposal in Providence, attract the greater interest. He recommends intercepting trunk sewers be constructed which shall lead sewage to Field's Point at the mouth of the Narragansett River, and that it be there treated by chemical means so as to precipitate the solids and clarify the water, which would then be turned into deep water at sea. As this proposed scheme, if it shall be adopted, is the first instance of chemical treatment of sewage on a large scale practised in this country, it possesses more than ordinary interest. Colonel George E. Waring has reviewed the report in the columns of the *American Engineer*, of Boston, and has criticised Mr. Gray's recommendations and deductions. The estimated cost of carrying out Mr. Gray's recommendations is 3,699,504 dollars. The following method of disposing of sewage, the convulsion, &c., was made public by Dr. C. H. von Dreyer, of Dayton, Ohio, at the sanitary convention at St. Louis. To a vault containing 40 barrels of faecal matter add one barrel of common salt; in 24 hours add 15 lbs of unslacked lime; chlorinated lime will then be added. After eight days it is entirely dissolved and ready. Then add 75 pounds of sal soda. In ten days sewage will be solidified and ready to form bricks, which, after drying thirty days in the air, are used as fuel, costing about one-half as much as coal, comparing heat units evolved. The Plumber's Association of Chicago has established a public circulating sanitary library, the only one of its kind in the world. Sanitary protective leagues have recently been formed in New York and Brooklyn among the prominent business men, and one is being agitated in St. Louis.

A successful sanitary convention was held at Columbus, Ohio, in February, and one is to be held at Lansing, Michigan, on March 19 and 20. These public meetings do much to increase sanitary knowledge among the lay

HEALTH OF IRELAND.

The quarterly return of marriages, births, and deaths recently issued by the Registrar-General of that country contains statistics relating to marriages for the quarter of 1884, and to births and deaths for the last months of that year. The marriages, births, and deaths exceeded their respective averages in the corresponding quarters of recent years. The returns of marriages for the last quarter of 1884, as compared with the corresponding period of 1883, show a decrease in the number of indoor and of outdoor paupers; but the number of persons in receipt of outdoor relief, how-

ever, considerably exceeded the average for the last quarter of the ten preceding years.

The births registered during the three months ending December last were 28,436, equal to an annual rate of 22.9 per 1,000 of the population in the middle of last year, estimated at 4,962,570. This rate was 0.9 below the average rate in the corresponding period of the five years 1879-83. In the four provinces of Ireland the birth-rates were 20.9 in Munster, 22.2 in Ulster, 22.4 in Connaught, and 22.5 in Leinster.

During the last quarter of 1884 the deaths registered in Ireland were 21,299, equal to an annual rate of 17.2 per 1,000 of the estimated population, which slightly exceeded the average rate in the corresponding period of the five years 1879-83. The meteorological conditions of the quarter were, on the whole, favourable to the public health. In Connaught the general death-rate last quarter was 12.2 per 1,000, in Ulster 15.5, in Munster 16.6, and in Leinster 20.5.

The 21,299 deaths registered in Ireland in the quarter under notice included 438 which were referred to scarlet fever, 424 to 'fever' (principally enteric), 366 to diarrhoea, 317 to whooping-cough, 118 to diphtheria, 74 to measles, and not one to small-pox. Thus, 1,737 deaths resulted from these principal zymotic diseases, equal to 8.2 per cent. of the total deaths and to an annual rate of 1.4 per 1,000, against 2.2 in England and Wales from these diseases during the same period. In the aggregate, the deaths from the principal zymotic diseases in Ireland during the last three months of 1884 were below those recorded in the corresponding period of the preceding year. Compared with the third quarter of 1884, the deaths referred to scarlet fever, diphtheria, and to different forms of 'fever,' showed a considerable excess. Scarlet fever was proportionately most fatal in Waterford, Fermoy, and Belfast; whooping-cough in Queenstown and Lurgan; fever in Limerick and Belfast; and measles in Armagh. No death from small-pox was registered in Ireland during the last six months of 1884.

The return, as usual, contains an important and interesting table relating to the mortality in urban and rural sanitary districts. In the forty-eight urban sanitary districts (including Dublin), comprising a population of rather more than a million persons, the death-rate from all causes during the quarter under notice was 27.3 per 1,000, and the zymotic rate 3.2; in the rural sanitary districts, comprising a population of somewhat exceeding four millions, the rate of mortality did not exceed 13.7, and the zymotic rate was only 0.9 per 1,000. In Dublin, consisting of nine urban districts, and having a population estimated at nearly 350,000 persons, the death-rate from all causes was 29.4 per 1,000, and the zymotic rate 3.7. In London these rates were respectively 20.1 and 2.1, and in Edinburgh 19.6 and 2.6 per 1,000.

The number of emigrants who left Irish seaports during the last quarter of 1884 was 9,343, being 1,247 less than the number in the corresponding quarter of 1883, but slightly exceeding the average number in the fourth quarter of the ten years 1874-83. According to the Board of Trade Returns, the number of emigrants of Irish origin who left the various ports of the United Kingdom at which emigration officers are stationed, which had been 1,667 and 1,950 in the last quarters of 1882 and 1883, declined to 1,800 during the three months ending 31st December last.

THE 'SANITAS' COMPANY (LIMITED).

The eighth ordinary general meeting of the shareholders of this company was held at the offices, Letchford's Buildings, Three Colt Lane, Bethnal Green, on Tuesday, Feb. 17, for receiving the directors' report and accounts for the year ending Dec. 31, 1884. It was largely attended; F. H. L. R. Moll, Esq., occupied the chair.

The report, which was taken as read, stated that the sales amounted during the year to 19,267/11. 11d. After

providing for bad and doubtful debts, the balance to credit of revenue, with the amount brought forward the previous year (90*l.* 18*s.* 9*d.*), amounted to 5,201*l.* 10*s.* 4*d.* From this sum 215*l.* 8*s.* 4*d.* had been paid during the year for interest on debentures and 1,266*l.* 13*s.* 4*d.* on account of interim dividend for the half-year ending June 30, 1884, leaving a balance of 2,877*l.* 14*s.* 7*d.* The directors recommended that a final dividend of $7\frac{1}{2}$ per cent., free of income tax, be declared, making, with the interim dividend already paid, a total distribution for the year of 12 $\frac{1}{2}$ per cent. This would absorb 2,302*l.* 10*s.*, and leave a balance of 575*l.* 4*s.* 7*d.* to be carried forward. The report further stated that during the past year the debenture debt of the company had been paid off, the capital required having been raised by the issue of shares at a satisfactory premium. Acting upon the recommendation of some of the largest shareholders the company had completed the purchase of the remaining two-fifths of all the foreign patents and trade marks for 'Sanitas' products. Under the recent convention entered into between Great Britain and certain other countries, the company are now taking steps to develop a trade in 'Sanitas' products on the Continent and elsewhere, and already a favourable arrangement has been entered into for the sale of 'Sanitas' in Belgium. In accordance with the articles of association, Messrs. F. H. L. R. Moll and M. Zingler, two of the directors, retired, but offered themselves for re-election, and the same course was adopted by the auditors, Messrs. W. Williams & Co. In advocating the adoption of the report, the chairman adverted to its main points. He remarked on the advantageous results to the company of the purchase of the remaining interest in the foreign patents; also that their plant had been considerably increased, and that, owing to this fact and the improved position of the company, they would be enabled to make important alterations to the benefit of the public in some of their leading productions. Thus it was their intention, so soon as the necessary arrangements could be made, to discontinue the manufacture of the lower quality of 'Sanitas' fluid, and to sell only the best quality at the price now paid for the second quality of fluid. He also called attention to the satisfactory progress they were making with the sale of their products upon the Continent, and that it was intended to grant licences for the manufacture or appoint agents for the sale of 'Sanitas' products abroad.

Mr. C. T. Kingzett, the managing director and chemist of the company, and to whose indefatigable exertions the success of the company is mainly due, said that they had registered the word 'Sanitas' all over the civilised world, which would prove a great security to themselves and their agents, and all their licensees. The report was adopted unanimously, the directors were re-elected, and a grateful vote of thanks accorded them.

THE METROPOLITAN PUBLIC GARDEN, BOULEVARD, AND PLAYGROUND ASSOCIATION.

The usual monthly meeting was held on March 3, at 83 Lancaster Gate, Lord Dorchester in the chair. The Council took into consideration upwards of fifty separate matters. The Secretary announced that Northampton and Wilmington Squares would be opened on the 4th inst., that the Lambeth Vestry had accepted the offer of 100*l.* towards tree-planting in Kennington Road, that the laying-out of the burial-ground of St. Bartholomew's, Bethnal Green, and Carlton Square, E., were being proceeded with, and that the Secretary for the War Department had declined to allow the Tower Garden to be thrown open. It was agreed to lay out the ground surrounding St. Paul's, Rotherhithe, to offer six seats for the garden in Horseferry Road, to ask the Kensington Vestry to erect seats in Brompton Road, and to approach the owners of Ravenscourt Park, and the disused burial-grounds of Christ

Church, Newgate Street, Christ Church, Spitalfields, Christ Church, Blackfriars Road, St. Martin, Vintry, St. John, South Hackney, and Guy's Hospital, with a view to their being opened to the public. Sums of money were voted towards the improvement of Wilmington Square and the western garden of Canonbury Square, and a grant of 10*l.* was made towards the formation of a gymnasium near Finsbury Circus.

On the 4th inst., owing to the generosity of the landlord, the Marquis of Northampton, the Metropolitan Public Garden, Boulevard, and Playground Association threw open to the public the gardens of Northampton Square, and Wilmington Square, Clerkenwell. The success of the opening of Canonbury and Ebury Squares has fully warranted this new undertaking, and the members of the Association are confident that the grounds will prove far greater boons in the neighbourhood than they have done hitherto. With such excellent examples as the Duke of Westminster and the Marquis of Northampton before them, it is to be hoped that other landowners will step forward and offer their enclosures to the Society, so that these may be converted into open gardens.

At the desire of the vicar, the Rev. H. G. Sprigg, the Association has improved and thrown open the ground attached to Christ Church, Battersea. This will be a welcome and peaceful resting-place in the midst of the bustling thoroughfare.

NEW INVENTIONS.

LININGS FOR CARPETS.

At a time of year when 'spring cleanings' are looming before us, it will not be without advantage to call attention to the 'Cedar Felt' for underlying carpets and floor-cloths. This material has been described on a former occasion, but it is of so unique and sanitary a character that it cannot be too widely known. It is manufactured by Messrs. C. Davidson & Sons, Limited, paper manufacturers, of Queen Victoria Street, and Mills, 66 & 68, Scotland, its special quality, from the sanitary point of view, being that the essence of cedar wood is incorporated in its make to such an extent that it will retain its properties for years. The pleasant odour, peculiar to cedar wood, is well known to be inimical to insect life, and consequently a preserver of carpets from the ravages of moth. The effect of the 'Cedar Felt' in covering the divisions between the flooring-boards, likewise prevents the wear of the various joints, and gives a feeling of warmth, and an elasticity to the tread not obtainable from an ordinary paper lining. The cedar felt requires no fixing down and is very inexpensive.

THE CLEANSING OF WATER-CISTERNS.

The cleansing of the water-cistern is one of the troubles that beset the householder, for, unless a man or a boy is employed on the premises, the cistern goes on from month to month, accumulating dirt and filth, until it not infrequently becomes a breeder of disease. Sir Francis Bolton in his monthly reports continually draws attention to the imperative necessity of cleansing water-cisterns, as it frequently happens that the water delivered pure by the companies is rendered unwholesome by the foul state of the receptacles in which it is stored. This state of things need no longer continue, in London at least, for an Association has been formed at 447 Strand, having for its object the cleansing of water-cisterns at so small a fixed charge that no person who values the purity of the household water supply can object to pay. On receipt of a letter a man is at once sent to the writer and the work is done. The company state in their circular that, for an annual charge they will cleanse the cisterns at fixed periods.

es during the year. The idea is a novel one, but if the risk is well done, the undertaking will, doubtless, command much public support. The previous knowledge of expense incurred will, presumably, induce many persons have their cisterns cleansed who have hitherto been deterred from having that highly necessary work done, by the terrors of the 'unknown quantities' contained in the subsequent 'little bill' presented by the plumber.

R. F. H. SMITH'S PATENT AUTOMATIC SYPHONIC SYSTEM OF VENTILATION.

A few years past Mr. Fredk. Henry Smith, of 52 Queen Victoria Street, E.C., has paid great attention to the subject of ventilation, has expended large sums of money, and spent the greater portion of his time perfecting a system of ventilation which is now complete and ready for practical application. This system was first practically carried out in what is known as the 'Island Room,' that is, the apartment in the centre of the block in the South Kensington Gardens where the electric lighting of the fountains was manipulated during the time the International Health Exhibition was open last summer, at only during the later part of the season, when its beneficial effects on the health and comfort of the six persons employed in the work were distinctly admitted. Mr. Smith has now fitted up one of his rooms at Queen Victoria Street, with the appliances, which the writer has recently had an opportunity of examining, and by a

and unbroken stream. This is effected by means of two plates or discs, specially arranged one over the other, the fresh air having to pass through a series of small holes which break it up into small streams, filling the intervening space between the two, and eventually mixing with and being carried off with the vitiated atmosphere. The size of the appliance is of course regulated according to the capacity of the room. But this arrangement is only for carrying off the foul air. Fresh air is admitted from the outside by tubes brought down the sides of the room; instead, however, of entering it at the usual level of about seven or eight feet from the ground, Mr. Smith discards all preconceived notions, cuts away about one inch from the bottom of the skirting boards nearly the entire area of the room, and boldly brings in his fresh air on a level with the ground. It may be supposed by some that draughts would result from this arrangement, but no room was ever freer from such objections as the one in which this mode of ventilation is carried out; in fact, freedom from draught is one of the especial features of Mr. Smith's invention. Objection may be urged that in still or foggy weather the automatic action may be rendered *nil*; but, although such an argument may apply to some modes of ventilation, it does not do so in this case. Syphonic action is at work constantly, regulated by the requirements of the room. Thus, if one person only is in the apartment, sufficient fresh air is provided for him; if the number of occupants be multiplied, so the action increases: each person gets a proper supply, while the extractor is multiplied in its work in

strengthened stay in the apartment of practically testing the results. The system is undoubtedly novel, simple in its construction, and, being based upon natural laws, is unerring in its effects. It is in the Vitrated Air Extractor, which is illustrated above in section and elevation, that the inventor has concentrated most of his ingenious efforts, with the result that it is not dependent for its action upon any mechanical appliances such as steam, gas, or water jets, or even a simple cowl; all being performed automatically by natural law, and doing its work evenly and effectively at all times of the year, and in all weathers. Mr. Smith's assumption is that to effectually ventilate a room and draw off the vitiated air, a somewhat similar arrangement must be adopted to the action of the respiratory organs of the human frame, or, in other words, that a ventilating appliance should be enabled, so to speak, to 'aspire' and 'expire' within the radius of its own contents. On reference to the illustration it will be observed that the 'levator' consists of a plate or disc, with two tubes fixed to its upper circumference, that to the right as shown in the sectional drawing aspirating the fresh air, the central tube carrying off the vitiated atmosphere. Both of these are connected with pipes that are carried along the joists between the floors to the outer atmosphere, where they are simply protected by gratings let into the brickwork. The arrows in the sectional view show the course taken by the incoming air, and also the vitiated air rising to the central tube, which is the larger of the two; thus the weight of the hot air through the outlet tube induces a current of cold air in the smaller one in one continuous

and similar ratio. If the gas be lighted, the extractor still further exerts itself to preserve a cool and healthy atmosphere. Such is the principle of Mr. Smith's automatic syphonic ventilator, which will doubtless be appreciated by every practical mind.

NEW HEATING APPARATUS.

THERE has just been placed in St. Luke's Church, Brierfield, near Burnley, a new steam heating apparatus, the invention of Messrs. Thomas Birtwistle & Co., Burnley. The apparatus is fitted up on the gravitation principle, and is easily worked with a pressure of 15 lbs. The boiler is in a cellar immediately below one of the vestries. The main pipe, which is 1½ inches in diameter, leaves the boiler and is conducted in a flue at one time used for a hot-air apparatus (which was formerly the mode adopted for heating the church) into the body of the edifice, from which branches are taken of one-inch pipes round the body of the pews in the centre aisle, and the east and west aisles. The steam is taken round in these pipes, and the condensed steam caused by circulation returned directly to the boiler, thus effecting a large saving of fuel. The vestries and the chancel are heated by the same medium—by a one-inch pipe passing round the outside walls. At the extreme end of the west portion of the church is fitted up one of Leed's patent steam coils, which radiates a very large amount of heat, thus warming the cold air which is brought to the church by the opening and closing of the doors. A sufficient quantity of pipe has been fixed in

order to allow a thorough system of ventilation which is about to be adopted, and which will consist of inlets of the cold air from the outside, and outlets of the foul air from the ceiling. This will make the church one of the most comfortable churches extant, both for good ventilation and efficient heating. The inlets are admirably arranged for ventilation at both seasons of the year, being for warm air in winter time, and in summer time for currents of cold fresh air. The whole of the joints in connection with the apparatus are made of Birtwistle's metallic steam joint packing, which is provisionally protected, and the adaptability of them for such purposes will be apparent when it is stated that the construction is of such a finished character as to render the slightest leakage impossible. In this church there are between 130 and 150 joints, which have been tested by a pressure of 60 lbs. to the square inch, and they have borne the test in a manner that has given unqualified satisfaction. This system of heating churches and chapels commends itself for many obvious reasons. In the first place the cost of working is very small indeed (much less than required for hot air or hot water apparatus), the cost of erection is by no means expensive, and the time in which an edifice like Brierfield Church can be heated comfortably throughout at a temperature of 70 or 80 degrees, is but three-quarters of an hour. Another feature, and by no means an unimportant one, is the entire absence of any unpleasant smell proceeding from the working of the apparatus. It may be remarked that this is the first church in the United Kingdom which has been heated with steam. The system appears to be likely to commend itself for adoption for similar edifices and public buildings generally.

IMPROVEMENTS IN FOG SIGNALS FOR RAILWAYS.

AN important improvement in the mode of fog signalling is about to be introduced by Messrs Morrison, Ingram, & Co., of Manchester, who have filed a specification, which has been accepted (Ingram's patent), for this purpose, and which, we understand, has received the approval of some eminent railway engineers. Few persons unconnected with the working of railways can be aware of the large sums of money that are annually expended by the different companies in fog signalling, which amount to many thousands of pounds. As an instance, on one of the principal lines running into the cotton metropolis, whose junctions and connecting lines extend about a mile and three-quarters from the terminus, each foggy day costs the company about 3*l.* 15*s.*, and when we remember that the approaches to every town of any importance have to be similarly treated, the cost may be easily imagined. But, under the present system, difficulties present themselves that the passenger who has to travel on such occasions is, perhaps, fortunately for his nervous temperament, not aware of. Fog signalling is now carried out mostly by the platelayers attached to a company, and, as fogs often make their appearance when not expected, and when these men have left work, the danger to life often assumes serious proportions. On Saturdays, for instance, these men, like most other artisans, are paid and discharged early in the day. A fog comes on, and they have to be collected to guard the lines. This is often a difficult matter, and the travelling public run great risks. By Mr. Ingram's invention the appliances which are automatic are under the control of the general signalman, who has only to move a lever when that portion of the line under his supervision is immediately guarded, and the driver of an in or outgoing train is warned. The new invention consists of a range of metal tubing, two ends of which culminate in powerful whistles, the other finishing in an India-rubber 'sack' or bag, and when not in actual use the whistles are thrown out of gear by reversing a lever by the signalman in his cabin. When required for use the drawing of a lever places the mechanism, which is of a simple character, into instant action, whereby immediately

a wheel goes over them the whistle is sounded, and this is kept up as every wheel passes over it. As automatic action is generally preferable to that dependent upon human agency, it may be presumed that the new signal will be more reliable. Beyond the first cost the expense will, in the opinion of those best able to judge, be comparatively insignificant; and if greater security to life can certainly be secured, our railway companies will not begrudge the necessary outlay connected with the invention.

THE PATENT ENCHANTRESS WASHING MACHINE.

THIS machine is constructed upon different principles to any hitherto introduced. One material difference is that it is not made of any ironwork, the substances used in its manufacture being wood and sheet zinc. There are several advantages resulting from these materials, the machine thus made being very light and portable—a great consideration where back premises are confined. All moulding is avoided, and in case of accident any damage can be mended by a common carpenter in a few minutes at the outlay of a trilling sum.

The essential parts consist of a tub 'T' and a rocker 'R.' Both are furnished with wooden rubbers; those of the rocker are seen on its circular surface in the open cut, and those in the tub are so arranged as to almost touch those of the rocker when rocker is in position.

The tub stands upon four legs, and has a hole to let water out, and the back is raised somewhat, and furnished with a ledge to catch inside of rocker when the machine is open, by which means rocker is held in place as shown in 'open' figure. The rocker is supplied with a frame, merely so that it can be elevated from the tub without lifting it out. It is attached to this frame by two axles. When the rocker is lowered on the tub these axles fall into and work in the two receptacles shown in the edge of the tub in the same cut.

To wash, the machine is opened and half filled with hot water, then the operator takes say six or eight shirts and soaps them, and places them anyhow in the tub. Now she lets down the rocker, as in closed figure, and having grasped the handle, 'H,' between the two uprights,

about eight rubs by pulling and pushing this and from her, always standing at the lowest end of the machine. The circular cut shows exactly the *crandé*. Then she throws up the rocker, turns over, gives six or eight rubs more, and they are washed in considerably under one minute, with all the buttons on.

It is explained that when in operation the rocker on its axis gives a rotary and general motion to the rubber between the rubbers on its surface and those on the fabrics on the other. In this machine there are no objections, pegs, or other contrivances which can catch clothes; consequently it is constantly used for lace curtains, antimacassars, &c. It is as cheap as a sledge; 35s. places it in the reach of many, and, being so portable, neighbours frequently machine between two or three houses. In fine, it occupies but little room when not in use; stands on 18 inches by 2 feet. The rubbing action being so it uses less soap powder, &c., than any known machine.

The entire freedom from cog-wheels, weights, complicated machinery, renders it not only safe in a house full of children, but easy to be understood and used by the most inexperienced in machinery. Its capacity extends from the washing of a few collars to that of a druggist 3 yards square. It is manufactured by Taylor, Kingswinford, near Dudley.

THE 'VICTORIA' BATH.

MORRISON, INGRAM, & Co., of Tonman Street, Glasgow, have recently commenced there the manufacture of cast-iron and other baths, an industry as yet the first-named hitherto almost exclusively confined to Scotland, and have patented an improved bath under the above title. In this bath, illustrated in the accompanying drawing, the water, both hot and cold, enters on a level

the bottom, and both at the same time. By this the usual noise attendant upon water entering from above is entirely avoided, and the great body of water is unavailing attendant—is reduced to a mere trickle. It will be seen that the valves are not covered with work, and are consequently free of access at all times. The waste-pipe is large, and the lever for opening the bath is in the form of a 'quadrant pull.' There is a good overflow pipe, with a tell-tale arrangement connected with it. A moulded porcelain plate, with soap and brush dishes, extends across the end; most complete in its arrangements, and desirable in its details. Notwithstanding the advantages described, it compares favourably in price with many of a similar character.

THE NEW HYGEIA CLOSET.

Devices that have of late been made to simplify water-closets and to divest them of their surrounding woodwork, have been commented on by Mr. D. J. Ebbetts in the *SANITARY RECORD* of Jan. 15, 1885, have received a

further extension by the introduction of the Patent Self-contained Hygeia Closet. Messrs. Morrison, Ingram, & Co., of Hygeia Works, Manchester, sanitary engineers and manufacturers of considerable repute, are the inventors of this apparatus, of which an illustration is appended. It is novel and slightly, and will undoubtedly be received with

much favour. The outer casing is made entirely of earthenware in one piece, and into this, the closet itself, of an improved 'wash-out' type, is placed, the surrounding space being entirely filled in with concrete, making the whole a solid body. The use of the concrete filling is obvious, as it prevents all fear of leakage. The only wood-work about the closet is the seat, which, being hinged, when lifted up enables it to be used as a slop-sink or urinal. The fixing of the Hygeia is reduced to a minimum, and altogether will be found of the most economical character, and the shape of the pan is such that perfect flushing is secured.

DIETETIC NOVELTIES.

CLARK'S COFFEE EXTRACT.

THE simple operation of making coffee in the old-fashioned way is nowadays considered too troublesome and wasteful, and various coffee extracts, which merely require mixing with hot water or milk to produce the stimulating beverage, are fast taking the place of the roasted berry. The latter loses, indeed, its aroma so rapidly, especially after it has been ground, that a really good cup of coffee is not always readily obtainable, and the coffee-consuming public will not take to the Continental habit of roasting and grinding the berries each time a cup of coffee is to be made. Amongst the most successful of coffee extracts is that of Messrs. E. Clark & Co., Optimus Coffee Works, Queen's Road, Battersea, who have lately kindly shown to the writer their processes of manufacture. Their success is chiefly owing to the careful attention bestowed by them upon the three following points; selection of the best and most aromatic coffee, devoid of excess of acidity; production of an extract without possible loss of the highly volatile aroma, and freedom from any addition of any substitute whatever.

As to the first of these points every coffee drinker must have observed that there is an enormous difference in the character of the infusions, even of perfectly pure coffee. Some are strongly acid, and this acidity naturally becomes concentrated in the extracts, and in some brands in the market is very noticeable. It causes such extracts to disagree with many persons. Messrs. E. Clark & Co.'s manager, Mr. Whitehead, by dint of long experience as a coffee merchant, has acquired the faculty of distinguishing between coffees suitable and those not suitable for his process of manufacture in an acute degree. In the second place he has succeeded in avoiding, by the retention of the full coffee aroma, the physicky and stewed taste and odour which characterise some former coffee extracts. And lastly, he makes a speciality of pure extract. Whatever

opinion may be held as to the legitimacy of the employment of chicory, there can be no doubt that all admixture of the root with the berry impairs the flavour of the infusion, although giving it the appearance of fictitious strength.

The samples which the writer has seen manufactured and tested were perfect in every way, and the public favour which they have already acquired testifies to the fact. It is evident that Messrs. Clark & Co. have been going the right way to work.

REVIEWS.

Sanitary Protection. A Course of Lectures by W. KAYE PARRY, M.A., B.Sc., T.C.D., Examiner in Sanitary Engineering, King's and Queen's College of Physicians, Ireland, &c. Dublin: John Falconer, 53 Upper Sackville Street. London: E. & F. Spon, 16 Charing Cross. New York: 35 Murray Street. Illustrated.

ALTHOUGH much has been said and written upon this subject in widely varied ways, it has been for the sister isle to produce one of the most exhaustive and practical works which has yet appeared on the question of immediate house drainage. A striking peculiarity being the fact that it is condensed into three lectures, which were delivered in the Theatre of the Royal Dublin Society, under the auspices of the Dublin Sanitary Association, during the current year. The unsanitary condition of the city has long been a matter of note, and the exigencies of the evil have occasioned a counteracting development of energy to try and mitigate the prevailing causes, and the Sanitary Association may be congratulated upon the way in which its precepts are expounded. In the first lecture Mr. Parry starts with the 'Principles of Sanitation,' and how far these principles are violated. The scientific introduction treats concisely and clearly of the hydrostatic and hydrodynamic forces called into action, and the flow of liquids through channels as one branch of hydraulics is duly referred to and illustrated by simple diagrams. It need not, however, be thought that these are too scientific and technical for the ordinary mind; there is throughout a touch of popularity which renders the lectures unusually interesting.

Formulae and data are given for ascertaining gravity and force, and the retarding forces or friction as applied to liquids are given as follows: 'Firstly, the friction is independent of the pressure, that is to say the resistance to motion in a pipe with a great head or pressure is the same as that in one with a small head. The second law is that the resistance is proportional to the surface exposed. The resistance is also inversely proportional to the volume, because the greater the volume, compared with the resisting area, the less will the velocity be retarded. If water be allowed to flow over a flat surface, inclined at an angle to the horizon, the retardation produced by the resisting surface will be very considerable, and the velocity of flow will be proportionately small; but if the same quantity of water be permitted to flow through a circular pipe, inclined at the same angle to the horizon as in the former case, the velocity of flow will be found to be considerably increased.' It goes without saying that these *dicta* are known to those who have any knowledge of statics, but in a numerous audience there will be many to whom such a preamble is very necessary, to enable them to understand how important are these influences when drainage work is under consideration. Illustrations are given of the sectional area of drains and sewers of different sizes containing the same quantity of liquid, so that a comparison of the extent of the resisting surface is seen at a glance. To set a in motion is the most important consideration in connection with the ventilation of drains, and the forces by which this is

effected, viz., natural ventilation and artificial ventilation, are clearly explained, the acting forces of natural ventilation being, diffusion, the winds, and the difference in weight of masses of air of unequal temperatures - this last being the most effectual means whereby a current is set up. A little knowledge is a dangerous thing, and there are many who, possessed of this slight acquaintance, imagine that if they ventilate a soil-pipe, merely by carrying it up to the top of the house that all is well, forgetful or rather ignorant of the fact that there must be an inlet for admission of fresh air, otherwise there can be no draught, and the so-called ventilator is merely a safety-valve, in case the gases in the drain become compressed. The lecturer has called attention to this point, and wisely so, as there are many instances of this merely provisional arrangement.

The effect of barometric changes upon sewers is noted, and it is shown that sewage will be enabled to carry a larger volume of vapour of water if an increase of barometric pressure takes place, and it will also retain more of the noxious gases generated by decomposition; and, similarly, a fall in the barometer will be followed by a considerable disengagement of gases. 'Air held by water is subject to the same laws as free air under like conditions of pressure. Increased temperature of the water is accompanied by dilatation and consequent escape of the pent-up air, and the decrease in barometric pressure also tends to the expansion and escape of air.' Variations of temperature and atmospheric changes have, therefore, great effect upon sewers, and this is a consideration often overlooked by those who suppose that the difficulties of drain-ventilation are readily met on a cut-and-dried principle.

The second lecture on 'Practical Drainage' is full of useful views and comparisons, which even the most learned need not disdain to follow. The leading types of intercepting-traps are reviewed impartially, and other men's ideas freely admitted. The many defects in workmanship, of which Dublin has its full share, are commented upon, and the different systems of good work are generally described in a way which commands the reader's attention.

The third and last of the series is upon 'Sanitary Plumbing,' and here, of course, is a large field for the refutation of fallacies. The different forms of water-closet apparatus are summarised with a verdict in favour of the 'wash-out' or wash-down principle; the good points of the 'valve' are recognised, however, but the lecturer looks to the former to be the lines on which the closet of the future is to be founded; the old pan-closet is illustrated and condemned, together with its inseparable D-trap. The other fittings, such as sinks, baths, lavatory-basins, and cisterns receive a certain amount of attention, and the lectures are concluded by a summary of the advantages to be obtained and maintained by good construction and periodical inspection by competent authorities.

Nature's Hygiene. By C. T. KINGZETT, F.I.C., F.C.S., &c. Baillière, Tindall, & Cox. 1884.

THE second edition of Mr. Kingzett's work has been much enlarged, and, to some extent, re-written.

Intended as it obviously is for the use of the general public, the first three or four chapters of the book are necessarily somewhat elementary, constituting, in fact, a kind of preliminary educational treatise on chemistry for the benefit of the uninitiated.

The chapters on Water-Supply and Analysis, and on the Disposal of Sewage by Irrigation and Chemical Processes are, however, not merely replete with sound teaching for the multitude, but also contain matter of such importance that it may well be recommended to the attention of the sanitary legislator. Mr. Kingzett is of opinion that, by a system of separation of the solid from the liquid portion of sewage, the utilisation thereof might be carried to the

manufacture of 'other valuable commercial commodities in addition to manure.'

The subject of contagious diseases is next introduced, and is followed by a description of antiseptics and disinfectants. The views of various pathologists on these points are fairly recorded, and their opinions on the great and important subject of the relationship between micro-organisms and disease are detailed at some length. The author himself inclines to what he calls the chemical theory of contagious diseases, *i.e.* he would attribute the morbid action of pathogenic micro-organisms to the formation of poisonous excreta during the performance of their vital functions. This view of the question does not, of course, diminish the practical importance of the germ theory, since, if there were no micro-organism, there would be also no poisonous excreta—*sublatâ causâ, tollitur effectus*.

We cannot see that Mr. Kingzett's illustration of the different effects of the alcoholic and acetic ferments upon solutions of sugar and alcohol respectively throws any light upon the attenuation of the virus of chicken cholera by the action of time and exposure to air upon the cultivated liquids employed for inoculating that disease.

Excess of alcohol kills yeast, and thus puts an end to the alcoholic fermentation of sugar, but a new ferment must be introduced to set up conversion of the alcohol into acetic acid. Even granting that the products of the life-action of the micro-organisms of chicken cholera are altered by oxidation, so as to be rendered comparatively innocuous, yet it is known that the organisms in the attenuated virus have not lost their power of reproduction altogether, for they will multiply in a fresh cultivation-fluid; therefore, when introduced into the blood of a healthy chicken, unless the organism itself has been changed by the process of attenuation, finding itself surrounded by suitable pabulum, it would surely produce excreta possessed of the same virulence as its original progenitors. Whether, therefore, we accept the view that the micro-organism produces the disease by the poisonous nature of its excreta or not, it is clear that the organism itself must be modified by the process of attenuation, and that the result is a modification of the disease in its host.

The chapter on the Treatment of the Sick is very good, though we should have been interested to hear Mr. Kingzett's opinion concerning the action of some other disinfectants besides 'Sanitas.' The merits and *modus operandi* of Sanitas are, however, very fully and clearly set forth, and there can be no doubt that it is both a disinfectant and also a powerful antiseptic, whilst it possesses the advantages which are rather uncommon in bodies of this class of being agreeable to the olfactory organs, non-poisonous, and not corrosive.

The second part of the book contains an interesting account of the author's researches into the production of peroxide of hydrogen in nature, notably during the oxidation in presence of moisture of essential oils containing 'terpenes,' *i.e.* hydrocarbons of empirical formula $C_{10}H_{16}$. The beneficial effects of the Eucalypti and the Pines in counteracting miasmatic influences are very fully discussed.

There seems every reason to believe that the hope of the author expressed in his preface will be fulfilled, and that his book 'will prove useful to many.'

A Code of Rules for the Prevention of Infectious and Contagious Diseases in Schools. Being a Series of Resolutions passed by the Medical Officers of Schools Association, Jan. 7, 1885. London: J. & A. Churchill.

A CODE of rules for the prevention of infectious and contagious diseases in Schools, drawn up and published under the directions of the Medical Officers of Schools Association, comes before the world with a degree of authority which renders the task of criticism easy. The

code will undoubtedly become the standard authority on the matters with which it deals, and will be of the greatest service to medical officers, not only, or chiefly, on account of the information with which it presents them, but because it will strengthen their hands in dealing with governing bodies and head masters.

The code is short, condensed, and dogmatic. Section I. deals with general hygienic considerations, such as drainage, water, milk, and laundry. Section II. is concerned with the arrangements of the infirmary or sick-room. Section III. with the medical examination of scholars on admission; it recommends that a primary certificate should in every case be handed in; enumerating the infectious diseases from which the child has already suffered, so that on the outbreak of an epidemic the medical officer may at once know what dimensions it may assume; a form is given for this primary certificate, and also a set of forms for certificates under other circumstances; Form No. II. is to be presented by the pupil on returning to school after a holiday; it is a certificate that the pupil has not been exposed to any infectious disease during the holidays or during the last three weeks of them. Form III. is for use when the pupil has recovered from infectious illness at home. Form IV. for use after exposure only to infection. Form V. for the use of the school authorities, to be sent by them to the parent when a pupil has recovered from an infectious disease and is about to be sent home. Form VI. is also for use by school authorities where a child who has been exposed to infection at school is sent home. In this place it may be observed that the dispersion of a school on account of the outbreak of an epidemic is strongly deprecated; such a step places a great responsibility on the shoulders of the school authorities, and the code lays it down that such a responsibility should only be taken when the mischief can be traced to some local sanitary defect, which can only be remedied when the pupils are absent; in other cases parents should be informed of the presence of the epidemic, and advised to remove their children, or not to do so according to circumstances. Section V. in which the regulations on this matter are given is entitled, 'Measures to be adopted when an infectious disease has appeared in a school;' it deals also with isolation of the earliest case, the management of the isolation ward, the disinfection of the dormitory, the treatment of doubtful cases, and the important question of the date at which patients may be allowed to return home or to school. Here the code is, quite properly, very dogmatic except in one case; the rule given for whooping-cough is too indefinite, and errs, many will think, in naming too short a period of isolation. Section IV. contains the general precautions against the introduction and spread of disease from neighbouring towns, by day pupils, and tradesmen; the possibility that the medical officer may help to disseminate the disease is also taken account of, and the use of a mackintosh, after the manner widely popularised by Mrs. Priestly, is recommended.

It would be difficult to exaggerate the value of this code, which ought to be carefully studied by every schoolmaster and in the hands of every parent.

A Report showing Seven Years' Sanitary Progress in the District of Torquay. By CHARLES MACMAHON, Sanitary Inspector. Standard Office, Torquay.

THIS report, printed by order of the Local Board at Torquay, of 'Seven Years' Sanitary Progress,' will be found well worthy of notice. It is compiled by Mr. C. MacMahon, Sanitary Inspector of the district, who may be heartily congratulated on the seven years' work of which he treats.

The report is divided by him into three parts—viz., His work (1) as Inspector of Nuisances; (2) As Surveyor of New Buildings; and (3) As a House Sanitary Engineer.

Under the first head he mentions the number of houses examined by order of the Local Board, as, also, the

several large buildings, such as the Town Hall, the Post Office, &c., which he was called upon to inspect; and then continues: 'special reports, stating the defects found, or the modern sanitary arrangements required, having reference to drainage, trapping, disconnection of waste-pipes from drains, ventilation of drains and soil-pipes, sanitary closets, and water supply, were prepared by me, and sent to those asking for them. My recommendations have been, in nearly all these buildings, carried out under my personal direction and supervision. With regard to all work, which I either order or recommend, I have made it a rule to examine it at least once daily during its progress. No pipe of any kind is either laid, fixed, covered, or cased in without my direction or permission. Thus a fair execution of all work is secured.'

From 1878 to 1884, both inclusive, 4,639 sanitary operations were effected in 2,390 separate houses or premises; and only seven legal proceedings were instituted before the justices.

As to the *value* of the work done, the number of houses visited in 1878 was 64, and the cost of works 128*l*. In 1884 the houses numbered 112, and the cost was 560*l*.

As to the testing of drains, the following is an extract:—

'I have used a volatile, strong-smelling oil, in order to discover defects in soil-pipes, drains, &c., without putting people to the expense of opening up floors and walls. I am pleased to be able to state that such testing may be invariably relied on. If the slightest odour escapes, there is a defect; if not, the drain or soil-pipe is sound. Many pounds have been saved in this way. If the test is properly applied, the *exact spot* where the fault or defect exists is found out.'

With reference to the examination of new buildings the following may interest our readers:—

'I found considerable deviations from the plans, &c., lodged with and approved of by the board, so much so that in some instances very little resemblance existed between the houses as erected and the plans, except, perhaps, the positions and outlines of the buildings. The ventilation of drains and soil-pipes was looked upon as superfluous and detrimental to the appearance of the houses, and was very indifferently carried out. In one noteworthy instance, I found by mounting to the roof, a piece of two-inch iron pipe cemented to the slates, *concealing inside* the actual ventilator, which was a $\frac{3}{4}$ -inch lead pipe, the object of the little dodge being to pretend that a 2-inch ventilator had been fixed as specified in the builder's agreement with the board. Rooms were sometimes found to be less than the minimum height (8 feet) allowed by the by-laws; and very frequently small bedrooms had no means of external ventilation provided; party walls not carried above the roofs; cisterns without covers; no ash-pits or boxes; yards left around the backs and sides of houses in a wet, undrained, unpaved state were common faults. The houses themselves were now and then found so damp that the plaster on the inside walls was easily impressed with the finger, and gave off huge tears of moisture, which coursed each other down the walls. Thus there was considerable difficulty in ensuring the proper healthy condition of new houses. The builders, I am pleased to say, now know what the board requires, and, as a general rule, carry out the by-laws, with the result that the new houses are in sanitary particulars satisfactory.'

The third head, that of 'Superior House Sanitation,' is the one which would probably commend itself more especially to every one of us, as individuals; we do not encourage the existence of 'nuisances' around us; we do not all build new houses; but we must all of us live somewhere, and we are responsible not only to ourselves and to our families, but to all in our neighbourhood, for the healthy condition of the houses in which we live. The following anecdote is amusing, and we would only wish that every one going to the seaside, and on the look-out for lodgings, were as particular as the 'gentleman coming to Torquay by the "Dutchman"' in this narrative. 'On Oct. 13 last, when I was about to proceed on my rounds

with my day's programme well filled, an occupier of a house rented at 120*l*. per annum came into the office in great trepidation. He asked "to have his house examined at once, as a gentleman was coming to Torquay, two days hence, by the 'Dutchman,' but he would only take the house upon the production of a sanitary certificate on his arrival." I examined the house, wrote the report in one of the rooms, and the owner was quickly put in possession of it. The alterations required involved the fixing of an entirely new closet in lieu of a very bad one, a water-supply to the same, the disconnection of a pantry-pipe from the soil-pipe, repairing defects in the base of the latter, found by testing, and lastly, the improvement of the water supply, as the scullery and pantry were supplied from w.c. cisterns. These works were in full swing the following day, and on the day after, with the certificate in my pocket, I finally examined the works about five o'clock in the afternoon, and the nervous occupier, whose living for the winter had been in jeopardy, was made happy, and able to rush off and meet his six months' tenant with the essential document. Thus it will be seen that I am bound to place my services at the disposal of any rate-payer or intending occupier, and upon the briefest notice, the work to be done involving the credit and well-being of the town, as affording safe houses for our visitors and residents.'

The following is the conclusion of this admirable report. The Torquay Local Board did good service in having it printed, and we feel it right to congratulate them on the work done, and on the energy and zeal of their sanitary inspector.

'The foregoing is an account of seven years of domestic sanitation in Torquay, carried out during what may be called the transition period of sanitary science. The change from locked-up, choked, clay-jointed, over-trapped, or untrapped, or masonry drains, and sometimes cesspools, to cement-jointed, self-cleansing, well-ventilated pipe conduits, having a single easily flushed trap between the house and the sewer; also from corroded metallic, double-trapped unventilated water-closets and insufficient water supply to simple glazed earthenware basins, having a single syphon trap, with full width extended soil-pipe above the roof for ventilation, and other outlets and inlets for the same purpose; syphon action flushing cisterns for closets; likewise the alteration from the sole supply of water for all purposes being drawn from one uncovered cistern under the roof or other unsuitable place, to separate and covered cisterns for the different purposes, and taps upon the main water-pipes for the purest supply. In brief, from fever-inviting, sickness-disposing dwellings to healthy homes, which, next to healthy bodies, must be the greatest of earthly blessings. The revolution (for such it is) is being quietly accomplished. With its unmarred natural beauties, its perfect sewerage system, and pure water supply, if is added to these the great desideratum of the age—healthy homes—it cannot be too much to say that Torquay is the healthiest, as well as the loveliest place in the United Kingdom.'

Science and Art of Modern Plumbing as Applied to Domestic Purposes.

The Removal of Sewage and the Drainage of Dwellings.

Both by J. W. HUGHES, Plumber, &c., Montreal.

THESE are two pamphlets, being reprints of lectures delivered upon the subjects named. The one we have placed first is, at the same time, the most ambitious and the least satisfactory. It is divided into five chapters—i.e.—I. Hydraulics of the Plumbing Trade. II. Domestic Sewerage, &c. III. The Hot-water System of our Dwellings. IV. Plumbing Apparatus and Fixtures. V. The Plumber and his Boy. These lectures are far too slight and inexact to be of general use, though they have probably answered their ostensible object in suggesting to the younger members of the craft subjects for special study. If we refer to Chapter III. we find diagrams of

five different systems of installing a domestic hot-water service, but no description is given of the different systems, or any hint afforded as to the author's experience of their relative value. In Chapter II. a diagram is shown of a very ingenious combination of pipes, traps, and valves, which the author made use of in experiments directed to test the syphonic action upon traps under varying circumstances. But the experiments themselves which, if properly conducted, would have been of great value, are not even referred to. Again, in Chapter IV., the author enumerates accurately enough the various kinds of closets, and states the various points which he considers should be attended to in the selection of one, but he does not attempt at all to show how these requirements are met in the various apparatus, but leaves his readers to apply his tests to a hundred different closets as well as they may. The last chapter contains several extracts from American writers concerning the trade, and the two following quotations will show that the American plumber is the object of the same unappreciative *badinage* as his English brother craftsmen. The *New York Herald* some time since said, 'Three weeks ago the writer sent for a plumber who never appeared, but yesterday he sent in a bill,' to which the *Courier Journal* replied, 'You ought to be happy. There are some plumbers who would have kept you waiting a week longer for your bill.' A correspondent of the *Philadelphia News* is supposed to ask, 'Why is it that when a plumber comes to fix the pipes he always has to go back and get his tools?' To this the editor makes answer: 'Probably because a long and careful examination convinces him that he can't repair the damages without tools.'

The second pamphlet on the drainage of dwellings is a very good *résumé* of the American system of house-drainage, containing many very practical hints and written in a methodical manner not often discoverable in the works of practical men.

If we look for the special circumstances which affect plumbing work in Canada we shall find them in the severe and protracted frosts of winter and the heavy snowfalls. Consequently we find considerable space devoted to the means to be employed in protecting plumbers' work, &c., from injury by frost. Our author omits the disconnecting trap on the house-drain, so generally insisted upon in England, because in winter the cold air, entering by it and ascending the drains and soil-pipe, is likely, in his opinion, to freeze the contents of the traps, and so cause great mischief. Mr. Hughes prefers to connect the house-drains direct with the sewers; but as the sewers have road-ventilators spaced some forty to fifty yards apart, the air entering by these ventilators could be but very slightly warmed in its passage to the house-drain. So that we fail to see what anything material in the direction of warmth is gained by the omission of the disconnecting trap.

A chapter of this very practical work is given up to the protection of pipes from cold. The author divides the precautionary measures to be taken into four heads:—1. Preventive measures as regards position or situation; 2. Protection; 3. Mechanical action; 4. Emptying the pipes.

To take the last head first, he admits the value of arrangements for emptying the pipes during a frost at night, though, as attention is required to effect the object in view, he places but little reliance upon it.

'Mechanical action' is, in other words, allowing the pipes to run, though, as he points out, this often results in waste-pipes being frozen up solid.

Under 'protection' he describes various kinds of casings which are used in Canada for the security of pipes in long-continued frosts, and his remarks and descriptions, illustrated by diagrams, are very suggestive, and should be tentatively read by all who are interested in the subject.

The first of the four heads will be readily understood, and its importance is in the work before us very properly insisted on.

We have spoken so far of that which forms the most

valuable experience to an English engineer; we will now take a rapid glance at the remainder of the work.

The laying of small pipe drains is recommended; but Mr. Hughes seems uncertain about the proper fall to be given under varying circumstances, although he would find the subject exhaustively treated of in a work to which he seems to have referred, *i.e.* 'Bailey Denton's Lectures.' A diagram shows the usual American arrangement of a soil-pipe up the centre of the house, having direct connection with the drain. The latter is not laid under the basement, but, with the object of gaining the utmost fall towards the sewer, is supported against an internal wall. The object aimed at is good enough, but the idea can hardly be effected in this simple manner as long as there are sinks and closets in the basement. The diagram shows, indeed, such a closet, but the difficulty is overcome by the naive expedient of raising it some three feet or so, and approaching it by a formidable flight of steps.

In the second chapter our author advocates the subsoil drainage of the sites of houses with proper subsoil drains, but, where these cannot be laid, he advises leaving the joints of the house-drain open, after it has left the premises, and filling round them with gravel and broken stones—a piece of advice which will hardly find acceptance amongst sanitary engineers.

Mr. Hughes's opinion as to both the location and choice of a water-closet are rather lax, though we may infer that he is greatly in advance of those for whom he writes.

As to location, after stating that a water-closet should be placed against an external wall and should be provided with a proper window, he proceeds to describe what must be done when closets have to be fixed in the interior of a house 'like cupboards.' Again, he says, 'It is bad practice to fit water-closets in the centre of a building, but sometimes it cannot be avoided.' Surely no writer should admit for a moment the possibility of such an arrangement. The pan water-closet is admitted to be a bad apparatus, but the possibility of its use is contemplated. Certainly it is insisted that it should be taken down and burnt out 'twice a year,' and anyone who had to face the expense and annoyance of these half-yearly cleansings would, we fancy, soon find it desirable to procure a more reasonable and effective apparatus. The advantage of fixing plumbers' work with the minimum amount of woodwork is insisted on. (See SANITARY RECORD for Jan. 15, 1885, page 304.) The author sees no necessity for the usual boxing-up as he says, 'Everyone knows what the apparatus is; no object is gained by trying to make it look like a writing-desk or jewel-case.'

It seems that, though many materials have been used for kitchen sinks, the popular one in Canada is plain cast iron (not enamelled), and in connection with these it is pointed out that the holes in the gratings are generally too small and the waste-pipes too large to be effectively flushed by the discharge—a fault which we have constantly had to remark upon ourselves.

There are many terse pieces of practical advice scattered through the pages of this useful little work, but we have only space to call attention to the chapter on cleanliness.

There was a time when a housewife would feel herself disgraced if every nook and corner of her house were not kept clean and spotless by countless scourings and sweepings. Nowadays the use of disinfectants, powders, and soaps has given a sense of security resulting in a sad falling off in the scourings and cleansings of fifty years ago. We will conclude our notice of this work as our author does, with the following recipe written by a physician in answer to a patient's request for a good disinfectant to use during the warm weather:—

R^y—Brush, 1; pail, 1; shovel, 1; wheelbarrow, 1; broom, 1; cloth, 1; soap, *ad lib*; *aqua pura*, quantum suff. (plenty of clean water). Add a sufficient quantity of brains and muscle to cause the whole to be vigorously worked, and use in large quantities until complete relief is afforded.'

NOTES ON BOOKS.

Johnston's Registered 'Clerk of Work' Sheets. Morrison Bros. 99 Buchanan Street, Glasgow.

THIS sheet is an elaboration of the form which is usually employed upon buildings of importance, or upon which a clerk of works is employed. It is often highly necessary to ascertain the cost of labour expended upon a work either during progress or at completion, and it is only by careful analysis of this description that such a result can be arrived at, either to settle disputes, arrange prices, or furnish statistics which are so often required. The value of material can always be more or less accurately determined by measurement, but time expended upon building works must be recorded, otherwise it is impossible to arrive even at an approximate estimate of labour undergone. First among the many influences at work to impede operations is the weather, which will often make or mar the profit upon a building transaction; accordingly we find the usual space for work and time stopped under unfavourable conditions. The lines allotted to the numbers and dates of drawings, letters, &c., received from the architect are insufficient, as two or three clumsily-written figures would fill these spaces, and the same remark would apply to 'Drawings required.' There is plenty of room, however, for 'Remarks,' and that boon to the builder and bane to the architect, 'Extras.' In the interests of the great unemployed it is much to be hoped that the 'busy' portions of these generally useful and compact sheets will be largely filled, not only in the north, but in all four quarters of the kingdom.

Rules to be observed by Nurses in Charge of Infectious Diseases in Hospitals and Private Houses. By Rev. J. H. TIMINS, M.A., F.G.S. West Malling: W. G. Chamberlain.

ISOLATION, fresh air, and perfect cleanliness are the three great requisites in the nursing of cases of infectious disease. The author of this little pamphlet apparently places most reliance on the use of certain 'disinfectants,' for the use of which he gives minute instructions. In our opinion these are calculated to do harm indirectly by withdrawing the attention of the nurse and other attendants from the vitally important points we mentioned above, and also by imparting a false sense of security, provided certain almost superstitious rites are complied with.

Jahresbericht über die Fortschritte und Leistungen auf dem Gebiete der Hygiene, im Jahre 1883. Von Professor Dr. UFFELMANN in Rostock. Braunschweig: 1884.

THIS year-book, which appears as a supplement to and uniform with the *Vierteljahrsschrift für öffentliche Gesundheitspflege*, will be found an indispensable companion to the student of hygiene. It contains notices of every work, pamphlet, and article of any importance that has appeared in the English, French, German, and Italian languages during the year, the precise references being given as footnotes. Military hygiene alone is excluded, as having in Germany an organ of its own. The contents are arranged under twenty principal heads or sections, and full indexes of subjects and of authorities are appended.

The compiler has evidently read each production with some care, for it is remarkable how clearly he gives the gist of each, and picks out anything really new or of special value. It is, therefore, not a mere index, but an epitome and a review, and as such will save the student much labour and time, frequently indeed rendering actual reference superfluous. The statistics given under infectious diseases, for example, are as complete as any one could wish. It is impossible for us to give anything like an abstract of a work containing in 240 pages references to the literary contributions of about 600 different writers.

CORRESPONDENCE.

[All communications must bear the signature of the not necessarily for publication.]

VENTILATION OF PUBLIC SEWER

Mr. C. Bond has asked two or three very questions upon sewer ventilation. I will answer the best of my ability, and in a practical from experience sadly injurious to myself, of will give an account. I am of opinion, and been, that the only correct way to ventilate sewers means of up-cast shafts from the crown of the sewer given points, carried up above the eaves of the which are in close proximity, but not into a shaft to any chimney. For one reason above all other is a danger, keep as far from it as you can. I think there is the danger that many imagine of gas blowing down the chimney. My reason for is in consequence of tests I have made, which I endeavour to describe, and, after that, give some for the result. First, I had a gas stove on which an iron vessel filled with cold water; the lid was cally sealed. From the top of the lid I fixed over ture of 2 inches diameter a tube, 2 feet 6 inches l a turned down nose, through which I got steam pressure when the water was boiling. I then glass cylinder, 6 inches diameter, on a box, 2 inch with an aperture in one side, 4 inches diameter, air into the box. I placed the turn-down nose into the top of the glass cylinder, through which distinctly see the action of the steam, and, as I am I could not get the steam down the cylinder a 2 inches before it took a direct and rapid up-cast closed the aperture in the box, and cut off the air result was the steam travelled about 2 inches to the cylinder, and the up-cast was considerably h but in no instance could I get it down into the it understood the experiments were made in a K and secondly in the outer air, so I had into external air to give me the results alternately. I I came to the conclusion that there is not th apprehended by many of sewer-gas blowing chimney, and for a reason obvious to me, as if if sewer-gas will blow down a chimney, the room chimney that would admit of that would always it is evident that there would be a down-cast as cast. Taking the average of chimneys the per cent smoky ones is very small. Not only so, it does because a chimney smokes that sewer-gas will be

For instance, when sewer-gas leaves the up-cast it has to be carried by the air or wind to the hood of the chimney, and if it carry it there why the chimney? I dare not think any scientific me there is a sufficient down-cast in a chimney to suck, and unless it so acts it is a thousand c one against the gas blowing down, and it is ette sible for it to do so if a fire is burning and escapes. That being so, anyone can satisfy his smoke with sewer-gas. If a sewer be properly by the means of up-cast shafts the pent-up gas v be exhausted, and the generation from day to be reduced to a minimum. Street gratings to a mistake, as it is clear that all the escape from a tendency to travel upwards, and the chances as will inhale it in its course. True, it may become still the deleterious effects are as sure, if less m gas escape at an altitude of 35 or 40 feet, a he the air is never stationary. Supposing it should it would become more distributed and c consequently less injurious. I know of a fashion where some three years ago the Corporation w

to open all the town gratings, and in less than forty-eight hours the whole town was impregnated with sewer-gas. After this experience the gratings were closed. These facts prove that the gas will escape at any opening. I have for years advocated the closing of the ground line gratings and the substitution of up-cast shafts, and I believe this will have to be done before a perfect system of sewer ventilation is accomplished. The sewer-gas from street gratings is just as dangerous if inhaled as though it was inhaled in a house, the only difference is that with the gas in the open air more oxygen is inhaled with it and it is more diluted, but, in proportion to the amount inhaled, so is the effect. I feel sure there is not one person out of every thousand knows the dreadful effects of sewer-gas upon the human system. Where it is detected it is usually treated as an unpleasant smell, and is so passed by; and, further, it is often attributed to something else, such as greens-water put down the sink by a thoughtless servant, when in fact it is one of the most deadly enemies with which man comes in contact, and which under the present system of drain ventilation he cannot avoid. To my own cost and sorrow I have of late had this fact so forcibly impressed upon me, that in whatever form sewer-gas approaches me, or however disguised, it will be difficult to deceive me.

I will now give a short account of my experience of sewer-gas and the dreadful ravages it makes. In March of last year I with my family occupied a certain house in the suburbs. Within a space of five days from taking possession the whole six in family and the servant had continual bad headaches. We then began to detect a bad smell at times. In fourteen days my eldest daughter had a very severe attack of persistent diarrhoea. The stench increased each day as the drains became more used. Within two months the whole of us (except the youngest boy of thirteen years, the reason for whose immunity I will explain further on) became so debilitated that we were unable to keep about for more than a few hours at a time. My own case was that of wasting of the flesh, so that in eight weeks I lost in weight 16½ lbs. My wife, eldest son, and youngest daughter were in the first stage of diphtheria. At that period small blood blisters began to show themselves on the back of my hands. We were under medical treatment over two months before our medical attendant could pronounce us safe. This gentleman pronounced the illness of myself and family to be blood poisoning, brought on by bad sanitary arrangements, and ordered us to leave the house immediately. This we did, and within eight or nine weeks we no longer needed medical attention. During the time we occupied the house I made many complaints to the landlord, but all the satisfaction I got was he thought I was very particular. Such cases as these should surely not be left wholly to the mercy of a landlord, but part of the evil should be remedied at the fountain head—the sewer. It is now nine months since we left the house, but we still feel the injurious effects caused by bad sanitation. As I previously mentioned, the youngest boy escaped, on account of being in the house only at night. I hope I have given some idea of the dangers of sewer-gas, and a remedy against the dangers.

I shall be prepared at any given time to go through the experiments I have before named, on any number of scientific gentlemen giving me notice of their desire to see them.

A NEW DEPARTURE IN HOUSE DRAINAGE.

Allow me to express the satisfaction I felt upon observing that Mr. W. P. Buchan had found time, whilst rearranging the awards of the Health Exhibition, to notice a humble contribution of mine to your pages.

Sanitary engineers have for years steadily worked at the problem of house drainage with, I hope, some success;

but now they need trouble themselves no more upon the subject, as Mr. Buchan, in his usual diffident manner, has finally informed us as to which arrangement it is that may claim the title of 'first-class style.' As to that other arrangement of mine, alas, it appears that it must be content to regard itself as 'second rate,' whatever that may be.

Mr. Buchan is the maker of a trap designed to be fixed at the foot of a soil-pipe—an excellent trap of its kind, no doubt. But as the adoption of my proposal would tend to abolish the use of such traps, I am not altogether astonished that he does not regard it with favour.

As to my proposal being new, I carefully guarded myself on the subject in the article in question. Several persons have been good enough to tell me of cases in which they supposed that the system I described had been used. But upon inquiry in each case I found they were very different, though they bore, may be, some resemblance to my work in this or that detail.

One detail which is found in several arrangements that I have inquired into, is a double soil-pipe with trap at foot, which would provide for the ventilating the soil-pipe in the natural way, i.e. in the direction of the flow of water, and it is simply the adoption to a *soil-pipe only*, of the principle which I suggest should be completely adopted throughout waste-pipes, soil-pipes, and drains; using the least possible number of traps, and relying upon one effective ventilation pipe for the entire system.

Feb. 20, 1885.

D. J. EBBETTS.

AWARDS AT THE HEALTH EXHIBITION.

By request of Jury No. 9 of the late Health Exhibition, we forwarded, at the commencement of last August, several filters, which the circular stated were 'to be tested.' They have just now been returned to us, and, to our astonishment, we find that they have *not* been tested, not a drop of water having ever been passed through them. You will understand that the nature of spongy iron renders it easy to affirm this with certainty. It appears almost unnecessary to point out that the only known way to test filters as to their sanitary merits consists in a chemical and microscopic comparison of water before and after filtration through them. Such testing can, indeed, have been the only reasonable object in retaining filters for almost seven months, extending far beyond the close of the Exhibition.

Surely nothing could show more clearly the hollowness of at least some of the awards made by the jury. Will the committee or the jury allow this stigma to rest on them as a body, or will they name the individual who is responsible for the blunder? It is perhaps expecting too much that that party will have sufficient courage to come forward himself and explain by what means he arrived at his conclusions, which were opposed to all scientific and practical evidence on the subject.

THE SPONGY IRON FILTER COMPANY.

T. G. MILLER, Manager.

[We are requested to publish the following correspondence, which may probably be taken as typical of much past, present, and to come.—ED.]

E. C. OWEN, Esq.,

Secretary,

Inventions Exhibition,

South Kensington.

Sir,—I am in receipt of your printed notice refusing my application for space at the above Exhibition. As that application referred to several patents which have not been shown at any Exhibition, I shall feel obliged by your informing me on what ground my application has been refused, and the more so as I happen to be aware that you are at the present time promising space to people who have not as yet sent in any formal application, much less as I did within the stipulated dates. I would call your attention to the fact that I was an exhibitor of three of my patents at the International Fisheries Exhibition.

and in addition to which I ventilated the offices of the executive, the lecture theatre, the fish dining-room, and south wing gratuitously. My exhibits were amongst the most attractive features of the Exhibition, and drew crowds of people to inspect them. Nevertheless, although the jurors recommended an award, the Executive Council overruled their decision on the ground of my exhibits being foreign to the object of the Exhibition. This objection was quite unfounded, as ship ventilators and working models of ventilated holds of steam trawlers were amongst my exhibits, and were specially examined by the jurors. In the Health Exhibition I again applied for space, including not only my former patents, but several new ones. I was offered about as much as was equivalent to the superficial area of a single compartment of a first-class railway carriage, although at the same time literally acres of space were being allotted to jams, pickles, and sugar-plums. In the present Exhibition, although I have again added to my list of novelties, my application is wholly refused, the cry having gone up for

the attention of the public to the circumstances of the case. Yours faithfully, (Signed) R. OAKLEY

International Inventions Exhibition,
South Kensington, S.W.

Dec. 27, 1884

Dear Sir,—I have received your letter of the 24th inst. and regret to have to inform you that the decision of Council, as previously communicated to you with reference to your application for space at this Exhibition, must be considered as final. Yours faithfully,

(Signed) EDWARD CUNLIFFE OWEN, Secretary.
R. Oakley, Esq.

'HOUSE-DRAIN VENTILATION.'

We have read with much interest the remarks which have appeared in your columns on the above subject, and there is one point which we should like to urge. If

FIG. 1.—Diagrammatic.

'more jam.' The executive and the personnel being practically identical throughout the three Exhibitions, the course pursued is no doubt dictated by one mind. Unless I receive a satisfactory reply to this letter, I intend to call

may be allowed to say so, we would suggest that it has not, as yet, been sufficient distinction made between 'House-Drain Ventilation' and 'House Drainage,' 'appliance' and the 'system.'

regards the 'ventilation of house-drains.' The permanent Board By-laws suggest two schemes—

inlet (in front of house), S = outlet (at back of house). The soil-pipe being at—say S;

inlet (at back of house), S = outlet (in front of house). The soil-pipe being at—say S;

In either of these cases the normal ventilating current would not, we imagine, be materially affected whether matter were passing down the soil-pipe or not.

If, however, the soil-pipe take the place of the upcast ventilating shaft, then, during the 'reversal of the current' in the soil pipe, the foul air would be emitted from the aperture intended for the inlet. (Fig. 1 shows such a plan.)

But, on the other hand, if the soil-pipe is made the downcast ventilating pipe, the effect is to ventilate both house-drain and soil-pipe with one continuous stream of air, which is stimulated by the passage of matter down the soil-pipe, no 'reversal of the current' being possible. (Fig. 2 shows such a scheme.)

It is a system of ventilation which we have adopted for some years past, and will, we think, stand on its own merits.

Next, with regard to the question of sanitary appliances in general, and dip-traps in particular. For our own part we thoroughly endorse the opinion that a dip-trap is a 'useless impediment in the passage of the sewage from the soil-pipe to the drain' (Knight's 'By-laws,' p. 102). Moreover they increase the cost of sanitary work, and are therefore undesirable.

The sooner it is clearly understood that a scheme of drain ventilation should, for its success, be independent of

The 'Continuous' System of House-Drain and Soil-Pipe Ventilation.

any special sanitary appliance (which can, of course, be costly or the reverse) the better for the public health, the public purse, and the cause of sanitary science as well.

SHARP & CO.

LAW REPORTS.

SUPREME COURT OF JUDICATURE.

COURT OF APPEAL.

Ballard v. Tomlinson.

THIS appeal raised an interesting and important point as to the right of one or two owners of wells having a common source of supply from underground water to restrain the neighbouring owner from so dealing with his well as to cause the water which the other owner pumped out of his well to be polluted. It appeared that since 1849 the plaintiff, a brewer at Brentford, drew the water for brewing from a well sunk to a depth of 222 ft. into the London clay and bricked round. From the bottom of the well a pipe was carried through the Thanet sand into the chalk, to a depth of about 300 ft. from the surface. From the sand and chalk, which were water-bearing strata, the water found its way by natural pressure into the well, from which the plaintiff raised it by pumping. About ninety-nine yards from that well, the defendant also had a well of similar construction and going down to about the same depth in the sand and chalk, but the surface of the ground was about 10 ft. higher than at the plaintiff's well. The evidence was to the effect that both wells were supplied from the subterranean water. The defendant, having ceased to use his well, made a drain by which the sewage was discharged into it. The plaintiff complained that the sewage had polluted the water in his well, and he claimed an injunction to restrain the defendant from so using his well as to pollute the water in, or coming into, the plaintiff's well, and also claimed damages for the injury caused by the pollution. For the plaintiff it was argued that, though there can be no property in underground water flowing in natural undefined channels, and therefore a landowner may so deal with such water as to deprive his neighbour of it entirely, yet he cannot so use his well as to prevent his neighbour drawing pure water. It was also said that the defendant's well and pipe were artificial channels, so that he was responsible for the consequence of allowing sewage to flow into the well. The fact of the pumping, it was said, could make no difference, for in either case nature would fill the vacuum caused by the abstraction of the water. For the defendant it was argued that he had not polluted any water in which the plaintiff had any property, and that if the plaintiff chose to draw the water from the common supply he must take it as he found it; and, further, that the effect would not have been caused but for the plaintiff's act in pumping. Mr. Justice Pearson gave judgment for the defendant (*see* SANITARY RECORD, March 15, 1884, p. 447), being of opinion that the plaintiff had no greater right to the quality of the water than he had to the quantity, and that it was one of the incidents to the use of the water that the plaintiff should take it subject to everything which had occurred to it by reason of the use of it by other landowners before it could reach his land. From that judgment the plaintiff now appealed.

Their lordships delivered judgment, allowing the appeal.

The Master of the Rolls said that it could not be denied that sewage had been collected in an artificial shaft on the defendant's land, and that it had percolated or been drawn through by the plaintiff's act into the water under the plaintiff's land, and that it had fouled that water. It was clear that no one has at any time any property in water percolating below the surface of the soil even while it is under his land. But it was equally clear that every one has a right to appropriate such water

and may prevent it from going on to the land of others. So his neighbour below may cause such water on the land above to come upon his land, and may absolutely deprive his neighbour of it. Therefore no one has any property in percolating water, but every one has a right to appropriate the whole of it. The percolating water is a common reservoir or source, in which no one has any property, but from which any one has a right to appropriate any quantity. Then the question arose whether any one of those who have that unlimited right of appropriation, but of whom each has no greater rights than the others, has a right to contaminate the common reservoir, or whether he is bound not to do anything which would prevent any of those persons obtaining the full value of their right. It was true, as suggested, that the defendant by polluting the common reservoir did not pollute that in which the plaintiff had any property. If all the plaintiff could show was that the common source was contaminated, he could not before he had appropriated any part of it, maintain an action in respect of that contamination. But it did not follow that he could not maintain the action when he had appropriated it, if there was evidence that the water which he had a right to appropriate had been contaminated by that which another person had done to the common source; in other words, although no one has any property in such a source, yet, inasmuch as every one has a right to appropriate it, he has a right to appropriate it in a natural state, and no one has a right to contaminate the common source so as to prevent his neighbour having his right of appropriation. As to the point that the pollution would not have been caused if the plaintiff had not used artificial means, and, therefore, that it must be taken to have been his act, that was not a true proposition. The question of natural, as distinguished from unnatural, user never applies to plaintiffs, but only to defendants. As long as a person does not use any means which are unlawful as against his neighbours, however artificial or extensive those means may be, he has a right to use them, and the right to appropriate the common source is not diminished by such user. The question of natural and unnatural user only goes to this, that although a defendant does contaminate water or anything else which goes on to his neighbour's land; yet, if that act is only what has been called the 'natural user' of the land, and although by that act the neighbour is injured, the defendant is not liable, because, otherwise, he could not use his land at all. With regard to the common source the question does not depend upon persons being contiguous neighbours; but if it can be shown that in fact the defendant has contaminated the common source, it signifies not how far the plaintiff may be distant from him, if it can be shown that the plaintiff has been injured by the act of the defendant. Therefore, upon a question which was uncovered by authority, his lordship was unable to agree with the learned judge. The ground on which he disagreed was that no one has any property in percolating water, which, as it comes from a common source, every one has a right to appropriate but no one has a right to injure.

Lord Justice Cotton was of the same opinion. The right to underground water was a natural incident of the ownership of land. The defendant was not exercising that natural right, and was not taking the underground water, but was putting upon his land filth which got down to the underground water which was partly under his land and partly under the land of the plaintiff. As soon as the defendant's act interfered with the plaintiff's natural right of ownership there was a cause of action.

Lord Justice Lindley delivered a written judgment to the same effect.

FISH-FRYING A NUISANCE.

Houldershaw v. Martin.

This case raised a question under the Public Health Act 1875, as to what is a 'nuisance,' and whether or not it must be injurious to health. An information had been laid against a fishmonger at Liversedge, near Dewsbury,

e, for causing a 'nuisance' by the smell of frying there was, according to the provision in the Health Act, 1875 (38 & 39 Vict., cap. 55, sect. 1), a certificate of a medical man to that effect—that it was a nuisance, the words of the statute nuisance or injurious to health.' The magistrates, rejecting the certificate as insufficient, because it did not contain the words 'or injurious to health,' though the Act are not conjunctive but disjunctive, and refused to entertain the complaint. (*See SANITARY RECORD*, Jan. 15, 1884, page 372, and May 15, 1884, page 411.)

The complainant appealed, but Lord Coleridge said the case was too clear for argument. The medical certificate was insufficient, for the words of the Act were 'a nuisance or injurious to health' (not 'and'), and there might be a nuisance not injurious to health, or there might be something injurious to health though not a nuisance, so that the certificate was quite sufficient, and, indeed, an indictment under this enactment (if it were an indictable offence) that the thing was 'a nuisance and injurious to health' would be bad, as being double and alleging two offences. Consequently the case was sent back to the magistrates.

THE TRUTH ABOUT A DUST-HEAP.

Andrews v. Mansfield.

There was an action arising out of an injunction which the plaintiff had obtained to restrain the defendant from allowing a field opposite his house, so as to be a nuisance by means of an offensive smell injurious to the plaintiff's health and comfort. The interim injunction had been confirmed by the Court of Appeal, but by order of the court it was not to be made perpetual until the question of fact whether there was such a nuisance as to be a nuisance had first been ascertained by a jury. Hence the inquiry.

The plaintiff was the owner of a small freehold at Stratford, where he carried on the business of a gardener, and his premises was a field which was rented by the defendant and used for the purpose of carting dust and

The carts would have to pass the plaintiff's house, and he complained in the first instance of the nuisance occasioned by the dust and paper which were taken to his house as the carts passed. Later in the year the weather became warmer, and particularly when the sun was out and warm and wet, the dust heap, which was 100 yards from his house, began to throw off noxious gases, and the smell became so bad as seriously to affect the health of the plaintiff and his family. A plague of flies next settled on the heap, and added to his discomfort, and about a month later the heap was sifted into what is called soft and fine, and the smell became so intolerable that the plaintiff, under medical advice, was obliged to leave the house and take his family to the seaside to recruit their health.

Several neighbours confirmed the plaintiff's complaint, as having themselves suffered from the smell, and three doctors were called, one of whom deposed that the heap was a mixture of abominations.

In the defence, as usual, an equally strong body of evidence was called to contradict the plaintiff's story. Several witnesses were produced who said they had smelt no smell, and several scientific witnesses were called who said they could detect no smell beyond that of ordinary dust-bin, but that it was physically impossible under the circumstances that there could be a smell as alleged, one of these witnesses, Dr.

Tidy, declaring his opinion that such an idea was ridiculous, as the noxious gases from the heap must be oxidised before they could have reached the plaintiff's house. It was also a part of the defence that, as such a smell as that complained of, the true cause was to be traced to other causes existing in the neighbourhood.

The jury eventually found a verdict for the plaintiff, and Mr. Justice Stephen thereupon gave judgment

and granted a perpetual injunction to restrain the defendant from continuing the nuisance.

ALLEGED EXCESS OF WATER-RATE.

Henderson v. The Folkestone Waterworks Company.

The question here, as counsel said, was novel. The plaintiff, the owner and occupier of a house at Folkestone, had been, as he alleged, rated by the water company in excess of what was held to be legal in *Dobbs's* case in the House of Lords, and he had paid the amount demanded of him under the impression that he was bound to do so, and now he sued the company to recover back the excess. The company, on their side, set up that it was a voluntary payment and not recoverable. The plaintiff set up in answer that it was paid by compulsion. But the Court found as a fact that the payment was voluntary.

Lord Coleridge said the law was quite clear that the plaintiff could not recover back this money. No doubt when money paid under an error in law had been extorted or obtained by duress or any kind of compulsion it could be recovered back, but that was not the case here. The law once ascertained to have been against the party who had thus by compulsion obtained payment of the money, it can be recovered back. But here at the time the money was paid, which was before *Dobbs's* case, the law was in favour of the company, and there was no authority to show that it could be recovered back on account of a judicial decision reversing the former understanding of the law. Moreover, in this case the payment was voluntary, and the assessment had been altered as to the future. If the plaintiff desired to dispute the assessment he could have applied to the magistrates to reduce it under the statutory power so to do. The law, however, did not allow money voluntarily paid under a mistake in law to be recovered back.

Mr. Justice A. L. Smith concurred, and observed that though the amount involved was small the principle involved was important, and the question had been decided in our Courts nearly a century ago. The learned judge cited two cases to show this, and added that he had never heard it doubted that money paid voluntarily, though under a mistake in law, could not be recovered back.

Judgment for the defendant.

SALT IN BEER.

At Lambeth, H. H. T. Martive, late of the Orchard Tree beerhouse, Camberwell New Road, was summoned at the instance of the Camberwell Vestry for selling beer or ale, being an article of food, which was not of the nature and substance and quality of the article demanded by the purchaser, contrary to the provisions of the Act for the Sale of Food and Drugs. A discussion took place with regard to the section on which the summons was to be heard. One section (the 3rd) dealt with the alleged offence on the ground that the article sold was 'injurious to health,' but ultimately it was agreed to go upon sect. 6 of the Act, which included the words in the summons. Mr. Biron, the magistrate, said he was fully of opinion that that would be the best course to adopt. The certificate showed that salt had been added to the beer to the extent of 187·6 grains per gallon, and if so, that was 'not of the nature and substance of the article' demanded. Dr. Bernays said the fact was as stated, and the amount of salt mentioned was after allowing a margin. The witness said he allowed 70 grains. He had examined many samples of beer, but had never before found such a quantity of salt in them, or anything like it. Mr. Hughes, who appeared for the defendant, pointed out the instructions given by the Local Government Board with regard to this question. Dr. Bernays said it was in those instructions deemed advisable not to interfere unless the mixture was over 100, and in the present case it was 190. Mr. Biron said it was a case of great public importance, and quoted the 35 & 36 Vict., sect. 3 and 6. He thought the section which was passed later on was intended to spread a net, as it were, over a wider space, as in a case like the present.

He therefore must convict, but thought a moderate penalty would meet the case, and ordered the defendant to pay a penalty of 20s. and 1s. 13s. 6d. costs.

A CORPORATION SUMMONED FOR A NUISANCE.

At the Jarrow Police Court, a summons which had been obtained by Dr. W. Whammond against the Jarrow Corporation for creating a nuisance and allowing it to exist on land to the east of Monkton Road was heard. Mr. Webber, who appeared for the prosecution, said there were 2,000 tons of night-soil exposed to the air, except at one part; and they intended to trace a case of scarlet-fever to the nuisance which it had caused. Dr. Whammond was called, and he produced samples from the heap, and they caused a very bad smell in court. Dr. Munro, Medical Officer to the Corporation, stated that, though a nuisance had existed at the place referred to, there was none existing at present. Dr. Bradley corroborated Dr. Whammond's evidence. Sarah Bulman, living in Salem Street, stated that one of her children had been attacked with scarlet-fever, which she attributed to the deposit of night-soil. Several residents in the neighbourhood gave evidence that they had suffered in health from the deposit. Mr. Thomas Gibb, one of the magistrates of the borough, said there was a space 50 yards by 17 yards, which was not covered with clay. He was certain that decomposition would always take place as long as water ran through the bottom. Mr. Joel, who appeared for the defence, called Dr. Hardcastle, of Newcastle, who said that he had gone over the place and found no smell. The fluid sample brought that morning was surface-drainage. Mr. Petrie, the Surveyor, and Mr. Batty, the Sanitary Inspector of the Corporation, gave evidence that no nuisance existed. The magistrates, after a long consultation and inspection of the place, decided that there was no nuisance existing within the meaning of the Act. No costs were allowed.

SHOCKING NEGLECT.

A disgraceful case has recently been brought before the notice of the Lanchester Board of Guardians, showing much neglect. An old man named Jonathan Garbutt, who resided at The Allotment, Low Waskerly, a secluded place near Consett, was some time ago stricken with a severe illness, from which he never rallied. He had no other attendant but his wife. As he got worse his body gradually became decomposed and the skin discoloured. The stench arising from his body was so terrible that none of his friends or neighbours dared to venture near the dirty hovel called his home, which became a public nuisance. At length the poor fellow's legs appeared to be rotting away, severing themselves from his trunk, whilst the agony he suffered was so dreadful that he frequently tore large pieces of flesh from his body and threw them away. Death put an end to his sufferings on September 10, when the parish authorities did not consider it their duty to provide a coffin for him; he was therefore buried something after the manner of a savage living amongst barbarians, which has caused considerable indignation in the neighbourhood. The defence of the relieving officer was that he considered deceased's relatives quite able to pay for a coffin. The clerk of the guardians was directed to write to their medical officer asking why he had failed to supply disinfectants to purify the foulness of the premises.

A CORRESPONDENT of *Invention* suggests that people who use warm water-bottles and India-rubber bags, would find a bag of sand far more convenient. The sand should be fine, clean, and thoroughly dried, then put into a flannel bag made about 8 in. or 10 in. square. The opening should be carefully sewn up, and the bag covered with linen or cotton cloth, to prevent the sand from sifting out. The bag may be quickly heated by placing in an oven or on a stove. The sand holds the heat a long time, and imparts a more agreeable warmth to the feet or hands than a warm water-bottle.

THE HOUSING OF THE WORKING CLASSES.

*How best to help the slender store,
How mend the dwellings of the poor?*

THE PEABODY FUND.—The trustees of the Peabody Fund announce that when the buildings in course of erection are completed, they will have spent the whole of their capital. Up to the end of last year they had provided for the artisan and labouring poor of London 10,144 rooms, occupied by 18,453 persons. The average weekly earnings of the head of each family in residence at the close of the year was £1 3s. 8½d. The average rent of each dwelling was 4s. 8½d. per week, and of each room 2s. 1½d. The birth-rate for the year reached 44.60 per 1,000, which is 10.93 per 1,000 above that of all London for the same period. The death-rate, including the deaths of those inhabitants of the buildings who were removed to hospitals, was 19.10 per 1,000, which is 1.24 per 1,000 less than London. The infant mortality was 13.69 in each 1,000 births, or 13.69 below that of London.

IMPROVED INDUSTRIAL DWELLINGS COMPANY (LTD.) The forty-third ordinary half-yearly meeting of this company was held at the Mansion House, Sir Sydney Waterlow, M.P., in the chair. From the report it appeared that the total income for the half-year amounted to 40,788s. 12s. 4d., while the total expenditure was 27,294s. 7s. 4d., leaving a divisible profit of 13,494s. 5s. which, added to the balance of 358s. 14s. 8½d., brought forward from the last half-year, gave a total of 13,852s. 19s. 8d. Out of this sum the directors recommended the payment of the usual dividend at the rate of 5 per cent. per annum, free of income-tax. The estates continued to be maintained in thorough repair, and constant attention was given to the sanitary state of the dwellings. The estates in the central districts continued to be fully occupied, but in the outlying districts, owing to the competition which arose in the suburbs and other causes, the letting was not so satisfactory. The chairman, in moving the adoption of the report and statement of accounts, trusted that the meeting would be of opinion that from the commencement of their operations to the present time they had continued to make gradual but certain and satisfactory progress. The thrift, economy, and care which had been exercised by the directors in the earlier years of the formation of the company had been the cause of its success. Mr. Alderman Stone, deputy chairman, seconded the motion, which was adopted. The election of Mr. A. B. Daniell and Mr. D. S. Waterlow as directors, in succession to Sir C. Frenke and Mr. Miles, deceased, was confirmed, those retiring by rotation being re-elected, as was also Mr. E. Hart as auditor. The chairman, in responding to a vote of thanks passed to the directors for their continued honorary labours on behalf of the company, expressed the pride which he felt at the work which had been, and was being, carried out by the company. They had now in occupation more than 5,000 tenements, housing something like 25,000 persons, and a more respectable body of people of the class to which they belonged could not, he ventured to say, be found in the metropolis or any provincial town in England.

THE eighteenth annual report of the Artisans' Labourers', and General Dwellings Company (Limited) for the year ending Dec. 31, 1884, states that from Shalbury Park the gross income was 24,855s. and from Queen's Park 53,652s. The loss from irrecoverable arrears during 1884 was small in both cases. Now that Shalbury Park and Queen's Park may be considered as completed estates, shareholders will, observe the directors, be interested to observe that the important item of repairs shows a decrease for the twelve months as compared with 1883 of 1,047s. This is the result of the thorough efficiency with which, for some years past, all necessary work has

The houses are now in good repair, and their cost in that state involves less outlay. There is a considerable increase in the amount of local and imperial

The amount expended for rates, taxes, and works was a net increase of 647*l.* 11*s.* 4*d.*, although a surplus has been obtained of nearly 400*l.* on the yearly water supply on the two estates. The directors decided to create a fund for the insurance against the non-hazardous portion of the company's premium of 306*l.* 11*s.*, being one year's premiums, set apart out of revenue and placed to the credit of the Fire Insurance Fund. The exceptionally low price of 1884 enabled the building operations at Park to be pushed on with great rapidity, and the close of the year 743 houses, including those commenced in the previous year, were completed, let and occupied. The development of the Hill estate has been proceeded with. The directors have under their consideration the question of a central site in the metropolis for the purpose of block-building as dwellings for the industrial class. Should the Manchester Ship Canal scheme be effected, the value of the Salford property will be enhanced. The increase of capital during the year has been 125,290*l.* The net revenue for the year ending 31, 1884, amounted to 57,611*l.*, being an increase of 7,820*l.* over last year. The amount available for dividends, including the balance brought forward from the previous year, was 59,875*l.* The interim dividends, paid on preference shares 1879 and 1884, and Sept. 8, 1885, amounted to 26,365*l.*, leaving 33,509*l.* for the preference dividends for the second six months of the year, amounting to 6,540*l.* were paid 31, 1885, leaving 26,969*l.* available for dividend on ordinary shares, on which the directors recommend the payment of a dividend at the rate of 5 per cent. per annum of income tax, for the second six months of the year, making 5 per cent. for the year. This will amount to 1,197*l.*, leaving a surplus of 5,772*l.*, out of which it is proposed to carry 4,000*l.* to revenue reserve, and to place 1,772*l.* to next year's account.

MANCHESTER AND SALFORD WORKMEN'S DWELLING COMPANY (LIMITED).—The annual meeting of the company (which is an undertaking to attempt the provision of healthy dwellings for the poor at minimum cost) is worked entirely on commercial principles) was held at the registered offices, 100 King Street, Manchester, on the 10th inst., Mr. Thomas Dickens, J.P., chairman of the directors, presiding. The report, presented by the directors, was as follows:—

The conditions which operated adversely to the interests in 1883 have continued throughout the year, and the rental has shown a slight falling off. The gross rental received, 1883, 108*l.* 8*s.* 3*d.*; rents received, 1884, 104*l.* 10*s.* 10*d.*. This shows an average weekly receipt of 1*l.* 1*s.* 8*d.* in the previous year. It should be noted, however, that a change was found necessary in the collection of the rents, and the receipts for the first half of the year show an increase of 3*l.* upon the previous year.

The new collector has been obliged to reject a number of tenants who entirely failed to pay their rents, and a few others who were not regular in their payments, to leave also, probably fearing similar consequences.

This has involved a considerable loss of rent, and the loss is only of a temporary character, and it is expected to be rid of such tenants. The poverty of the tenants in many cases seeks to become tenants of the company, such as that even 3*d.* per week is a sufficient inducement to cause them to occupy a single room for a family in one of the wretched buildings in the neighbourhood in preference to the excellent accommodation which the company's dwellings afford. The effect of the company's dwellings has been to reduce the rents for the unhealthy dwellings referred to, and it is expected that until the people are educated to appreciate the importance of healthy dwellings, or the Corpora-

tion close those that are unfit for habitation, the company's premises will suffer from the competition.

The revenue account showed a surplus of 12*l.* 17*s.* 4*d.* for the year, which, it was agreed, should be carried forward, making the total surplus 51*l.* 18*s.* 3*d.*

At a recent meeting of the Plymouth Workmen's Dwelling Company (Limited), a dividend of 4 per cent. was declared, and it was announced that there was a good prospect of 5 per cent. in a short time.

PARKS AND OPEN SPACES.

*The law condemns both man and woman
Who steals the geese from off the common;
But lets the greater felon loose,
Who steals the common from the goose.*

PUBLIC PARKS.—A recent calculation shows that Paris has 172,000 acres in parks, or one acre to every thirteen inhabitants; in Vienna the proportion is one acre to 100 persons; in Chicago, one to 200; in Philadelphia, one to 300; in Brooklyn, one to 639; and in New York, one to 1,363. New York, however, proposes to buy 3,808 acres for additional parks at an estimated cost of 2,000 dollars per acre, or in the aggregate an expenditure of 7,616,000 dollars.

Lieutenant-Colonel Robinson has offered to sell thirty-two acres of land, situate on the Osmondthorpe Estate, to the Leeds Corporation for a public park for the inhabitants of the East End of Leeds, from which it is only about twenty-five minutes distant. He has reduced the price to 9,000*l.*

At the last meeting of the Newcastle City Council it was agreed to set apart twenty-five acres of the Nuns Moor as a recreation ground for the use of the inhabitants of that city.

SANITARY JOTTINGS.

A SANITARY Association has just been started at Preston, with the special object of applying pressure on the Town Council to take measures for the reduction of the abnormally high mortality of the borough. A successful inaugural meeting took place on the 9th ult., when a resolution was unanimously passed, calling on the Corporation to institute an inquiry without loss of time into the excessive death-rate of the town.

In 1880 the Lanchester Joint Hospital Board, in the county of Durham, after being duly constituted, resolved to build three hospitals in the union, one at Consett, another at Tanfield, and the third near Lanchester; but on various pleas, but principally on the score of economy, the buildings have never been proceeded with. Infectious disease having again become prevalent in the district, the authorities have been urged to carry out their original designs; and at a recent meeting of the Board, after a sharp discussion, it was resolved to proceed at once with the erection of a hospital for infectious diseases at Consett. A meeting of the representatives of the Durham Town Council, the Durham Rural Sanitary Authority, and the Brandon and Willington Local Boards, has recently been held at Durham to take into consideration the advisability of amalgamating the various authorities for the purpose of erecting a permanent central hospital for infectious diseases, for the joint use of the several districts comprised in the above authorities. After a long discussion, during which Mr. Lisle, clerk to the Durham Guardians, stated that the Boards had no power to make a central hospital,

It was ultimately resolved that each district should provide a hospital for itself.

SPREADING SMALL-POX.—Elizabeth Smith was summoned before the Darlington Borough magistrates on the 23rd ult., on a charge of exposing herself in the public street whilst suffering from small-pox, although she had been frequently warned of the danger of doing so. After medical evidence had been given in support of the case, Mr. Lindler, on the part of the Corporation, said he did not press for other than a nominal penalty, their principal object being to prevent such occurrences in future. After suitable admonition from the chairman the defendant was fined in the mitigated penalty of five shillings. Six cases of small-pox, which recently occurred at Darlington, are supposed to have originated from infection caught in the crowded tent of a travelling auctioneer. Four of the cases were removed to the Darlington Fever Hospital, with successful results. One was removed to the patient's own home, where isolation and proper treatment was possible, and that also ended in recovery. But the sixth, a stubborn patient, persisted in also being taken home, where isolation was impossible. The result was that the neighbourhood speedily became infected, and one fatal case has already occurred through culpable obstinacy.

An epidemic of measles is now very prevalent in Sunderland. The death-rate of the borough for the week ending Feb. 28 exhibited an average of 37 in the 1,000, the excessive mortality being attributed to this cause. The Corporation of Sunderland have now an improved Bill before Parliament, which, if passed, will enable them to deal more effectually with matters affecting the public health than they have hitherto been able to do. The Bill has provoked much opposition in the borough, but on a recent poll of the ratepayers a large majority in its favour was exhibited.

An excellent shelter for the use of the labourers on the Quayside, Newcastle, was opened by the Mayor of that city on the 28th ult. This is an example of kindness and consideration which we should be glad to see extensively followed.

Scarlet fever still forms by far the largest percentage of the cases of infectious disease notified to the medical officer of health for Newcastle-on-Tyne.

Dr. J. H. Raymond, health commissioner of Brooklyn, New York, says of sulphur as a disinfecting agent:— 'The experience of this department, covering nearly a score of years and thousands of cases, demonstrates to our satisfaction that sulphur will, if properly applied, destroy all infection. I have never known a second case of small-pox, or other contagious disease, to break out in a house where the first case occurred, and after fumigation, in which there was even a suspicion that the house was the infecting agent.'

Arrangements have been made, in accordance with the conditions of a gift of 1,000*l.* to the Public Gardens Association, to afford immediate relief to unemployed and distressed workmen by providing them with work in the laying out of recreation grounds and accomplishing other objects within the province of this organisation. This is a timely and reproductive work in more ways than one.

The owner of eight houses at Bermondsey has been summoned by Mr. Thomas, the sanitary inspector of Bermondsey, for neglecting to put them in a sanitary condition and fit for human habitation. The houses in question were in a filthy state, without a proper water supply, and having unpaved yards. The defendant was ordered to pay penalties amounting to 53*l.* 16*s.* The owner of houses in Lamb Alley, Bermondsey Street, was summoned for a like offence, and ordered to pay 34*l.* 4*s.*

THE contract for the sanitary work and repairs of drainage of The Lodge, Merton Abbey, has been given to the London Patent Automatic Disinfectors Company, 53 Queen Victoria Street, London, E.C.

EXHIBITIONS.

PARIS INDUSTRIAL EXHIBITION, 1885.

This exhibition is being organized by M. Duret, President of the Chambre Syndicale des Industries Diverses, at Paris, and will be held from July to November 1885, in the Galleries of the Palais de l'Industrie, which has been lent by the French Government to the promotion of this undertaking. It is now stated that the Organizing Committee has decided to form three foreign sections, one for England, another for Belgium, and a third for Italy, in order that the progress achieved by French workmen may be compared side by side with the methods adopted in these different countries. By virtue of a decree published in the *Journal Officiel* of Jan. 10 last, the portions of the Palais de l'Industrie assigned to this Exhibition have been constituted a bonded warehouse. Communications should be addressed to M. Duret, at the Palais de l'Industrie, Champs Elysees, Paris.

INTERNATIONAL EXHIBITION IN EDINBURGH.

At a meeting held in Edinburgh on Feb. 20, presided over by John Clark, it was resolved to hold an International Exhibition in the city in the summer of 1886, of Industry, Science, and Art. A committee was appointed to carry out the details.

ARTISANS' EXHIBITION IN DUBLIN.

An Artisans' Exhibition at Dublin, for works of Irish Industry, is announced to be open on June 1, 1885, and it will remain open for three months. The work of all artisans resident in Ireland, and of Irish artisans wherever resident will be received. The objects to be exhibited will include hand-made and machine-made work, whether completed by one or more artisans, and whether made by them at home or in the workshops of employers. In the latter case the exhibits would bear upon them the names of both artisans and employers. In addition to the above, it is intended to admit within the scope of the Exhibition a collection of pictures, an art and collection, objects of domestic industry, inventions (to be exhibited in the names of the actual inventors only), apparatus and fittings for handicraft teaching, models of artisans' dwellings and of workshops (especially those in which dangerous or unwholesome trades are carried on). In the department of home industries and art workmanship, the work of women is especially invited. To make the Exhibition as conducive as possible to the education of the artisan class, it is intended to organize in connection with it a Trade Congress, lectures, concerts, and other entertainments of a high class. Further particulars may be had on application to the Sanitary Artisans' Exhibition, Mansion House, Dublin.

LOCAL INTELLIGENCE.

At the meeting of the Newark Town Council and Urban Sanitary Authority on Feb. 3, Mr. Knight asked what was the duty of the Public Analyst. The Mayor said he was paid £15 a year as a consulting fee for his services, and any ratepayer could have food or drink analysed by him on paying 10*s.* 6*d.* If they could reduce it to 5*s.* 6*d.* it would be used by many ratepayers to whom the fee of 10*s.* 6*d.* was prohibitory. Mr. Howe thought that the £15 was very thrown away. Alderman Pratt said the Act of Parliament would not allow the Public Analyst to be dismissed except with the sanction of the Home Secretary, and another would immediately be appointed to succeed him. Mr. Howe said the fact that an article had been sent by the public to Dr. Ashby for analysis and that the people were well satisfied with their milk, butter, and so on, might say their beer. (The good folk would seem to act on the principle that 'where ignorance is bliss, 'tis folly to be wiser.—Ed.)

Mr. Chesnut, the Public Analyst for Hastings, reported to the Town Council and Urban Sanitary Authority, at their quarterly meeting, that during the year ending Dec. 31, 1884, 35 samples were submitted to him, of which 12 proved to be adulterated and 23 pure. As compared with last year there was a greater variety, and as more sample, also twelve adulterated samples in the place of 10. Prosecutions were instituted in every case. In the case of 10 samples of mustard, the prosecutions were abandoned on account of some previous decisions of the superior courts, and one in respect to sample of whisky was upset on a technical objection, whereas all others were successful, and resulted in fines ranging from 5*s.* to 10*s.* The following is a detailed list of the analyses:—Milk, genuine, 12; adulterated, 3. Mustard, adulterated, 9. Raspberry jam, genuine, 6; adulterated, 1. Brandy, genuine, 1; gin, 1; port, 1. Ham, 1. Coffee, adulterated, 4. Whisky, genuine, 1; adulterated, 4. Food samples of water were analysed for the Authority during the year.

At the meeting of the Ashborne Local Board and Urban Sanitary Authority, on Feb. 9, the following resolution was moved by Mr. Alfred Hall, seconded by Mr. R. D. Holyoak, and carried unanimously, and the clerk was requested to forward a copy of it to Mr. Cooper:— 'That this Board do now so record upon its minutes its warm appreciation of the valuable services rendered by the late Mr. Richard Cooper, as a member during many years, and in recognition of his high character, business capacity, and unflinching kindness of courtesy. That his fellow members are fully conscious of the loss they have sustained by his untimely death, after a long and painful illness, and beg to tender to his widow and son an expression of very deep sympathy and condolence with them in the irreparable bereavement they have sustained.'

The Cardiff Port Sanitary Authority have increased the salary of Mr. Joseph G. Gower, the Inspector of Nuisances, from £40 to £50 per annum.

st quarterly meeting of the Louth Town Council and tary Authority, the Public Analyst reported that no been submitted to him for analysis.

sham Improvement Commissioners have been continued nitary Authority until March 25, 1886, by Order of the nment Board.

bridge Guardians and Rural Sanitary Authority have, action of the Local Government Board, increased the r. J. H. Square, the Clerk, £30 per annum.

nightly meeting of the Sittingbourne Local Board and tary Authority on Tuesday, the 3rd inst., the Medical ealth reported the deaths of two little girls, which he strictly traceable to over-pressure of work. It appears, to observe, 'both these little girls were the pride of their m their great aptitude for grasping the subjects taught, ately rest for the brain was not sought until too late.' ame to the conclusion that they could take no action in because it was not one which would come within their as a sanitary authority; but regret was expressed, if the well founded, that the facts were not reported to the he time, so that there might have been an inquiry. tutory half-yearly meeting of Old Monkland, Lanarkshire, oard, on the 5th inst., a communication was read from the pervention, enclosing, for the information of the Paro-, a copy of a letter addressed to the Clerk of the Old Monk- Authority on the complicated question of medical officers the parish. The letter is dated Feb. 20, and states that dical officer or officers is or are at once appointed in terms c Health Act, the Board of Supervision will take pro- compel the Local Authority to comply with the require- s Act as directed in their letter of Oct. 23 last.

d Government Board have declared the enactment con- ction go of the Public Health Act, relating to the making as to houses let in lodgings, to be in force within the ban Sanitary District, Lancashire.

hamstow Local Board and Urban Sanitary Authority, at eeting, upon the recommendation of the Finance Com- mended the salary of Mr. Gilbert Houghton, the Clerk, num, to enable him to have the assistance of an addi- , upon condition that he (Mr. Houghton) gives his per- lance at the offices, up to ten o'clock every morning in is decision was arrived at after a long discussion; and all rs who were present, with one exception, voted for it; mmediately gave notice that he would, at the next meeting, he resolution be rescinded.

The Nelson, Lancashire, Local Board and Urban Sanitary Autho- rity have increased the salary of Mr. William Dent, the Surveyor and Inspector of Nuisances, from £150 to £200 per annum.

At a statutory meeting of the owners and ratepayers of so much of the parish of Eglwysilan, in the county of Glamorgan, as is comprised in the rural sanitary district of the Pontypridd Poor Law Union, held at the schoolroom, Groes Wen, on the 26th ultimo, the following resolution was passed:—"That it is expedient that so much of the parish of Eglwysilan as is comprised in the Pontypridd rural sanitary district should be constituted a Local Government district."

APPOINTMENTS.

MEDICAL OFFICERS OF HEALTH.

ADAMS, Matthew Algernon, F.R.C.S. Eng., L.S.A. Lond., F.C.S., has been re-appointed Medical Officer of Health for the Maidstone Urban Sanitary District, at £200 per annum, for five years.

ALLERN, Josiah, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the No. 1 Division of the Belper Rural Sanitary District, Derbyshire, at £125 for one year.

BILLIARD, Richard Atherstone, L.R.C.P. Lond., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Kingston Urban Sanitary District, Herefordshire, for one year from Lady-day.

BLACK, George, M.B., C.M. Univ. Edin., has been re-appointed Medical Officer of Health for the Keswick Urban Sanitary District, at £25 for one year.

BUCHANAN, Peter, M.B., C.M. Univ. Glasg., has been appointed Medical Officer of Health for the Coleford Urban Sanitary District, Gloucestershire, at £20 for one year.

CAPE, Joseph Thomas, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Totnes Rural Sanitary District, at £100 for one year.

CHAPMAN, James, L.F.P.S. Glasg., and L.M., L.S.A. Lond., S.S. Cert. R.C.P. Edin., has been appointed Medical Officer of Health for the Hursley Rural Sanitary District, at £25 per annum (in addition to £120 per annum and fees as Medical Officer and Public Vaccinator for the Hursley District and the Workhouse of the Hursley Union), *vice* Selwood, deceased.

CLEGG, Walter, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Boston Rural Sanitary District, at £180 per annum, for three years.

DAKEYNE, Thomas Edward, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Leek Rural Sanitary District, Staffordshire, at £80 for the year ending March 25.

DAVIES, Daniel Rees, M.B., C.M. Univ. Edin., L.R.C.P. Edin., L.R.C.S. Edin., and L.M., has been appointed Medical Officer of Health for the Aberystwith Urban Sanitary District, at £50 for one year, *vice* Jones, whose appointment has expired.

DAVIES, Edward, M.D. Univ. St. And., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Northern Division of the Wrexham Rural Sanitary District, at £60 for one year.

GAYLOR, Edward, L.R.C.P. Edin., and L.M., L.F.P.S. Glasg., has been re-appointed Medical Officer of Health for the No. 2 Division of the Belper Rural Sanitary District, at £125 for one year.

HARKER, John, M.D. Heidelb., L.R.C.P. Edin., has been re-appointed Medical Officer of Health for the Lancaster Port Sanitary District, for the year ending March 25, 1886; no fixed salary, payment according to services rendered.

JONES, William, L.R.C.P. Lond., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Southern Division of the Wrexham Rural Sanitary District at £60 for one year.

JOY, Frederick William, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Thetford Urban Sanitary District, at £20 for one year.

LAMB, William, M.D. Univ. Edin., has been appointed Medical Officer of Health for the Arnold Urban Sanitary District, Nottinghamshire, at £20 for one year, *vice* McMillan, resigned.

LANGDON, Thomas Charles, F.R.C.S. Eng., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Winchester Urban Sanitary District, at £100 per annum, for three years.

MEAD, George Owen, F.R.C.P. Edin., has been re-appointed Medical Officer of Health for the Newmarket Urban Sanitary District, at £25 for one year.

PROSSER, Thomas Gilbert, M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Monmouth Urban Sanitary District, at £25 for one year, *vice* Mayou, whose appointment will expire on the 25th inst.

VERTUE, Francis Henry, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Southwold Urban Sanitary District, Suffolk, at £10 for one year.

WHITE, Sinclair, M.D., F.R.C.S. Eng., has been appointed Medical Officer of Health for the Sheffield Urban Sanitary District, at £500 per annum, *vice* Whitgrave.

WOOD, William Dyson, L.R.C.P. Edin., L.R.C.S. Edin., L.S.A. Lond., has been re-appointed Medical Officer of Health for the combined Bicester, Chipping-Norton, Henley, Thame, Witney, and Woodstock Rural Sanitary Districts, and Bicester, Chipping-Norton, Henley, Thame, Wheatley, and Witney Urban Sanitary Districts, in the county of Oxford, at £616 per annum, for three years.

SURVEYORS, CLERKS TO GUARDIANS, INSPECTORS OF NUISANCES, &c.

ALLEN, Mr. C., has been re-appointed Inspector of Nuisances for the Leek Rural Sanitary District, Staffordshire, at £80 for one year, ending March 25.

AVLESBURY, Mr. Councillor, has been elected a Member of the Dorchester Port Sanitary Authority, *vice* Snook, deceased.

BARRAS, Mr. George Thomas, Solicitor (son of the late Clerk who held the appointment for forty-one years), has been appointed Clerk to the Rotherham Guardians and Rural Sanitary Authority, at £150 per annum as Clerk to the Guardians, and such further salaries as Clerk to the Rural Sanitary Authority, the Assessment Committee, and the School Attendance Committee, as may be annually fixed, and fees as Returning Officer.

BEAUMONT, Mr. Herbert, has been appointed Clerk to the Wakefield Guardians and Rural Sanitary Authority, at £50 per annum as Clerk to the Guardians, £80 per annum as Clerk to the Rural Sanitary Authority, such amount as may be fixed annually, usually £50, as Clerk to the Assessment Committee, £10 per annum as Clerk to the School Attendance Committee, and fees as Superintendent Registrar of Births, &c., and Returning Officer, *vice* Wilson, deceased.

BIRD, Mr. O., has been re-appointed Clerk to the Newhaven Local Board and Urban Sanitary Authority, for three months, from April 7.

BOURNE, Mr. John, has been appointed Surveyor and Inspector of Nuisances to the Shepton Mallet Local Board and Urban Sanitary Authority, at £100 per annum, *vice* Hardisty, resigned.

BOVBY, Mr. John, has been re-appointed an Inspector of Nuisances for the Totnes Rural Sanitary District, at £35 for one year.

BRIDGEWATER, Mr. Basil Bently, has been re-appointed Inspector of Nuisances for the Hereford Urban Sanitary District, at £80 for the year ending March 25.

BUCKLEY, Mr. J. A., has been elected Chairman of the Hampton Wick Local Board and Urban Sanitary Authority, and a Member of the Lower Thames Valley Main Sewerage Board, *vice* Sir Thomas J. Nelson, deceased.

BURBURY, Mr. J. H., has been elected a Member of the Kenilworth Local Board and Urban Sanitary Authority, *vice* Robbins, resigned.

COMPTON, Mr. Thomas Morant, has been re-appointed Inspector of Nuisances for the Carlisle Urban Sanitary District, at £125 for one year.

DOODY, Mr. C., has been elected a Member of the Nantwich Local Board and Urban Sanitary Authority, *vice* Jackson, resigned.

DURRANT, Mr. W., has been re-appointed Inspector of Nuisances for the Chertsey Rural Sanitary District, at £200 per annum, for three years.

EDDOWES, Mr. William Chapple, has been appointed Surveyor to the Shrewsbury Town Council and Urban Sanitary Authority, at £300 per annum, *vice* Butler, resigned.

GAMON, Mr. William, has been re-appointed Inspector of Nuisances for the Winchester Urban Sanitary District, at £100 per annum, for three years.

GOULD, Mr. R. D., whose duties as Surveyor to the Town Council and Urban Sanitary Authority of Barnstable will cease from March 25, has been appointed Consulting Surveyor, at £100 per annum.

GRINLEY, Mr. Samuel S., the Assistant Surveyor, has been appointed Surveyor to the Hendon Local Board and Urban Sanitary Authority, at £150 per annum, *vice* Pollard, whose appointment has expired.

GRIMSHAW, Mr. Richard, Inspector of Nuisances for the Rishton Urban Sanitary District, has been appointed Inspector under the Sale of Food and Drugs Act.

HANKIN, Mr. Joseph John, has been appointed an Inspector of Nuisances for the Preston Urban Sanitary District, at 30s. per week.

HARRIS, Mr. John, has been re-appointed Inspector of Nuisances for the Newnham Urban Sanitary District, at £10 for one year.

HARPUR, Mr. S., who resigns as Surveyor to the Merthyr Tydfil Local Board and Urban Sanitary Authority in June, has been appointed Consulting Engineer, at £150 per annum, with expenses and the use of a horse.

HEPWORTH, Mr. George, has been appointed Surveyor to the Brighouse Local Board and Urban Sanitary Authority, for one year, *vice* Rogerson, whose appointment has expired.

LEES, William Hewson, A.R.I.B.A., has been appointed Surveyor under the Metropolitan Building Act 1855, for the South East Deptford District, *vice* Whicford, deceased.

LUCAS, Mr. Radnor, Branch Manager of the Wilts and Dorset Banking Company, has been appointed Treasurer to the Town Council and Urban Sanitary Authority of Chard, *vice* Farmer, resigned from ill-health.

MATTHEWS, Mr. Henry, has been re-appointed Inspector of Nuisances for the Martley Rural Sanitary District, at £100 per annum from year to year.

MILNER, Mr. William, has been appointed an Inspector of Nuisances for the Preston Urban Sanitary District, at 30s. per week.

MUNDAY, Mr. R. White, has been re-appointed Surveyor to the Buckingham Town Council and Urban Sanitary Authority, at £50 per annum.

OSBORNE, Mr. James, has been elected a Member of the Ashborne Local Board and Urban Sanitary Authority, *vice* Cooper, deceased.

PAUL, Mr. A. D., Bank Manager, has been appointed Treasurer to the Chard Guardians and Rural Sanitary Authority, *vice* Weaver, resigned from ill-health.

SANDELL, Mr. Henry, Bank Manager, has been appointed Treasurer to the Devizes Guardians and Rural Sanitary Authority, and to

the Devizes Town Council and Urban Sanitary Authority, *Locke*, deceased.

SHELDON, Mr. John, has been re-appointed Surveyor to Eaton Local Board and Urban Sanitary Authority, I at the rate of £90 per annum, for three months.

SMITH, Mr. Claudius, has been appointed Inspector of Nuisances for the Kington Urban Sanitary District, Herefordshire, at £100 per annum, *vice* Wislade, resigned.

SMITH, Mr. Isaac, has been re-appointed Inspector of Nuisances for the Lancaster Port Sanitary District, at £10 for the year ending March 25, 1886.

STEPHENSON, Mr. John, has been re-appointed Inspector of Nuisances for the Boston Rural Sanitary District, at £156 per annum, for three years.

SUGDEN, Mr. John, has been elected a Member of the Local Board and Urban Sanitary Authority, *vice* Sugden, his father, deceased.

THOMPSON, Mr. Joseph, has been appointed an Assistant Inspector of Nuisances for the Halifax Urban Sanitary District.

TOLLIT, Mr. W. F., has been appointed an Inspector of Nuisances for the Toines Rural Sanitary District, at £35 for one year, *vice* Watson, deceased.

TROUNSON, Mr. J. C., has been appointed Assistant Surveyor to the Town Council and Urban Sanitary Authority of Plymouth, at £140 per annum, *vice* Buchan.

TRUBSHAW, Mr. J., has been elected a Member of the Local Board and Urban Sanitary Authority, *vice* resigned.

WALLIS, Mr. Thomas Wilkinson, has been appointed Surveyor to the Town Council and Urban Sanitary Authority of Loughborough, at £100 per annum, *vice* Marsden, resigned.

WARD, Mr. William, has been appointed Surveyor and Inspector of Nuisances to the Town Council and Urban Sanitary Authority of Honiton, at £50 per annum, *vice* Plucknett, deceased.

WHIBLEY, Mr. George H., has been appointed Collector of Rates to the Town Council and Urban Sanitary Authority of Macclesfield, at £80 per cent. commission, *vice* Oakley, deceased.

WOOD, Mr. Frederick, Bank Manager, has been appointed to the Tiverton Guardians and Rural Sanitary Authority, *vice* Dunsford, resigned.

PUBLIC ANALYSTS.

JONES, Mr. E. W. T., has been re-appointed Public Analyst for the Borough of Wolverhampton, for one year.

STOKES, Mr. Alfred Walker, has been appointed Public Analyst for the parish of St. Luke, Middlesex, at £50 per annum, *vice* resigned.

VACANCIES.

MEDICAL OFFICER OF HEALTH for the Parish of St. Luke, London, at £150 per annum. Application to G. W. Prest, Clerk, City Road.

MEDICAL OFFICER OF HEALTH for the Lewisham District, at £100 per annum. Application, 23rd inst., to H. S. Winnett, Clerk, Board of Works.

MEDICAL OFFICER OF HEALTH for the Guilford Rural Sanitary District, at £45 per annum. Application, 28th inst., to Clowes, Clerk to the Authority, New Buckenham, and

MEDICAL OFFICER OF HEALTH for the Llandysilio Urban Sanitary District. Application to Thomas Hughes, Clerk.

TOWN CLERK AND CLERK TO URBAN SANITARY AUTHORITY for the Wigan Sanitary District, at £700 per annum and costs out of office. Application, 23rd inst., to M. W. Peck, Clerk.

TREASURER to the Bridlington Guardians and Rural Sanitary Authority. Application to C. Gray, Clerk.

CLERK to the Houghton-le-Spring Guardians and Rural Sanitary Authority, Co. Durham.

CLERK to the Sculcoates Guardians and Rural Sanitary Authority, Yorkshire.

ENGINEER AND SURVEYOR to the Merthyr Tydfil Local Board and Urban Sanitary Authority, at £350 per annum, with the use of a book-keeper and the use of a horse. Application, to Thomas Williams, Clerk.

SURVEYOR to the Town Council and Urban Sanitary Authority of Norwich. Application to the Town Clerk.

SURVEYOR to the Bradstow Local Board and Urban Sanitary Authority. Application to the Clerk.

SURVEYOR to the Workshop Local Board and Urban Sanitary Authority, at £120 to £150 per annum, with an office. Application, 23rd inst., to John Appleton, Clerk.

SURVEYOR to the Matlock Local Board and Urban Sanitary Authority. Application 21st inst., stating salary not to exceed £100 per annum, to J. W. Skidmore, Clerk.

SURVEYOR to the Frome Local Board and Urban Sanitary Authority. Application to G. W. Bradbury, Clerk.

SURVEYOR, INSPECTOR OF NUISANCES, AND COLLECTOR of Rates to the Huddersfield Local Board and Urban Sanitary Authority. Application to G. H. Hibbert, Clerk, 50 Westgate, Huddersfield.

ASSISTANT SURVEYOR to the Hendon Local Board and Urban Sanitary Authority. Application to Samuel Tilley, Clerk to the Authority, West Malling.

COLLECTOR to the Town Council and Urban Sanitary Authority of Louth. Application to T. F. Allison, Town Clerk.

have now arrived for initiating researches in this direction.

There is one difficulty in connection with the action of disinfectants on specific infective matter—viz., the presence or absence of spores in the materials operated upon. In some specimens of bacteria examined, the spore stage of growth appears to have passed by, so that a lower temperature, a smaller quantity, and a less potency of a disinfectant will then suffice. As regards small-pox, &c., there is no certain evidence of the presence of specific living organisms, and, therefore, the first point appears to be to procure evidence of their existence. At present we reason from analogy—i.e. we infer from the symptoms occurring in a case of small-pox that they are caused by the entrance into the blood of a specific infection. The quantity necessary for infection is most probably very minute, as in the case of specific septicæmia, a one-millionth part of a drop of infected blood was sufficient to destroy the life of a young rabbit with symptoms of septicæmic poisoning. It was also found that by heating the blood to 212° F. for six hours, and then to 250° for one hour, the infectiousness of the blood in this instance disappeared.

The word disinfectant is ordinarily used in a most extended sense, being applied to agents which remove offensive smells, or check putrefactive action, as well as to other chemical agents that act as germicides, with or without being deodorants or antiseptics. Strictly speaking, it is a substance capable, when used in proper quantity and under suitable conditions, of taking away the power from an infected article or animal, of setting up in a healthy animal, including man, an analogous disease to that from which the sick suffered. This may be done by the direct action of the disinfectant in destroying the specific contagion or by arresting or preventing its action in the body. The former class of disinfectants are germicides, the latter mostly antiseptics. In addition to these there are the oxydising agents, which are for the most part germicides, when used of a sufficient strength.

The dose of infectious matter necessary to spread the disease is very doubtful, but, judging from the amount required for a successful vaccination, the quantity for small-pox is larger than for septic diseases. I have already mentioned that a millionth part of a drop of blood containing a septic poison, when introduced into the blood of a rabbit, was sufficient to cause death in a little more than twenty-four hours, and that the blood of the animal that died was swarming with bacteria. The minute dose of zymotic poisons which will destroy life shows the excessive care that should be used in disinfecting all the excreta, the clothing and bedding of patients, and, where possible, the air expired from the lungs and the vapours given off by the skin of the patient. This latter is, however, a medical question. In fumigating a room with sulphur, the chimney should be blocked up, paper be pasted all around the window sashes, the opening around the doors properly closed, and all other openings properly pasted over with brown paper. All the personal belongings used by the patient and in his room, such as bedding, beds, carpets, &c., should be either baked or burnt. It must also be remembered that there is very good evidence to show that during epidemics the virus has greater intensity than at non-epidemic periods, and that, therefore, extra care, if possible, should be used in disinfection. The question as to

the utility of anointing the bodies of the sick with carbolic and other soaps, or with medicated oil, does not fall within the province of this paper.

Disinfectants are so numerous that I do not propose discussing any but those that are most frequently employed, or which are efficient and capable of being safely used by the public. They may be conveniently grouped into (1) desiccating agents, (2) oxidising agents, (3) germicides, and (4) antiseptics. In the first, the most important is dry heat and heated steam; amongst the second, permanganate of potash and manganate of soda, sanitas tablets, and other bodies said to evolve peroxide of hydrogen, whilst in the third class are comprehensive sublimates, chloride of zinc (Burnett's), arsenic, nitric, sulphuric, and hydrochloric acids, chlorine and some chlorides, sulphurous acid, and most nitrites, glacial acetic acid and some similar chemical agents. As to antiseptics, there are numerous, and include alum, chloral hydrate, mercuric salt, salts of iron, copper, &c., carbolic acid both pure and impure, and some other tannins. Many of these disinfectants act not only as germicides when used of great strength, but also as antiseptics, and the same remark applies to oxidising agents, so that it must not be supposed that the above-named have only the specific action of a class in which they are grouped. I do not propose discussing the comparative value of all these bodies.

In selecting a disinfectant for general use, we must consider its efficiency, its safety, its cost, and its freedom from poisonous qualities seen in leading indications; unfortunately, however, of those which are cheap and non-poisonous, such as chloral and alum, are not sufficiently active for general use, whilst sulphate or perchloride of iron are objectionable because they stain linen, woollen goods, and should therefore be avoided. The same objection applies to Condy's blue when used of sufficient strength to act as a disinfectant, and the expense of the fluid is also a drawback to its general use. Carbolic acid in liquid forms is a comparatively cheap and efficient disinfectant, but those from which tar and other acids have been removed, except for special purposes, should alone be used, as it is useless to employ cheaper sorts, unless with the addition of some similar base to render them soluble. Glacial acetic acid, in the form of aromatic vinegar, has been employed for a very long time, and was in the olden time by physicians when attending cases of gaol fever, plague, &c. It was also used to have been carried by thieves and others pillaging the houses and bodies of those who died from the plague. Bunches of sweet-smelling flowers and of flowers were placed in front of the cells when trying prisoners brought from the Old Bailey in times when gaol fever prevailed. These aromatic essential oils containing peroxide of hydrogen, and are therefore of some use in sick rooms. Carbolic acid, either in the liquid state or in the form of a mixture with sulphurous acid, &c., is also very useful, but requires discretion in its use.

I shall now proceed to discuss the most efficient disinfectants, considering, in the first place, disinfectants and heat.

Aerial Disinfectants.—The two disinfectants in this class chiefly employed are chlorine and sulphurous acid gas. In addition, however, to carbolic acid, sanitas oil, terebene, solution of chloride of

ly's fluid are sometimes diffused through the sick chamber by means of a vaporiser, are more commonly used by sprinkling the fluid on a sheet fastened to the door frame, to admit of persons passing in and out of the room. They are also often sprinkled about the room, and even the house generally, or are in saucers. As I have just mentioned, they are of little service. If, however, they are used while the patient is in the room, of such a nature as might injure the patient, it becomes a question if they should be used at all, but some experiments by Dr. Klein (published in the supplementary thirteenth Annual Report to the Local Sanitary Board) afford some hope that by judicious management the risk of infection may be avoided by their use. Certainly the offensive sick rooms occupied by patients having scarlet fever, typhoid, and some other fevers, may be disinfected by the vaporisation of Condy's fluid, in solution, and other oxydising bodies, if a proper vaporiser be used. Dr. Klein has made a number of experiments upon the 'swine plague,' which is highly infectious, and usually causes death in swine. He first tried the use of phenilacetic and phenilpropionic acids in the juice of a diseased lung, and found that a mixture containing 1 of the acid to 800 of blood, rendered the juice innocuous in twenty minutes after its use. He had also shown, in a former report (1877-78), that the infection spreads from a diseased animal to a living animal placed in the same room, even when the two animals were separated by considerable space. On Nov. 6, 1883, a pig was placed in a stable, 18 feet long, and infected with the disease. On the 13th day the stable was fumigated with chlorine, so that the air in it became pungent. A healthy pig No. 2, was placed in it, and allowed to remain for 24 hours with the door closed, and at the expiration of that time the stable was again fumigated sufficiently to make the air well pungent, and the pig allowed to remain three hours longer, and was taken away. The same process was repeated every day until the 18th, when pig No. 1 died, but pig No. 2 remained quite healthy.

A similar set of experiments were made on Nov. 23 to 28 with pigs Nos. 3 and 4, when pig No. 3 showed symptoms of the disease on the 24th, it was found, however, on close inquiry, that the attendant had neglected the second fumigation on the 26th, so that when pig No. 4 was removed on the 28th the smell of chlorine was very faint. In a second series of experiments it was found that healthy pigs were put into a stable imperfectly fumigated they took the disease. Dr. Klein, therefore, put two diseased pigs in separate stables (a and b) and after a few days had them removed to stables c and d. Stables a and b were well fumigated with chlorine for six hours, and into each of which was put a healthy pig, and kept there for several days during which time they remained well. After a few days they were inoculated with swine plague, and showed symptoms of the disease after two or three days' incubation. Pig No. 4, which was suffering from the disease at the time of its removal to stable c, died in due course.

This is a very important experiment, especially if the results should be obtained hereafter, since the experiments by the same experimenter have

shown that chlorine is not so powerful a germicide as sulphurous acid gas, which, I believe, is now used almost to the exclusion of everything else, as an aerial disinfectant. In Hackney for many years past the infected rooms and articles therein are disinfected with sulphur before any of the contents are removed to the disinfecting hot-air apparatus, 1 lb. of sulphur being used to each 1,000 cubic feet of air in the room. This has been done with most satisfactory results; as, except in cases where the disease has occurred again in less than fourteen or fifteen days, there has scarcely been an instance of recurrence, at any rate within three or four months. I am not aware of any case in which another family has come to live in the room or rooms when vacated, and the disease has broken out again, except where it has been shown that they came from an infected house.

The use of aerial disinfectants as usually carried out by sprinkling floors, articles of clothing, &c., with a disinfecting fluid, or of wetting sheets to allow of evaporation, is worse than useless, as it is apt to engender a false confidence in those who use them. Of course, after the experience of Dr. Klein, I am not prepared to say that they cannot be employed so as to prevent the infection of nurses, visitors, and others, if the chlorine or sulphur be used in a sufficient quantity to make the air almost irrespirable. It seems to me too great a risk to expose a patient and visitors to these gases of sufficient strength and for the time requisite to render the infectious matter inert, especially as regards small-pox, when they can protect themselves in another way, viz., by vaccination or revaccination. If Dr. Klein's experiments can be successfully carried out by others, the plan might be useful in preventing the infection of persons outside the sick room, by forcing the air through solutions of these gases, instead of into or rather through a furnace.

Heat.—The most certain and useful disinfecting agent is dry heat. This is applied in several ways, the operation being generally carried out in what may be termed large ovens, heated either by coal or gas. But as superheated steam is to all intents a dry heat, because the slight moistening of the articles steamed soon goes off after the door of the apparatus is opened, the disinfectors worked by it may be looked upon as ovens. Numerous experiments have been carefully made on the temperature at which certain matter capable of conveying infection becomes sterilised. The apparatus in use at Hackney is Fraser's, which has been in satisfactory operation there since 1871, but it has this objection, that the heat gets up slowly, and is not so readily under control as some others, being heated by coke, and, unless carefully watched, articles placed in it get scorched. There is another apparatus recently introduced by Jennings, which was tested at the Exhibition of 1884, and obtained a silver medal, in which the heat is obtained from gas, the burners being below, and the articles to be disinfected being placed on rods above. It is stated that in little more than half an hour the temperature rose to 262° F. The same, however, may be said of Lyon's disinfecter, which is worked by superheated steam, and, so far as I have seen, is more penetrating and less risky than dry heat. With this apparatus I saw a thermometer placed in a mattress indicate 242° F. in forty minutes. Another machine for disinfecting by dry heat is Ran-

some's, which is worked by gas, and has the great advantage of being provided with a self-acting apparatus for regulating the supply of gas and keeping the contained air at one temperature. The disadvantage of Lyon's machine is that it requires a six horse-power engine for its efficient working, unless steam can be borrowed for the purpose. Some experiments were made some time since by Dr. Henry on vaccine lymph to ascertain the temperature at which it becomes sterile, when it was found that a temperature of 150° F. continued for two hours was sufficient for this purpose, but that 120° continued for three hours did not have a similar effect. In using heat it must be remembered that the same temperature which will sterilise infectious matter, if applied for two hours or more, will not do so if used for half an hour only; so that the temperature of 230° to 240° , which is that employed at Hackney, where the articles are, as a rule, kept in for about three hours, and which rarely scorches, has answered very satisfactorily. Experiments at this temperature have been made on yeast, bacteria, living organisms in sewage, and fungi, with the result of destroying the power of propagating their like. It must, however, be remembered that although bacteria are destroyed at this temperature, the spores, if any be present, will not be deprived of their vitality. Dr. Baxter placed points charged with vaccine lymph into an oven to ascertain the temperature required to render dry lymph sterile. He found that until a temperature of above 176° F. had been reached the lymph remained active, but the time in which it was exposed to the highest temperature noted was not more than thirty minutes, whilst Dr. Henry exposed the lymph in the first set of experiments for four and in the second for two hours. Similar results have been obtained in other experiments.

Some years ago I made numerous experiments conducted on each group of objects for nearly three weeks, and ascertained that the living organisms in sewage, including infusoria, vibrios, bacilli, spirilla, were deprived of motion by a temperature of 140° Fahr. The infusoria, as might have been expected, became motionless at a much lower temperature, viz., 110° ; at 125° most of the vibrios, bacilli, and spirilla became motionless, and at 135° nearly all the bacilli ceased to move, and at 140° all were dead. At the end of four days some bacteria were moving about, but as the beakers in which the experiments had been carried out were not covered, they might have been newly introduced from the air. These experiments agree very well with those on vaccine virus, but not at all with the investigations of Mr. Crace Calvert and others. It is doubtful how far we should apply the results of experiments such as these to the infectious matter of zymotic diseases, but the rough proof afforded by disinfection by heat, of infected clothing, bedding, &c., is, I think, sufficiently reliable to justify us in saying that the exposure of infectious matter to a temperature of 240° F. for an hour, after the disinfector has been raised to that temperature, is sufficient to prevent the spread of an infectious disease.

Although the term 'disinfectant' has been used here in its broadest sense, I think it should be confined to germicides, as I stated years since. If I had adopted this restricted meaning, I should have left unnoticed some chemical agents which I am desirous of bringing before your notice, and I shall therefore refer to them in the order previously stated.

Condy's Fluid is a solution of permanganate of potash, and in a very expensive form, when used as prepared for sale. The permanganates are oxydising agents, and manganate of soda has been largely used by the Metropolitan Board of Works, for oxydising the animal matter contained in the sewage poured into the Thames. Condy's Fluid is often used by sprinkling it on a sheet in the sick room, and other disinfectants are often used in the same way. As regards small-pox, and other zymotic diseases, there is but little, if any, use in evaporating Condy's Fluid in a sick room, even by a vaporiser, except for the purpose of removing unpleasant smells by oxydation. As regards small-pox, there is certainly a special reason why it and other aerial disinfectants must be useless, viz., that experiments by Chauveau seem conclusively to prove that the poison is not volatile. Bedside experience also points to the same conclusion. I noticed when experimenting with Condy's Fluid, used in rather large proportions, that it increased the movements of microscopic life in sewage, apparently by setting free oxygen, and it was not until the colour of the fluid ceased to be discharged, on its addition to sewage, that any prejudicial effect on life was perceptible. As regards the influence of permanganate on vaccine lymph, it was shown that one half, 0.5 per cent., of this disinfectant sterilised it, but that a smaller quantity did not. The permanganate itself, and not Condy's Fluid, was used in this experiment.

Carbolic Acid.—Considerable differences occur in the results of experiments according to the kind of acid used. Many of the experimenters have used the pure crystallised acid, but this is not the substance usually employed by local sanitary authorities and their officers. The same remarks that have been made on Condy's Fluid as regards aerial disinfection when a patient is in the room, apply with greater force to carbolic acid, as it is not an oxydising agent, and cannot be safely respired when it is evaporated by a vaporiser to a sufficient extent to prove a disinfectant. Pure carbolic acid is more of an antiseptic than a germicide, but some of the other tar acids contained in the fluid acid, as usually sold, are more potent germicides. I found that 1 per cent. of No. 5 carbolic acid (which is called miscible, although it is so only to a certain extent) would destroy bacterial and infusorial life for a long period, but at the expiration of about twenty-eight days, living bacteria were detected in the solution, apparently through the evaporation of the acid. A solution of $\frac{1}{4}$ per cent. destroyed infusoria, but not bacteria. Dr. Baxter reported some experiments with carbolic acid (pure crystals) in the sixth report to the Privy Council, to the effect that, when less than a 1 per cent. solution of acid with vaccine lymph was used, the mixture remained active, but when mixed with $1\frac{1}{2}$ per cent. its activity was diminished, and with 2 per cent. it ceased to be infective. This is important, as a 2 per cent. admixture of acid is a strength far in excess of that ordinarily used for disinfecting purposes. Mr. Wynter Blyth also carried out a series of experiments with various chemical disinfectants on the spores of the anthrax bacillus, and showed that neither carbolic acid nor any other chemical agent will deprive these spores of their power of germinating in a proper cultivating liquid. The same remarks apply to carbolic acid powder.

The action of chlorine and chloride of zinc is effective when a certain strength is used. These

ter found that when chlorine was added to virus in sufficient quantity to make it acid, was in the proportion of 1633 per cent., the as sterilised. I added chlorine water to but the quantity necessary to make it acid in excess of that likely to be ordinarily id but little effect was produced on the . Chloride of zinc in the proportion of one ett's Fluid in 200 of sewage, was sufficient to tion in the various forms of life ; but a solu-chlorinated lime in the same proportion did xduce any decided effect. Hydrochloric ic) acid was also tried, and had, with the hlorides, but very little influence on the ant odour, but it stopped all evidences of life as it was added to the sewage in sufficient es to make it decidedly acid. All these dists, as well as sulphurous acid, are somewhat us to use, especially by uninstructed persons, uld not be distributed to all comers.

axter made a series of experiments on dry lymph with chlorine, sulphurous acid, and our of carbolic acid, when he found that it essary to expose the lymph to the action of rine and carbolic acid vapour for thirty before it was sterilised, but that an exposure minutes to sulphurous acid gas was sufficient purpose, showing that sulphurous acid gas is y the most active aerial disinfectant readily ole with which we are acquainted.

orine, when added to sewage in the propor- t per cent., removed the offensive smell and d the infusoria, but not the bacteria ; but er cent., bacterial motion ceased. The agent advantage of substituting a rather pleasant r the offensive odour of sewage.

ckton is a good disinfectant, but it labours e disadvantage of being dangerous to use, as a quantity of sulphurous acid in solution, ot carefully unstoppered in hot weather it ie out of the bottle almost like ginger beer, troy or decolorise the fabrics, clothes, &c., with which it comes in contact. dded in the proportion of 2 per cent. to ewage, it removed the offensive smell and d the bacteria, and no life was discovered in ge acted upon during the twenty-one days l it was kept.

um was by no means satisfactory, as it emoved the offensive smell nor destroyed the hen 2 per cent. was added to sewage, illed the infusoria. It, however, decidedly the putrefactive change when added to a ision of beef.

ction of Ditches, Middens, &c.—Although itan sanitary officers have but little to do disinfection of ditches, &c., yet it is of im- for inspectors at large to have some know- the agents most suitable for this purpose. lphate or perchloride of iron is used, a pre- of oxide of iron occurs with decomposition carbonate of ammonia found in ditch- it received the drainage of houses, and ted hydrogen is deposited as sulphide of om 20 to 30 grains of sulphate per gallon e is necessary. Lime is often used, but is fficacious, as the organic matter contained recipitated mechanically, and the offensive en becomes, after a time, worse than before, sulphide of calcium formed from the sul- l hydrogen remains dissolved in the water.

Hillé's process for deodorisation consists of lime, tar, and salts of magnesium, mixed with water, and in suitable cases is very useful. For middens, cess-pools, &c., sulphate of iron in solution, with fluid carbolic acid added, is suitable, or nitrate of lead may be used. Sufficient of this for an ordinary sized cesspool may be made by dissolving 1 lb. of litharge (sugar of lead) in 2 gallons of water, and adding 7 ounces of strong nitric acid, part only of the water being added before the acid. If carbolic acid be used, from 50 to 100 parts of water should be added to each part of acid. If the powder be used, we must remember that it ordinarily varies in strength, but generally consists of about 33 per cent. of carbonate of lime and other chemicals in McDougall's powder, whilst Calvert's contains from 20 to 30 per cent. of fluid acid and alumina. For cesspools, and occasionally for drains, a mixture of 6 lbs. of quicklime and 1 pint of carbolic acid makes an efficacious mixture. These lime powders should not be used to any extent for urinals, as they choke up the pipes rather quickly ; nor too largely and frequently for house-drains, for the same reason. Terebene is a powerful deodorant, as it removes the smell of ammonia and sulphuretted hydrogen, and, if used in full quantities, it substitutes a somewhat pleasant for the unpleasant smell. It consists of terebene, sulphate of copper, or of iron, and sometimes of both, as well as alum and a little bichromate of potash, and is one of the very best disinfectants for house-drains and cesspools. Chloride of lime is objectionable, because the volatile parts escape after a time, and decomposition of the sedi- ment sets in, giving off a most disagreeable smell.

Inspectors of nuisances will be so rarely called upon to report on the best means for disinfecting polluted rivers that I need not go into this question, especially as the means to be adopted will depend upon the refuse poured into them. The same remark also applies, but in a less degree, to sewers, as it is evident that the refuse from sugar factories, paper makers, chemical works, &c., requires different and special treatment. The occasional use of carbolic acid to sewers is of very little use, as the quantity of sewage quickly carries it away ; but if the gullies are trapped, carbolic, sanitas, or terebene powder may be usefully employed, as they deodorise the offensive contents, and prevent matters from arriving at a state of putrefaction before they find their way into sewers. The great use of disinfectants for house-drains is to delay the decomposition of any organic matters that may be detained in them or may coat their interior. The health of the inhabitants of the houses, of the sewer men, and of those who pass over untrapped gullies or ventilating openings, is, for this reason, less injured than it otherwise might be. The same remark applies to scrubbing-brushes, flannels, and other articles in drains which check the flow and cause deposits. The offensive smell from ventilating openings from sewers at the level of the street is believed to be best remedied by animal charcoal being placed in perforated trays or boxes between the openings and the sewers, but I have not noticed any permanent good effect, unless the charcoal is frequently changed and kept dry.

There are many other disinfectants besides those I have cursorily mentioned, which may, under certain circumstances, be usefully employed. I state this as I do not wish it to be considered that I believe all others besides those mentioned are valueless. There

are many of considerable efficacy, including salicylic acid, which are very useful as antiseptics, but they are chiefly used as preservative agents. I also have not considered in detail arsenic, chromic acid, corrosive sublimate, &c., as they are too dangerous and too expensive for ordinary use.

THE SANITARY STATE OF WHITECHAPEL.*

LAST year this country escaped a threatened visitation of the cholera which was so fatally prevalent in the south of Europe. It seems probable that if such immunity is again to be enjoyed, the sanitary authorities and the public generally must not relax in their efforts to unite their forces in watchful and earnest endeavours to improve the sanitary condition of the country.

In June of last year it was found that a large concourse of Russian Jews, hunted out of their native country, had sought shelter and protection near the members of their own faith and station in the neighbourhood of Whitechapel, and much activity was aroused with the object of raising the hygienic standard as high as circumstances would allow. Russia is not the country to teach cleanliness, and persecution is not the atmosphere in which to practise it; hence the Jewish Board of Guardians, mindful of their duty to their neighbours, and anxious that this additional crowding should not add strength to the threatening danger of an epidemic, determined to call their sanitary committee into active service, and to appoint, at their own expense, a special sanitary inspector, to observe and improve the healthy lodgment of the immigrants. The Board seems to have been stimulated to take this step on learning the startling intelligence that in that season of symotic peril, with this additional burden cast upon the authorities, the staff of the Whitechapel Local Board consisted of no more than two sanitary inspectors told off to regulate the hygienic condition of 7,500 houses. As the newly-appointed sanitary officer had no legal power, his services were offered to the Whitechapel Board, but, having been declined, he was left to exercise over landlords and tenants as much influence as he could command by means of printed notices and personal interviews. The sanitary committee of the Jewish Board report that many of their notices were respected, and thus a certain amount of responsibility and work was taken off the shoulders of the very limited district staff. When, however, attention could not be secured to the many grave sanitary defects which the inspector discovered, he was bound to report them to the local authorities of Whitechapel. The Jewish sanitary committee state that 'out of the total number of 1,747 houses visited, there were no fewer than 1,621 houses in which the water-closets were unprovided with any arrangement for flushing with water, and only 126 in which any such appliances existed.' And in October they addressed to the Whitechapel District Board of Works a letter, calling in these words their 'attention to the fact that in a very large

number of cases of sanitary defects brought to your notice in the months of June, July, and August last, no remedial action has been taken by the owners.' This letter points out a number of typical cases with very grave defects, in their opinion, rendered the houses in which they existed as unfit for human habitation, and the examples submitted do not represent homes of the Jewish poor. The Whitechapel Board, as will be seen later on, mistaking these specimens as the total number, congratulated themselves on its paucity.

The public authorities of the district express in this letter of information and advice a warmth no degree warmer than that proffered to the appointed inspector, and instructed a sub-committee to issue a report which frowns on the apathy of these volunteer fellow-labourers as though they intruded on the preserves of the regular sanitary authorities. It says 'that much more good (if the public persisted in) will result in the future which may be termed the enthusiasm of the moment of the inquiry has toned down to so much. Although this committee has been in existence for more than a quarter of a century, and has, on the occasion of the appearance of every epidemic, set to work erecting stand-pipes, yet it is evidently in the Jewish committee were far from having attained that goal at the time they issued their letter. The committee have perused the communication with regret, because, with the exception of the compliment paid to the medical officer and the sanitary inspectors, it is a continuous outpour of complaint and complaint . . . and your committee is clearly of opinion that it is the habits of the people more than the condition of the structural defects of the houses that have misled the agents of the guardians in framing their reports.' Then, passing by the necessity for water supply, thus to contest the superiority of one system as compared with another, it appears that, on the question of water supply to closets, the Jewish guardians were, from the first, impressed with the importance of a water apparatus being provided to every house. The system has, of course, very great merits in the circumstances; but Dr. Liddle, the late Medical Officer of Health, long since discarded it as unfitted to the habits of the people in the portions of the district, and the system of water-taker being appointed to flush the closets was substituted.

And, in conclusion, whilst refuting the charges of the Jewish Board, they 'point to the fact that the rates of mortality in the district were 18.9, 21.9, and 24.3 per 1,000. The last rate was raised in consequence of the deaths amongst infants from diarrhoea.' The Medical Officer of Health, states in his report for 1884 'that in the third quarter of the year there were increased deaths from infantile diarrhoea in the district at considerable disadvantage compared with some other districts. I stated in my report for the last quarter that such deaths belonged to the class of diseases of the digestive system, and not to the class of zymotic diseases, because it is usually caused by the administration to infants of food which they are unable to assimilate. It is so every medical man could bring evidence to demonstrate. The simple wit-

* Report of the Sanitary Condition of the Whitechapel District for the Quarter ended Jan. 3, 1885, also for the Year 1884. By Joseph Liddle, Medical Officer of Health. Board of Guardians for the Relief of the Jewish Poor Twenty-sixth Annual Report, from Jan. 1, 1884, to Dec. 31, 1884.

such foods from the diet of an infant apparently dying from diarrhoea, and the substitution of a diet more closely allied to its natural food, frequently produces almost miraculous results.' True, unsuitable food is a point of the highest consideration, and such diet is more fatal in summer than winter, but so is an insanitary atmosphere, and unwholesome food is not consumed only in the third quarter. Diarrhoea does not attack infants only who are fed with unwholesome food, nor is it exclusively the disease of infancy, although the very young and the very old are its chief victims. It is found mapping out in hot and damp seasons the several areas where foul conditions and poverty are most rife, so that the prevalence of diarrhoea—even though it be infantile diarrhoea—may be taken as measuring the degree of virulence which surrounds a badly drained, badly ventilated, and unhealthy region. In reference to the population of the Whitechapel district, Dr. Loane reports that it consisted chiefly of poor from the south of Ireland, 'but now by far the greater proportion comprises Russian and Polish Jews; and so rapidly have the latter poured into the district within the last few years that (according to the Registrar-General's Report for 1881) I find that in a total population of 71,363 persons there are no fewer than 9,660 foreigners,' of whom 5,293—most of them driven from Russia—belong to 'that wretchedly filthy class known generally as "Polish Jews."'

The report continues:—'Those who have any experience of the poor people to whom I allude . . . will know how much anxiety and work are necessary to enforce habits amongst them which, although natural to more civilised people, are not understood by the class to which I allude. It was no doubt the result of this undue proportion of foreigners to our inhabitants in the district that originated a letter to your Board from the sanitary committee of the Jewish Board of Guardians.' This letter and the Board's reply are both published in the medical officer's report; but the rejoinder from the Jewish Board is omitted, because the doctor states he considers 'the results of your sub-committee's inspections and meetings adopted by the Committee of Works, and also by your Board, remain uncorrected.' Now this 'rejoinder,' which appears in the annual report of the Board of Guardians for the Relief of the Jewish Poor for the year 1884 (1884), seems to us to be a most important document, including the whole question, and reviewing its bearings most judiciously. We learn from it that, however ill the Russian immigrants might be in the manipulation of sanitary machinery, and however ready to flush it with abundance of water, yet either the water nor the machinery is available, for the authorities—whilst stigmatising their filthy habits—have refused them both. Hence all who dwell under such regulations must, whether voluntarily or otherwise, be 'a wretchedly dirty class.' In support of our opinion we quote some extracts from the rejoinder above referred to:—

Board of Guardians for the Relief of the Jewish Poor.

It is a source of satisfaction to my committee that your Board in its report practically admits most of the facts stated in our communication of Oct. 30 last. No denial is given to the statements as to the filthy and unsanitary condition of the back-yards, the absent or defective traps, the absent or uncovered

dustbins, and the general non-compliance with the Regulations framed by your own Board under the provisions of the Sanitary Act, 1866. Nor does your report challenge the accuracy of our statements as to underground rooms improperly and illegally inhabited. Nor does it deny any of our statements as to noxious emanations from sewers, nor as to noisome and offensive trades suffered to exist in your district, except to throw doubt on our verbal accuracy in one of the instances cited, and to intimate that in one other instance the nuisance had, since the date of our inspection, been abated.

The chief facts being thus admitted, we therefore indulge the hope that the frank declaration of your report that 'much remains to be done' implies that your Board is resolved that much shall be done to remedy those crying sanitary defects which are so detrimental to the health of the district.

There being but few differences between us as to facts, little would remain to be said were it not for a serious divergence of opinion on certain points based upon these facts—1, the question of water supply to water-closets; 2, the insufficiency of your Board's sanitary staff; and 3, the closing of houses deemed unfit for human habitation.

With regard to the condition of the water-closets, your report attributes their foulness (and also the filthy state of many of the dwellings complained of) to the habits of the foreign Jews, of whom there has recently been a large influx. Without in any way admitting that the habits of these poor immigrants are at all inferior to those of the lower class of British poor, we desire to point out that the condition of the water-closets in the houses occupied by the British-born Jewish poor (unquestionably as cleanly in their habits as their non-Jewish neighbours) is radically bad in the Whitechapel district, and that there is, as a matter of fact, no difference between the condition of the closets in the houses occupied by our English poor and that of the closets in the houses occupied by our foreign poor. It is, indeed, practically impossible for water-closets to be kept clean, or for the drains leading therefrom to become other than stagnant cesspits, in the absence of sufficient water as a motive power for, and as a means of diluting, the sewage matter.

Your report quotes the opinion of your late most able and experienced officer of health, Dr. Liddle, who is stated to have long since discarded the principle of water supply to closets, and it adds that 'the system of a caretaker being appointed to flush the closets with water was substituted.' We desire to remind you that no such 'system' is in existence; that no 'caretaker' has ever been 'appointed' by your Board or by any one else to perform the hypothetical hand-flushing referred to; and consequently when your report tells us that 'this flushing of the closets with water thrown into them was adopted, and this mode of cleansing closets is approved by Dr. Loane,' your present excellent and zealous medical officer, your Board probably means to imply that if there were a caretaker to each water-closet, and if that caretaker were to effectually flush the closets by hand, that mode of cleansing would meet with the approval of Dr. Loane. But any person having the slightest practical acquaintance with the homes of the poor would at once see that the supposed hand-flushing is an impossibility, there being in such places neither pails nor other utensils at hand for the purpose, nor a sufficient stream of water from the small-bore ($\frac{1}{4}$ inch) taps in the yards to enable such an

operation as regular hand-flushing to be done with facility or efficiency. Dr. Liddle's opinion on any sanitary subject would always be received by us with the highest respect, but we cannot help thinking that his opinion which you quote in your report is rather out of date, having been founded on his experience of the old apparatus at that time in general use, and not on the improved and simple water supply arrangements, which are not easily subject to derangement or injury.

Setting aside all questions of opinion, the facts remain that in that part of the Whitechapel neighbourhood which lies within the City the Commissioners of Sewers have uniformly insisted upon water supply to all closets, that the houses so fitted are occupied by precisely the same class of people as those occupying the tenement houses in the district under the control of your Board, and that the result has been successful, there being a marked contrast between the condition of the houses of the poor in your district and those in the City. We submit that this practical experience is far more valuable than any opinion.

The suggestion in your report as to the formation of a staff of visitors to instruct and encourage the poor in the sanitary principles to be observed by them in their habitations, has long been anticipated by the Jewish Board of Guardians. For years past it has sent its honorary visitors, both ladies and gentlemen, to the homes of the poor, to impress upon them habits of cleanliness, and within the past two years the efforts of a fresh band of energetic and cultivated ladies have been exerted in the visitation of the Jewish poor. Further and more extended efforts in this direction are under consideration, and it is hoped that they may be productive of the results anticipated. But our visitors have always felt it to be useless to talk to the poor of cleanliness in the absence of a proper water supply. For this reason, in the year 1866, during the outbreak of cholera, the Jewish Board took the initiative of procuring for the poor a constant water service, and at its own expense erected stand-pipes—an example that was shortly after followed by your Board in several parts of the district—so giving the first impetus to the movement which has since happily resulted in a constant water supply throughout Whitechapel. For a like reason we now respectfully urge your Board to follow the excellent example set by the City of London by insisting on proper water supply to all closets in your district, such a measure being, in our judgment, equally essential to decency, cleanliness, and health.

With regard to the insufficiency of the present staff of two sanitary inspectors, we find nothing in your report that would alter the views expressed in our letter of Oct. 30. You state that 'your medical officer has expressed himself perfectly satisfied that the inspectors have been able to meet the necessities of the cases as they arose, and your committee are of opinion that they have done so.' This assurance emanating from your officer would, in ordinary circumstances, be quite satisfactory; but we would remind you that as long ago as 1868, your late respected medical officer addressed to your Board a strong printed remonstrance against the reduction of the staff of inspectors from four to two—a reduction which was accomplished in spite of his remonstrance. Although the number of houses in the district has been, since 1868, somewhat diminished, consequent on the operation of the

Artisans' Dwellings Act and other causes, yet the houses in the district have been so much further deteriorated by wear or tear that, to use the language of the report, they have to be 'continually watched by the sanitary officers of the Board.' How impossible such a work must be for a staff of two inspectors acting in a district containing 7,500 houses, the great majority of which are of an inferior class, has been shown so well by Dr. Liddle, your late medical officer of health, that we take leave to quote his opinion. After giving an elaborate calculation to show that in order to inspect the tenement houses of the district only once in three months, which he regards the minimum amount of inspection necessary, the work would occupy two strong active men their entire time working $7\frac{1}{2}$ hours per day, making no allowance for interruptions, for meals, or for any other duties; and after detailing some of the other work required of the inspectors, such as the hearing and answering complaints at the Board's offices, attending to stoppages in drains, abatement of noxious trades, preparing and serving notices on landlords, subsequently visiting to see to their compliance, supervising cow-houses, slaughter-houses, or bakehouses, seeing to the emptying of public dustbins, besides many other duties (more fully enumerated in his report of March 26, 1868), Dr. Liddle writes: 'I have probably said enough to show that I had fully considered the question relating to the number of inspectors who are required to perform the sanitary work of the district when I urged upon the Board not to diminish the number of the staff, but rather to increase the efficiency of it. If the Board agrees with me in thinking that the work should be done in the way I have pointed out, they must come to the conclusion that not less than four active young men are required for the purposes.'

We regret to find that there is some divergence of opinion between your Board and ourselves as to the degree of dilapidation, filth, and insanitary condition that would warrant you in pronouncing a house 'unfit for human habitation,' and that your report goes so far as to assert that 'the sensational description of the houses contained in the communication of the Jewish Guardians is not warranted by the facts.' As we submit that our remarks on this head were not sensational, but were a plain unvarnished statement of facts, we take occasion to quote them. We said: 'A large number of the houses in your district have been found so dilapidated as to be absolutely past remedy from a sanitary point of view. These are either so old, or have been neglected by their owners for so many years, that they may be considered rotten and poisonous throughout. The floors, walls, and ceilings reek with the impurities of half a century of neglect. There are also cases in which, apart from the rottenness of the structures themselves, the nature and position of the sanitary arrangements render the houses unfit for human habitation. We allude to such houses as have their water-closets situated in the basement immediately under inhabited rooms, or such as have their water-closets, dustbins, and water-taps accessible only through the cellars, which thus become receptacles of filth.' We assert without hesitation that most of the eighty-seven houses noted in our list as unfit for human habitation fully answer the foregoing description. Many of the houses referred to are in the Bell Lane area (which was condemned as long ago as 1877), and are still standing, crowded with inmates. Of these houses your late medical officer,

Dr. Liddle, reported to you in September 1877: 'The houses are in such an unhealthy state that they cannot be improved without the necessity of totally abolishing them.' If this was the state in 1877, there cannot be after a further seven years' wear much exaggeration in our statement that they are absolutely past remedy from a sanitary point of view. Yet these are the houses (and there are many more like them) condemned by your own medical officer in 1877, and which, after waiting for seven years, you hesitate to pronounce 'unfit for human habitation' and proper to be closed by a justice's order under the Nuisances Removal Act. Your report intimates that two unhealthy areas, the Bell Lane area and the Pearl Street area, are again proposed to be cleared under the Artisans' Dwellings Act. These schemes are already many years old, and they may or may not be adopted and carried out. But we submit most respectfully that no such prospect, even when not remote, should be allowed to so far paralyse the hand of your Board as to prevent its dealing in the meantime with such houses in the so-called condemned areas as may be 'unfit for human habitation.' Indeed, we submit by procuring the closing of such houses, you will be aiding the scheme, and lessening the cost of its execution to the Metropolitan Board of Works, and consequently to the ratepayers, as compensation would be based on the value of the bare land unencumbered by the houses and their tenancies. In other places where no 'scheme' is imminent, but where the houses are equally unfit for human habitation, such as parts of Pelham Street and Great Garden Street indicated on our list, the closing of the houses would be speedily followed by their demolition and reconstruction by the owners; and so the 'little by little' process of reconstruction—the suggestion of which seems to have excited the surprise of your Board, but which is after all the only natural process of improvement—would be accomplished without any cost whatever to the ratepayers, and without the necessity of displacing at one time the inhabitants of 'acres upon acres of houses,' and suffering their sites to lie useless and unproductive for years.

With respect to the penultimate paragraph in your report as to the encouragement given to occupiers to prefer their complaints to volunteer officials instead of directly to your Board, we venture to assert that the observations are not in any way applicable to the operations of this committee. Complaints as to sanitary defects are neither invited nor encouraged by us. Most of the sanitary grievances, of which we have written in our previous communications and in this letter, have come under the personal observation of my committee or its inspector in the course of their investigations. It appears also from your report that your Board objects to our issuing 'Notices for the Abatement of Nuisances,' as tending to inflate the value of our efforts at the expense of the recognised authority. We have certainly never issued 'Notices for the Abatement of Nuisances,' having no legal warranty to do so; but we have, in order to avoid the necessity of troubling your overworked officials unduly, and also to avoid delay, addressed letters to owners of houses where nuisances had been discovered, requesting an abatement of such nuisances; and we have much satisfaction in stating that the result of this arrangement has been so far successful that out of 402 cases in which we directly addressed the owners, 83 were attended to without your Board's interposition. We have thus troubled your officers

with only the balance of cases in which owners have ignored our letters.* But for this course our complaints to your Board would have been more numerous.

In conclusion, we regret that we cannot concur with your Board in finding the vital statistics of Whitechapel a subject of congratulation.

The death-rates quoted in your report for four quarters ending September 1884, are respectively 22·9, 18·9, 21·9, and 24·3 (an average of 22) per 1,000. These figures are probably far from accurate, being based on a doubtful estimate of the present population; and even this average death-rate (22 per 1,000) is greatly in excess of the general death-rate for London, which was 20·44 for 1883.

But, according to the best authorities, the true test of the sanitary or insanitary condition of a district is to be found in the infantile rate of mortality, and especially in the diarrhoea death-rate. Comparing your district with its neighbours—in 1883, Whitechapel had 78 deaths from diarrhoea to 2,472 births, or 3·1 per cent.; St. George's in the East had 56 deaths from diarrhoea to 1,901 births, or 2·9 per cent.; Shoreditch had 128 deaths from diarrhoea to 5,102 births, or 2·5 per cent.; Stepney had 53 deaths from diarrhoea to 2,153 births, or 2·5 per cent.; Bethnal Green had 89 deaths from diarrhoea to 5,310 births, or 1·7 per cent.; Mile End Old Town had 56 deaths from diarrhoea to 4,212 births, or 1·3 per cent.; Whitechapel thus appearing at the head of the list. This death-rate was considerably increased in 1884, the deaths from diarrhoea in Whitechapel having been 108 in 1884 against 78 in 1883. The report of your medical officer for the quarter ending last September states the infant mortality of Whitechapel to be 26 per cent. of the births, while that of London was only 22·2 per cent.; equal to 56 per cent. of the total deaths in Whitechapel, compared with the general London rate of 50·7 per cent. of the total deaths.

If, therefore, the vital statistics of your district point to any conclusion, it is this—that its sanitary condition is far below that of its neighbours, and it thus appears that a grave responsibility rests on your Board until more active measures are taken for its amelioration.

Signed, on behalf of all the members of the Sanitary Committee of the above Board,

LIONEL L. COHEN,
Chairman.

ALFRED TURNER, Esq.,
Clerk to the Board of Works
for the Whitechapel District.

* The form of letter sent to owners is as follows. It will be seen that it is not at all in the nature of a 'Notice.'

BOARD OF GUARDIANS FOR THE RELIEF OF THE JEWISH POOR.

Sanitary Department: 13 Devonshire Square, Bishopsgate, E.

188

SIR,
Having been appointed by the above Board as Sanitary Inspector to report upon the condition of the dwellings of the Jewish Poor, I have visited the house number _____ of which I understand that you are the owner, and have found therein the sanitary defects mentioned below. I shall feel obliged by your taking such prompt and sufficient measures as may be needful for remedying such defects.

I am,
Yours obediently,

[The Inspector attends at the office of the Board daily, from 8.30 A.M. to 9.30 A.M.]

SMOKELESS HOUSES AND MANUFACTORIES.*

By THOMAS FLETCHER (of Warrington).

THE Council of the Institution having invited me to speak on the question of 'smokeless houses and manufactories,' have imposed on me a very congenial task. There is no possible doubt that all large towns can be made absolutely smokeless with economy, and also, that the strongly acid nature of the atmosphere in all large towns and cities can be very greatly improved. How bad the state of things in London is at present may be judged from the fact that, wanting some litmus paper, which is used in testing for weak acids, I failed totally to obtain any, after a long search, which was not already turned in colour by the acid of the atmosphere, and I had to telegraph direct to the makers for some. I held a strip of this paper out of a railway carriage window for a few seconds, with the result that the exposed part was turned red by the acid in the air. The mud in the streets, the damp stone walls, and even the moisture on the leaves of plants, all gave a distinct acid reaction. I have seen the leaves of plants, miles away from the city, burnt by a light shower after a fog in the city. When our towns are smokeless the total consumption of fuel will be decreased enormously, as I will prove to you, both in houses and manufactories. The most advanced users of fuel are beginning to see through the fog and smoke, and I believe it is now a question of a very limited time before we see the end of the nuisance. The question of smoke must be looked at from a money point of view, and smoke abatement must be either compulsory or profitable. Not one householder or manufacturer in a thousand cares how much smoke he makes provided it goes the right way up his chimney. My principal business to-night is to give you actual results obtained in my own works and house, which are, and have been for a long time, practically smokeless. The house was built with the ordinary fireplaces for coal, an open fire range with boiler, hot-water cylinder, and the usual appliances. What it would cost to work this with coal entirely I cannot tell you, for the simple reason that gas has been used, more or less, since the house was built. Those who have had experience with coal will be able to compare the figures as to comparative cost. In the first place, absolutely no alteration has been made with any existing fireplaces or fittings, except that a large gas meter and good-sized gas pipes have been fixed. The extensions as regards gas have been gradual, and in the last eight years probably 5*l.* may have been expended in gas fittings, to get a large service to every room in the house. The first cost of the whole of the appliances, gas fireplaces, cooking, water-heating, bath-heating, washing, drying, ironing, &c., at 'Stores' prices, for the house, which contains thirteen rooms, would be about 26*l.* Of the three sitting-rooms, two are used only at intervals, and fires are used in at least three bedrooms every night and every morning for about seven months in the year, fires being also lighted whilst the bedrooms are being used as dressing-rooms. The whole of the cooking for ten persons, water-heating for baths, and general domestic purposes, and a portion of the washing and drying (sometimes all) are done entirely by gas.

Now comes the question of cost. In the first

place, it would be practically impossible to have coal fires in the bedrooms, both night and morning, as we have them, and here gas scores one important advantage. If it were possible, there would be with us at least twelve fires to be lighted every day for six or seven months. This, and the consequent cleaning, would be nearly, if not quite, one servant's work; in fact, if the extra labour in cooking by fire and the usual style of washing are added, there would certainly be quite the work of a servant, which, for seven months, would mean in food and wages at least 16*l.* Our total gas bill for twelve months has been, on an average, with gas at 3*s.* 3*d.* per 1,000, 8*l.* for lighting and 13*l.* to 14*l.* for all other service, *i.e.* fires, washing, cooking, and baths. This for the last two years may be considered an experiment, and, being so, no doubt has had extra supervision, which, when discontinued, may possibly mean 5*l.* or 6*l.* per annum in extra waste; but the fact remains that with ordinary care the work has been done in a style totally impossible with coal, for two years in succession, at about the same cost as coal, and with a great saving in servants, dirt, and inconvenience. Further than this, whilst one of the children was suffering from scarlet fever, we were enabled to maintain perfect isolation in the upper part of the house, and so prevent the spread of the disease—a matter almost if not quite impossible if gas had not been available for all purposes. From what I can learn, it would appear that in the districts where coal is plentiful and comparatively cheap, it costs about 7*l.* per annum for the kitchen fire and about 3*l.* each for sitting-room and nursery fires. In London, where coal is twice as costly as with us, I do not believe the actual expenditure per annum is on the average any higher, the fire grades being very much smaller, and the lavish expenditure of coal common in the north is checked in this neighbourhood by its excessive cost. Many English cooks will burn one hundred pounds or more of coal in preparing a dinner; on the other side, I may refer to some tests made for the Committee of the Gas Institute, and published November 1884. In one of them, with a consumption of 25 cubic feet of gas, which is in fuel value equal to about one pound of coal, the work done was 7½*lbs.* mutton roasted (not baked), 1½*lbs.* soles grilled, 5*lbs.* potatoes roasted, a rice pudding, rhubarb tart, and samples of puff pastry baked, the weights of the latter three dishes not being taken. The whole of the cooking was very well done. I do not wish you to imagine that even this small quantity of gas fuel was absolutely necessary, as the actual heat absorbed by the food whilst being cooked would not be one-fourth of this. There is a limit to excessive economy in the fact that the necessary arrangements for this are not always either cheap or easy to manage for such irregular work as domestic cookery. We have rather large and straggling plant houses and conservatories, the boiler of which is heated by coke, this giving a smokeless chimney. I am not an advocate of smoke prevention as it has been commonly dealt with, as an abstract matter which is desirable at any cost, and I would not use any of the arrangements referred to except as a matter of direct advantage. I am only an average mortal, and consider my own pocket and convenience.

One of the difficulties with gas has been that for kitchen purposes an open fire is sometimes a necessity, and this, the missing link between the old and new systems, I think we have at last succeeded in

* Abridged from a lecture delivered at the Parkes Museum on March 26, 1885.

obtaining, by a gas fire which will roast, bake, heat water, and warm the kitchen with a single burner. Those whom business calls into closely-populated districts in the early morning will, I think, agree with me that private houses, as a whole, are as great a nuisance as regards smoke as manufactories. The people employed in a works will, as a total, make more smoke and create a greater nuisance with their house chimneys than is made in the works. The workman's wife can, by the use of gas, save herself a great amount of hard dirty work and reduce her expenses to a greater degree even than those who are in a better position in worldly matters. There is one point against the adoption of coal gas as a general fuel for domestic purposes in the fact that it has been, and still is, almost invariably sold at a fancy price.

My recent statement in the *Journal of the Society of Arts*, that we carry on a manufactory employing 130 (and more recently 140) hands, with the necessary steam power, forges, fires, &c., without any smoke, has called forth many comments and expressions of disbelief. I can only say that if our chimneys, which are fifteen in number, have a smoky end, it is outside and in full view from the Warrington station on the London and North-Western Railway. Coke is used for the fires and forges, simply as a matter of economy, and the steam boiler is worked also with coke, occasionally assisted by a very small quantity of slack, a space of about half of an inch being open under the boiler furnace doors to supply a thin film of air over the surface of the fire. Our steam boiler, to those who do not know it, is a joke: it is an old-fashioned, externally fired, egg-ended pattern, 15 feet long, 3 feet 6 inches diameter, with a fire 3 feet wide and 2 feet 8 inches deep, and a shallow flue 5 inches deep, the whole length of the boiler, without return. It fortunately happens that Mr. Paterson, the president of the Manchester District Association of Gas Engineers, has been making experiments on the evaporative power of coke and coal in a double-flued Lancashire boiler, 18 feet long and 6 feet diameter, the cost of which is about three times that of my own, and the space occupied being more than double. In this boiler, with two fires, he evaporated an average of 724.5 lbs. of water per hour, using 1 lb. of coal for every 8.05 lbs. of water converted into steam. With coke, in the same boiler, he evaporated 765.3 lbs. per hour, with an average of 7.8 lbs. of water per lb. of coke. In our small boiler, with a single fire, we have evaporated in a twelve days' test 1,000 lbs. of water per hour, and the average fuel consumption for two years has been, as near as I can possibly estimate, 1 lb. of coke to every 7½ lbs. of water made into steam: the exact figures to decimals are not available, because we use from the same coke supply for the blacksmith's fires. The credit of the high duty of the boiler may fairly be given to the width and shallowness of the flue and firebox, and with a very good reason. The boiler inspectors objected to the flues preventing proper external examination, so we cut the setting away, making a deep flue of the usual form. As a matter of experiment this was left open for six months, and our fuel consumption went up about 20 per cent. We now fill the deep flue behind the bridge with loose bricks, so that they can be removed for inspection of the boiler, and our fuel consumption has dropped to its normal level. You will bear in mind that I do not recommend so small a boiler to be worked so hard as to evaporate

1,000 lbs. of water per hour, as it is extremely difficult to prevent priming, but the fact that we can on an emergency get, with a good engine and expansion valves, about 30 horse-power indicated from a boiler 15 feet by 3 feet 6 inches with coke as fuel, is, I think, an unanswerable argument in favour of a smokeless boiler. The fire bars are 12 inches from the bottom of the boiler, rather thick fires are used, and the boiler is, at every inspection, reported to be in first-rate condition by the Manchester Steam Users' Association, who are perhaps the most independent and hard to please of any boiler insurance company in existence. If it paid better to have a smoky chimney we should have one, so far as the nuisance inspector would permit. Steam users have occasionally tried coke as a fuel and failed to keep up steam: an explanation of this failure has been afforded by our having for a time to drive the boiler to its maximum possible power. After clinking the bars a thick mass of cold and possibly damp coke is thrown on, which, under ordinary circumstances, affects the supply of steam at once. If, at the time of firing, a thin scattering of slack is thrown on the top of the coke, a clear smokeless flame rises instantly, which keeps up the steam until the coke is fairly incandescent and capable of doing the work: if, when driving our hardest, we had omitted to do this, we, like some others, should have failed to obtain satisfactory results, although this assistance from slack is never required except when hard firing and excessive driving of the boilers is a necessity. We have in the Lancashire district a large number of works which, in the opinion of the proprietors, cannot be carried on without making smoke. At the Leeds meeting of the Society of Engineers my lecture on flameless combustion was received as a curiosity, and the demonstrations were taken as laboratory experiments rather than possible commercial facts. That they created a strong impression in the minds of earnest experimenters was proved by the communications received from scientific men all over the world. The value of the possible application of this system of heating has been fully appreciated as an abstract idea, and endeavours have been made to reduce it to practice on a commercial scale. I think the honour of having first applied it practically in large furnaces may fairly be given to Mr. F. Radcliffe, the forge manager at the Royal Arsenal, Woolwich. In a steel-making furnace of the simplest construction and of exceedingly low cost he has combined a gas-producer of almost unlimited power, from which the hot gas is taken direct into the furnace, a simple continuous regenerator, and a furnace of a power which we may fairly say is practically almost unlimited. With the direct introduction of the hot gas into the furnace he obtains a heat of any character required, and a regenerator which is free from liability to choke with burnt pitch and exceedingly simple and cheap in construction. The small amount of waste heat, which in the present experimental furnace goes into the chimney, can with ease be utilised to make steam for the power which is always required for dealing with the products of the furnace. I have examined this furnace whilst in full work, and have also looked into the chimney, and both were as free from flame and dirt as this room.

We may take it as an accomplished fact that small, compact, and cheap furnaces can be built which will make gas from the poorest fuels and will give a pure flameless heat of any character and of

any required intensity. It is simply a question of form and detail to adapt this system, not only to the open hearth steel furnace in which it is now used, but also for iron puddling, all classes of reverberatory furnace work, glass-making, heating gas-retorts, and in fact any purpose where high temperatures and continuous heat are wanted. The waste heat is always needed for steam raising, and after this there are many other industries to which any remaining heat could be applied. There are several purposes to which gas is applied to a limited extent, and matters are at present in a state of transition. Amongst these I may mention bakers' ovens and furnaces for stained glass and enamels. No doubt in a short time these and other matters will be worked out so fully as to make the adoption of gas-fuel a necessity of the trades; a beginning has been made, and a little time now is needed to perfect the arrangements, which, up to the present, do not fill all necessary requirements for every trade as to simplicity, convenience, and economy. The ground has been cleared by independent experimenters, and I think it may fairly be said that both houses and all manufacturing industries can be profitably carried on absolutely without smoke, and it is simply a question of time as to when this state of things becomes general throughout the world. The future of gaseous fuel is settled beyond all question on the best of all possible grounds, that it is profitable to use, and users of solid fuel will soon discontinue their present system when they learn their position in the matter.

THE PASSIONATE STATISTICIAN TO HIS LOVE.—(*Modelled upon Marlowe*).—We commend the following remarkably clever parody to the attention of those of our statistical subscribers who have not yet met with it. It may strengthen their predilection for their useful study:—
'For my part, I am a passionate statistician. . . . Go with me into the study of statistics, and I will make you all enthusiasts in statistics.'—*Mr. Goschen at Whitechapel.*

Come live with me, and be my love,
And we will all the pleasures prove
That facts and figures can supply
Unto the Statist's ravished eye.

And we will sit 'midst faction's shocks
And calculate the price of Stocks,
The music of whose rise and fall
Beats most melodious madrigal.

We'll learn how the last Census closes,
And the art of counting noses;
And taste the pleasures, sweetly solemn,
Of abstract brief, and lengthy column.

We'll tot the figures fair and full
Relating to the price of wool,
The annual range of heat and cold,
The death-rate, and the price of gold.

Percentages shall stir our blood,
Analyses as clear as mud.
Oh, if these pleasures may thee move,
Come live with me, and be my love.

The marriage rate, the price of meat,
Shall yield us raptures calm and sweet;
And analytic 'Tables' be
Prepared each day to give us glee.

Economists our praise shall sing,
The Statesman's eloquence we'll wing
If these delights thy mind may move,
Then live with me, and be my love. —*Punch.*

THE DOGMATISM OF SANITARY REFORMERS.

By D. J. EBBETTS.

II.

To continue my remarks upon this subject, I would select for consideration the recognised rule that the wastes from all sanitary fittings should be trapped. If I select again a valve water-closet apparatus, and ask whether it is really necessary to fix a trap under this fitting, I find that every authority (with one exception) appears to assume the necessity for it.

In considering the general utility of such traps, we must bear in mind that each trap diminishes to some extent the force of the discharge passing through it, retains at times some offensive matter within the dwelling, and becomes, under certain circumstances, the object of elaborate precautions against syphonage. In the presence of these considerations I suppose I may take it that it is very desirable to avoid the use of traps whenever we can safely do so.

Now, if we look at other popular varieties of closets—for instance, those of the 'wash out' or 'hopper' kinds—we find that they are provided with S traps. This one trap is considered to afford sufficient protection to closets of these kinds. Then why should two traps be required for a valve water-closet?

A valve closet has a mechanical valve that closes the outlet of the basin, retaining in it a large volume of water. Why should it be necessary to fix a syphon trap under this valve? It is generally said that the mechanism may fail, or a piece of paper may catch on the edge of the valve and so prevent it from shutting close enough to retain the water in the basin. And so, as it is just possible that the valve may fail, a trap is placed under it; but where is this process to end? If the trap fails, what then?

We must remember that the trap is as certainly liable to failure as the valve. It may be placed sufficiently out of level so that it becomes a trap no longer; it may be emptied by capillary attraction. By-the-bye, not at all an unusual occurrence. Rag, paper, string, or matted hair, dipping into the water at one end, and extending over the bend at the other, soon empty the trap by capillary attraction, combined with the evaporation from the greatly increased surface of water exposed to the air. Traps may be unsealed by evaporation alone, and lastly by syphonage.

Now, the last danger is one that is very generally recognised, and if we examine a stack of, say, three valve-closets, one over the other as usually erected, we shall find each trap has an air-pipe branched into a vertical ventilation-pipe, which latter is carried up to a safe height; so that, through not being content with the valve as a sufficient protection for the closet, we have to fix traps under them, and then have to provide the latter with air and ventilation-pipes. Truly a complicated state of affairs, even if a necessary one.

But it will be noticed that the other objections to the use of the trap are not remedied by the addition of these pipes, and that one of the objections—namely, the unsealing by evaporation—is actually and very considerably increased by means of them. A current of air being established through these ventilation pipes and in immediate vicinity to the traps, the evaporation necessarily becomes very

rapid. Colonel Waring, the well-known sanitary engineer, having examined the large number of experiments upon this subject: 'I believe most firmly that when the back ventilation, as now practised, is all the traps of a house, the destruction by evaporation will be much more to be a syphonage would be in the same set of circumstances.'

to be borne in mind that by ventilating seriously increase the liability of its contents being frozen; which is certainly a consideration weighed in estimating the supposed advantages of using traps in the position that I am now in.

it is admitted that a syphon trap is as insecure as the valve under the basin, it will at there is this difference between the two.

in favour of the valve, that while on one hand the trap might fail in some way and be acquainted with the fact, so, on the other hand, if the valve were to fail, the fact would be all the same, and, in any decent household, would be being immediately put in order.

g then, as I have said, that every unnecessary should be abolished, I should prefer not to have under a valve w.c. apparatus, omitting, of course, at the same time, the cumbrous air and soil pipes.

mentioned that one authority at least admitted the omission of traps in the position which I am considering; I alluded to Mr. Norman Shaw. His system of soil outlets which he uses has been described and illustrated in the *SANITARY* as well as in some of the hand-books on the subject; and, having for six years experience of the working of several hundred traps arranged in accordance with his ideas, I think that I have not been able as yet to discover any ill effects that have followed upon the use of the trap.

I suggest as probable that a great deal of labour has been expended in modern internal plumbing from our not fully recognising the great advantage that has been effected in the arrangement of soil-pipes, &c.

we began to perceive the terrible dangers connected with the futile attempt to bottle up the wastes in closed drains and soil-pipes, we not only began to work to ventilate and purify the latter, but at the same time elaborately ingenious arrangements for trapping and ventilating the internal drains; whereas, if the drains and soil-pipes were arranged, and of such sizes that they are perfectly cleansing, and are, moreover, well ventilated, a very simple trapping of the wastes would be all that is necessary, provided that we were not afraid of the dreadful bogey of syphonage.

It leads me to consider (with some trepidation) the possibility of connecting the wastes of baths, &c., directly to soil-pipes. In the most advanced American work it is usual to connect the trapped wastes of washstands, baths, and sinks direct into the soil-pipe, and I have not been able to discover any actual harm has resulted from this practice being early carried out. But in England the practice is not in question is generally condemned in a categorical manner. I am willing to admit that the plumber's work of a new house one would be to arrange for a separate waste-pipe to the lavatories, &c., but in modifying the

arrangement of old houses (which, as I have said before, must be accomplished with the severest regard to economy that is compatible with efficiency, if such work is ever to gain favour with the mass of householders), in work of this kind it appears to me that no real objection need be taken to such a course, provided—1stly, that the waste is trapped and secure against syphonage; 2ndly, that the soil-pipe and the drains are, as I have suggested they should be, perfectly cleansed and fully ventilated.

I have so far attempted to show that there are various things insisted upon by sanitary authorities in a rather unyielding manner, that cannot, I think, be necessarily considered as invariable essentials of good work. On the other hand, it might, I fancy, be shown that there are details of modern sanitary work which appear to be rather lost sight of by the same authorities.

To take one small example, how do you find the trapping of bath and lavatory wastes and overflows arranged by most authorities? Generally the overflow and waste are connected before the latter enters the trap. And this arrangement may certainly be seen often enough even in work executed under the supervision of engineers of experience.

Now, if we imagine a basin filled with water, and suppose the plug to be suddenly lifted, the water will descend the waste-pipe, but being, of course, materially retarded by the increased friction consequent upon passing through the trap, it will rise in the overflow-pipe to very nearly the same level as in the basin. The same thing would necessarily happen with a bath similarly fitted.

The column of water, ascending the overflow-pipe quickly enough, would carry soap and other floating impurities with it, and as it slowly descended again these impurities would in part be deposited upon the interior of the overflow-pipe and would form a slime whose decomposition would produce gases readily escaping into the fitting and the room.

Many may, at first sight, think that this defect is but a small one, but it is one that requires no great ingenuity to overcome, and is, therefore, a defect which it is not necessary that anyone should accept as inevitable.

Without considering at present the various ways in which this imperfect arrangement may be avoided, I may point out that it is often possible to take the overflow direct through the external wall, and to discharge it in the open, with proper protection from a back draught of cold air.

If I have not succeeded in convincing any one of the truth of any of the propositions which I have advanced, I hope I may have done some good in my attempt to persuade people to think out all details for themselves, without necessarily accepting the somewhat imperious dictates of many of our instructors—men, in many cases, may be, to whom we owe a great deal, but who are apt very often, I think, to overlay a simple subject with an elaboration of precautions, increasing thereby the complication and costliness of all work, and inviting the ridicule of the unbelievers; a sure means of preventing what we should all help forward—the spread of sound, simple, and clear views upon the subject amongst the masses.

A MILK-SELLER of Quarrington has been fined 5*l.* and 2*s.* 4*d.* costs by the Sleaford magistrates for largely adulterating his milk with water.

CHEAP COOKING FOR THE PEOPLE.

By H. FORBES CLARKE.

MUCH attention has lately been called to the importance of cheap cooking for the people. The success of penny dinners in London, and perhaps even more so in some parts of the country during the past winter, has led to the natural question, If so much benefit can be derived by children, why cannot similar advantages be provided for adults at a correspondingly increased cost? As honorary secretary of the Central Council for Promoting Self-supporting Penny Dinners, I have had several in-

great trouble to solve the question of cheap food in the most satisfactory manner. At the kitchen opened by him in October last, pea-soup and lentil soup are sold at 1d. a quart, potato stew at 1½d. a quart, raisin pudding 12 ounces for 1d., and whole-meal bread 14 ounces for 1d. In the dining-room, 7 ounces of bread and a pint of soup are supplied for 1d., so that, as a gentleman high in authority who takes a great interest in the subject—and who on personally inspecting the dining arrangements found the soup most excellent—has observed, 'If a man only has a second penny, he can make a rattling good dinner for 2d.' The first balance-sheet, showing a considerable profit, has proved that on a strictly commercial basis dinners of a most

Becker's Patent Cooking Apparatus. (Patented in all countries.)

quiries on this subject. The Sisters of the Convent of Mercy, Galway, were desirous of providing cheap teas and suppers for factory girls; the secretary of a flax manufacturing company at Belfast wished to supply cheap meals for the workpeople, and a lady at Roubaix, France, has sought information on behalf of the girls employed in her father's cotton factory. Nearer home, one gentleman in the City wrote respecting dinners for errand-boys, and another wanted to know if substantial dinners could be supplied for 2d. or 3d. each for workmen. This has already been done at Gateshead by the Rev. W. Moore Ede, the rector, who has taken

nourishing and satisfactory character can be provided at a cheap rate to cover all expenses. The essential condition for the success of such efforts is economical cooking, and the principal requisites of this are small cost of fuel, and, especially, little waste of food. Both of these are secured in Carl Becker's Patent Cooking Apparatus, which has been in use for two years on the Continent, and can now be seen in full working order at the St. Paul's Work-house, where the inventor, as a practical experiment, has fitted up, at his own expense, a large-size apparatus capable of cooking from 300 to 1,000 dinners daily. The accompanying block gives

an accurate illustration of the apparatus which is in use in thirty kitchens in Stockholm which have been opened by Mr. L. O. Smith, the ex-Brandy King of Sweden, who has studied the question of cheap cooking for many years. The Rev. Moore Ede, who visited Stockholm on purpose to see what Mr. Smith was doing, thus describes Mr. Becker's apparatus :—' It consists of a large oblong box, the outer case of which is lined with non-conducting material, and the interior is divided into three compartments (the number varies according to the size) by partitions of non-conducting material. This box contains water, which is raised to the required temperature by means of jets of steam, and in this heated water are placed the pans in which the cooking is done. Each pan may be described as an oven heated by warm water. Owing to the division into three compartments, separated from one another by non-conducting material, it is possible to cook at the same time and in the same apparatus at three different temperatures, and thus to secure to each class of food exactly the amount of heat required, neither more nor less. Also, owing to the manner in which the heat is applied by means of external application of warm water, it is possible to cook very slowly, and thus to secure the perfect cooking of every portion.

The following advantages are claimed for this apparatus, which is extensively used by the German Government, and is also in private use in Germany, Austria, Italy, and, as already mentioned, in Stockholm :—

1. A saving of from 60 to 70 per cent. of fuel.
2. The food is prevented from being burnt or over-cooked.
3. The nourishing substances of food are more efficiently prepared for digestion, and many kinds of food are increased in bulk, so that more people can be fed from a given quantity of raw material.
4. The food thus prepared gains in taste and flavour.
5. The cooked food can be preserved in the air-tight pans for four or five days.
6. Scrupulous cleanliness can be observed.
7. Labour in cooking is much diminished.

A personal inspection of the apparatus at St. Pancras Workhouse has convinced me that it is well adapted for the thorough cooking of various foods, with considerable economy of fuel. On a recent Sunday morning Mr. Becker undertook by his apparatus to save 10 per cent. of raw meat and yet to supply the prescribed weight of ration for each inmate, and he successfully accomplished this; 450 lbs. of bacon, when cooked by his method, yielded as much food as 500 lbs. cooked by the ordinary method. On another occasion pork weighing 163 lbs. when put into the pans was found to weigh 161 lbs. when cooked. In cooking meat the water is never heated to boiling point; each pan is provided with a thermometer, and when the desired heat is obtained the steam is shut off. As the water only loses a small proportion of its heat during the night it requires very little steam the next morning to make it ready for cooking again, and so considerable fuel is saved. Another advantage, especially in summer, is that the temperature of the kitchen during cooking is hardly raised, nor does any smell escape from the pans, which are hermetically sealed by means of copper rims fixed to the covers, which, when shut, are surrounded by water.

It will be seen by the foregoing description that

Mr. Becker's cooking apparatus is well suited for cheap cooking, and if adopted in this country would doubtless give the same beneficial results which are obtained by it in other countries. His address is 42 Finsbury Pavement, E.C.

MR. E. H. SHORLAND, of St. Gabriel's Works, Manchester, is now supplying his Patent Manchester Grates, Manchester Stoves, to the new Board Schools, Stanwix; Infirmary, Bradford; Board Schools, Skipton; Industrial Schools, Wilton Gilbert; New Seamen's Barracks, Devonport; Central Station, Liverpool; Central Station, Warrington; Sedburgh Grammar School Sanatorium; Cottage Hospital, Maidenhead; Manchester, Sheffield, and Lincolnshire Railway Company's New Offices, Manchester; National Provincial Bank of England, Manchester; Masham Grammar School; New Schools, Lincoln; New Schools, Wrexham; and numerous other public and private buildings. Mr. Shorland has also received a letter from Messrs. Edgington and Summerbell, of Windsor, saying that the Vertical Ventilating Tubes supplied by him to the British Orphan, Slough, the Windsor Infirmary, and other places are acting exceedingly well, and giving entire satisfaction.

LORD CAMPERDOWN'S WATER RATE REGULATION BILL. The eight metropolitan water companies have forwarded to the members of the Select Committee on this Bill the terms of an amendment which, if accepted by the Committee, will reconcile the companies to the provisions of the Bill. The nature of the amendment is that the companies shall not have power to cut off water in order to enforce payment of rates until a period of twenty-one days shall have elapsed after the delivery of full particulars to the consumer, and if within that period he applies to a magistrate to fix the amount of the claim then the companies' powers are not to be exercised until the magistrate has decided the dispute between the parties. The metropolitan companies are of opinion that, so far as the metropolis is concerned, this would afford sufficient protection to the consumer and, at the same time, leave in the possession of the companies an effective weapon for enforcing payment of their rates. They offer no objection to the provision of the Bill requiring them to furnish the particulars of their charge, unless it be that they do not think that this need be done every quarter.

SMALL-POX AT DURHAM. Dr. Barron, the Medical Officer of the city of Durham, reports that out of 400 cases in nine months 39 proved fatal. It is fully believed that if a proper hospital or other efficient means of isolation of patients had been provided at the outbreak of the epidemic the number of cases and the mortality would have been much reduced.

PLOTS AND STRATAGEMS.—A general shopkeeper named Ware, residing at Preston, was charged before the Wingham (Kent) magistrates on the 4th inst., under the Sale of Food and Drug Act, with selling spurious butter. It was found upon analysis to be composed entirely of fat foreign to butter; and upon the defendant pleading guilty he was convicted and fined 48s., which included costs. The sample of the precious compound was obtained by a police-constable attired as a country labourer.

THE POLLUTION OF RIVERS.—The horrible condition of the River Churnet was brought forward and keenly discussed at the meeting of the Leek Guardians and Rural Sanitary Authority on the 1st inst., and the following resolution passed unanimously :—' That notice be given by the Clerk to the Leek Improvement Commissioners, requiring them to abate, without further delay, the nuisance caused by the pollution of the River Churnet by sewage matter, dye-water, solid refuse, and other matters, in accordance with the provisions of the Rivers Pollution Act, and other Acts of Parliament having that object.' It was stated, in the course of the discussion, that the Rural Sanitary Authority had given the Commissioners a six months' notice nearly five years ago.

THE SANITARY RECORD.

APRIL 15, 1885.

The Editor will be glad to receive, with a view to publication, announcements of meetings, reports of proceedings, and abstracts or originals of papers read before the members of any sanitary or kindred association.

Local Authorities throughout the country would confer a favour on the EDITOR of the SANITARY RECORD by forwarding to him all documents relative to Water-supply, Sanitation, and Health matters generally, which come under their notice. He would also be glad to receive reports from Engineers of Waterworks, Sewerage Projects, and Domestic Drainage Improvements for notice, comment, and illustration.

THE SALE OF UNWHOLESOME MILK.

It is a fact, now well recognised, that milk may be a most dangerous vehicle for the conveyance of infection. The milk itself may be to all appearance fresh and wholesome, but in the families which drink it disease breaks out. Serious epidemics have taken place, which have been clearly traceable to the milk coming from some particular farm where it was exposed to contamination. With such cases the law at present is practically powerless to deal. Under the Public Health Act it is an offence to sell or expose for sale milk which is 'diseased or unsound, or unwholesome, or unfit for the food of man;' but no sanitary inspector could detect the germs latent in apparently good milk, and no magistrate would be likely to condemn such milk. The premises where it is sold in towns are usually kept clean, and the milk is not exposed to contamination there. The milk dealer takes care of this, for if his premises looked unattractive he might lose his customers. The contamination is at a place far distant from the shop, at the farm where the milk is produced, or at the house of the middleman in the country who buys milk from the farmers in order to send up to the town. The person who, without care for anything but his own profit, exposes milk to contamination and so exposes numbers of people who are not his neighbours to the risk of being poisoned, is the person whom the law ought to reach, but at present he enjoys a practical impunity. It is very doubtful whether the milk on his premises could be condemned under the provisions of the Public Health Act, however unsound and unfit for food it might be proved to be; for it would generally while there not be exposed for sale. What is wanted is some efficient means of preventing milk, which is afterwards to be used for human food, from any risk of exposure to contamination.

Unfortunately the Public Health Act contains no section enabling anyone to see to and enforce cleanliness in dairies. Such a power is, however,

given by Section 34 of the Contagious Diseases (Animals) Act, 1878, 41 & 42 Vict. c. 74. That section enables the Privy Council to make orders for registration of all persons carrying on the trade of cow-keepers, dairymen, or purveyors of milk, and for securing cleanliness of milk stores, milk shops, and vessels for containing milk for sale, and also for prescribing precautions for protecting milk against infection or contamination. In accordance with this section a general order in Council was issued on July 9, 1879, and is still in force. Under it all dairies must be registered, and proper precautions must be taken for ensuring cleanliness and protecting the milk from all risk of contamination. The carrying out of this order is entrusted to the bodies who are constituted local authorities for the purposes of the Contagious Diseases (Animals) Act, but those bodies are not the same as the local authorities whose duty it is to carry out the requirements of the Public Health Act. Whether a farmer or milk dealer in the country has ever been prosecuted for exposing milk to the risk of contamination, we do not know; but, if such prosecutions ever take place, they are so rare as to afford no security for the Order in Council being obeyed, and we doubt whether the majority of farmers who produce milk in the country for sale are even aware that their premises ought to be registered.

The policy of the law under which the duty of enforcing regulations as to milk is imposed on bodies who have no interest in enforcing them, and every interest in doing nothing, may well be doubted. But at present the justices of the county, under the Contagious Diseases Act, and the poor law guardians, under the Public Health Act, are the local authority who alone have any right to interfere with a farm where milk is polluted previously to being sold. The local authorities of the towns whose inhabitants are poisoned by it would be ready enough to prosecute; but the farmer does not keep his dairy, and seldom exposes the milk for sale, within the limits of their jurisdiction—he has usually parted with it before it gets there, to a shopkeeper who is innocent of all knowledge of the unwholesome place from which it comes—and consequently poisonous milk may be distributed without anyone being either prosecuted or punished. This state of the law obviously gives but an insufficient protection to the public health; and as the general law will not help them, some towns are anxious to get powers to protect themselves.

The Corporation of Bradford are promoting a Bill in Parliament this session which contains a clause enabling them to deal with any person 'supplying milk for sale or use within the borough, although such person may reside, or his dairy cowshed or milkshop may be situated, beyond the borough boundary.' This clause would effectively do away with the exemption from prosecution which the rural dealer in milk now enjoys, but it is objected to as unduly extending the jurisdiction of the borough authorities. There is some force in the objection, though we do not think that it should necessarily be fatal to any legislation in the proposed direction. The general principle of our law no doubt is that criminal jurisdiction should be exercised by tribunals which sit in the locality where the offence was committed; and this principle would be infringed by giving borough justices power to impose penalties in respect of cowsheds in the country, perhaps many miles away from their town.

are certain seeming exceptions to this principle which seem to show that there would be no stency in giving the proposed additional to the Bradford Bench—for instance, the cases the Adulteration Acts where country farmers in towns for selling adulterated milk, or the Public Health Act for selling diseased out these seeming exceptions are in reality only cases in which the farmer commits an offence in town, and in which he is therefore properly tried there, and not in the district where he lives which he has not broken the law. The case came with regard to unwholesome milk; where never can be shown to have sold it or exposed it in a town, he may be prosecuted in the country so doing. It is, however, rarely possible for this, and consequently the further powers needed for. It seems to us that the requisite might be given to urban authorities if they are empowered to appear as prosecutors outside the district in cases where the conduct of a person supplying food endangered the health of the district. They have such powers subject to the sanction of the Attorney-General, with respect to pollutions of streams; and ought, we think, be trusted not to use any such vexatiously if they were allowed to prosecute before the magistrates of the district where the offender is. With this modification we are glad to see Bradford obtain Parliamentary powers for the clause which is contained in its present Bill, and further to see the general law amended to secure the same powers for the local sanitary authorities of all urban districts.

SMOKE ABATEMENT.

PROVISION for the purpose of abating the nuisance by smoke has been tentative and gradual. The first Act was passed for the metropolis only (16 & 17 Vict., c. 128). It imposed a penalty on any person who, after August 1, 1854, uses any furnace which is not constructed as to consume or burn its own smoke, or who uses any properly constructed furnace, not using the best practicable means for preventing or counteracting the smoke or annoyance. Provisions were expressly made applicable to buildings above London Bridge, as well as to buildings used for manufactories. This was amended in 1856 (19 & 20 Vict., c. 107) by including furnaces employed for the purpose of baths and washhouses, among those liable to penalty, and extending to the Nore the part of the Act within which steamers must keep their funnels under control. The force of these Acts was weakened by a saving clause contained in the Act of 1853, which provides that 'the justices before whom any person may be summoned may remit the penalty, if they shall be of opinion that such person has constructed or altered his furnace as to consume or burn, as far as possible, all the smoke arising from such furnace, and has carefully attended to the same and consumed or burnt, as far as possible, the smoke arising from such furnace.' The next Act was the Sanitary Act, 1866 (29 & 30 Vict., c. 90), which applied to the Country generally, and under it smoky chimneys were defined to be liable to be dealt with summarily. 'Any person or furnace which does not, as far as

practicable, consume the smoke arising from the combustible used in such fireplace or furnace, used for working engines by steam, &c.,' and 'any chimney not being the chimney of a private dwelling-house sending forth black smoke in such quantity as to be a nuisance,' are the kind of chimneys with which that Act deals. But here again, as in the earlier metropolitan Acts, there is a saving clause under which 'the justices may hold that no nuisance is created within the meaning of the Act and dismiss the complaint, if they are satisfied that the fireplace or furnace is constructed in such a manner as to consume as far as practicable, having regard to the nature of the manufacture or trade all smoke arising therefrom, and that such fireplace or furnace has been carefully attended to by the person having the charge thereof.' The Act of 1866 has been repealed, except as regards the metropolis, by the Public Health Act 1875 (38 & 39 Vict. c. 55) but the above provisions are re-enacted verbatim by Sect. 91 of that Act, and they are now the provisions in force throughout the Country; for the metropolis the three Acts of 1853, 1856, and 1866 are still in force.

There can be no doubt that a certain mitigation of the smoke nuisance has been effected, and if the local authorities, whose duty it is to prosecute, and the magistrates who have to hear cases in which persons were charged with infringements of these provisions were really in earnest, much more might be done. Many persons, however, who habitually offend escape prosecution altogether; and where prosecutions are undertaken, and convictions obtained, the penalties imposed are often so small that manufacturers think it is worth while to take the risk of having to pay a fine rather than go to the expense of altering their furnaces so as to consume their smoke. A Bill has this year been introduced into the House of Lords, by Lord Stratheden and Campbell for the purpose of strengthening the hands of the local authorities in the metropolis, so as to secure a more complete abatement of smoke. Its main provisions are (1) to enable the local authorities in the different districts of the metropolis to make by-laws for prohibiting or regulating the emission of smoke from any building within their district. 2. To enable the Metropolitan Board of Works to make by-laws with reference to the construction of fireplaces or furnaces in any new buildings hereafter to be erected. 3. And repeal of the words which exempt the chimneys of private dwelling-houses from the operation of the Acts. As far as it goes, this Bill, if it becomes law, may be useful; but if it is to be passed, we think it ought to apply to the Country generally, and not merely to the metropolis. The Bill, however, does not touch the real cause of the comparative failure of the existing laws—i.e. the apathy of the local authorities, whose duty it is to enforce them. Laws, of course, cannot be self-acting, and courts can only impose penalties when offences are proved before them. We see no reason why neighbours who know of persistently smoky chimneys should not be allowed to institute prosecutions in respect of them. The danger of being ordered to pay costs if they failed to prove their case would, we think, be sufficient safeguard against such prosecutions being rashly undertaken. If this alteration, however, cannot be made in the law; at any rate, a power of instituting prosecutions for smoke might be safely given to the inspectors of factories, who are public officials, and who are free

from the suspicion under which local authorities labour, of wilfully neglecting to put the law in operation from reasons of self-interest. If the existing laws were put in force the smoke nuisance would be largely abated. Further legislation may be useful, but even at present much may be effected.

DEFYING THE LAW.

SITUATED in an obscure corner in Whitechapel, close to Leman Street Station, is the Mill Yard Chapel of the Seventh Day Baptists. The small burial-ground in its rear has, during the last few months, become famous from a legal point of view. The facts are these:—The London, Tilbury, and Southend Railway Company propose to acquire the ground for railway purposes, the trustees are anxious to sell it, but the Metropolitan Public Garden Association and the other promoters of the Act, which received the Royal assent last August, for the Prevention of Buildings on Disused Burial-grounds are opposing the company's Bill on the plea of its illegality. No doubt the owners of the ground are to be pitied; they are offered 6,500*l.* for the property, and with this sum could build a chapel elsewhere; therefore they fully intend to defy the Act, and will not yield without a hard struggle. But if the land is not acquired for railway purposes, is it to remain as it is? Here is the difficulty. The Seventh Day Baptists are tired of their little meeting-house in Whitechapel, and desire to start afresh in Mildmay Park; but how are they to have a new place of worship if they fail to sell the Mill Yard Chapel and Burial-ground? It would be well if some benevolent friend were to offer them another meeting-house (and there are several in London which are closed and useless, the Gibraltar Chapel, Bethnal Green Road, for instance), so that the site of the building and the burial-ground might be converted into a pleasant garden for the inhabitants of one of the most crowded parts of London.

That there would be railway-lines on three sides of the ground would not necessarily disturb the comfort of those who might use such a garden; the people living in the neighbourhood are accustomed to the constant noise of the trains, and the very fact that the railway-lines will be 40 feet above the ground shows that they must be much nearer to the windows of the houses than they would be to the garden below. The experience of the members of the Public Garden Association has taught them that even a quarter of an acre of ground, if laid out with trees, paths, and seats, is an immense boon in its neighbourhood, and is fully appreciated by those who live near enough to use it.

It is high time that the railway companies should be checked in their appropriation of open spaces, they have swallowed up enough already, burial-grounds, commons, parks, squares and private gardens have given way before them. In London alone they have annihilated at least a dozen burial-grounds, have run their lines through others, taking away considerable pieces of the ground, have indirectly caused the demolition of many more, and have destroyed several places of worship with vaults containing the remains of the dead. Among the offending railways are the Great Northern, Great Eastern, South-Eastern, London and North-Western, London Bridge and Charing Cross, and last, but not least, the District and Metropolitan

Railways. Public opinion upon such matters has changed very much of late; this was evident two years ago in the struggle of the London and North-Western Railway Company for St. James's burial-ground, Hampstead Road. The passing of Mr. Holland's Act has proved a most useful step in the right direction, Londoners are learning to appreciate the efforts of those who are working so actively to secure additional open spaces in the overcrowded town, and they will take good care that in the Mill Yard and future cases the Act is not infringed, so that the disused burial-grounds of the metropolis may be saved from the encroachments of the railway companies as well as from the hands of the speculative builders.

SEASON TICKETS AND THE ARTISANS' DWELLINGS QUESTION.

FOLLOWING closely in point of time upon the observations with regard to railway facilities for artisans which we made in these columns last month, came the semi-official announcement that the railway companies were preparing for some considerable concessions in the way of working-men's tickets. It may be worth while, therefore, to trace these concessions to their source, and to appraise their value to the classes immediately interested.

About the middle of 1884 the Artisans', Labourers', and General Dwellings Company, failing to get any satisfactory assurances from the directors of the Great Northern Railway, presented a memorial to the Board of Trade, praying for an official inquiry, under the Cheap Trains Act of 1883, as to the sufficiency of the provision of workmen's trains on the Great Northern and Great Eastern Railways for the Noel Park (Wood Green) district. Mr. Chamberlain at once ordered an official inquiry, which was held both on the spot and at the Board of Trade offices by Major Marindin. Mr. Oakley, general manager of the Great Northern line, Mr. Birt, general manager of the Great Eastern line, and Mr. Farrant, the managing director of the Artisans' Dwellings Company, were examined, and Major Marindin was convinced of the insufficiency of the workmen's trains for that district. Thereupon the Board of Trade informed the railway companies that they were satisfied of the truth of the complaint of the insufficient accommodation, and (having in view the provisions of the Cheap Trains Act of 1883, making the running of workmen's trains up to eight o'clock in the morning compulsory) asked them what they proposed to do. The detailed scheme has not yet been sent in, but it is understood that, on the invitation of the general manager of the Great Northern Railway, who objects to run any more workmen's trains, and does not see his way to issue third-class season tickets (which is the real and equitable solution of the difficulty), the railway companies generally, and not only for London but for the suburbs of all large towns, propose to issue for all trains arriving at their destination up to 8 A.M., third-class return tickets at half the usual fares, the return journey to be made after 4 P.M. on usual days and after 12 on Saturdays.

It would be idle to deny that this is a great concession. But it is not all that the working classes are entitled to under the Cheap Trains Act of 1883, and it is possible that the concession now offered by the railway companies will facilitate their arrangements.

id alter their views as to the desirability of doing re justice to the third-class passenger by giving m a season ticket at a fair and proportionate ice. The limitation of the return journey to four clock and after is the most serious drawback in e scheme. Many men, especially in the building ades, have irregular hours of labour. They may ave their homes with fair weather, but when they t to their job, or after breakfast-time, rain may me on ; they will then be dismissed for the day, ut instead of being able to get back to their homes, ey must, under the plan of the railway companies, lle about all day—most probably at a public-house —until the hour arrives when their ticket becomes available.

The remedy for this very undesirable state of affairs is the extension of season tickets to the hird-class artisan passenger. We said our say on this subject last month, and have nothing now to add, except to hope that the Board of Trade will not be hoodwinked by the companies into the belief that by their proposed new action the requirements of the Cheap Trains Act are fully met.

WATER RATES.

DISPUTES between the London water companies and their customers as to the amount payable by way of water rates continue to be frequently reported in the newspapers ; and on more than one occasion magistrates have decided the law to be, as we have previously pointed out it was, that the person who disputes the value put on his property by the company must take the necessary steps for having the value settled by a magistrate, and cannot content himself with refusing to pay the rates demanded. If he does, the company is justified under the Waterworks Clauses Act in cutting off the supply. This power is one which on sanitary grounds we should like to see taken away from the companies, or at any rate put under the control of the local authority or of a court of justice. A Bill is now before Parliament, introduced by Lord Camberdown, which proposes that this power shall be exercised only when an order for the purpose has been obtained from a Court of Summary Jurisdiction. The Bill was opposed by the water companies, who clearly attach value to the power they at present have ; but as that power not only may be ut is exercised in a manner detrimental to public ealth, we think the proposed restriction on its exercise is likely to be beneficial. The Bill further proposes to make it obligatory on water companies to give their customers a statement of the particulars by which the rate they demand is made out. That they should do this is admitted to be reasonable, and the proposed alteration is not seriously opposed. Whether even an unpretentious Bill like the above will become law this year is of course doubtful. If it does, consumers of water will do well to remember that the companies can at present cut off water in cases where the amount to be paid is in dispute, and that they have every disposition to use this power.

Other legislation affecting water companies has also been commenced this session. The necessity of getting the value of premises for purposes of water rates, ascertained independently of the valuation for poor rates and other similar purposes, is felt to be a grievance ; and where the

valuation made for the poor rate is on the whole fairly made, as is the case in the metropolis, it certainly seems to be unnecessary to make a second valuation for the satisfaction of the company. Mr. Torrens's Bill for making water rates chargeable on the basis of the poor rate assessment has passed its second reading in the House of Commons, on the understanding that its operation is to be limited to the metropolis. If it passes into law, the London magistrates will be relieved from the troublesome duty of ascertaining the value of premises in case of disputes as to water rates. The Metropolis Valuation Act provides for the revaluation of all premises in the Metropolis every five years ; and, if the water companies are given—as presumably they will be—the right of being heard on the question of the valuation of any house supplied by them, there is no reason to suppose that the alteration of the tribunal by whom the value is to be ascertained on which their rates are based, will work unfairly. Outside the metropolis there is at present no security for any regular periodical revaluation of property, and it is notorious that assessments in different districts vary greatly. It would be manifestly unfair to subject the rates, which water companies now levy under Parliamentary sanction, to capricious reductions at the hands of interested local tribunals ; and, consequently, Mr. Torrens's Bill is now not to extend to the Country generally. The late Government introduced a Bill for the purpose of securing a general and equal valuation everywhere of property liable to taxation, whether for imperial or local purposes. That Bill failed to pass, and has not been reintroduced by the present Government. If ever it becomes law, water rates may fairly be made chargeable on the public assessment made under it ; but while the assessments remain as capricious as they are now, companies, outside the metropolis, are in fairness entitled to have the value of property in case of dispute, ascertained specially for the purpose of their rates, and no tribunal seems likely to do this more satisfactorily than the magistrates on whom the duty is now imposed.

A case which was recently before the Queen's Bench Division (*Coleman v. West Middlesex Water Company*) raises a question which will be of importance, irrespective of the persons by whom the valuation of property is made. The point to be decided was what should be included in ascertaining the value of trade premises. The house as to which the dispute arose was a public-house, and in addition to the rent which would have been charged for it as an ordinary house, the tenant had made payments in respect of the licence and as a premium for the good-will of the business. The question was whether these payments were to be considered in arriving at a determination as to what was the annual value of the house, and the court determined that they were. Ever since the House of Lords, in *Dobbs's* case, settled that water rates were to be charged on an annual value arrived at in the same way as annual value is arrived at for purposes of poor rates, those acquainted with rating law have known that circumstances which enhance the value of property in the hands of its occupier must be considered, as well as circumstances which cause deductions to be made from the rent nominally paid. A licensed house is usually more valuable, and so commands more rent, than an ordinary dwelling-house ; and it would consequently be rated higher to the poor rate. As water has to be paid

for, not according to the amount consumed, but according to the annual value of the premises to which it is supplied, it follows that higher water rates must be paid by business premises than by private houses of the same size. The announcement of this rule may be unpleasant to tradesmen, who are consumers of water, especially since the recent decision of Mr. Paget that a barber may properly be charged extra for the water he uses for shaving; but, until the rules of rating are altered, it must be accepted as correct.

NOTES OF THE MONTH.

THE SEWERAGE OF LONDON SUBURBS.

THE drainage of London proper is itself a sufficiently complicated question, but the sewerage of the outlying suburbs is a difficulty even greater. The parish of Tottenham is in despair about its drainage, and it has been suggested that the district should be annexed to the metropolis, so that it could get the benefit of the main drainage system. But the Metropolitan Board of Works have reported adversely to this suggestion, on the ground that special legislation would be required, and that 'in considering the question of the drainage of Tottenham, it would be further necessary to have regard to the possible expediency of taking the sewage from other localities in the valley of the Lea. Moreover, there is the larger question whether it would be expedient to deal with any particular portion of the outlying districts of the metropolis other than as part of a measure for the general extension of the drainage to the whole of the districts round London. On these grounds the Metropolitan Board, whilst willing to accept the responsibility for a larger area if imposed upon them by the legislature, could not undertake to help Tottenham out of its present difficulties. A number of members commented in very uncomplimentary language on the condition of the Lea, and one remarked that 'there seemed to be no body in existence to remove this crying evil' of the pollution of rivers by the drainage of towns. We fear that Tottenham is not alone in the imperfection of its sewerage: indeed, an organised and systematic inquiry into the sanitary administration of the whole of our metropolitan suburbs seems urgently called for.

'E PUR SI MUOVE.'

WHEN the grave and reverend seigniors at the Local Government Board can so far cast aside official prejudice and the lack of precedent as to sanction the appointment of a woman to the post of vaccination officer, it must be confessed that the times are moving on. We have always looked upon a vaccination officership as one of the least desirable of public appointments, from the point of view of the holder's comfort. The honest performance of the duties involves a great deal of inquisitorial investigation into the domestic arrangements of families, and a perpetual fight against the ignorance, carelessness, dilatoriness, if not positive wrong-headedness of parents. The householder's mental picture of a vaccination officer is a somewhat grubby and prying person, with exasperating forms that must be filled up under the direst penalties, and with a strong family likeness to the rate-collector. But a vision of better things arises now that the

Local Government Board have assented to the appointment of a 'young lady' as vaccination officer of the Fordingbridge Union. Instead of instinctively grasping the nearest available pail of dirty water at the approach of the emissary of the law, we may expect that the artisan mother will greet with open arms the sympathetic person who accepts the proffered chair, and artfully extracts the information which she desires whilst dandling the baby. The first shock of novelty once over, women will soon be the favourites at elections for vaccination officerships, and we shall cease by-and-by to be astonished at the temerity of the Fordingbridge Guardians in setting so novel a precedent. After all, there is nothing to disqualify a woman from filling most local offices if she be eligible in other respects. It has been judicially decided that she may be a commissioner of sewers, governor of a workhouse, keeper of a prison, gaoler, parish constable, returning officer for a Parliamentary election, guardian, and overseer of the poor. It is true that in the case of the last-named office the judges ungallantly remarked that a man ought to be appointed, but that, if there was no man available, a woman was the next best thing. Nor ought we to omit to mention another parochial office which it has been gravely ruled that a woman may properly hold. The Court of King's Bench laid down once upon a time that women were eligible for the office of sexton, and that women who were ratepayers might vote at the election: though the Court somewhat cruelly gave as its reason for not excluding them that this was 'an office that did not concern the public, or the care and inspection of the morals of the parishioners.' But this must have been long before 'women's rights' came within the range of practical politics.

THE FALLACIES OF WATER ANALYSIS.

THERE appears to be something like an organised revolt against approval or condemnation of potable water, according to the report of an analyst on its chemical constituents only. We noticed a case of the kind at Canterbury last month; and a similar instance has recently happened at Enfield. At Canterbury they seem to have quite a taste for litigation on the subject, for, subsequent to the occurrences reported in our last number, the Town Council sought to get closed the well of 'a maiden lady, who had drunk the water all her life, and had never suffered any ill effects.' The sanitary authority contended that the water was contaminated, and therefore dangerous to health. In support of this the town clerk produced the analysis of the East Kent public analyst, which was supported by the report of the medical officer of health, and also an analysis made by Dr. Corfield, medical officer of St. George's, Hanover Square. On the other hand, defendant's counsel read a report upon the water by Dr. Robinson, the health officer for the East Kent Sanitary District, to the effect that the water was not unsafe for drinking purposes, although the nitrates were high. Eventually the magistrates decided in favour of the sanitary authority, but granted permission for the water to be used for other than domestic purposes. We observe that a notice of appeal was given by the defendant; so that there is reason for hoping that the whole question will be investigated before a superior court of law.

THE LIFE-HISTORY OF PARLIAMENTARY RETURNS.

One may judge from the utterances of politicians in the papers, so many departments of Parliamentary procedure appear to be in such a form that we much fear a shout of derision for an improvement of such unconsidered Parliamentary returns. A member of Parliament who wants some information or statistics to garnish a speech or pamphlet with hopes to electrify society; or some persecuting constituent, with a similar end in view, sends an eagerly prepared skeleton form, which the member would like filled up by a Government department without further trouble to himself. What is more than to move for a return, say, of the potatoes consumed in each canteen of the prisons at home and abroad, thereby enabling the people as to the way in which the finances are frittered away, and enhancing the position of the mover of the return as a far more energetic politician, at one and the same time the Minister who has the responsibility of granting or refusing the proposed return is placed in a dilemma that if he, knowing it to be perfectly sound and misleading, declines to grant it, he must answer for his refusal, and will almost inevitably make an enemy of the member whom he has refused, and so, for the sake of peace and quietness, no objection to the return. It is then relegated to some subordinate clerk to prepare, in a quiet and unobtrusive manner, and is in the fullness of time laid upon the table of the House. By the time it is printed, and is circulated amongst the hands of readers for whom Blue-books have been sent. Few people feel the smallest spark of interest in it; fewer still take the trouble to read it on the day of its final delivery to the tender hands of the butlerman is seldom long delayed. We deny that this is a sufficiently accurate life-history of the average Parliamentary return, and we will give him chapter and verse in return.

TYPHOID FEVER AND CATTLE MANURE.

A report on the sanitary condition of Carlisle, 1884, Mr. W. Brown, the medical officer of Carlisle, records eleven cases of typhoid fever, which are associated with the existence of animal manure in such places as slaughter-houses, cow-houses, and buildings used for the dressing of tripe and other offal. These cases possess more than ordinary significance from the fact of their affording support to the views of Mr. Henry Lawrence, who has traced the origin of many cases of typhoid fever to a close connection with the presence of animal manure. Mr. Lawrence, who was formerly appointed surgeon in the Colonial Department in the Cape Colony, gives the results of his experiences of typhoid fever at the various stations and other isolated places at the Cape during a period of twenty-five years, under circumstances where its *de novo* origin must, he holds, be indisputable, and where cattle manure in great quantity to infect the air or gain access to water was invariably the apparent cause of the disease. Mr. Lawrence, after giving a detailed account of a remarkable series of outbreaks where the possibility of infection by human beings was excluded, sums up his conclusions as follows:

'Typhoid fever arises independently of infection from any other human being; having so arisen, it is communicable to others in the usual well-known ways. In the cases described where it has arisen *de novo*, cattle manure has been invariably present in sufficient quantity to infect the air or water used for drinking purposes. Typhoid has not been traced to the presence of horse or sheep manure, and epidemics of the disease in England are mostly referable to dairy farms. As long as dairies are considered safe in every other way, if there is no case of typhoid fever on the farm, so long, I believe, will they prove to be fresh centres for the distribution of the disease. While the question is still *sub judice*, great care should be exercised in keeping milk free from contamination by air or water infected with cattle manure. Apart from milk epidemics, the pollution of water used for domestic purposes with cattle manure, either by soakage from cattle inclosures or surface drainage of pasture land, is not uncommon. It has given rise, I believe, to several recorded epidemics not otherwise accounted for.'

THE BOUNDARY COMMISSION.

OUR readers may remember our indulging in a little speculation in the January number of the SANITARY RECORD as to what was to happen in case the limits of municipal boroughs—now, under the Redistribution Bill, to be unified with those of Parliamentary boroughs—were extended in the future under the provisions of local Acts. We asked whether in such a case the Parliamentary borough would expand by automatic process or remain unexpanded, or whether new redistribution on a microscopic scale would every now and then be necessary to readjust boundaries. We observe with considerable satisfaction that the point raised by us has been deemed worthy of consideration by the Boundary Commissioners, who, in their report presented to Parliament, comment on the growing desire of boroughs for municipal extension, and the frequent extensions which are sanctioned by Parliament without any concurrent extension of the Parliamentary boundaries. Their proposal for adjusting the boundaries in such a case is that a special report should be made to both Houses, so that provision may be made, if thought desirable, for the extension of the Parliamentary boundaries at the same time. But will not this tend rather to encourage spread-eagleism on the part of the more ambitious Corporations?

PRIVATE BILL LEGISLATION.

THERE appears to be no likelihood that the debate on our present system of private Bill legislation, started by Mr. Craig Sellar on an early evening of the session, will be renewed this side of the prorogation. So that the soothing advice of the Government to leave the question open for the next Parliament to grapple with will probably have, *volens volens*, to be accepted, although all the honours of the debate were with the advocates of reform. As to the particular method in which Parliament is to be relieved of the duties which are now performed by its most inefficient and perfunctory members there is no doubt considerable room for argument. No proposal yet made fully meets the case; but when horror is expressed at the

transfer of the Committee stage of Bills to judges, it is well to remember that similar objections were raised to turning over the hearing of election petitions to the judges—a reform which has since worked admirably. Attempts to amend the present system as to private Bills are still regarded in the House as rather a feeble kind of joke. It is hopeless to expect any reforms from within, unless what it is the fashion to call a 'healthy public opinion' on the subject is created without. And we are glad to observe that in this spirit the Association of Municipal Corporations, at its annual meeting held recently, passed a resolution 'That the present system of referring private Bills to a committee in the House of Lords, and to another committee in the House of Commons, occasions unnecessary delay and expense, and that it is expedient, in the interests of the public, that one committee only should sit upon private Bills, and that such committee should be composed of members of both Houses of Parliament.' Reform in this direction would no doubt be the best to begin with.

THE DRAINAGE OF THE LOWER THAMES VALLEY.

THE last word has not yet been written on this much-vexed and complicated question. We are not concerned for the moment as to whether it was the wisest course in the first instance to have set up a Joint Board for the drainage of the various sanitary areas in the Lower Thames Valley; but, the Board once established, it would be the height of folly at this time of day to resume the *status quo*. And this is the view which has evidently swayed the Local Government Board in arriving at a decision on Mr. Thornhill Harrison's report of the prolonged inquiry which he recently held into the proposed dissolution of the Lower Thames Valley Main Sewerage Board. The only district that the Whitehall Board will consent to sever from the Joint Board is Heston and Isleworth, the circumstances of which are peculiar. This particular district was not originally included in the combination, but was subsequently added at its own request. It is to a certain extent isolated from the remainder of the district, and has special facilities for disposing of its sewage in its own area. But these considerations do not apply in the case of the other districts that desired separation. There is the greatest difference of opinion on the part of the constituent authorities on the question of the dissolution of the district, and of the new districts necessary in the event of the district being dissolved. Difficulties similar to those which led to the constitution of the main sewerage district would infallibly arise, and if a scheme for the diversion of the sewage at a moderate cost could be devised there would be extreme difficulty in carrying it out except by a Joint Board. The Local Government Board are therefore not prepared to issue a provisional order for the dissolution of the main sewerage district, or the separation of any constituent district with the exception of Heston and Isleworth, though they are ready to grant a provisional order altering the present basis of contribution of the constituent districts and the terms of office by elected members. As to Sir Joseph Bazalgette's scheme, the Board are not at present prepared to approve of it, and if the Joint Board should determine to renew their application for sanction to a loan with a view to its being

carried out, the scheme should be carefully revised and perfected before it is submitted to the Board. The Board are also of opinion that before the Joint Board arrive at a final decision with regard to this scheme, they should fully consider whether it might not be practicable to adopt some other scheme which would provide for the disposal of the sewage outside the district of the Joint Board, and which would entail less cost.

THE VALUE OF VACCINATION.

THE Leicester anti-vaccinators are no doubt sufficiently proud of their imposing demonstration of the other day, with its phalanx of victimised parents, its cartloads of unpolluted children, its gallows for the effigy of Jenner, and its other crudities. It might have been worth while for the Government authorities to have had struck off a special edition of 20,000 copies of Dr. Gayton's recently issued pamphlet on vaccination, for presentation to each of the 20,000 demonstrators, though we suspect that, after all had been supplied, a good many of the pamphlets would have remained on hand. It is all very well for Mr. Hopwood and other leaders of the blind to use fine swelling language about the absolute inutility of vaccination and its powerlessness to affect small-pox. Let them read Dr. Gayton's figures—or, for the matter of that, any other recognised treatise on the subject—and then say how they hope to square those figures with the dogmas which they so persistently seek to establish. Dr. Gayton is eminently fair and practical. He argues from his own observations, and bases his conclusions on his own figures. He even makes admissions which to the strict disciple of Jenner may seem somewhat heterodox; and yet, after making every allowance, what is the outcome of the 10,403 cases which have come under his care?—an experience greater, we believe, in point of numbers than that of anyone else except the late Mr. Marson. Dr. Gayton analyses the mortality in great detail, but for our present purpose it may suffice to call attention to the following:—

	Number of Attacks.	Percentage of Deaths to Attacks.
Well Vaccinated Persons	2,085	8'97
Imperfectly Vaccinated	4,854	9'37
Said to be Vaccinated, but without evidence	1,295	27'18
Unvaccinated	2,169	43'70

We shall be interested to know how the anti-vaccinators propose to prove from these figures the impotence of vaccination to affect small-pox.

THE METROPOLITAN PUBLIC GARDEN ASSOCIATION.

At a meeting, held on April 7 at 83 Lancaster Gate, Colonel Burges in the chair, the secretary reported that the fund for giving work to unemployed labourers was being used in carrying out the various undertakings now in hand, and that about sixty *bona fide* unemployed men were working daily and working well at fourpence per hour in digging, planting, painting, &c. It was agreed to take over and lay out the Beaumont Burial-ground, a small cemetery in Stepney, and to offer to lay out several other disused burial-grounds in the metropolis; to

h their owners with regard to Soho Square, Dalgar Square, Chelsea; to grant a sum of wards the expenses of the garden adjoining y's, Whitechapel, and 5/ to the public play in Spicer Street, Mile End New Town; to the resistance to the proposed appropriation Mill Yard Burial-ground, Whitechapel, for purposes; and to offer seats for the ground ding Marylebone Parish Church. It was an l that the trustees of Red Lion Square, 1, and Trafalgar Square, Mile End, had over these enclosures to the association, and ore long these two gardens would be thrown the public. The secretary also reported playground in Union Road had been taken the Vestry of Newington, and that, owing representation of the association, a portion of for sale south of Royal Mint Street, E., was ved from being built upon, and made into a ind for the children of the neighbourhood, nd in question being the site of the Aldgate round. Many other subjects engaged the 1 of the meeting, among which was the of the opening of the squares in Belgravia where during the months when the residents rrounding houses are out of town.

DRAINAGE OF THE HOUSES OF PARLIAMENT.

ve so often pointed out the moral of the overnment Board—the arcanum of sanitary being housed in a structure that for sanitary probably transcends any other public build-recent erection, that we fear most of our by this time involuntarily shudder at the ntion of the new Home Office. We turn : with considerable alacrity to an entirely original illustration of how not to do it, as ed in the drainage of the Palace at West-

Last summer, odours unpleasantly sug-of drains, offended the nostrils of our rs whilst they were toiling at St. Stephen's country's good. The ravages of cholera on tintment were in everybody's mouth when ld spare breath from the debates on the e Bill; and it was universally felt that ing must be done; to put a stop to these in-mells. Happily the holidays were approach-so members were soothed into comparative y the assurance that one of the inspectors of l Government should investigate the matter e vacation. The matter has been investi-nd a nice state of affairs has been disclosed ; is the smells are waiting for the advent of to reassert themselves, nobody has thought while to stir the sleepy Office of Works into 'he report of the inspector who has inquired matter states that the main drainage of the f Commons is very defective. The chief enormously large, and out of proportion to rements of the buildings. It runs across ker's yard and then along the south side of ard, and joins the main artery of the me- drainage in Bridge Street. This chief ntary sewer is almost large enough for a walk upright in, and has actually been by the officials conducting the examina-ose to the point where the sewer passes lace Yard, there is a sudden drop of 18 the level. Beyond this point, and for some

60 or 70 feet, there is, and apparently has long been, a collection of stagnant and offensive deposit of the worst kind. This alone is sufficient to cause the odours which were so remarked last summer. Again, the average height of the sewage stream in the main Bridge Street drain is three feet. The Parliamentary sewer discharges into this only 18 inches above the bottom of the main drain. There is, therefore, a constant backflow of the sewage into the Parliametary drain, whenever the main stream is over 18 inches in depth. The sewer-grating in the middle of the roadway at the point where Parliament Street and Bridge Street meet has, indeed, long possessed a peculiar fragrance of its own. We have often wondered how our hundreds of legislators, with their passion for asking questions on subjects of the most trivial kind, could pass by this grating day after day, and never think it worth while to draw attention in the House to its pestilential odour and ask whether the cause was known. The inspector's report supplies the answer as to the cause, and the remedy ought speedily to be forthcoming. The notions of the Parliamentary architect as to drain-ventilation appear to be simplicity itself. It has been hitherto fondly supposed that a thorough ventilation was established by means of the shaft that runs from the chief Parliamentary sewer up into the Clock Tower. During the session of Parliament, an enormous furnace is kept always burning in the Clock Tower night and day. With this the drain-ventilator is connected, in order that a strong current of air may be continually drawn upwards towards the purifying flames. It is now found, however, that the other end of the sewer has been hermetically closed! We cannot find in our heart to spoil the moral of this ingenuous little story by any comments of our own; but could anything possibly be more delightfully illustrative of the arts of the jerry-builder?

EPIDEMIC MORTALITY IN PARIS.

WHILE almost everywhere else the death-rate from preventable diseases is declining more or less rapidly, in Paris the last decade has witnessed an increase, most marked in those most immediately dependent on insanitary conditions, especially those connected with sewerage and water supply,—viz., diphtheria and enteric fever. M. Jacques Bertillon has furnished us with the following figures showing the death-rate per 100,000 living from several diseases:—

	Measles.	Whooping Cough.	Diphtheria.	Typhoid.
1865-69	32	10	43	54
1872-76	35	10	65	50
1877-80	39	19	100	(1877-79) 50
1881-83	46	20	97	(1881) 97 (1882) 95 (1883) 149 (1883) 98

Diphtheria and typhoid have thus doubled during the last decade.

THE INFLUENCE OF SANITARY CONDITIONS ON HEALTH.

THE death-rate of Danzig before and since the introduction of an improved water supply and a regular system of sewerage furnishes another striking proof of the enormous influence exerted by such conditions as those of the soil and water on the

health of a town population, and of the true economy of expenditure, however apparently heavy it may seem. Not until the end of 1869 was that city provided with a public supply of pure water, and the present sewerage works on the system in vogue in most English towns were carried out about 1872. In the nine previous years the general death-rate was 36·39 per 1,000. Since 1871 it has been 28·56 or 7·83 per 1,000 less, although the latter period includes the small-pox epidemic of 1872, the heaviest since 1838, and the cholera of 1873.

But enteric fever is the disease in which these factors play the most important part, and the results in the case of Danzig are remarkable. From 1863-71 the enteric death-rates per 10,000 were 11·2, 7·7, 9·8, 12·3, 12·3, 8·9, 7·0, and 11·0, while from 1872 to 1883 they have been 8·0, 4·1, 5·1, 3·3, 2·6, 2·7, 1·9, 1·8, 0·8, 1·4, 2·1, and 1·0, giving for the former period an average of 9·9, and for the latter of 2·9, or for the last six years of 1·5. Even this figure does not give a fair idea of the actual mortality, for if we deduct the deaths in hospital of strangers from the neighbouring villages the rates for the last three years are found to be 1·1, 1·4, and 0·6.

It is worthy of notice that the enteric death-rate was not appreciably affected by the water supply alone; it was not until the completion, three or four years after the commencement of the sewerage works that the improvement became manifest.

SUPER VISION OF DRAINAGE WORK.

A VERY useful and complete code of regulations has been drawn up by a special committee of the Glasgow Corporation with regard to municipal supervision of the drainage of houses. The Lord Advocate has been invited to include them in his General Police Bill for Scotland, and it is certainly greatly to be wished that they had universal application. We have no space to give the code of regulations in its entirety, but must find room for those relating to the efficiency of the drains, which run as follows:—6. Sufficient traps and ventilation must be provided and fixed in position to the satisfaction of the Master of Works. 7. No pipes to be covered until inspected by the Master of Works or his representative; and no junction connecting drain pipes and plumber work to be covered up until examined and passed by him. 8. The Master of Works to have power to use the smoke test on all drains and plumber work before the building is occupied, and at any other time he may consider necessary; all expenses connected with the test to be paid for by the proprietor of the property. 9. No dwelling-house to be occupied until a certificate has been given by the Master of Works that the drains and cesspools, with traps, have been properly constructed and the house otherwise fit for occupation.

BIRMINGHAM PENNY DINNERS.

THE last of the series of penny dinners for children, inaugurated about the commencement of December last by Mrs. Birt Davies Coleman, at the Acorn Hotel in Birmingham, was given a few days since, upwards of 300 children being present. The 'wind-up' dinner consisted of Irish stew, plum-pudding, oranges, ginger beer, &c., and at its conclusion the children were entertained with a magic-lantern exhibition. These dinners, of which 5,814

have been supplied, have been carried on by Mrs. Coleman, with the aid of a number of friends, who have materially assisted in the charitable object in view by contributing articles of clothing for needy children. A number of these friends were present on the occasion in question, including Canon Bowlby, Mrs. Colonel Smythe and Misses Smythe, Miss Joanna Hill, and other well-known and philanthropically-inclined residents of the town and neighbourhood.

A COSTLY SEWER.

AT a recent meeting of the Birmingham Town Council, considerable discussion took place relative to a report presented by the Public Works Committee upon the cost of construction of an intercepting sewer running through the Cole Valley, and a branch sewer, which, when their construction was agreed to in 1881, were estimated to cost 28,000*l.*, and for which 30,000*l.* was borrowed. The work is now approaching completion, and it is found that the cost will be, not 28,000*l.*, but 62,000*l.* This excess has been occasioned principally by the nature of the ground in the line taken by the sewer, a great portion of it being running sand, which was only discovered when the work was too far advanced to render an alteration of route possible. It was explained that the intercepting sewer was a long one, extending something like seven miles, from Stratford Road, near Sparkhill, to the new sewage farm at Tyburn, and it would drain 3,855 acres of land, 956 of which were within the borough. The drainage of the district had been delivered into the River Cole, but such strong representations were made with regard to the pollution of the water occasioned thereby that the matter had to be taken in hand. Nine shafts were sunk along the line of route and no cause of difficulty was discovered. The first section of the work was given to Messrs. Aird and Co., but when that was finished and the pipes were brought across the Tame into the valley on the other side, it was found that the soil was extremely treacherous. Special arrangements were made with the contractors, who did not care to undertake such risky work at a fixed sum, and the sewer was proceeded with. It was found that the bad ground extended for 2,300 yards, and for 900 yards of this distance there was running sand of the worst description, which had to be taken out a bucketful at a time, and a tunnel constructed through it. Instead of about sixteen weeks in which that part of the sewer ought to have been constructed, it occupied about sixteen months, and a million and a half gallons of water per day were pumped out for six or seven months. Every yard of the tunnel, which in some parts was 35 feet deep, had to be shored up, and all the timber had to be left in when the work was completed. The cost of the sewer to the end of the bad ground, about 3,610 yards in all, was 35,666*l.*, or about 10*l.* per yard. It was agreed to sanction the borrowing of an additional 23,750*l.*

DESTITUTION AND THE DEATH-RATE.

AT the meeting of the Sanitary Committee of the Middlesbrough Town Council, held on the 7th inst., Dr. Malcolmson, Medical Officer of Health, reported that the death-rate of the west district of the south side of the town during the month of March showed an average of 30·95 in the thousand. In

answer to inquiries Dr. Malcolmson stated that this high death-rate arose from the excessive mortality amongst young children in that district, owing in a great degree to the great destitution that unfortunately existed there. In many of the houses there was not a single blanket, and many of the children had not a single article of flannel underclothing, sides being very insufficiently fed. Alderman Thibald said that he was able from personal observation to corroborate Dr. Malcolmson's statement, who, in answer to further inquiries, suggested that if each child could have a quart of milk daily, some flannel underclothing, and a blanket at night, it would tend more than anything else he could suggest to a diminution of the death-rate.

THE PUBLIC HEALTH

DURING MARCH 1885.

The mean temperature during the month of March at the Royal Observatory, Greenwich, was $40^{\circ}3$; it was 5° below the average March temperature in one hundred years, and as much as $4^{\circ}2$ below that recorded in the same month of 1884. An excess of temperature prevailed on twelve days of the month, while on the other sixteen days it was below the average. The warmest day of the month was the 4th, when the mean was 50° , and showed an excess of $6^{\circ}5$; the coldest day was the 22nd, when the mean did not exceed $34^{\circ}7$, was $7^{\circ}0$ below the average. Rain was measured at Greenwich on eight days during the month, to the aggregate amount of 1.5 inches, which was slightly below the average March rainfall in sixty-one years, though it exceeded that recorded in the corresponding month of any of the three preceding years. During the first five days of this year the rainfall has amounted to 5.3 inches, which was 0.3 of an inch above the average for the same period of sixty-one years. The sun was above the horizon during 366.9 hours in March, but only 105.5 hours of bright sunshine were recorded at Greenwich; the amount was below the average of the third month of the five preceding years, though it considerably exceeded that registered in March 1884. The wind was very variable throughout the month.

In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, which have estimated population of nearly nine millions of persons, 157 births and 19,216 deaths were registered during the five weeks ending the 4th inst. The annual birth-rate, which had been 36.4 and 35.6 per 1,000 in the first two months of the current year, further declined to 34.2 during March, and was below that recorded in the corresponding month of either of the two preceding years 1883-84. In the twenty-eight towns the lowest birth rates last month were 26.1 in Brighton, 27.6 in Halifax, and 29.2 in London; in the other towns the rates ranged upwards to 40.1 in Sunderland, 40.4 in Cardiff, and 40.7 in Newcastle-upon-Tyne. The birth-rate in London last month was equal to an annual rate of 33.2 per 1,000, while it averaged 35.0 in the twenty-seven provincial towns.

The annual death-rate in the twenty-eight towns, which had been 24.4 and 21.2 per 1,000 in the two preceding months, rose again to 22.5 during March. The rate slightly exceeded that recorded in the corresponding period of 1884, which was equal to 22.0 per 1,000.

The lowest rate of mortality last month in these towns was 16.9 in Brighton. The rates in the other towns, arranged in order from the lowest, were as follow:—Derby, 13; Birkenhead, 18.2; Hull, 18.8; Portsmouth, 19.3; South, 20.0; Bradford, 20.1; Birmingham, 20.2; Salisbury, 20.5; Leicester, 20.9; Sheffield, 21.1; London, 21.5; Leeds, 21.5; Wolverhampton, 22.3; Nottingham,

22.4; Halifax, 22.4; Huddersfield, 23.4; Blackburn, 23.9; Norwich, 24.4; Liverpool, 25.1; Bristol, 25.2; Bolton, 27.1; Preston, 27.1; Manchester, 27.1; Newcastle-upon-Tyne, 30.4; Oldham, 30.5; Cardiff, 32.3; and the highest rate during the month, 43.0 in Sunderland. While the death-rate in London, as above stated, did not exceed 21.2 per 1,000, it averaged 23.7 in the twenty-seven provincial towns. The 19,216 deaths from all causes in the twenty-eight towns during the five weeks of March included 2,153 which were referred to the principal zymotic diseases, of which 775 resulted from measles, 604 from whooping-cough, 183 from 'fever' (principally enteric), 178 from scarlet fever, 158 from diarrhoea, 131 from small-pox, and 124 from diphtheria. These 2,153 deaths were equal to 11.2 per cent. of the total deaths, and to an annual rate of 2.52 per 1,000. This zymotic rate showed a further increase upon those in the two preceding months, but was below that recorded in the corresponding period of 1884, which was 2.84 per 1,000. The zymotic death-rate in London during March was equal to 2.29 per 1,000; in the twenty-seven provincial towns it averaged 2.72, and ranged from 0.4 and 0.6 in Brighton and Derby, to 4.1 in Bristol, 5.3 in Newcastle-upon-Tyne, 8.3 in Cardiff, and 18.3 in Sunderland.

Measles was the most fatal zymotic disease in the twenty-eight towns during March. The rate of mortality from this disease in these towns, which had been 0.42 and 0.50 per 1,000 during the first two months of this year, further rose during March to 0.91, a higher rate than has been recorded in any month since June last. In London the death-rate from measles did not exceed 0.79 per 1,000, while in the twenty-seven provincial towns it averaged 1.01, and showed the highest proportional fatality in Newcastle-upon-Tyne, Cardiff, and Sunderland. In the last-mentioned town a serious epidemic of measles prevails, no fewer than 199 deaths being referred to that disease during the five weeks under notice, equal to an annual rate of 16.6 per 1,000. The death-rate from whooping-cough, which had been 0.66 and 0.65 per 1,000 in the two previous months, rose to 0.71 during March, but was considerably below the rate recorded in the corresponding month of last year; in London the rate of mortality from this disease was equal to 0.62 per 1,000, while it averaged 0.79 in the twenty-seven provincial towns, among which the highest rates were recorded in Cardiff, Preston, Bristol, and Oldham. The rate of mortality from 'fever' corresponded with that recorded in each of the two preceding months; in London the fever death-rate last month did not exceed 0.15 per 1,000, whereas it averaged 0.27 in the twenty-seven provincial towns, among which the highest rates were recorded in Newcastle-upon-Tyne and Norwich. The death-rate from scarlet fever, which had steadily declined during the four previous months from 0.45 to 0.29 per 1,000, further fell last month to 0.21, a lower rate than has been recorded in any month in recent years; this disease was proportionately most fatal in Leeds and Wolverhampton. The mortality from diarrhoeal diseases was slightly below the average for the corresponding period of recent years. The death-rate from diphtheria was equal to 0.15 per 1,000, and showed a further decline from the rates recorded in the first two months of this year; this disease was proportionately much more prevalent in London than in the aggregate of the provincial towns. During the five weeks of March 131 fatal cases of small-pox were recorded in the twenty-eight towns; the fatality of this disease showed a further decline from that in the two preceding months. Of these 131 deaths, 104 occurred in London, 9 in Manchester, 5 in Liverpool, 4 in Sunderland, 2 in Bradford, 2 in Newcastle-upon-Tyne, 1 in Birkenhead, 1 in Leeds, and 1 in Cardiff. Judged by the returns of the Metropolitan Asylum Hospitals, the prevalence of small-pox in London showed a further decline during March. The number of small-pox patients under treatment in these hospitals, which had been 1,147 and 1,103 at the end of the two preceding months, further fell to

879 at the end of March. The average weekly number of new patients admitted to these hospitals, which had been 248 and 203 during January and February last, further declined to 131 during March.

The rate of infant mortality in the twenty-eight towns, measured by the proportion of deaths under one year of age to births registered, was equal to 158 per 1,000 during March, against 171 and 143 in the corresponding periods of the two preceding years 1883 and 1884. While the rate of infant mortality did not exceed 148 per 1,000 in London, it averaged 167 in the twenty-seven provincial towns, among which it ranged from 89 in Derby, 101 in Wolverhampton, and 103 in Plymouth, to 201 in Newcastle-upon-Tyne, 212 in Bristol, 239 in Sunderland, and 271 in Cardiff.

The death-rate from diseases of the respiratory organs, judged by the metropolitan returns, was below the average during March. The weekly number of deaths referred to these diseases in London averaged 448, and the annual death-rate was equal to 5.7 per 1,000. In Liverpool the annual rate of mortality from these diseases was last month equal to 6.6 per 1,000.

The causes of 509 of the 19,216 deaths recorded in the twenty-eight towns during the five weeks of March were not certified, either by registered medical practitioners or by coroners. These uncertified deaths were equal to 2.7 per cent. of the total deaths, which exceeded that recorded in any recent month. In London the proportion of uncertified deaths did not exceed 1.4 per cent, while it averaged 3.6 in the twenty-seven provincial towns, ranging from 1.4 and 1.5 in Plymouth and Leicester, to 6.9 in Hull, 7.8 in Halifax, and 8.7 in Oldham.

Among the population living in the outer ring of suburban districts around London, estimated at rather more than a million persons, the annual death-rate during March from all causes was equal to 19.3 per 1,000, against 20.0 and 17.3 in the corresponding periods of 1883 and 1884. During the five weeks ending the 4th inst., 122 fatal cases of small-pox, 62 of whooping-cough, 38 of measles, 34 of diphtheria, 22 of 'fever,' 15 of scarlet fever, 13 of diarrhoea, were recorded in the outer ring. These 306 deaths were equal to an annual rate of 2.9 per 1,000, which showed a slight further increase upon that recorded in the first two months of the year. The fatality of measles, scarlet fever, and whooping-cough showed an increase, while that of diphtheria declined. Of the 122 deaths from small-pox recorded in the outer ring during March, 99 occurred in the district of West Ham (including 12 of London residents registered in the Metropolitan Asylum Hospital at Plaistow), 10 in Edmonton, 4 in Croydon, 4 in Brentford, and 2 in Kingston districts. Of the 34 fatal cases of diphtheria, 7 were returned in the sub-district of Tottenham.

NOTIFICATION OF INFECTIOUS DISEASES.

THE table on page 463 contains uniform statistics relating to sickness and mortality in thirty-one of the thirty-nine urban sanitary districts of England and Scotland in which the notification of infectious diseases is compulsory. The population of the thirty-one towns for which we are enabled to publish complete statistics for the month of March is estimated at rather more than three millions of persons. The annual death-rate from all causes during March in these thirty-one towns averaged 22.05 per 1,000 persons estimated to be living therein, against 24.12 and 21.03 in the first two months of the year. The rate of mortality in the twenty-eight towns dealt with by the Registrar-General in his weekly returns was 22.50 during March, and therefore was slightly above the rate in the thirty-one towns in the accompanying table. The death-rates last month were considerably below the average in Burton-upon-Trent, Derby, Accrington, Reading, Edinburgh, and Aberdeen; while they showed an excess in Jarrow, Burnley, Manchester, Oldham, and Stalybridge.

The death-rate from the eight infectious diseases dealt with in the table averaged 0.65 per 1,000, showing a slight further decline from the rates recorded in the five preceding months, which had steadily fallen from 0.93 to 0.67 per 1,000. No death from any of these infectious diseases was recorded last month in Accrington, Derby, Hartlepool, Heywood, or Lancaster; while in the other towns the rates ranged upwards to 1.17 per 1,000 in Portsmouth, 1.27 in Greenock, 1.56 in Burnley, 1.76 in Leek, and 2.19 in Rotherham. Seven deaths were referred to small-pox in Manchester, 2 in Bradford, and 1 in Birkenhead, during the month under notice; scarlet fever was proportionally most fatal in Halifax, Preston, and Rotherham; enteric fever in Blackburn, Portsmouth, and Burnley; and diphtheria in Edinburgh and Portsmouth. Two deaths from typhus were recorded in Edinburgh, 3 in Greenock, and 2 from puerperal fever in Burnley. With regard to the notified cases of infectious disease in these thirty-one towns, it appears that the proportion of persons reported to be suffering from one or other of the eight diseases specified in the table was 4.75 per 1,000, against rates declining from 7.92 to 4.66 in the five preceding months. While the proportion was under 1 per 1,000 in Accrington, Heywood, Lancaster, and Warrington, it ranged upwards in the other towns to 7.28 in Halifax, 7.56 in Leicester, 8.51 in Edinburgh, 8.91 in Greenock, and 14.99 in Rotherham. The excessive rates recorded in the last-mentioned towns were due to the prevalence of scarlet fever. Thirty-one cases of small-pox were notified in Manchester, and 3 in Yarrow; scarlet fever showed the greatest proportional prevalence in Edinburgh, Leicester, Halifax, and Rotherham; enteric fever in Blackburn, Burnley, Portsmouth, and Rotherham; diphtheria in Burton-upon-Trent, Edinburgh, and Portsmouth; and 3 cases of puerperal fever were notified in Manchester during last month.

During the first quarter of this year the rate of mortality in these urban sanitary districts has been equal to 22.21 per 1,000, against 23.36 in twenty-eight of the largest English towns. With regard to the proportion of deaths to reported cases during this period, it appears that the mortality of scarlet fever was equal to 9.0 per cent. of the cases notified; of enteric fever to 17.4 per cent.; and of diphtheria to as much as 39.2 per cent.

FEVER HOSPITALS.—The Felling Local Board have instructed their surveyor to prepare plans for the erection of a fever hospital to accommodate twelve patients.

THE March number of the *Western Temperance Herald* gives some interesting particulars, accompanied by a table, showing a list of thirty workhouses within the area of operations of the Western Temperance League which have respectively the lowest and highest cost for consumption of stimulants for each inmate. Of the thirty Unions included in the list those having the lowest expenditure for intoxicating drinks, fourteen—or nearly one-half—are in Devon and Cornwall, and Axminster heads the list with a cost of only 1/4d. per head, Falmouth comes next with 1/2d., Helston and Bideford 1 1/2d. each, St. Columb 4 1/2d., Launceston 6 1/2d., St. Austell 7d., Holesworthy 9d., Devonport 10 1/2d., Liskeard 1s. 1 1/2d., Kingsbridge 1s. 2 1/2d., Bodmin 1s. 4 1/2d., Truro 1s. 9 1/2d., and Stonehouse 1s. 11 1/2d. Amongst the thirty Unions in which the highest cost for consumption is shown, there is not a single West-country workhouse, and of this number Romsey stands lowest on the list with a consumption per head of 10s. 9 1/2d. or nearly 9s. above the highest of those which show the least average expenditure, viz., Stonehouse. Gower heads the whole list with an expenditure of 24s. per head. It is deserving of mention, also, that for thirteen years not a penny has been expended at Wrexham Workhouse upon intoxicants for the paupers, and there are hundreds of Unions throughout the country where either no wine, or no spirits, or no malt liquor is consumed by the paupers at the ratepayers' expense.

SPECIAL REPORTS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

Friday, March 20.

(T. ORME DUDFIELD, M.D., President, in the chair.)

THE following gentlemen were elected members of the society:—Nominated by Dr. T. Orme Dudfield and Mr. Shirley Murphy—Joseph Loane, M.R.C.P. Edin., M.O.H. Whitechapel; J. Shaw, M.R.C.S., M.O.H. Rotherhithe; Frank Argles, M.R.C.P. Edin., M.O.H. Wanstead. Nominated by Dr. C. E. Saunders and Mr. Shirley Murphy—W. Marston Clark, L.R.C.P. Lond., M.O.H. Twickenham; F. Carter, L.R.C.P. Lond., M.O.H. Billericay; W. G. Groves, M.R.C.S., M.O.H. Woodford; R. B. Rygate, M.B., M.O.H. St. George's-in-the-East.

The following were elected associates:—Edward C. Robins, F.S.A, F.R.I.B.A., and H. Saxon Snell, F.R.I.B.A.

Mr. Wynter Blyth, Medical Officer of Health for Marylebone, read a paper on—

THE ACTION OF DISINFECTANTS ON MICRO-ZOIDS.

The author of the paper enumerated the diseases of animals and men, which may be considered beyond a doubt to have an intimate connection with micro-zoids, viz., mouse and rabbit septicæmia; a fatal disease of the guinea-pig produced by the micrococcus tetragenus; the anthrax of animals and men; fowl cholera, glanders, malignant oedema; bovine and human tuberculosis; erysipelas; some forms of pneumonia; and acute osteo-myelitis. On the other hand, it had not been proved satisfactorily that diphtheria, scarlatina, relapsing fever, cholera, typhoid fever, and some others were due to micro-zoids, though the balance of evidence seemed to be in favour of such a view. Probably zymotic diseases would come to be recognised as consisting essentially of the invasion of the tissues of individual mega-zoids by legions of micro-zoids.

The term 'disinfectant,' the author used throughout, as synonymous with 'germicide.' A colony of micro-zoids submitted to a solution of a true disinfectant, and then having been freed from the disinfectant and put into the best possible conditions for development and growth, showed no signs of life; the colony had been disinfectant, that is, killed.

Hence, according to this view, disinfection meant either a destruction of pathogenic micro-zoids or a poisoning of them, the effect being for practical purposes the same.

The author then briefly detailed his own experiments on spore anthrax, published in the Royal Society of Edinburgh's Transactions, and summarised the experiments of Schiff and Fischer on phthical sputum, and those of Fischer and Proskauer on the action of chlorine and bromine. The author next observed that in continuation of his first research he had made some observations on mouse septicæmia; threads were infected with mouse septicæmia and soaked for half-an-hour in Tuson's disinfectant, a saturated solution of sulphate of iron (Morgan's fluid); a 10 per cent. alcoholic solution of cresylic acid; a 10 per cent. solution of sulphuric acid; a 10 per cent. solution of chlorozone, and a strong solution of chloride of zinc. The sulphuric acid and the alcoholic solution of cresylic acid disinfect the threads perfectly, but of the other agents some had no effect, others disinfect superficially.

His most recent research was on the pyridine bases; he had raised a pure cultivation (from the last stages of nasal catarrh) of a yellow bacillus, which liquefied gelatin, the liquid gelatin then becoming yellow and fluorescent; this bacillus produced spores of moderate resistance, was not pathogenic, and grew with convenient rapidity at ordinary temperatures. Threads infected with this yellow bacillus were soaked in a 1 per cent. solution of pyridine, collidine,

lutidine, and acridine, and then, having been freed from the disinfectant, they were brought upon nutrient gelatin; the threads were found to show no signs of growth around them, whereas the 'control' threads grew rapidly.

The antiseptic power of pyridine was tested on the organisms found in sour milk, and pyridine was shown to inhibit growth.

Since the pyridine bases are present in tobacco smoke, the smoke from an ordinary pipe of tobacco was passed through water, and the resulting solution was found to be, so far as the yellow bacillus is concerned, strongly disinfectant. The results of experiments with the yellow bacillus when treated with solutions of morphine, strychnine, atropine, and other alkaloids were also given, from which it would seem that strong solutions kill the bacillus.

Turning to the practical aspect of the question, the author summarised the general conclusions to be drawn from these researches.

Disinfectants, when they are not destructive agents, act as poisons. They poison the micro-zoid in a manner not essentially different to the lethal poisoning of a higher life form, and this is the reason why such poisonous substances as corrosive sublimate, carbolic acid, and chlorine, are most to be relied upon.

It was evident that, to disinfect perfectly, the element of time must not be disregarded; to receive specific excreta in a strong solution of sulphate of iron or of carbolic acid, and then within a few minutes to cast the excreta into a drain, could only superficially disinfect, and such excreta might in many obvious ways again become dangerous.

He considered that the best and most efficient way to disinfect a room after disease was—

First, to make it as much as possible an hermetically sealed box, and in this box evolve chlorine—three pounds of chloride of lime and three pounds of hydrochloric acid for every 1,000 cubic feet of space. The chloride of lime was to be divided into several distinct parts in deep vessels, and to be placed not on the floor but as high as possible; the hydrochloric acid was to mix with the chloride of lime gradually in the manner detailed by Fischer and Proskauer. The room was to be shut up for twenty-four hours.

Secondly, all things in the room capable of being submitted to a moist heat were to be taken away to a suitable apparatus.

Thirdly, the floor was to be washed with a solution of corrosive sublimate (1 : 1,000).

The principles of this process had been carried out in the parish of St. Marylebone for more than a year; and he considered this method the best at present known.

DISCUSSION.

In the discussion which followed, the president, after moving a vote of thanks to Mr. Wynter Blyth for his interesting paper, observed that the subject of it had been dealt with more than once in recent years by the society, papers having been read by two former presidents, the late Dr. Letheby and Dr. Thomas Stevenson. The importance of the subject justified reconsideration of it from time to time. He could not help contrasting the results of disinfection as commonly practised with the views of the reader of the paper. Speaking from personal experience he was able to assert that disinfection of the sick room and its contents was, in practice, a success, notwithstanding the views propounded by Mr. Blyth as to the extreme difficulty of killing the organisms which were supposed to be the seeds of infection. He appealed to the practical experience of other medical officers of health whether this was not so, and whether they could not confirm his statement that when disinfection was carried out carefully, after the usual manner, infectious disease did not reappear in the disinfected house, always supposing that at the time of disinfection such disease was not in process of incubation. Occasionally disease—especially scarlet fever—reappeared after the return of a patient from the hospital, and he suspected that, although the skin of the patient in such cases had apparently done peeling, there might be infectious

tangled about the roots of the hair. He believed occasionally the reappearance of disease was due to ration from disinfection, by the owner, of some article of clothing, &c., that had been exposed on. But cases of recrudescence of disease were not in comparison with the total number of rooms, infected. As to the material used, Mr. Wynter preferred chlorine, and had suggested the use of &c., to protect metal surfaces from the attack of vermin. Would not the coating protect the so? Dr. Thomas Stevenson had employed use of carbon at St. Pancras, and had every reason satisfied with the results. In common with the rest of his colleagues he himself used sulphurous acid, as well satisfied with it as a disinfectant despite Mr. Wynter Blyth had said regarding its inefficiency as a disinfectant.

Mr. J. of Newington, agreed with the president that the use of sulphuring rooms had yielded trustworthy results for the last twenty-eight years he had relied on the method of disinfection. He doubted whether the expense attending the disinfection of bedding by super-heated steam was quite warranted, and never had reason to believe that the less expensive apparatus of Dr. Ransome had failed to do its duty.

Dr. E. Saunders took exception to the term 'micro-organisms.' He thought that scientific terminology should rather be complicated by new names except for very special reasons. This name was really misleading, as it implied as small life-like forms those which were in fact forms, which meaning was properly conveyed by the word microbe.

Mr. Kingzett spoke of the destructive effect of chlorine on the tints in the apartments and in rusting steel and he admitted that there are some diseases—anthrax, diphtheria, and a few others—with which there was a direct connection between them and certain micro-organisms, but he did not think that these micro-organisms were the cause of the disease. It was to chemistry that we should look as to what constituted the diseases. They then proceeded to review the experiments of Lister and others, and said he differed *in toto* from them. He compared the sanitas fluid with chlorine, and for his products all that could be claimed for them was that they were disinfectants. He was now making further experiments which he hoped to bring before the society.

Mr. Moore said he had entered as a pupil at the Health Exhibition, so as to settle in his mind some points of this question. He thought it was owned that micro-organisms are the cause of many diseases. The yeast plant produced alcohol in fermentation of sugar, and others produced putrefaction—certain acids, and everybody must know that they produced anthrax. If a poison from an animal's body was inoculated into another animal it dies of the same disease. But it must be admitted that in a great many diseases the effect of this micro-organism is not direct, and perhaps never would be proved from direct observation, because many of the organisms are so small, that they never will be seen even by micro-observation. He did not agree with all Mr. J. said, and thought it would be only by experiment as Mr. J. (Mr. Blyth) had pointed out that the fact was proved that micro-organisms were the cause of disease, &c. If something could be found that would doubt prevent the organisms from carrying out their work would be a great step. He could not agree with Mr. J. when he said that all disinfectants must be used. The speaker was strongly of opinion that some disinfectant could be found which was not so. There was published by the Health Exhibition authorities on disinfection, and there was one paragraph in it which stated that some non-poisonous disinfectant might be found upon an experiment made by a French chemist upon a fungus, and it was found that this plant

could be grown under certain conditions. Steel was taken, and the growth was increased, and, if other things were added, the growth decreased. Silver was one of these. This was added, and the growth was completely stopped, and the plant was so sensitive that it would not grow in a silver vessel. He believed that it was probable that some disinfectant would be found, as the silver acted upon the plant. He thought Mr. Kingzett was right as to chlorine being so destructive; but practically he agreed with the president, in disinfecting the rooms by burning sulphur, taking off the wall papers, whitewashing, scrubbing the floors with carbolic, and having the clothes disinfected by heat; and this last point was an important one. Their secretary (Dr. Saunders) had taken the words out of his mouth as to an objection to the term 'micro-organisms' used by Mr. Blyth.

Mr. Corner confessed to some disappointment on the reading of Mr. Blyth's paper, because they would go away with no better means of disinfection than they had at present. It appeared to him that chemists, after directing their attention to this subject, had it brought home to them that what they had been doing was utterly valueless. Mr. Blyth's experiments appeared to have been directed towards a class of cases which they did not often deal with, and he had not applied his tests to small-pox, scarlet fever, and typhoid. It was in this direction that they wanted ground upon which to work. How did Mr. Blyth explain the disappearance of disease from a large number of houses in which no disinfection had been practised at all—perhaps one-half? What became of the infection in the remainder? It must die out, and, if so, what was the cause of it? If they could only stop the growth of these poisons for a time, until they were issued from the premises, and had disappeared into the drains (and the drains, if fairly disinfected, were not vehicles for disease), that would be something gained. He thought Mr. Blyth might, perhaps, have given them his opinion upon the experiments of Professor Lister's work, because from those experiments he believed they might be able to gain something very important. With regard to alcohol, he might refer to Mr. Hutchinson's practice. He (the speaker) had used it in hospital practice in the case of wounds and amputations, and he found a solution of spirit—one in three—had a powerful preventative effect in the cases of erysipelas, hospital gangrene, &c. Another point was that in disinfecting rooms the clothing of the people was left untouched, but if there was only one room what was to become of the people, who perhaps had no change of clothing. An institution was really needed in which poor people could enter to be bathed, and their clothing disinfected by heat. In twelve or twenty-four hours a system of disinfection could thus be carried out. The present system in such cases was only a half measure. In Poplar he used sulphur and dry heat, but he was not sure that it was not the turning out altogether and the general cleansing that did the good. He had experienced difficulty in destroying the infective character of threads used for ligatures, and this bore out the statement of Mr. Blyth that microbes attached themselves to threads with great tenacity.

The President remarked that with reference to Mr. Corner's remarks respecting the disease not appearing again when no disinfection had taken place, and as to the disease having died out; perhaps the poison had not always died out for long afterwards. He knew of a case in the country where the infection of scarlet fever had shown itself twelve months after the first outbreak.

Dr. Willoughby said, that with regard to Mr. Corner's remarks as to the disease dying out, they would only apply in some cases, because the persons who were most susceptible would succumb, while those who were not susceptible would escape, but a new comer to the place, perhaps months after, would contract the disease. The speaker then referred to many authorities on the subject, concluding by suggesting that experiments should be made in respect of small-pox, enteric fever, &c.

Mr. Wynter Blyth, in reply, said with regard to the observations of the president as to whitewashing, taking off wall-papers, &c., that similar precautions were adopted by him. As to the difficulty of using chlorine, he might have rusted the steel and the fire-grates and destroyed the tints of the apartments, but he did not mind that so long as he disinfected the rooms properly. Dr. Saunders had taken exception to the term micro-zooids, but 'zoid' was a word very extensively used by all writers on zoology. He rather preferred the term, although it might be open to objection. He had received a paper from Mr. Kingzett, but he had not read it, as he wished whilst making his experiments to remain perfectly unbiassed. Dr. Moore had stated that there would be a non-poisonous disinfectant found; but it had to be found. He did not dispute that the ordinary disinfecting operations do get rid of a large amount of infection, but not all of it. With regard to experiments upon scarlet fever, measles, &c., such experiments were at present not possible.

The meeting then adjourned.

THE RECENT EPIDEMIC AT KIDDERMINSTER.

PROPOSED REMEDIAL MEASURES.

WITH a view to the remedying of the various sanitary defects found to exist in the town of Kidderminster, both in connection with the sewerage and the water supply, and to carry out the recommendations made by Dr. Parsons, the Local Government Board inspector, as the result of his inquiry into the cause of the recent outbreak of enteric fever, special reports have been prepared and submitted to the Town Council by Mr. Comber, the surveyor, and Mr. E. Pritchard, C.E. Dr. Parsons recommended that the Town Council should, with all practicable speed, procure an additional supply of water, free from all risk of pollution, and as soon as this could be accomplished discontinue the supply from the well at the sewage pumping station; maintain a careful guard against any conditions likely to cause pollution; remove all irregularities in the construction of the sewers, make provision for frequent and adequate flushing, prevent the discharge of heated liquids into the sewers as much as possible, provide openings at about every hundred yards to allow of a free passage of air, the severance of all air connection between house-drains and sewers, the management of the sewage farm so as not to cause a nuisance, the reconstruction of large or defective ashpits on a smaller and more modern scale, the remodelling of the existing by-laws and the consideration of making others for dealing with offensive trades, the construction of a public abattoir and the closing of the more objectionable of the existing slaughter-houses, the replacement of middens so placed or constructed as to be a nuisance with some form of improved dry closet, and the making of arrangements whereby the medical officer could be promptly furnished with notice of deaths from infectious diseases.

The above are among the recommendations made by the Local Government Board inspector, and it will be seen that they involve an almost entire revolution in the sanitary arrangements of a town like Kidderminster, and the expenditure of a vast sum of money. Messrs. Pritchard and Comber also reported on the subject, and recommended the tubing of the well at the pumping station, the construction of another well, with additional pumping power, the covering-in of the existing reservoirs, and the construction of a high-level service reservoir, a constant supply of water, the prohibition of pig-keeping in the populous parts of the borough, the abolition of midden privies, and various matters connected with the flushing and ventilation of the sewers. It was proposed to carry these recommendations into effect by sinking a well through soft red sandstone of 10 feet diameter and 123 feet deep, with a borehole of 18-inch diameter and 377 feet deep,

making a total depth of about 500 feet, erecting machinery capable of raising 1,250 gallons per minute, conveying the water to covered reservoirs, whence it could be distributed in mains as required; by reconstructing the Park Lane sewer, which has in three instances a reverse fall, whilst in two other instances the inclination was not sufficient to allow the heavier matters to pass down freely; by reconstructing such portions of other sewers as are the least satisfactory, applying a system of open ventilation to the sewers throughout the town, and constructing 56 flushing tanks of 1,000 gallons holding capacity each, fitted with a self-acting discharging syphon, in various parts of the town. On February 12 a special meeting of the Town Council was held to take the whole matter into consideration. First came the report of the Drainage and Waterworks Committee, who stated that, after an interview with Mr. Pritchard as to the possibility of some of the more costly items being dispensed with without prejudicing the safety of the town and the health of the inhabitants, they had come to the conclusion that it was absolutely necessary the works advised by him should be carried out without delay. They therefore recommended that application be made at once to the Local Government Board for sanction to borrow 27,000*l.* for the carrying out of the work recommended; that a site be purchased for a reservoir; that Mr. Pritchard be employed as the solely responsible engineer of the works, at a remuneration of 5 per cent. upon the amount expended; and that an independent clerk of the works be engaged. The report was adopted. The sanitary committee at the same meeting recommended that notice be given to all owners of properties having privies and middens causing a nuisance in any part of the town on or about the level of the Horsefair to convert them into water-closets, and alter dustholes in accordance with a plan deposited in the borough surveyor's office; that all middens connected with privies in the higher parts of the town be filled up to within nine inches of the ground-level; and that all dustholes be roofed; also that the model by-laws of the Local Government Board respecting cleansing of footways, the regulation of common lodging and slaughter-houses, and with reference to offensive trades, be adopted. These recommendations were all agreed to.

SANITARY MATTERS IN AMERICA.

(FROM OUR OWN CORRESPONDENT.)

THE TENEMENT-HOUSE COMMISSION.

IN previous letters I have spoken of the Tenement-house Commission created by the State Legislature of New York to investigate and make a report upon the evils attending the tenement-house population. The report has at last been made public. It is estimated by the Commission that there are 26,000 tenements in New York city. The death-rate among tenement-house dwellers has risen from 51.11 in 1870 to 56.50 in 1884. This death-rate would be greater if so many cases of sickness were not removed immediately to the charity hospitals, to which institutions the deaths, when they occur, are credited. There is one district known as 'The Bend,' where the mortality of children under five years of age is 65.00. The Commission recommends that this block be cut through, extending from Leonard Street to Pell Street. If this is done, some of the worst tenement-buildings will be removed. They support this recommendation by citing the provisions of the Cowan and Cross Parliamentary Acts for the removal of buildings for sanitary purposes. It is in the rear tenements, of which there are 3,000, in which there is the greatest sickness. These should have additional part-space, or should be removed.

The chief inspector attached to the Commission was Mr. Frederick Owen, a sanitary engineer, and the author of the supplement on American practice to the reprint of Parkes's 'Hygiene, made by Wm. Wood & Co. N.Y.

has made a supplementary report, in which he concludes as follows:—

There are buildings that should be ordered to be immediately vacated. The number needing an inspection of buildings is very large. It is impossible to make owners and tenants obey sanitary laws without strict systematic action. For this a larger force is necessary at the health department. Privy vaults in the city should be condemned, and replaced with water-closets rather than soil-sinks. All water-closets, vaults, and school-sinks in tenement-house cellars should be removed. Cellars throughout lack care and attention. Waste of water requires special attention. The majority of bedrooms are without light and air. The darkness of halls conduces to immorality. The location of fire-escapes often exposes unnecessary danger. The condition of the tenements is generally in advance of the tenements, and they appreciate the importance of sanitary measures. Some of the worst tenements contain but three families. Rents are unnecessarily high. Illegal crowding is universal among the Irish Jews, the Italians, and the low Irish.

Such, in brief, are the conclusions of the Commission. In accordance with the conclusions, a Bill has been formulated which attempts to correct these evils.

THE SANITARY COUNCIL OF THE MISSISSIPPI VALLEY. Second in importance to the American Public Health Association is the association known as the Sanitary Council of the Mississippi Valley. It was organised seven years ago by the banding together of all the State and municipal boards of health in those States liable to be affected by the presence of yellow fever in the valley, at St. Louis. The most active officer has been the secretary, John H. Ranch, the secretary of the Illinois State Board of Health. It has always been a strong and influential organisation, having the confidence of the people, and plenty of money donated to them to work with. It held its seventh annual meeting at New Orleans on March 10 and 11. In view of a probable invasion of cholera, and the necessary introduction of yellow fever, a committee was appointed to formulate a system of concerted action by States and municipalities represented in the council, to prevent the introduction of foreign epidemics, and their read introduction. The chairman of the committee was Dr. R. C. Kedzie, of Michigan. The committee's report was the most important item of the proceedings, and was adopted as the report of the council. Quarantine by detention was declared to be a thing not now necessary save for the purpose of observing and purifying suspected vessels. In order to intelligently handle a vessel asking admission to the Mississippi River, its previous history must be known. In order to discover this, the Secretary of State, Washington, is requested to require from consular officers at ports from which vessels may clear for United States' ports, information in addition to the bill of health, which will permit the ante-clearing history of the vessel to be known to our quarantine officers. The Secretary of the Treasury is requested to station a revenue cutter off the mouth of the Mississippi River to prevent the entrance of infected ships. If an infected vessel enters the river the State Board of Health of Louisiana is responsible for its control and isolation until danger from it has passed. In order to secure confidence, each member of the council pledges that real or suspicious cases of yellow fever or cholera shall be immediately described to the balance of the council. In order that there may be no loophole for escape of responsibility in this matter, the symptoms indicative of yellow fever and cholera are given.

OFFENSIVE SMELLS FROM SEWER VENTILATORS.

The report of Mr. Rogers Field, C.E., upon the condition of the sewers in the district of Bromley, Kent (January, 1885), will be found to be of such general

interest to all who are connected with sanitary work that we shall not hesitate to quote freely from it.

The drainage of this district has been designed upon the 'separate system,' and the soil drains consist of pipes laid in the modern manner with manholes or lampholes at every change of direction. The greater number of these manholes, and lampholes are provided with surface ventilating gratings, and other intermediate ventilated lampholes are freely used to increase the facilities for frequent supervision and to aid in the general ventilation.

It seems that complaints had been made pretty freely concerning offensive smells from these ventilating gratings. From time to time some of the gratings had been closed, and in a few instances ventilation-pipes from the drains (in lieu of these surface ventilators) had been carried up trees or buildings. The nuisance still continuing, the Board had very properly called in Mr. Rogers Field to examine into and report upon the cause of these bad smells, and to suggest the best means of removing them.

Mr. Field states that 'the most frequent causes of offensive smells from sewer ventilators are, according to my experience, defective sewers or house connections.' He, therefore, made a preliminary examination to see whether the nuisance could not at once be attributed to these causes. But not finding sufficient defects to account for the smells complained of, he instituted a very thorough and careful investigation of the whole system, embracing as it does about twenty-three miles of sewers. The sewers were found to be 12-inch pipe sewers, with in a few instances 9-inch pipes. The gradients of the sewers Mr. Field considers to be 'generally good, ranging for the most part from 1 in 50 to 1 in 150.' These sewers had been laid in straight lines from point to point, with the manholes, &c., that we have already referred to. Mr. Field's observations, which were carried out in great detail, consisted principally in flushing each drain at its head, and in watching 'the speed of the flush of water from manhole to manhole.' 'At the same time observations were made on what substances were washed along by the flush, so as to judge whether any deposit had taken place in the sewer.'

But the experiments were not confined to the public sewers. Many of the houses were entered by permission, and their drains and connections examined. As the result of his extended observations Mr. Field finds that many causes contribute in various degrees to produce the offensive odours complained of. In the first place, there were certain minor defects in the sewers, such as settlements in the channels of the manholes, which, by retaining decomposing sewage matter directly under the ventilating gratings, would tend materially to produce the nuisance objected to. Then defective house-connections were the cause of some trouble, as they in many instances admitted fine sand, &c., into the sewers, where it offered a serious impediment to the flow of sewage. Another defect was occasioned by an injudicious manner of flushing the sewers. 'In many places the flushing is effected by boards which are temporarily fixed in certain manholes so as to block up the outlet and cause the sewage to back up in the sewer above them. When the sewage has risen to a sufficient height the boards are suddenly withdrawn, and a rush of sewage takes place down the sewer and creates a flush. When the sewage is thus backed up it rises above and covers the benches of the manholes, and on the sewage receding when the flushing board is withdrawn the fecal matter which has been floating in the manholes is left stranded on the benches,' just where its putrefaction would produce the evils complained of. On Mr. Field's suggestion this method of flushing (objectionable as it is for other reasons besides that alluded to) has been discontinued. The gravest difficulty in connection with the sewers is probably that occasioned by the fact that the sewers generally are too large for the work they have to do. It has been mentioned that nearly all the sewers are 12 inches in diameter. 'Such a statement as this of itself goes to show that either some of the sewers are too small or some

too large, as it is impossible that all the sewers can have the same amount of duty to perform. In the present case the 12-inch sewer, which has the greatest duty to perform, never runs more than a quarter full, and it is therefore evident that it is not too small. It follows, consequently, that a number of the sewers must be too large.' When it is remembered that the system of sewerage is extended to the outlying parts of the district it will be readily imagined that, the population being a good deal scattered, 'long lengths of sewers are frequently to be found in roads where there are no houses,' 'that in many cases during the greater part of the day the sewers are almost dry,' and that 'in many cases there are so few houses connected with the sewer that the greatest flow of water that takes place is not sufficient to force the solid matter along, and in such cases the sewage continues to accumulate until the sewer is artificially flushed.'

All sewers are liable to slight irregularities which matter but little when there is a strong flush of water, but when there is hardly enough water to move the solids along, it is manifest that the slightest irregularity will be of grave importance, as it will often retard the passage of sewage-matter, and sometimes even arrest it until it is forced on again by an extraordinary flush.

Mr. Field considers that this disproportion between the size of the sewer and its work is the principal defect in the system, and he is confirmed in that opinion 'by the fact that the few sewers which have a constant and appreciable flow of sewage in them are much less offensive than those which have little or no flow.'

The report continues, 'Many people would consider the fact of the pipes being larger than what is required no fault at all, but I cannot agree with this. Where the quantity of sewage is small, the larger the sewer is the less power the sewage has to force itself along, and *vice versa*. After making every allowance for future increase of population, there can be no question that smaller pipes would be amply sufficient for many of the sewers, and that they would considerably facilitate the passage of the sewage.'

Another objection taken by Mr. Field was that through various alterations to the manholes the ventilation had been diminished; as he says, 'The greater the extent of ventilation the more thorough will be the dilution and oxydisation of the gases in the sewers, and the less their offensiveness. This was well illustrated by a fact that was observed on several different occasions in the course of my investigation. A ventilator on the top of a manhole would be noticed as emitting an offensive smell, and on removing the manhole cover, so that a much freer ventilation was afforded, the smell would gradually diminish, and, after a time, practically cease. This seems to point to the fact that it would be advantageous to increase the ventilation.' The substance of Mr. Rogers Field's recommendations is that additional effective flushing of the sewers should be resorted to, that structural defects should be remedied, and that the utmost additional means of ventilation should be provided.

It must be gratifying to the Bromley Board to find that their sewage system has come out so well from Mr. Field's very searching investigations, and they, no doubt, will be eager to adopt his suggestions, which are carefully made in detail, and may then rely upon the extinction of those complaints which have been the occasion of their asking for this valuable report.

A NOVEL REMEDY FOR THE DRAINAGE DIFFICULTY.

It is probably unwise to speak of a *novel* remedy. To claim novelty for anything nowadays raises up at once a cloud of eager disputants, who are prepared, if need be, to go back to the Deluge to prove that the remedy in question, or something which they consider to be practically the same thing, has been proposed before. Of course no one can complain of this. Nothing is new in *this world*. But this eagerness to discredit the assumption

of novelty too often prevents people from fairly considering the proposition before them, whatever it may be. Our case this result may not so surely follow, as we do whether many will be ready to dispute our suggestion. This is practically a novel idea. We will let Mr. J. Walker, C.E., of Stirling, describe it in the words of own circular which he has sent to us.

To the Queen and People of Great Britain.

The great object of this paper is to point out to who take an interest in the matter the sanitary state this country at present. If the terrible pollution of the water and land now going on is not averted, the only outcome must be desolation and death. A good many years since Baron Liebig predicted that this would take place and he was in the habit of saying—'Those British ignorant people: they rob the land of the best manure and put it into the rivers—to poison themselves and the cattle.' Well, that was true then, and is true still, will only be cured by disseminating information among the inhabitants. Now, to give every reader of this paper a practical idea of how the present sanitary system is carried on, take any town of 10,000 people, divide the number by five, we then get 2,000 families. Now, each family will require 5,950 gallons of water in the week and all of it becomes liquid sewage—in twelve months 309,400 gallons. The whole of the 2,000 families pollute every twelve months 615,800,000 gallons, make it into liquid sewage, and there is little wonder that disease and death are in so many houses.

Now, to get rid of all these difficulties we must take this pure air system, and then we shall be in a position to do away altogether with traps, cesspools, and common sewers. There will then be no such thing as liquid sewage in any town, nor sewer-gas in any house.

The engraving shows houses for three families; there may be four or six rooms, each having their

room with the usual conveniences. A shows the wall, B the soil-pipe, and is common to all the houses. The top-end rises above the roof, while the lower end enters the air-tight receiver D at the base of the wall, where the water is separated from the manure and sent to the drain. The soil-pipe is also joined to an air-pipe outside the wall, which keeps a continual current of air passing down the soil-pipe, and carries every

from the bath rooms. If every house was fitted as we should hear no more of sickness from. Now, that every reader of this paper may find the great value of this invention, I will point out its works. If we take the same number of as at first, we find a difference. Each family uses only 30 gallons of water in the week, and lbs. of manure. In twelve months, 1,560 gallons used, and a ton of the best manure be secured for. The 2,000 families will use 3,120,000 gallons and there will not be a pint of liquid sewage to anything, besides leaving 2,000 tons of the best. Now, if Town Councils would consult with the and tenant farmers in the locality to work this system out, it would be a blessing for all, in the first place, the towns would get rid of all liquid sewage; and, in the second place, the that persistent scourge, sewer-gas, while the would also be enabled to double the value of his he manure for many purposes would require to be dried and sifted, that it might be riddled over field in the month of February of each year, and quantity of grass would be more than doubled. To show the farmer the great value of this manure, one of the experiments made by Baron Liebig and Way for the Royal Agricultural Society, which I correct. Twenty parts of land were prepared with cattle manure, and twenty parts in the same mixed with household undiluted manure. Both with wheat, and the outcome of the first was 11. of gluten, while the second gave 35.1, the of gluten showing how the land has been robbed years. People say the farmers cannot live. Not can, if they are always taking out of the land, putting anything into it; and I should say they deserve to live. Now, if this important scheme into operation in every town on the bank of six months they would be clean. Every town its own work; all that is required is a large so that the people may understand the matter, a model of the receiver and pipes. And, last would desire that our most Gracious Sovereign point one of her exalted councillors—a man of s, strong mind, and great moral courage—and the same power that Moses had to prevent every defiling the water. There must be no compromise house or houses must be fitted up according that this abomination may be swept off the earth. We thought that it might interest some to have a position placed before them. Our readers will not point to the serious objections that there are suggestion, and an enthusiast like Mr. Walker is, afraid, beyond the reach of argument. It is, at a gratifying sign that an appreciation of the difficulty should be spreading among people who are not but little technical knowledge upon the Ed. S.R.]

A NEW MILITARY HOSPITAL.

Sanitary authorities have exhibited during the past the Horse Guards, a well-made model and a large military hospital for one of our stations in Egypt, the exact locality, for prudential reasons, the moment withheld from the general public. It is sufficient, however, to state that the site is a fine insula, the principal stretches of water running west, overlooking on one side a harbour, which instantly affords an ever-changing and interesting further picturesqueness will be gained by planting of shrubs in the long central avenue of the. The special requirements of the uneven site have been carefully studied and successfully met by the Major-General Sir Andrew Clarke, of the Royal Artillery, and Mr. E. Ingress Bell, an architect of repute.

Beginning from the mainland from the east we find ample accommodation for the medical officers, and detached buildings assigned as follows: 'separation wards' for infectious cases, or those whom it is often for a variety of reasons desirable to withdraw from the general number, 'Prisoners,' 'Medical Staff Corps,' and 'Administration'—i.e. kitchens, stores, laboratory, &c. A covered way on the north of the main avenue affords a convenient method of reaching the blocks of wards, and at the same time shuts off the mortuary and various depressing surroundings.

The wards, nine in number, are circular in shape, 66 feet in diameter, about 21 feet high, and 80 feet apart; each will contain twenty-six patients, making 300 in all, including the accommodation provided in the previously mentioned buildings. The liberal allowance of 2,600 cubic feet of air will thus be allowed to each patient, and we may mention that hitherto the minimum amount for hot climates has been fixed at 1,500 feet. The advantage of a circular ward is apparent when the ventilation is considered, as the vitiated air is drawn in a direct longitudinal direction from the bed to the centre of the building, there collected and carried up through a shaft about 6 feet in diameter in the dome, worked by a fan-extractor, whereas in a rectangular ward the air is drawn more or less diagonally across the room, and the exhalations from one patient may pass disagreeably close to or even directly across the bed of another.

Further advantages are claimed for the circular plan, as the circle encloses a larger area and cube than any figure of equal perimeter, and therefore will, with a given length of walling, accommodate the greatest number of patients, as the whole length of the enclosing wall, with the exception, of course, of the actual door openings, can be allotted to beds, whereas in a rectangular ward the two longer sides only are capable of such appropriation. The important question of aspect also can be more readily considered, and the exigencies of a site are more easily met, to say nothing of the larger amount of light and air between the wards themselves, thus conducing to the better ventilation of the entire space. In addition to the points mentioned, the full diameter of the ward may be exposed to, or defended from, any desirable or undesirable quarter of the compass, as the varying circumstances of the season or hour may dictate. We are inclined to agree, then, with the conclusion that the circular form is, in short, the logical result of attempts which have from time to time been made to improve the sanitary condition of wards of the ordinary construction by rounding off their internal angles. By degrees the quadrants have been struck with ever-increasing radii, and this proceeding strengthens the view that the ultimate solution of the problem lies in the adoption of the circular form. Bearing in mind the heat of the climate, various means have been considered to render the place comparatively cool when necessary, and with this view a fountain is placed in the centre of each ward under a suitable canopy, which cannot fail to be effective in appearance. The beds can be wheeled out into the verandah, which is formed by the arcade, and this arcade serves also to cut off the direct rays of the sun, no slight consideration. There is a storey or 'Baracca' above, on the principle of the Italian 'Belvedere' (for which Oriental precedent can be found before the Christian era); in times of emergency double the normal accommodation could be thus provided; and although this temporary space would not perhaps, be so sanitariously perfect as the lower half, the addition would doubtless at times be welcome. An instance of a sudden demand upon hospital resources may be noted at the present time in Egypt, where the total of sick and wounded in the British force is 500, including 100 cases of sun-stroke and other effects of excessive heat and exhaustion; the base hospital providing accommodation for only 140 patients, the auxiliary hospital on Quarantine Island has been enlarged so as to hold another hundred beds, and in order to relieve the pressure on the medical department

the *Pembroke Castle* has taken on board 200 cases *en route* for England.

The suggested use, therefore, of this upper portion is shown by the erection of a screen between the arches on the south side, from whence the unhealthy winds blow for a period of about three months in the year, the north-east and north-west winds mostly prevailing. There is an open

Attention is shown to the individual wants of less cases by providing a separate building of three floors containing on one floor a large reading-room, medicated below, and a chapel above; it goes without saying agencies of this description tend materially to hasten valence. The sea water for baths will receive a filtration through rocks. The drinking is drawn

and hollow basement of rather less than six feet in height, so as to obtain a thorough current of air under the floor, and this height has been purposely arranged so that it is not sufficient to be afterwards converted into a habitable space, otherwise the temptation might prevail to occupy this area either for stores or hospital purposes.

source seven miles off through an aqueduct constructed 250 years ago. A further supply for domestic use will be obtained by utilising the rain-water from roofs, there being an average rainfall of 15 inches a year.

The buildings generally will be warmed during the

gly cold weather by steam pipes, but supplemented by yard's stoves. The electric light will be used throughout, of course, the details in this respect are not yet ranged. A free Classical style of architecture has been opted, the materials to be used being stone and concrete, a decidedly satisfactory effect being given to a class structure which does not, as a rule, lend itself readily artistic influence.

LABOURERS' DWELLINGS IN WHITECHAPEL.

THE East End Dwellings Company have erected a large and interesting block of dwellings in Cartwright Street, Royal Mint Street, containing about 280 rooms intended for the lower working class or labourers. It appears that the site is a portion of a considerable quantity of land in that district cleared by the Metropolitan Board of Works, and contains 25,420 superficial feet, purchased for 3,650*l.*, which at twenty years' purchase means a ground rent of about one penny three-farthings per foot. This land, though cleared at the ratepayers' expense, was purchased at a price which scarcely represents its value if applied to other purposes, and it is less than the absolute cost to the ratepayers. The locality must, of course, be borne in mind, but as much as threepence and fourpence per foot sometimes paid for land for similar purposes in other situations—therefore an opportunity is here afforded of acting on very reasonable terms.

The buildings generally have been fully described and compared elsewhere; it is with the thoughtful system of sanitation that we are concerned for the present. Whilst due economy has throughout been exercised in the design and construction of this block, the work has not been sedulously cut down, value for the money has been found, and the important considerations of effectually disposing of the sanitary difficulties of a large building (or series of buildings) have been met with an unusual degree of success. In most of the dwellings provided for the upper working class it is usual to provide a water-closet and a sink and draw-off tap for each tenement or set of rooms; it is of course means considerable expense both in the first cost and in subsequent repairs, but 'down East' such refinement has not yet proved to be requisite, consequently the latrines are placed together on the landings adjoining the staircases, with ample light and ventilation, as it is rightly assumed that darkness and dirt go ever hand in hand, even under more favourable circumstances. Each separate latrine has therefore its own external window. The latrines, in sets of five, four, and six, are constructed on the trough system, they are made of concrete and lined with asphalt, so that the entire length is without a joint, the result being simplicity, soundness, and satisfaction. The three stacks of soil-pipes consist of five-inch cast-iron water-main pipes, carried up above the roof for ventilation, caulked with lead, and coated inside with Ames Smith's composition. It is worthy of remark that a part of the drainage system passes underneath the building, the soil-pipes of each block discharging into an inspection chamber (of which we give plan and section), which in each case is placed in a small forecourt or recess the company's property.

The water supply from the New River Company is constant, and is delivered into a 500 gallon cistern in the roof above each latrine space, there being one of Doulton's automatic flushing cisterns of 50 gallons to flush each set of closets on each floor; the New River Company, however, have sealed the ball-cocks, so that the amount of flushing power is not at present dependent upon the pressure at the buildings, but depends upon the decision of the water company, who maintain that waste is likely to be placed if discretionary power be placed in other hands. This point, however, is being discussed, and will probably be satisfactorily arranged.

The rain-water is conducted from the roof in the usual

way and assists in flushing the yard-drains and the inspection chambers. In reference to this it may be stated that it was intended to carry the rain-water from the feet of the front rain-water-pipes direct to the street gutter (as may often be seen elsewhere) in cast-iron channels sunk in the street pavement, and approval of a drainage plan showing this arrangement was obtained from the Metropolitan Board of Works; but the Whitechapel District Board of Works, claiming superior powers over the street pavements, determined to exert their powers, and refused to allow covered cast-iron rain-water-pipe channels to be carried in this case across the footway into the gutter. After considerable discussion, it was thought advisable to defer to the 'powers that be' rather than contest the question, and, at a small expenditure, carry the water into the inspection chambers aforesaid. Due provision is likewise made

for taking away the surface-water, and for draining the two detached wash-houses.

The water supply for domestic use is drawn direct from three rising mains, one of which passes up each staircase from the street mains. On each staircase landing is a 'Kilmarnock pattern' waste-not self-closing cock; under each of these cocks is a small sink, or rather drip-catcher, the short waste of which delivers into the trough of the adjoining latrine, the trough of the latrine being made the receptacle for the slops and dirty water which are usually thrown down the sink (tea-leaves and such-like are found to choke an ordinary sink-waste in a position like this), and the stout wooden seat of each latrine is strongly hinged as a flap to fold back when the latrine is being used as a slop-sink.

Adjoining the wash-house at each end of the back-yard is a urinal, also cleansed by a self-acting flushing tank, placed in the upper part of the wash-house. All the drains are laid in straight lines, with ventilating-pipes carried up from the head of each branch, with Doulton's trapped gulleys in the yard to receive the surface-water. Generally speaking, it may be said that the system is as complete as may be desired, and the East End Dwellings Company owe much to the architects, Messrs. Davis & Emanuel, for the way in which the various requirements have been fulfilled.

THE BUILDING TRADES' EXHIBITION AT THE AGRICULTURAL HALL.

THE sixth annual exhibition of materials and appliances appertaining to the building and kindred trades was opened at the Agricultural Hall, Islington, on March 16, and remained open for a fortnight. Though not quite so large in the point of number of exhibitors as one or two of its predecessors, it was decidedly superior to many in the extent and representative value of the exhibits. This was markedly noticeable in the case of several old supporters of the Exhibition, who availed themselves of the opportunity offered them of obtaining additional space, and filling it with some meritorious productions. Although, as always, there were a large number of exhibitors whose inventions have been fully described in the *SANITARY RECORD* on previous occasions, the Exhibition was not wanting in new inventors and inventions. Architects, builders, and all interested in house property have now learnt to look upon the Islington display as one where the best and newest materials and appliances are to be seen. It is in contemplation by the Executive to considerably enlarge the scope of the Exhibition next year, while still keeping it confined to its legitimate objects. The arrangement of the Exhibition devolved, as usual, upon Mr. Philip Shrapnell, who has been connected with these annual displays from their commencement, and was carried through with the most satisfactory results.

A good collection of Wood-working Machinery was on show, the exhibitors including Mr. E. H. Brown, Kingsbury Road, Ball's Pond, N.; Sagar & Co., Halifax; Lewis & Lewis, Cambridge Heath Road, E.; and W. Reynolds & Co., Edwards Street, Blackfriars Road, S.E.

Mr. E. S. Hindley, of Bourton, Dorset, and 11 Queen Victoria Street, E.C., who has secured a great amount of support for the manufacture of small portable engines, introduced by him at low prices, and of very attractive appearance, exhibited several of them of different power. A collection of very good wood-working machinery formed another section of the exhibit.

Joinery was in strong force, and included all kinds of machine-made woodwork used in house construction; that of foreign manufacture was rather extensively represented, the exhibitors being Duffy & Son, Stock's Road, S.E.; Andrews & Son, East Moulsey; S. Ransom, Kensal Road, Westbourne Park; and Esdaile & Co., Wenlock Basin, City Road, N.

Mr. Samuel Putney, Baltic Wharf, Harrow Road, Paddington, made an excellent display of his patent 'Pavodilos' Solid Wood Flooring, which has already been described in these columns. This mode of laying flooring, or floor borders, panels, dados, &c., is much to be commended, and is being largely used. It is admirably adapted for temporary purposes, as well as for permanent work; the rapidity with which it can be laid down or fixed being a great recommendation, coupled with the closeness of the joints. The different colours of the woods employed add a charm to the *ensemble* that can only be otherwise obtained by the adoption of parquet, which cannot be well employed for temporary purposes except at a considerable cost such as few persons would indulge in.

Messrs. Shrapnell & Bridger, 37 Walbrook, E.C., exhibited some excellent specimens of parquet flooring, both on their own account and as agents for Mr. Charles Steinitz, of Camberwell. The principal feature in the first-named examples was the superior manner in which the joints were made, causing squares of a much larger size than is generally attempted to appear of one piece, though composed of several slips. It is well known that architects object to specify parquet where the sections are beyond a certain size, for fear of the warping of the wood. The reporter has been shown specimens of this firm's work, made as described, that have been put to such severe tests as have satisfied critical minds with regard to their soundness and durability. This parquet flooring is

also offered at a lower price than any other. The specimens shown of Mr. Steinitz's make were of a character, the principal example being a floor of floral design composed of walnut and purple wood, which evinced considerable skill as to design and finish.

Other exhibitors of parqueterie included Bassant, Wells Mews, Wells Street, W.; Brothers, 23 New Broad Street, E.C.; and Edner, 51 Clerkenwell Road, E.C.

Mosaic work was well represented by the Messrs. Diespeker & Co., 40 Holborn Viaduct. Their productions have received attention in these former occasions. They were by far the largest of their specimens showing considerable artistic comprising a wide range of subjects, suitable for floorings, but for all decorative purposes with material could be used. Attention was drawn to the low price at which a mosaic flooring could be obtained, enabling them to compete with the common tile, while offering a more durable article.

Mr. J. F. Ebner, 51 Clerkenwell Road, also showed some very good examples of mosaic work in glass.

Messrs. Maw & Co., Jackfield, Shropshire, to a choice collection of tiles, exhibited some specimens of mosaic, the prominent feature being decorative majolica and mosaic arranged as for the combination including D'Ors and Ruby gold, a really fine specimen of work.

Imitations of mosaic were also shown by Mycenian Marble Co., 6 Bunhill Row, the artist imitating chimneys, columns, pediments, and linings for various classes of buildings, and other all of which were of attractive character and low price.

Specimens of stone were well to the front, Messrs. & Sons, of High Wycombe, showing some good specimens from their quarries in Bucks; the Mangotsfield Stone Co., Limited, having some bold examples of well-known material, which has been mentioned in former exhibitions. A general collection of paving, and road stones was sent by Samuel & Sons, Millwall; and Painswick stone, from Barnard Stroud, was shown by Mr. Isaac Gardinercombe. The celebrated Bath stone, of different hardness, was sent by Messrs. Pictor & Son from their quarries at Box, Stoke, Corsham, and Farleigh Down, their competitors being Messrs. Brothers, from the same neighbourhoods. The included columns, panels, cornices, blocks, and objects.

Of bricks and brick ornament there was a good display. Messrs. Thomas Lawrence & Son, Brackley, generally make a point at these exhibitions of showing a specimen of their productions erected to represent recently built or about to be executed. On this occasion they exhibited a carved and moulded red-brick way, with a handsome oak door, the work being executed by Messrs. Cubitt & Co. as the entrance to a villa residence in the country. It was an excellent workmanship, and exhibited their well-known facing bricks to advantage. The bricks made were of three colours—a rich orange red, bright and rich dark red. Samples of house and wall cream, strawberry, and red—were also shown.

As a set-off to the last-named, a somewhat different erection, but on a rather larger scale, in brick ornament and moulded bricks, was shown by Messrs. Wright, East Acton Brick Works, W., and elicited considerable approbation.

Other well-known firms exhibiting bricks, colours, &c., were the Woolpit Brick and Tile Works, Suffolk; the Rowlands Castle Brick Works, 49 Finsbury Pavement, E.C.; the Danton & Co. Red-brick, and Tile Works, Sevenoaks; the

slain Pottery Company, Limited, Cobridge, Stoke-
rent; (Vitresous-faced), Bacon & Co., Midland Rail-
N.W.; Muldoon Brothers, Roman Road, Barnsbury,
in addition exhibited specimens of asphalt and wood-
-paving, &c.; E. Plowman, Lower Gravenhurst,
Amphill, Beds; and by Rosher & Co., Upper
nd Street, Blackfriars, in combination with artificial
garden furniture, &c.

st of the specialities in roofing tiles were exhibited.
J. Matthews, of Weston-super-Mare, in addition to a
e collection of garden vases and other floral articles
le for in and outdoor use, for which he has estab-
l a well-earned reputation, exhibited Poole's Patent
ing Roll Square-cornered Roofing Tiles, of which he
aker. They are well made, and are claimed to be
against wind-stripping and rain-drifting. Mr.
pe, of Monmouth, was as usual present with his
t Lock-jaw Tiles; and Mr. Henry Hall, F.R.I.B.A.,
hty Street, W.C., exhibited his Patent 'Hanging'
all Tiles, adapted for facing old or new walls, rough
ings, or for fixing to fireproof-work of iron and con-

They are of attractive appearance, can be supplied
ferent colours, also with patterns stamped on them
relief. They are easily fixed, will not fall off, and
puted impervious to damp, fire, or frost.

e newest invented tiles for roofing purposes were
1 by Messrs. H. J. & C. Major, of the Patent
Works, Bridgwater. In the SANITARY RECORD
ay 1884 a description was given of the works of this
firm, the first founded in Bridgwater for the manu-
e of tiles, and now some 250 years old. The
etshire town has gained a reputation for roofing
hat no other can aspire to, and so popular has the
become in connection with these articles that we
t adopted by some makers in other parts of the
ry; but, if imitation is the sincerest form of flattery,
case it is not altogether appreciated by Bridgwater

mostly for London Vestries and the Board of Works. Its
cost is some 15 per cent. less than York stone, and its
fine, even, and close texture is generally admired.

W. H. Lascelles & Co., Bunhill Row, sent amongst
other specimens of their concrete, a massive bay window,
and a porch in red, made for the Victoria Mansions,
Westminster, for Messrs. Perry & Co., builders, Bow,
from designs furnished by Mr. Bassett Keeling. They
likewise exhibited some excellent joinery work, of which
a prominent feature was a wainscoat door with raised
panels, and an 'overhead' for the same, designed by
Mr. H. Egan Rumble, Eastbourne.

Curzon's 'Impervious' Concrete Paving, *in situ* and in
slabs, was exhibited by the company taking that name,
of Westminster Chambers, S.W. This material is used
for all paving purposes, including stables, cowhouses,
&c., and is hard, durable, and altogether commendable.
Patent slate bricks for engineering and other purposes
were also shown, claimed to be harder than the Blue
Staffordshire variety.

Mr. S. D. Pochin, of Millwall, was present with
samples of his adamantine concrete building stones, plinths,
quoins, &c., also flagging, granite kerbs, &c., formed of
very hard and durable material of good appearance.

The Imperial Stone Company, Limited, East Green-
wich, were also well represented. A leading feature
with this Company is Silicated Stone Sewer and Water-
pipes, the latter made to a large diameter, combining
great strength with sanitary requirements.

Wilkes's Metallic Flooring and Eureka Company,
Limited, Devonshire Square, E.C., sent a variety of
articles to which their material is applicable, including
every purpose for which natural stone is utilised.
Amongst the examples were some very creditable figure
castings in concrete, and samples of stable paving as laid
down at Marlborough House for H.R.H. the Prince of
Wales.

2. The tiles in question, of which we append illus-
trations, are of the 'locking' type, and each one is pro-
vided with a 'rib' or 'web' across the face of the upper or
lower tile, and a corresponding one underneath the lower
tile. There is in addition a secure lap formed of deep
grooves at the side; thus every part is amply protected and
perfectly secure against the entrance of snow or rain,
blowing by wind. They may also fairly be claimed
non-porous, which they undoubtedly are. Each tile
is subjected to a pressure of sixty tons, which not only
brings the atoms together to such an extent as to cause
water to run off as fast as it falls upon them, but it produces
a gloss upon the tile which gives them a superior
appearance to all others. The patent can be applied to
ridge-water tiles, and the demand has become so
great that the firm are now working on the patented
tiles to the full extent of their capabilities.

Principal houses which have made specialities of
manufacture of artificial stone, concrete, and similar
materials, were well represented. The Patent Victoria

Company, Kingsland Road, showed examples of
production in the form of staircases, ornamental
sinks, cut specimens, and their noted paving
tiles. It is stated that as much as eighty miles in length
of paving has been laid during the last sixteen years,

An adamantine clinker of buff colour in small oblong
blocks for paving stables, &c., extremely hard, was
shown by Messrs. Towers & Williamson, of Little
Bytham, Stamford.

The various Paint Companies who claim especial
features in their productions, most of whom have been
mentioned in the SANITARY RECORD on prior occasions,
were represented. Amongst them were the Indestructible
Paint Co. (Browning's Patent), Cannon Street, E.C. The
Invisible Preservative (colourless) solution made by this
Company for protecting work from the action of the
atmosphere, was selected for coating Cleopatra's Needle
when that monument was erected on the Thames Embank-
ment. It was recently stated by Dr. Bartlett, who ex-
amined the Obelisk so late as last November, that he
believes no other solution with which he is familiar would
have proved so effective, and that the Obelisk is at the
present moment sounder than when the solution was first
applied.

Amongst the other firms exhibiting paints and damp-
proof solutions were the Silicate Zopissa Co., A. Leslie
& Co., London Road, Southwark, H. Thompson & Co.
(Magnetic Oxide), Merrow Street, Walworth, and Robert
Morgan & Son (Economical), 217 Blackfriars Road, S.E.
In paper-hangings Messrs. Woollams & Co., 110

High Street, Manchester Square, W., as usual made a most artistic display, a natural consequence of the fact that some of the best designers of the day are from time to time pressed into the service of this enterprising firm. Messrs. Woollams again proved their power of producing the most elegant designs in all shades of colour without using noxious pigments, every specimen of paper exhibited being free from arsenic and otherwise innocuous. The patterns of the papers comprised damasks both in blocks and water colours, on plain and mica grounds, dado decorations, and friezes in Italian, Genoese, Indian, Japanese, and English designs, the blending of colours in many of the examples being very well carried out.

Messrs. F. Walton & Co., Limited, Sunbury-on-Thames, exhibited numerous specimens of their popular decorative material, 'Lincrusta Walton,' to which was awarded a Gold Medal at the recent International Health Exhibition at South Kensington.

The Harding Ventilator Company, of East Parade, Leeds, whose patent air diffuser was fully explained in the SANITARY RECORD of February 15, in the report of the Leeds Exhibition, exhibited their principal appliances for the admission of fresh air without draught. Without now going into a detailed description of all their specialities, attention may be directed to the ingenious mode employed in casements, illustrated below. The fresh air is first admitted into a chamber from the outer atmosphere, and has then to pass through a number of glass tubes before it enters the building, by which means it is divided into small streams before mixing with the interior atmosphere.

For dwelling rooms, or where necessary, the fresh air is made to pass through a series of fine silk gauze filters, that can be taken out for cleansing at any time. This method has the effect of cleansing the incoming air, a most essential feature, and possesses the further advantage of arresting the too rapid passage of the air, preventing all feeling of draught or sensation of chill. The room ventilators can be made of the most ornamental character, and their intention may be concealed to a great extent, thus preventing any peculiar appearance in the room so ventilated.

The Cambrian Chemical Company, Limited, 110 Cannon Street, E.C., exhibited for the first time at this Exhibition their Patent Cambrian Metallic Red Paint, claimed to be anti-corrosive and indestructible. It is particularly recommended for all outdoor work, either for wood or iron, and, judging from the testimonials in possession of the Company, is highly esteemed by those who have made trial of it. It is made in the neighbourhood of Pontypool, from coppers or green sulphate, from which by the patented process adopted, the sulphurous acid is thrown off, leaving a pure pigment as the residue. It gives a smooth and glossy surface to either wood or metal, has considerable covering power and lasting properties; and has been proved to be well-adapted to the London atmosphere. It is put up in small tins for private use, as well as in bulk for large consumers.

A large collection of Fibrous Plaster, Carton Pierre, &c., was on show, but presented no novel feature.

Hitchins' Fire-Proof Plastering Company, Limited, 1 Gresham Buildings, Basinghall Street, E.C., had a half-timbered building, of pleasing appearance, showing the method of fixing this valuable material, which is adapted both for internal and external use. It is supplied in slabs that are readily fixed, and the composition is of such a character that it is not only fire-proof, but is of such a nature that it is almost impossible for a ceiling covered with it to fall, even if covered with water.

Messrs. Hayward Bros. & Eckstein, Union Street, Borough, S.E., contributed a noteworthy collection of exhibits, comprising a variety of appliances essential in the construction of all buildings claiming in any sense to be designed on sanitary principles. The appliances shown, which are all manufactured by the firm themselves, comprised their well-known Patent Semi-prism Reflecting Lens Pavement Lights; Illuminating Lights, for cellar, subways, and various other uses; Hayward's Sheringham Inlet Ventilator; Improved Mica Outlet Ventilator; Silk Flap Ventilators, for prevention of down-draught in air-extracting shafts; Hayward's Venetian or Louvre Inlet and Outlet Ventilators; Fresh Air Mica Inlet Valves, for ventilating drains; Revolving Archimedean Screw Ventilator; Air-tight Inspector Cover for Drains; Improved Circular Iron Staircase, with tread, riser, and spandril in one; lastly, a very simple but very essential appliance in the shape of a Self-

locking Coal-plate. The two illustrations given of it in its respective positions of fixture and removal clearly demonstrate its automatic action. It consists of a projecting ring fixed in the pavement into which the self-locking coal-plate is dropped and immediately secured or locked by the projecting bolts on each side. It cannot by any possibility be removed from the outside, while it is immediately released from the inside by pushing up the weighted lever. It is sincerely hoped this safety coal-plate will be widely adopted, and so lessen the number of accidents occurring through carelessly fastened coal-plates.

Mr. Thaddeus Hyatt, 9 Farringdon Road, E.C., also exhibited a variety of Prismatic Pavement Lights, and lenses suitable for all kinds of flooring, areas, stall boxes, &c. A bull's-eye pattern was shown, strong enough to bear the traffic of horses and carts. A pretty arrangement was exhibited comprising encaustic tiles and glass lenses suitable for halls of private houses. Mr. Hyatt is the patentee of this combination.

The leading firms of ventilating engineers were well represented, Messrs. Robert Boyle & Son, Holborn Viaduct and Glasgow, occupying a prominent position.

Their exhibits comprised a variety of examples of their patent Self-acting Air-pump Ventilators, several very well-designed turrets being conspicuous. Ridge Ventilators, oil-pipe Ventilators and Cowls, Ship Ventilators, for which the firm hold the gold medal awarded by the Shipwrights' Company, their patent Air Warmer, for supplying warmed fresh air to rooms and public buildings, and their complete and economic system of ventilating workmen's cottages were amongst the exhibits, which altogether numbered eighty articles, making it by far the most extensive collection of ventilating appliances in the Hall.

Messrs. Edgar Aldous & Son, Elmshurst, Upton Lane, Forest Gate, exhibited their system of ventilation, which has been fully described in the columns of the *SANITARY RECORD*. The ingenious arrangement adopted by the firm, Aldous in their 'Extractor,' of utilising a down-draught to form an up-current, has been proved to be most effective. To meet the demand existing for a simple mode of ventilating a single apartment by drawing off the vitiated air without the use of unsightly appliances, the firm have recently patented a ceiling-ventilator which combines the principle of their turret exhaust as applied to an entire building. An illustration of the invention is appended. It is intended to be fixed between the ceiling and the flooring of the room above. Presuming that the centre ornament in the ceiling is pierced to allow the vitiated air to pass out, it is drawn into the 'bonnet' to be

drawn on a level with the ceiling, and takes the direction of the exhale-pipe, and is carried outside the wall, where it escapes through the square box opening fixed a few inches from the wall. The better to effect the exit of the vitiated air an inhale-pipe is provided, and by means of the trumpet-shaped opening covered with a perforated metal frame in fresh air, which is carried along to the bend, and enters the exhale-pipe, thus producing an additional current, and passing off with the heated atmosphere. The pipes, which are all on a level or parallel with each other, may require to be made the necessary length, and the appliance can be easily fixed by removing the flooring-boards of the room overhead. This ventilator is inexpensive, automatic in action, free from down-draught, and will remain perfect so long as the material lasts.

Messrs. Kite & Co., Chalton Road, N.W., made a good display of their well-known Ventilating Appliances, illustrated by some interesting models showing their working. Like the last-named firm, Messrs. Kite's appliances have been fully described in the *SANITARY RECORD* on former occasions. One of the prettiest articles in connection with the ventilation of rooms shown at this Exhibition was an elegant Wall Cabinet, for erecting on a chimney-breast, as an outlet ventilator, so arranged that no loose parts are connected with it to make an unpleasant noise, so common to chimney-breast ventilators.

Messrs. Smith & Stevens, Leicester Square, in addition to some well-devised Locks and Lock Furniture, exhibited their Patent Door Springs and Checks, and Gilmore & Clark's ventilating appliances, one of which, the 'Autothermikon,' is of the automatic character, opening and closing as the temperature of the room rises or falls.

The collection of grates, stoves, kitchen-ranges, and

heating apparatus left nothing to be desired so far as excellence of design and finish were concerned.

The principal display was made by Messrs. Yates, Haywood, & Co., who occupied the larger portion of the east end of the hall, the wall being faced with a row of Mantels and Over-mantels in cast iron, wood, marble, and slate, supplemented with Grates, Tile Hearths, and the usual appendages of the fireplace. The designs comprised examples of the Early English, Adams, and Queen Anne styles, many of them being of an artistic character. The firm have entered with considerable spirit into the manufacture of cast-iron over-mantels, and are second to none in their designs and colouring. The exhibit also contained a variety of hot-air and other stoves, kitchen ranges, and other articles in cast iron of their manufacture.

Messrs. George Wright & Co., Rotherham, and Queen Victoria Street, E.C., had a smaller but exceedingly good exhibit of a similar character, amongst which we noticed the old 'Bivalve' Grate, originally invented by Mr. Wright. It is now made as either a slow or quick combustion grate and named the 'Interchangeable,' giving perfect control over the draught.

Mr. James B. Petter, of Yeovil, was also present with his popular Nautilus Grate, which, at our hands, has already received the high meed of praise to which it is justly entitled.

Mr. T. J. Constantine, of Fleet Street, exhibited his valuable and widely known 'Treasure Range' and economic cooking appliances. The Wilson Engineering Company had a stand with the Ranges associated with their name. The Eagle Range Company contributed their speciality. American pattern stoves and ranges were sent by Messrs. Smith & Wellstood, of Ludgate Circus, and Messrs. Poore & Co., of Cheapside. Gas-cooking and heating stoves were exhibited by Messrs. H. & C. Davis & Co., Camberwell, A. J. West & Co., Lisle Street, Leicester Square, and Messrs. Wilson & Son, Leeds.

Mr. Renton Gibbs, Mill Street, Liverpool, had a working model of the heating apparatus made by him for so many years past. Its capacity for adaptation is almost universal, and has been applied to Turkish baths, for drying clothes, bricks and pottery, and for churches, private houses, &c.

Messrs. Deane & Co., London Bridge, as the London agents of Mr. Fletcher, of Warrington, had a stand containing that gentleman's excellent inventions in cooking and heating stoves, bath and water heaters, &c., including many articles for laboratory use heated by gas, such as muffles, furnaces for crucibles, blowpipes, forges, &c.

Mr. Harry Hunt, Palace Works, Newington Green, N., who was the first to introduce into England Canadian heating stoves burning anthracite, under the name of the Crown Jewel, exhibited a notable collection of these economical and excellent heating appliances. Latterly the designs of these stoves have been very much improved and made more in accordance with English taste. One of the new ones, named the 'Argus,' a base burner like the Crown Jewel, holds sufficient fuel, either coke or anthracite coal, to burn from thirty-six to forty-two hours, a length of time unparalleled in stove burning. As a hall-stove, if kept burning continuously through the winter months, which can be done with perfect safety, the cost of fuel will not exceed a few pence per diem, and the temperature can be regulated to any requirement. The value of keeping the house at something near an equable temperature during cold weather is now generally admitted, and no better appliance for burning coal or coke than the Canadian stoves can be obtained. Mr. Hunt also exhibited a valuable improvement for kitchen ranges, which can be attached to any existing kitchener without taking it out. It is an arrangement for reducing or enlarging the fire at will, forming an economical appliance, and one calculated to assist the cook in an emergency. It consists of a means of lifting the fire towards the hot plate, and takes the form of a box

fixed in the brickwork at the back of the ash-pan. The few appliances now in use for this purpose rise in a somewhat semicircular form, but in Mr. Hunt's invention, by depressing a lever, the fire is made to rise in a completely vertical position, causing the heat to be equably distributed, and enabling work to be done with a very small consumption of fuel. It has also the advantage, when raised, of preventing the cold air from passing over the top of the fire and cooling the flues. It will be found an invaluable addition to the ordinary kitchen.

Several makers of electric house and other bells, and burglar alarms, exhibited a very creditable collection of their inventions. Messrs. Eck, Callow, & Co., Dean Street, Holborn, exhibited Brown's patent automatic indicating and testing fire-alarm, of which they are the sole makers for the United Kingdom. In the event of a fire occurring in a building fitted with electric bells to which this appliance is attached, an alarm is quickly sounded. The fire alarm consists of a thin ribbon of metal that fuses at a very low temperature, and so sets the entire range of bells ringing. It may also be fitted to actuate any kind of external alarm, and, in combination with Brown & Saunders' single wire fire alarm telegraph, may be arranged to transmit the alarm and locality of a fire to the nearest station, an advantage of considerable importance. Harrison's patent burglar alarm, another form of electrical apparatus shown by the firm, appears to be a valuable indicator of the burglar's whereabouts. It is fixed outside a building as near to the top as possible, and connected with all accessible windows or doors. Immediately on the opening of either the circuit is made complete, a loud report ensues, and a powerful light is simultaneously ignited, which burns for a considerable time, showing the house where the attempt has been made, and presenting a chance of securing the culprit, whose nerves, by-the-by, would probably be rather upset by so unlooked-for a light on the subject. Mr. Julius Sax, Great Russell Street, W.C., one of the earliest makers of electrical appliances, contributed an excellent collection, including house bells, burglar, and fire alarms, lightning-conductors, and watchmen's clocks.

Mr. Geo. Porter, Cullum Street, E.C., also a well-known manufacturer, exhibited his system, which includes the pneumatic and electric in combination, every push being separately connected to the indicator by a small metal tube. Mr. Porter's indicators are very substantial instruments, and require a much less amount of battery power than has usually to be employed, while the bells ring effectively irrespective of distance.

Mr. William Pressland, High Street, Stoke Newington, had a collection of electric bells, including examples suitable for railways and mines, invalid sets, lightning conductors, galvanometers, &c.

Messrs. Gretton, Mynn, & Co., Grocers' Hall Court, E.C., supplied incandescent electric lights to the exhibitors, the Benson and Grubbe dynamo being the apparatus used.

Galvanised iron tanks for domestic and other uses were shown by the old-established firms of Burney & Co., Millwall Docks, E., who are makers to the Royal Navy, and Crouch & Jay, Maroon Street, E.

Specialities in locks formed another feature of interest, one of the most notable being the patent 'Springless' latch-bolt locks exhibited by Messrs. Chas. D. Douglas & Co., Queenhithe, Upper Thames Street, E.C. In these locks the latch-bolt is worked by means of a metal block poised in such a manner that one of its edges carrying the entire weight rests upon the 'follower,' and is brought into action immediately the handle is turned, taking the place of the ordinary spring, and the handle may be turned to left or right with equal facility. The advantages of this principle are so apparent that it must recommend itself to all buyers of locks. The action is more easy than that of the spring, there is nothing to become deranged in use, consequently there is not anything to interfere with the free play of the latch-bolt, which cannot by any means 'stick' or refuse to move.

To this action the firm have recently applied the 'push' and 'pull' movement, making four actions for actuating the bolt. This combined application is the most perfect mode of opening or closing a door extant. Messrs. Douglas & Co. also exhibited an improved mode of securing the knob on the lock-spindle, that constant source of trouble in a house. This invention seems to render it impossible that a knob should become loose or fall off. Another improvement shown by the firm was a lock and latch for a railway-carriage door, which, by one pressure, and that of the gentlest character, latches and locks the door securely. The interior construction of this lock is simple, but ingenious, and cannot fail to effect its purpose. It has already received the approbation of one of the largest railway companies, and wherever adopted will be received as a boon by travellers.

Mr. F. T. Biggs, Leadenhall Buildings, E.C., exhibited his patent tubular lock, which has a ball latch, enabling the door to be opened by a 'push' or 'pull,' the furniture being fixed on the door and not attached to the lock. A patent spring door hinge of an ingenious character was also on view at this stand.

Messrs. Joseph Kaye & Sons, 63 High Holborn, one of the first makers to introduce the 'push' and 'pull' lock, exhibited a variety of examples of their specialities, the principle being shown in many different applications, even to latching drawers on board ship.

Other exhibitors of locks and their appendages were Messrs. Chubb & Sons, Queen Victoria Street, E.C., whose collection showed very fine finish, and also included locks on the push and pull principle, a plan evidently progressing in public favour; Broughton & Co., Queen Victoria Street, including the Chelsea patent reversible centre-bit mortise; Mr. R. Adams, Great Dover Street, who also had his usual collection of fanlight openers, reversible windows, spring hinges, &c.; Mr. Alfred Gill, 9 Arthur Street West, E.C., &c.

Improvements in the construction of windows were also exhibited by Mr. J. D. Tucker, Bromley, Kent, in the form of weather-tight sashes; Mr. Harry Pearce, Great Portland Street, W., as agent for Messrs. W. & R. Leggott, Bradford; simple mode of opening and closing fanlights, skylights, &c.; Messrs. Meakin & Co., Baker Street, W., locking windows, reversible sashes, &c.; Pennycook & Co., Ironmonger Row, St. Luke's, fanlight openers; and Mr. M. Williams, Frodsham, & Co., Chester, improved metallic casements.

The imitations of various marbles in enamelled slate for chimney-pieces, &c., were well set forth by Messrs. Sessions & Sons, of Gloucester, a firm which has taken a leading position in relation to decorative slate articles generally, as well as in the different sanitary appliances to which this material is applicable. Enamelled slate urns were exhibited, facsimiles of those supplied by the firm to a number of noted public buildings and railways, and which have been largely exported to Australia and foreign countries. The exhibit also included baths, sinks, wall-linings, and other decorative articles of an interesting character. Messrs. Muldoon Brothers, Roman Road, Barnsbury, had also a good collection of slate goods.

Sanitary appliances formed a conspicuous feature in the Exhibition. Messrs. Shanks & Co., Cannon Street and Glasgow, made a good show of their manufactures, but nothing new, and the same remark may apply to Messrs. Capper, Son, & Co., Ingram Court, Fenchurch Street; Brazier & Son, Blackfriars Road, S.E.; Bolding & Son, South Molton Street, W.; and John Smeaton, Imperial Buildings, Ludgate Circus. Stanford's Patent Joint for stoneware pipes was shown by Mr. H. Ough, of Austin-friars, E.C.

Moule's Patent Earth Closet Company, Garrick Street, Covent Garden, made a fully representative display of their various pattern closets, on which it is unnecessary to make further comment.

Messrs. Ewart & Son, 346 Easton Road, did not exhibit anything particularly novel, but many objects of

ve character. Their stand contained specimens everything in the shape of their manufactures and decorative zinc work. The display Roman baths, the Zenobia, and Moncrieff tubs, and others of a cheaper character, their Califont 'or instantaneous waterheater; a variety of conservatories and flower-boxes and their s and smoke curers, known by the name of the and Prince. The decorative zinc work for roofs ornamentation of buildings was of the most varied illustrating how cheaply and effectively this can be utilised for such purposes.

Miss Muller, Dashwood House, New Broad .C., exhibited an ingenious invention made at asen on the Rhine, for fixing under the cover-roofs, and under floors in heating and drying nents, ice cellars, &c. It is made in the form and slabs of small pieces of cork cemented to-The bricks are very light, and besides being -conductors for heat or cold, are well adapted for sound. A small house was exhibited, built f the material with the addition of a few wood

Patent cork mouldings for steam and hot-water ilers, &c., were also shown, and a fire-proof non-g material supplied in a dry powder. This is to be applied to any kind of pipe or flue passing ater, or superheated steam. It is said to adhere y, and to resist all external influences.

F. Orme & Co., St. Andrew Street, E.C., sent adable collection of wood and metal working r, including drilling machines, saw benches, machines, tire benders, lathes, &c. Many of the were of American manufacture, and were fine s of workmanship and finish. Pumps of Ameri- : were also conspicuous, a notable one being a d rotary pump for steamboats, mines, &c.

. J. Hopkinson & Co., Huddersfield, exhibited a ti-collapsible hot-water cylinder for baths and hot-water appliances. This cylinder is formed etal corrugations, producing immense strength, nting the unsightly bulging or collapsing that a occurs in cylinders made of plain sheet metal, : consequently able to withstand a much greater f pressure.

ilkesden Paper Co., 34 Cannon-street, E.C., and t, were present with specimens of the various hich their material is adaptable. It has been y adopted by Government for the Egyptian c. Amongst the most notable articles shown was heel, the buckets being made entirely of the d a water-tank of the same material, intended to its waterproof qualities.

ellent assortment of draining and other levels, staves, and other scientific instruments were ; Joseph Davis & Co., 6 Kennington-park-road, luding a large collection of their Fitzroy barom- hich note has been taken on several previous

. Pascras Iron Works, Pancras-road, N.W., sent illection of stable, cowhouse, and piggery fittings, f manufactures to which they have given much , and for the excellence of which they are univer- mitted to compare favourably with their com- Not less noteworthy were the examples of egged ironwork forming part of this display.

. Hodgkinson & Clarke, Limited, Small Heath, am, whose specialities have often been described ITARY RECORD, contributed their usual quota ing shutters, window blinds, stained and painted ds, &c., exhibited through the medium of the ction that always forms a conspicuous feature at ibitions.

ndon Patent Automatic Disinfectant Company, i Victoria Street, E.C., exhibited their excellent . for attaching to any kind of water-closet or the automatic discharge of a disinfectant every

time the apparatus is used. Although this apparatus has been fully described in the SANITARY RECORD on a prior occasion, we make no apology for reverting to it again.

Illustrations of it are appended, fixed to a closet, and not fitted. Small as the appliance is, it will hold sufficient disinfectant for 10,000 gallons of water. It is easily fixed, inexpensive, and may be removed by a tenant should change of residence supervene.

Mr. C. G. Roberts, Haslemere, Surrey, exhibited his Patent Rain-water Separator, an invention of considerable value, particularly in country districts, where rain-water forms such an important item in domestic water supply. This apparatus has also received detailed description at our hands when shown at former exhibitions.

A very useful invention, consisting of metal laths to take the place of the ordinary wooden ones for ceilings and partitions, was shown by Mr. G. M. Edwards, 54 Gresham Street, E.C., also dove-tailed corrugated iron sheets for use in combination with Portland cement for fire-resisting floors, partitions, &c. These inventions deserve high commendation and universal adoption.

Messrs. Groom & Co., Clerkenwell Road, commanded considerable attention for the many excellent domestic culinary articles shown on their stand, including their popular potato steamer, shown in action. At the National Health Society's Exhibition held at Humphreys Hall in June 1883, a diploma was awarded to it, and it has since received other commendations and medals. As a cooker of potatoes it stands unrivalled.

Mr. P. A. Maignen, 32 St. Mary-at-Hill, Eastcheap, had a stand containing a variety of his Filtres Rapides; a name that is fast becoming a household word. Mr. Maignen has just opened a West End depot in Pall Mall, where the various kinds of this filter are to be seen and its simple construction explained.

Filters were also shown by Mr. W. L. Bartow, Pontefract, Yorkshire, the principal feature in which was that the water first passes through slabs of natural stone, and afterwards through a block of carbon.

Two meritorious inventions were shown by Mr. H. Jonas, Mortlake, Surrey, sole agent to Dr. Nicholls, the patentee. They consisted of a carbon closet and dust-bin. The first-named is a square galvanised iron closet having a wooden seat. The lid, which is hinged, is made in the form of a circular box containing soot, charcoal, or some other deodoriser. A perforated metal disc let into the bottom of this box causes a portion of the contents to fall on the excreta every time it is shut down. As a gas-tight joint is made when the lid meets the opening, the gases rising from the contents are absorbed or rendered innocuous by the antiseptic mixture in the box lid. The closet has two strong handles attached to it, enabling it to be removed for emptying, the contents forming a valuable manure. The dust-bin is secured against the escape of offensive smells in a similar manner to the closet. It is, like the closet, made of strong galvanised iron in different sizes. It is an admirable invention, and supplies a long felt sanitary want in the disposal of house refuse.

Mr. John Grundy, Duncan Terrace, City Road, exhibited

his warm air ventilating grate, the mode adopted being to utilise the chimney as a heating chamber, and carry the products from the fire up a flue-pipe in its centre to the roof. By this means a great amount of heat is accumulated, which is admitted by means of ventilators let into the chimney-breasts into the rooms on each floor immediately above. This plan has been adopted with success by other makers, and is worthy of more general adoption, both as a means of arresting the waste of heat, economising fuel, and reducing smoke in a corresponding ratio.

Messrs. Turner Brothers, St. Albans, Herts, exhibited with some commendable inventions. The 'Hercules' Gas Engine, patented by Mr. Turner, senior, is of the vertical type, the one exhibited being ostensibly of 1 horsepower, though really more, even in its nominal capacity. It is excellently made, simple in construction, compact, and economical, perfectly quiet in working, and there is no noise at the end of the exhaust-pipe. It is also notable for the absence of springs, levers, or small parts to get out of order. It is also stated to be one of the cheapest, if not the cheapest, in the market. A cheap, compact, and well made Saw-bench was also shown, and there were several specimens of iron lift and force pumps, an important speciality with the firm. Another invention of a sanitary character exhibited was a new water-waste preventer or flushing cistern, well named the 'Simplex,' on the syphon principle. Its advantages over many others appear to be in its simplicity. The syphon is formed in the shell of the cistern, pipes and bells being dispensed with, leaving the space clear and unimpeded for working, examination, and removal of any sediment that may collect. As the water is delivered from the bottom it is noiseless, and there are fewer working parts and less mechanism than in any with which the writer is acquainted. A single pull down of the chain, if only for an instant, secures the entire emptying of the cistern. The principle can be applied with equal facility to a urinal, and it has the practical advantage of being very low in price.

Mr. T. P. Cook, 34 Snow Hill, E.C., exhibited a variety of Interior Builders' Fittings, including wash-fasteners, cabinet brass-foundry, locks, and door furniture. Of the latter he had on show a very ingenious, though simple, arrangement for fixing the knob to the spindle, known as Dennis's Patent. It can be adjusted to the most minute degree, and is not liable to get out of order. Mr. Cook also exhibited his patent portable dustbin, described in the *SANITARY RECORD* of Oct. 15, 1884.

THE DUBLIN SANITARY ASSOCIATION.

At the annual meeting of this association, Sir George H. Porter, M.D., in the chair, Mr. LaTouche read the twelfth annual report, from which it appeared that the number of its members at present was 238; that the income for the past year was 361*l.* 15*s.* 11*d.*, as against an expenditure of 257*l.* 3*s.* 5*d.*, leaving a balance of 4*l.* 12*s.* 6*d.* The report described in detail the work done by the society during the past year. It then stated that the death-rate in Dublin for the year 1884 was 27.9 per 1,000, as compared with 29.1 for 1883, and 27.9 for 1882, and an average rate of 29.2 per 1,000 for the ten years preceding 1884. Although there had been a satisfactory decrease in the death-rate in Dublin for the past year as compared with 1883, and also with the ten years then ending, this city still retains its position as the most unhealthy of the great towns of the United Kingdom, and points to the necessity for increased vigour in dealing with the sanitary condition of Dublin.

The Chairman, in putting the resolution, regretted to have to say that Dublin yet afforded a large field for their exertions, having regard to the condition of many of their streets, the density of the population in some quarters, and the wretched habitations of the poorer classes. However, he was happy to say that they had done a great

deal of good work, and that they would be able to carry it out to the end. There was no doubt that that association had stimulated other bodies to look to the sanitary condition of Dublin. For instance, the Dublin Corporation had cleared about four acres, on which artisan dwellings had been erected.

A NEW AMBULANCE LITTER.—Mr. Robert H. Nisbet, secretary to the Sunderland Provident Dispensary, and the inventor of an ambulance emergency case which has met with considerable acceptance in many parts of the country, has just completed an ambulance litter, which can either be used in conjunction with, or separately from, the ambulance case. It consists of two bronzed iron tubes, 8 feet in length, closed at the ends. These are kept in position by two cross-bars, with hooks at each end, and secured with set screws. A piece of tarpaulin, 6 feet in length, runs between the cross-bars, to one of which a pillow is attached, and two shoulder-straps or slings complete the arrangement.

YORKSHIRE SAUSAGES.—Fred Smith, general hawker, and Robert Wilby, pork butcher, were recently summoned at the Hull Police Court for selling or exposing for sale a large quantity of beef which was unfit for human food. It appeared that Smith had purchased the carcass of a diseased cow for 16*s.*, and disposed of a portion of it at a low price to Wilby, on whose premises it was found, along with some diseased horse flesh, ready to be converted into sausages. A plausible defence was offered, but Mr. Twist, the stipendiary magistrate, said that it was one of the worst cases brought before his notice. The public had a right to be protected from such infamous and disgraceful practices as the traffic in diseased meat. Both the defendants were committed to prison for two weeks each with hard labour.

ALDERMAN CAIL, of Newcastle, in consequence of constant complaints as to the limited and inferior water supply to the dense population of the various towns in Tyneside, has recently addressed a pamphlet to their authorities, showing how an abundant and satisfactory supply of water of excellent quality could be obtained for the above district from Ulleswater Lake in Cumberland and Westmoreland. No insurmountable or very expensive engineering difficulties present themselves, as the proposed source of this almost illimitable supply is situated at such an altitude as would enable the water to descend by its own gravity to all the villages and towns situate in the Tyne Valley as far as the east coast. The practicability of this scheme was amply demonstrated in the year 1874, when a careful survey of the district was made by a staff of experienced engineers and surveyors, at the instance and cost of Alderman Newall, of Gateshead. Unfortunately at that time the project did not receive the amount of support from the local authorities to which it was entitled; or they might now have been spared the unpleasant contemplation of a possible water-famine during the ensuing summer. Alderman Cail in his exhaustive pamphlet also urges that the Corporations of Newcastle and Gateshead should buy up the interests of the existing water company, whose resources are inadequate to meet public requirements in a satisfactory manner, so that their works might be made supplementary to the more comprehensive Ulleswater scheme. There are at present only about 900,000,000 gallons of water in store in the reservoirs of the Newcastle and Gateshead Water Company, whilst the daily consumption in those towns averages about 13 millions of gallons daily. It is stated that at least 550 millions of gallons of water flow out of the Ulleswater Lake into the River Eska every twenty-four hours. It is to be hoped that the local authorities, in the face of an increasing population and necessarily increased consumption, will make some satisfactory effort to meet the growing wants of the community.

MUNICIPAL FINANCE.

THE growing importance of the financial administration of Corporations makes it very desirable that sustained attention should be devoted to municipal finance in the columns of a journal which chronicles the manifold ramifications and developments of public hygiene. With this view we purpose to give, from month to month, a table showing the market prices and other valuable particulars as to the consolidated stocks of corporations which are dealt in on the London and Provincial Stock Exchanges, together with a summary of the leading facts as to Municipal Finance which have transpired during the preceding month.

New Issues of the Month.

Since our last issue, two important corporations have come into the public market as borrowers of money. The Commissioners of Sewers of the City of London, who, though arrogating to themselves independent powers, are to all intents and purposes a Committee of the City Corporation, desire £1,000,000, which is to be expended in redeeming existing loans bearing a higher rate of interest, and in effecting improvements now in progress in the City of London. The City of Glasgow want £500,000 for much the same objects. But whilst Glasgow demands, and apparently obtains, at least £100 cash for every £100 of stock, the Commissioners of Sewers would have been content with 96 per cent. As a matter of fact, they got an average price of £96 10s. 11d., having offered the loan by the plan of public tender; but it is absurd to suppose that the credit of the City of London is 3½ per cent. worse than that of Glasgow. Probably the reason for the difference lies in the fact that the Commissioners of Sewers Loan is in the form of debentures to bearer, subject to annual drawings, and repayable in twenty years; whilst the Glasgow Loan is a handier, safer, and more popular form of Stock, repayable in a lump at a fixed date (May 15, 1914).

The securities for the London Loan are the Sewers and Consolidated Rates, leviable by the Commissioners of Sewers in the City of London and the Liberties. The rateable value of the City has enormously increased during the last half century. In 1831, the rateable value was £797,904; by 1861 it had increased to £1,301,160; by 1871 to £2,476,616; by 1881 to £3,503,035; and it is now £3,623,133. The existing loans chargeable on the rates amount to £1,591,041, including £600,000 to be extinguished by the present loan.

The securities for the Glasgow stock, and for the other obligations of the Corporation, consist of—(1) Assessing powers over the city (a) for general police and statute labour purposes, which amount in all to 1s. 7d. per £, but are only exercised to the extent of 1s. 4½d. per £, which will yield at least £184,000; (b) for parks and galleries, which amount to 2d. per £, and yield, at least, £24,100; (c) for the Municipal Buildings Act, 1878 (1d. per £), which yields, at least, £12,200; (2) the rates leviable by the Corporation over the city and outlying districts for the supply of (a) water and (b) gas; (3) The properties belonging to the Corporation connected with the markets and slaughterhouses. In addition to these securities, the Corporation of Glasgow have power to levy a guarantee rate, unlimited in amount, over all lands and heritages within the city subject to assessment. The gross annual rental of the City of Glasgow for 1884-85 is £3,406,370. The borrowing powers vested in the Corporation under the provisions of their Loans Act amount, after deducting the sums set apart as sinking funds, to £4,246,334, and have only been exercised to the extent of £2,914,191.

NOTE.—The Stocks marked with an asterisk (*) are transferable in books kept at the Bank of England; those marked with a dagger (†) at London Banks. The rest are transferable by deed in the usual way, and the Agents are officials of the several Corporations.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

'Something attempted, something done.'

ABERDEEN.—By no means an inconsiderable portion of this report, which is a careful and thoughtful production, is taken up with an account of the working of the system of compulsory notification of infectious disease, and a description of the homes of the poor. As regards the former, Dr. Simpson has much of interest to say. He observes that in Aberdeen the system has worked very satisfactorily, and without friction. This success has been mainly due to the cordial co-operation and aid of the medical profession. Individual members have several times at the sacrifice of their own interests, given valuable assistance for the public good. Apart from the question, not yet settled, whether one class of the community should be expected to be so self-denying, experience in the working of the Act has shown that the Act is incomplete, and that if the onus is to be laid on the medical men for the purpose of preventing disease, the same should be laid also on the citizens. For it is frequently in those cases where there is much danger to the public that a medical man is not called in at all, or, if so, at a late period of the disease when his services are useless, either to the patient or to the sanitary department. Thus, in two ways, the public health is apt to suffer; first, by the individual not obtaining the necessary medical attendance that might have prevented a fatal issue, secondly, by the spread of disease. Purveyors of milk and dairymen are especially liable to conceal infectious diseases that may have occurred on their farms, from the fear of personal loss they may sustain if it should become known, and from this cause great harm frequently accrues. It is from these unknown (unknown until the mischief is done) sources that people frequently owe their typhoid fever and diphtheria. Speaking of the homes of the poor, Dr. Simpson has a painful and, unfortunately, a common experience to relate. Many of the houses inspected during the year (and they numbered over 10,000) were damp, dark, ill-ventilated, and dirty, requiring light, ventilation, repair, and cleaning; some uninhabitable, and others overcrowded. The prevalence of these conditions has not been overlooked by the authority, for by continuous inspection and energetic action, many of the dreary and unhealthy homes of the poor have been quite transformed, and by securing dryness, light, and ventilation, have been made more healthy and comfortable. As a rule, however, neither the occupier nor proprietor appreciated the boon conferred by these alterations. Pending the decision of the Royal Commission, Dr. Simpson advises his authority to proceed slowly in the matter of improvement schemes, and urges, in the meantime, a vigorous and stringent enforcement of the regulations relating to houses let in lodgings. The health of the town was very satisfactory in 1883, the general death-rate (19.05 per 1,000) being lower than any previously recorded. From the principal zymotic diseases also, the death-rate was below the average, representing 1.0 per 1,000. Whooping-cough was the most fatal of this group, destroying 63 lives; diphtheria accounting for 17 deaths, typhoid fever for 16, and typhus for 8. The circumstances attending the prevalence of these diseases, as well as the measures adopted for their repression, are carefully recorded by Dr. Simpson. The infectious hospital proved of signal service during the year, although the means for securing the removal of patients were quite inadequate.

DUNDEE.—The fact that no fewer than 248 deaths (of which 231 occurred in children under five years), out of a total of 550 referred to zymotic causes, were recorded from whooping-cough, is a subject to which Dr. Anderson devotes much attention. The number of children living in the burgh under the age of five is estimated at 19,735, and the mortality from this disease alone reached the

terribly high rate of 14 per 1,000. In asking for the causes of this excessive fatality, Dr. Anderson is of opinion that the two factors mainly responsible for this widespread and long-continued epidemic were the ignorance of many parents as to the serious and fatal character of the disease, and the attendance at school of children from infected households. There is a general opinion amongst the public that whooping-cough is a mild disease of children, that each child must take it, and the earlier the better, and that no precautions are necessary to protect their own or their neighbours' children. It is indeed singular and curious, as Dr. Anderson observes, to note how this fatal and pestilential belief survives in the public mind, notwithstanding the most overwhelming evidence to the contrary annually afforded by vital statistics. With regard to the influence of school attendance, it is estimated that there occurred 2,822 cases of infectious disease during the year, and yet there were but 40 applications for certificates of freedom from infection. The only inference to be drawn from these figures is that many parents and teachers evaded the law, and Dr. Anderson advocates, as the only remedy, the rigorous punishment of every offender. Typhoid and diphtheria (which together caused 81 deaths) were prevalent throughout the year, and were found largely in association with sanitary defects. There were repeated outbreaks of typhus fever in various portions of the district, which, thanks to the sanitary organisation of the burgh, were easily and speedily suppressed. Dr. Anderson speaks in high terms of the utility of the compulsory notification of infectious disease, which from the first has been an unqualified success. The death-rate from all causes is estimated at 23.91 per 1,000 of population.

IPSWICH.—The sanitary condition of this borough continues to improve under Mr. Elliston's able supervision. During 1883 the arterial system of sewerage was actively pushed forward in all parts of the town, new sewers having been constructed in upwards of 124 streets and roads, thus relieving many extensive and populous localities. In dealing with this subject, Mr. Elliston properly reminds his authority of the importance of seeing that all houses are connected with the main sewers under skilled supervision, and to this end he advises a house-to-house inspection. The deaths from zymotic causes numbered 97, being equivalent to 1.85 per 1,000, which is below the average of the previous ten years. There was a sharp epidemic of whooping-cough in the spring, and measles became prevalent towards the end of the year. Scarlatina continued to crop up month after month in various parts of the districts, but only 10 deaths were registered from the disease. The Infectious Hospital played an important part in preventing this outbreak from assuming epidemic proportions, and, by isolating some of the worst cases, it gave a continuous check to the natural rate with which the disease would otherwise have increased. As many as 58 cases of scarlet fever were removed to the hospital. A large number of these were adults, who passed through a severe attack, but in no case did the disease terminate fatally, all the patients being discharged cured. There was a marked decline in the mortality from typhoid fever, and the fatality from diarrhoea was below the average. The death-rate properly due to the town is estimated at 19.2 per 1,000, the lowest, with one exception, on record; and Mr. Elliston takes advantage of the completion of the tenth year of the operation of the Public Health Act to emphasise the results which have followed from its energetic administration in Ipswich. At a low estimate 600 lives have been saved, and some 3,000 cases of sickness prevented. Having regard to these figures, and to the low death-rate recorded in 1883, Mr. Elliston has much reason to be gratified with the results attending his administration of the sanitary laws.

THE USE OF OPIUM.—Dr. O'Hanlon, medical officer of the Spennymoor Local Board District, reports that the use of opium is spreading amongst the female population of that district.

DIETETIC NOVELTIES.

LONDON MANUFACTURING COMPANY'S MEAT PREPARATIONS.

IES of most beautiful, delicate, and first-rate prepa- of Meat have been submitted to us by the London acturing Company. Essence of meat, transparent ht in colour, concentrated beef tea of a delicate yet ul meat flavour and odour, and turtle soup of excel- ality, are the company's specialities. Their purity nuineness make them specially adapted for invalids' d they will no doubt meet with the appreciation ervice.

company's factory is most elaborately fitted up with digesters, enamelled pans and baths, and is kept in airable condition of cleanliness and sweetness. This cessity both for the manufacturer and the consumer; : factory that has once been infected with germs of position can never turn out preparations free from ud and possessed of unlimited keeping qualities. The n Manufacturing Company's preparations are, as a of fact, entitled to the highest commendation.

NEW INVENTIONS.

SANITARY STOVE-SCREENS.

spread of sanitary, that is to say cleanly, notions is ced in small things as well as great; from sewerage re ornaments. Formerly people used in the summer is, when fires were given up, to cover their stoves dust-collecting paper curtains of a more or less nent character, which also impeded ventilation by imney. The willow-shavings, which were also used bright stoves, were likewise liable to the objection of g dust and blacks. These expedients for hiding ily iron stoves are now superseded by small folding er screens placed in front of the stove, concealing it ut impeding ventilation. These screens are generally of stout millboard, painted or printed in various s suited to all kinds of furnishing, and, if carefully d, add to the adornment of a room. They are, of , removed whenever a room is cleaned, and the tion of a duster removes any loose dust which may dhered to their surface during the week.

their advantage appertaining to this form of screen coals and wood, which Sydney Smith declared to best stove ornaments, can be kept in the stove all ar round, so that paterfamilias can have the luxury ire on a chilly evening, even in the summer, with r the trouble of removing the little screen in the fire-

srs. Charles Lee & Co., of 78 Milton Street, E.C., eld an exhibition of these sanitary stove-screens at lanchester Hotel, Aldersgate Street, which gave who attended it an opportunity of noting the variety oderate price of these pretty appendages to the fire-

Much ingenuity has also been expended in making screens applicable for other purposes than merely aling the fire-stove.

REVIEWS.

Years' Experience (now Fourteen Years) in Works Intermittent Downward Filtration. By J. BAILEY-DENTON. E. & F. N. Spon.

is the second edition of Mr. Bailey-Denton's well- work. The history of intermittent sewage filtra- of great interest from the time when Dr. Frank- experiments were published by the Rivers' Pollution issioners, on the Mersey and Kibble basins (1870) to the present time. From one cause or another, stem of sewage treatment appears to have met with

constant misrepresentation and abuse ever since it was first essayed in practice at Merthyr Tydfil in 1871. It should be generally known by this time that Mr. Bailey-Denton recommends the use of intermittent filtration beds in connection with land treated with surface irrigation, reserving a small portion for osier beds for the reception of overflow waters. Where a large extent of suitable land is difficult to acquire, the proper defecation of the sewage to be dealt with, can be accomplished by intermittent filtration alone, at a moderate original outlay and without the slightest nuisance. With a suitable soil and proper preparation of it, the sewage of nearly 3,000 persons may be treated successfully upon one acre of land, and in unfavourable soils the sewage of as many as 1,000 persons can be perfectly defecated upon the same extent of land.

A complaint that is constantly made by holders of surface irrigated sewage farms, is that they are obliged to dispose of the liquid sent to them whether they want it or no. If they could have just the amount of sewage that they require, and at the periods when they require it, they would be glad enough to pay a moderate price for it. For instance, during a continued drought the tenant of a sewage farm would be very glad of a large supply of screened sewage. But at other times it must often be the case that he would much prefer, not to take any for a week or so at a time, rather than flood continuously his already supersaturated land. By combining intermittent filtration with surface irrigation, the possibility of satisfying the farmer in this direction is arrived at. When the sewage is not required upon the farm it is turned upon the filtra- tion beds, so that the farmer can satisfy himself completely in this matter, taking much or little as he sees fit. It must not be forgotten either that if the filtration areas are properly cultivated in ridge and furrow, vegetables can be grown upon the ridges (out of reach of the liquid sewage) with great success. The use of osier beds springs from the fact that it is practically impossible to treat the overflow- waters in time of storm. This water, therefore, is turned upon the osier beds for clarification before finding its way to the natural stream of the watershed.

The author determined that as intermittent filtration had been somewhat prominently referred to in terms of approval by the Royal Commission on Metropolitan Sewage Dis- charge, and as the first edition of the work in question was out of print, to issue a second edition through the same publishers. In the preface to this edition, Mr. Bailey-Denton quotes *in extenso*, from the report of the Commissioners, a favourable description of many of the works designed by him. The Commissioners, in con- clusion, compare this process with surface irrigation in regard to the three questions—Will it produce effectual purification? Will the process be in any way objec- tionable? What will be its cost? These three questions the Commissioners answer practically in favour of inter- mittent filtration. The author then explains the present satisfactory condition of the several farms which formed the subject of the first edition. He subsequently considers the following selected cases that have been dealt with since the date of the first edition (1880)—*i.e.* Dewsbury, Yorkshire; Withington, Lancashire; and Watford, Hert- fordshire. In each of these cases, even when the proper conditions have not been fully attended to, a real practical success has been obtained. It is suggestive of the state of the brooks in some parts of Yorkshire that the author says, concerning the Dewsbury works, 'The sewage consists chiefly of dye wash; nevertheless the effluent is very good, and everyone that sees it is surprised to see how clear it is. There are a good many mill hands come to have a bathe at the outlet, it being the only clear water for miles that they can bathe in.'

These additions to the second edition add considerably to the value of a very useful work, which ought to be in the hands of everyone interested in the subject—and who nowadays is not? Mr. Bailey-Denton has published many useful works, but probably none of them are of more general value than the work before us.

Foundations and Materials used in Buildings. By JOHN HOLDEN, F.R.I.B.A., F.S.I., President of the Manchester Society of Architects. John Heywood, Manchester, and 11 Paternoster Buildings, London.

MR. HOLDEN deals practically with the ordinary problems in building, commencing with foundations, the circumstances under which concrete becomes necessary for purposes of stability, the proper method of laying footings, and other matters. His remarks on the sanitary importance of a good foundation are well worthy of attention.

'You all know,' says the author, at p. 60, 'that in large cities like London, Manchester, Liverpool, and others, there must of necessity be a very large amount of refuse always to be got rid of, and low lands are eagerly sought after to be used as tips. This is all very well so long as the land is in the country and lying idle, but as these tips are generally close to the towns (the closer the better, cartage being a consideration), as soon as the depression is filled up with this rubbish—very often partly nightsoil—the owner finds that his land has been converted into building land and is marketable, and, quite irrespective of the consequences, it is disposed of and built upon. In Manchester the nightsoil is at present dealt with by the Corporation in another manner, so that we must not credit them now with tipping that material; but Harpurhey and Collyhurst are instances of this mode of treatment in former years, and I well remember in 1865 surveying some land in Harpurhey, close to the continuation of Queen's Road. I had several days' work there in settling some boundaries, and the low land at the side of the road was in process of being filled up with nightsoil, road scrapings, and rubbish. The stench was something horrible, and effectually spoiled my appetite for the time. But the opportunity was too good to be lost by the owner of the land, and cottages were built as close to the edge of the tip as was practicable. This part, of course, is now all thickly populated, and we may imagine the state of these houses, built of the lightest materials, with little regard for sanitary arrangements (which in those days were very much worse than they are now), and with not the slightest attempt made to counteract the evils existing below. But tenants were plentiful, for poor people are obliged to live close to their work, and must put up with anything in the way of shelter.'

He suggests that where land has been filled up in the manner described, the authorities should not allow any buildings to be placed upon it until the plot has been levelled, and a layer of good concrete, twelve to eighteen inches thick, formed over the entire surface intended to be covered by buildings.

'No doubt,' says he, at p. 61, 'the landowners would fiercely oppose this expense, but when by such means as these tips, land, practically valueless, is made worth 5s. to 7s. 6d. per yard, or a rental of from 100l. to 150l. per acre, I contend that the owner should be forced to spend some of this gain (towards which he had done absolutely nothing) on the land itself for the protection of the public.'

Referring to the importance of damp-proof courses, the author recommends the use of asphalt, strong cloth pitched both sides, felt, or lead, discarding slate for this purpose, from its liability to crack under pressure. He also advises coating the outside of a wall with pitch, or a mixture consisting of 3 lbs. of pitch to a gallon of tar, with a little naphtha. This, he says, will decay and come off, but in the meantime the mortar will have become hard, and the wall will be kept dry. One expedient for curing damp walls, which he says he has tried with success, consists in filling in the space next to the outside of the wall for about eighteen inches to two feet wide with brick rubbish, through which the moisture getting at this part will percolate into a drain provided for the purpose. The top in such a case is covered with cement, to prevent water from running off the walls into the trench, a gutter being formed to convey it away. Mr. Holden very properly recommends the use of non-absorbent bricks for building purposes, so far as they are obtainable, laying it down as

a rule that they should not take up more than 20 per cent. of water. It may be doubted whether he will meet with unqualified support in his objections against the grouting of walls and pargetting of flues. That both practices are often made a means of partly remedying or concealing defective work, we do not deny; but we cannot always be certain of securing the desired standard of non-porosity in every brick used, and when so much water is liable to be absorbed by the bricks as to prevent the mortar from setting thoroughly, grouting is advisable. As regards the pargetting of flues, it is practically impossible to guard against open joints in internal work, and the pargetting forms a safeguard, although too frequently an impudent one.

We are glad to note that Mr. Holden advocates hanging basement windows as much as possible out of the ground, thereby dispensing with cellar areas, which he rightly designates 'filthy nuisances.' In his remarks upon timber, he records some curious experiences in connection with dry rot. In one case the fungus attacked the timbers of a ventilated floor to an alarming extent, while the floor of the adjoining premises, which was unventilated, remained unaffected. We agree with his recommendation that every part of a building should be easy of access for cleaning purposes—a desideratum too often overlooked, and also with his remarks upon the advisability of sealing hollow spaces under floors. A warning that comes more than once in the pages of this little pamphlet, should be laid to heart by building owners and architects—to give personal attention to the qualities of work and materials.

Principes Techniques d'Assainissement des Villes et Habitations. Par A. WAZON. Paris: Baudry et Co.

THIS is a remarkable book. Remarkable in two ways: firstly, because of the high uniform merit of the work itself; secondly, because it marks in so powerful a manner the fact that France is awakening to the claims of sanitary science.

This work is the production of an experienced engineer, who has evidently devoted considerable time to the exhaustive study of all writings bearing directly or indirectly upon the subject before us—not only French or German writings, but English and American also, and including the leading technical journals in both countries. His constant acknowledgments in foot-notes and in the text testify to this fact in the most liberal manner, and appear to us to prove that he has passed over no known authority upon the subject.

M. Wazon approaches his task with all the deliberation of a practised writer. His preliminary division of the work is as follows:—

1. The supply of pure water to towns.
2. The distribution of the water to houses.
3. Drainage of houses.
4. Drainage, &c., of public ways.
5. Public sewers.
6. Utilisation of sewage waters in agriculture.

Thus he starts with pure water; and after it has been supplied to the house, and has passed away with the soil, he follows it along the sewers till it is used to fertilise the land, and eventually reappears to join the river, approximately as pure as when originally taken from the same stream.

This work is, in fact, a study of the problem of sanitation in connection with Paris, although a greater portion of it is of course applicable to other towns.

The six divisions of the work are again subdivided elaborately, and each subdivision is exhausted with the deliberation of a professor; in fact, we shall see that if the author errs slightly at times, it is in attaching undue importance to arguments which might well convince a student, but would have met with less success from one who relied more upon extended personal experience and less upon books. For M. Wazon will, we are sure,

pardon us if we assume that a French engineer cannot unfortunately have had much professional experience in many of the subjects treated upon in his masterly work.

M. Wazon commences by considering how much water is necessary for an effective supply for all purposes to a town like Paris. It appears that Paris nominally receives a supply equivalent to 168 litres per head per day; but that in 1881, and again in 1882, a water famine was experienced of such severity that placards in the public streets warned everyone to economise the precious fluid in every possible way. The only town in France which is satisfactorily supplied is Marseilles, in which every inhabitant receives a cubic metre per diem. The experience of New York curiously enough confirms that of Marseilles. When the new supply from Lake Croton is completed, New York will have a total of 350,000,000 gallons per diem; and as the population in a year or two may be taken at 1,500,000, it will be found that each inhabitant will have a provision of a cubic metre of pure water every day. Assuming that the population of Paris will reach two and a half millions in 1886, our author concludes that the same number of cubic metres of pure water should be provided daily for that town. The existing means of water supply to Paris are then carefully considered, and minutely estimated one by one.

Rain-water cisterns are never of much practical use in large towns; and, in Paris, we can well believe M. Wazon that the 'locataires' of the Mansards often empty into the gutters liquid refuse, which, descending into a rain-water cistern, would of course prevent the possibility of its being used for domestic purposes.

Wells.—Of these Paris possesses about 30,000, but they are unfit for domestic purposes, being contaminated by drainage from cemeteries and from the numberless cess-pools still in use.

The main resource of Paris is shown to consist of the following sources:—The aqueduct of Arcueil, which supplies a pure water; the aqueducts of Près St. Gervais and Belleville, which supply a selenitic water hardly suitable for drinking; the Canal de l'Ourcq, whose waters are only fit for flushing the sewers and channels, and fire extinction, &c.; artesian wells at Grenelle, Passy, and Butte aux Cailles; the aqueduct of Dhuis, which delivers a pure drinking water; the excellent water of the Aqueduct de la Vanne; various deliveries of the relatively pure water of the Marne, and of the tainted water of the Seine.

These sources yield about 459,000 cubic metres daily. Our author, after considering various minor projects for increasing the water supply, enters into a most interesting description of a project for bringing 1,800,000 cubic metres daily from the Loire. If this project were carried out, he calculates that the total supply would stand as follows:—Present actual supply, 459,000 cubic metres; various minor projects, 261,000 cubic metres; from the Loire, 1,800,000 cubic metres; total daily supply, 2,520,000 cubic metres. This total is, of course, the amount which the author starts by requiring.

It is laid down by M. Wazon that as the water once taken from a pure source is kept sealed from all defilement in a proper subterranean aqueduct, so it ought in like manner to be kept sealed and free from all possibility of pollution, until it is delivered at each household fitting. The regulations for water supply in force in Paris are commented upon and objected to, and the author is then led to examine in detail the ordinary method of installation. The first objection is taken to the use of lead pipes; various substitutes are examined—as plain iron pipes, lead lined with tin, galvanised iron, tinned iron, enamelled iron, iron pipes prepared with Angus Smith's solution, and lastly, iron pipes protected by the Bower-Barff process; which latter arrangement seems to be preferred by M. Wazon, though the practical difficulties which impede its general adoption are apparently overlooked. Storage cisterns are condemned, in accordance with the principle laid down; for, says M. Wazon, the water in a storage cistern is never

closed to dangerous germs, besides that they are subject to visits from insects, birds, rats, and the cats that follow them. Such cisterns must always be liable to contain much organic matter, and are almost necessarily placed in the worst position to maintain their contents at an equable temperature—cool in summer and mild in winter. M. Wazon would substitute for the cistern an ingenious apparatus (of Carré's) in the basement, which would retain a supply of water, and maintain the pressure through the pipes even when the public mains were empty. He claims that the water would easily be kept at the proper temperature, would be absolutely safe from contamination, and, in case of an accident, instead of a dangerous overflow, you would have only a pool in a basement cellar. He does not meet the fact that this would be a far more complicated and costly affair than the ordinary cistern arrangement, and more costly and troublesome to keep in order. To take one small point, it would involve the use of nine valves instead of four, a fact of importance surely to all who have extended experience in arranging such matters for the use of the ordinary householder.

The water-main, after leaving this really ingenious contrivance, ascends and branches to each flat, and delivers into sealed filter-cisterns for potable water and into waste-not flushing cisterns for water-closets, &c.; in this way it is designed that from the moment the water is taken from its source to the time that it is actually drawn off for use it is preserved fresh, aerated, but absolutely free from contamination of all kinds.

The next subject treated of is domestic filters. A lucid and careful description of all the leading filters is given, and spongy iron is selected as the best material. Most of the ordinary cistern-filters are objected to as not providing for the constant aeration of the filtering material. This objection cannot be applied to the simple cistern-filter designed by Mr. Bailey-Denton; but, while according it all praise upon this particular, M. Wazon points out that it is necessary to take the filter to pieces to clean the filtering material. This would militate against the constant cleansings, which he considers of so much importance. Our author, therefore, awards the palm to a clever self-acting closed cistern-filter, made by Carré of Paris, which he describes and illustrates.

The domestic hot water service is next treated of. Various systems are illustrated. The special conditions of Paris life, the living in self-contained flats on one floor, render the supply by means of a hot-water cistern undesirable, as so little pressure can be obtained upon the fittings, and consequently large pipes and fittings have to be used. Besides that, the warm water that is constantly drawn for domestic purposes is, we are told, left open to contamination, though this is, as we know, not necessarily true. M. Wazon recommends the adoption of the American cylinder system, with some thoughtful amendments of his own. He then treats of the supply of water to water-closets, urinals, sinks, and hydrants, and reviews the arrangements made for house supply in Paris, adding a series of well-considered suggestions as to official inspections into the waste of domestic water, and with twelve clearly defined conclusions sums up this second part of the volume.

The third part, like all the others, starts with general principles and ends with conclusions. This part treats of the removal of Domestic Residua (drainage, dust, vegetable and other refuse). Before the siege of 1870 all dry domestic refuse had to be placed in the streets between 7 P.M. and 7 A.M. But since that time it may only be placed in the street at the time that the carts are passing—that is, from 5 A.M. to 7 A.M. To obviate the inconveniences attending such an arrangement, many concierges have provided receptacles in which all the residents of the house can deposit their refuse at all hours. The author suggests the addition of a pipe with doors upon each floor as a shoot for such refuse, although he does not seem to be fully aware of the objections that have in practice been made to the use of such shoots. The connection of rain-

water pipes with drains are, it seems, officially ordered to be made direct, with the protection only of a small iron syphon at the foot of each pipe. This is rejected for a proper disconnecting trap, for it will be remembered that in Paris a large number of Mansard windows usually dominate the heads of the rain-water pipes.

Internal domestic drainage is the subject of the next chapter. M. Wazon condemns the direct connection of soil-pipes with drains, and, rejecting all valves as a means of disconnection, considers in an elaborate chapter the value of a water trap for this purpose, and, in conclusion, advocates its use. The valuable labours of Dr. Carmichael, Professor Tyndall, Wernich, and Raphaël Pumpey are passed in review. And Dr. Miquel is shown to have arrived at the same conclusion as Dr. Carmichael upon the vexed question whether germs can pass through a water trap or escape with the evaporation of the water, for he says, 'The vapours rising from the most impure waters are always exempt from germs.' Various forms of traps are considered and described, their ventilation is very fully discussed, and the author proceeds to examine one by one the various domestic fittings and their installation, the most important being the water-closets. It appears that no *ordonnance* interferes with the installation of a water-closet. It may be with means of ventilation or without it, against an external wall or in the darkest corner of the staircase. It may be connected with a drain or with a fixed cesspit, or even a *movable* one. When rules are made they are more often very misleading. Soil-pipes of cast iron must have an internal diameter of 20 centimetres ($7\frac{7}{8}$ inches), and if of glazed ware a diameter of 25 centimetres ($9\frac{1}{2}$ inches). This latter diameter is obligatory also for the ventilation-pipe, which has to be taken up from the cesspit.

The dangers arising from the use of large soil-pipes of glazed ware in rapidly built houses must indeed be appalling. M. Wazon divides the multitude of closets into three classes—pan closets, wash-out closets, and hopper closets. The first class of course he dismisses very summarily, and the second class he considers imperfect, and ultimately prefers the last class. Amongst the latter class he commends Hellyer's Artisan and Vortex closets and Buchan's ingenious Carmichael closet. Advising the abandonment of the usual wood enclosures, he describes them as 'enclosures which soon become the receptacle for dust and putrefying leakages, and thus constitute a veritable chamber of horrors full of effluvia and of dangerous germs in the event of a contagious illness in the *'appartement.'*'

As cesspools are still largely used in Paris, and are costly to empty, it will be readily understood that the proprietors are opposed to the proper installation of a pure water supply on every floor, and still more energetically to the use of water-closets. The various kinds of cesspools are described, and amongst them we find the movable cesspit, *i.e.* a watertight cask of the maximum capacity of 250 litres, which is placed in a cellar under the foot of the soil-pipe. It is needless to say that these casks often overflow the cellar to a great extent through not being emptied often enough, and are quite incompatible with the use of water-closets. The various systems of main drainage are described and illustrated by four pneumatic systems, and four systems actuated by gravitation. The English system by gravitation is finally recommended for adoption.

The French, German, American, and English methods of house drainage are forcibly reviewed, and here we think that our author's rather 'doctrinaire' view of the subject leads him astray. One of the immovable axioms with which he starts is that all traps should be ventilated against syphonage. Looking, therefore, at the drawings and writings of the principal English authorities upon the subject, he finds little or no mention of this important point, and at once condemns them. Our readers will be sorry (if amused) to find on this black list Capt. Douglas Galton, Professors Corfield, de Chaumont, and Henry Robinson, and Messrs. Rogers Field, O. Tarbotton, &c.

The indictment against Mr. Rogers Field seems especially weak, for in the illustrations to the Annotated Model By-Laws (which are the occasion of Mr. Field's condemnation) he only illustrated the meaning of a certain text placed before him, and did not attempt to show what he considered a perfect arrangement of plumbers' work.

Fortunately there exists one man who has saved the reputation of this country. Mr. Hellyer, in 'The Plumber and Sanitary Houses' has shown every trap in the house ventilated, so England is safe once more. M. Wazon does not appear to admit that, under some circumstances, traps do not require to be ventilated, and certainly does not appreciate the special dangers which follow in the train of their indiscriminate ventilation.

The English system of house drainage with, of course, the ventilated trap, is the one which M. Wazon recommends for use in Paris.

The fourth part, on the sanitation of public ways, leads our author to the conclusions that impermeable pavements should generally be adopted, that the planting of trees should be increased, that subsoil drainage should be undertaken in low-lying quarters, that special precautions should be taken to prevent the impregnation of the soil with gas, that it is desirable to increase the number and efficiency of public urinals and water-closets, that the cleansing of the streets of Paris may be considered as a model of what it should be, and that frequent watering of public ways in dry weather is absolutely indispensable.

The fifth part supplies an interesting history and description of the Parisian system of main drainage, and discusses the details of the sewers (manholes, &c.) in comparison with those of England and America.

In the sixth and last part, the various methods of utilising sewage in connection with agricultural land are judiciously considered, but though intermittent filtration is fairly treated of, Mr. Bailey-Denton's happy combination of the latter with surface irrigation is not mentioned.

The arrangement of the work throughout is exceptionally methodical, and it is expressed in a simple terse text that is lucid to the last degree. For these reasons the book may well serve as a model to many practical writers in England. We know of no English work that treats this subject in so thorough and exhaustive a manner, and we hope that M. Wazon will receive the appreciative thanks of his countrymen for his very useful work.

Robert Boyle, Inventor and Philanthropist. A Biographical Sketch.

THIS little book contains a biography of the late Robert Boyle, the original inventor of the well-known air-pump ventilator, which, however, has been improved on by his son, the present head of the firm of Robert Boyle & Co.

Robert Boyle, sen., was evidently a most energetic and persevering man, who, early in life, showed remarkable aptitude in mastering scientific knowledge of all kinds.

One of his first public acts seems to have been the establishment of depôts in Glasgow for the supply of pure bread for the poor, an article not to be obtained at that time. He appears also to have passed a great deal of his time in delivering lectures in connection with missionary and other philanthropic work. These were, as usual, illustrated with dissolving views, and we are told that 'the whole of the apparatus, even to the grinding and polishing of the lenses, was the work of his own hands.'

We are told that Mr. Boyle had the idea of diminishing the number of wars by making war more terrible. With this end in view, he invented a detonating powder of great explosive force, and submitted it to the Government, by whom it was not (in the inventor's opinion) properly treated. A sincere desire to improve the ventilation of poor dwelling-houses apparently led to the gradual development of the air-pump ventilator, which passed through many stages before it reached its present form.

The remainder of the book before us is filled with testimonials from capable witnesses as to the value of the

—the best fixed extraction ventilator before the world to the intelligence with which Messrs. Boyle and I have used it in various important works.

Practical Plumbing. By P. J. DAVIES. Vol. I. N. Spon.

It forms the first volume of what may be regarded as a cyclopædia of plumbing and kindred subjects. It is an experienced plumber, whose writings on plumbing in the *Building News* and other papers must have been noticed by most of our readers.

It is, no doubt, primarily intended for the use of the young apprentice to the craft, but it contains a large amount of information that will be well received by many others.

Subjects treated upon in this volume include among many others:—The production of lead from the subsequent manipulation, lead casting, lead-soldering, lead-milling, solder, soil-pipe making, lead-sint making, elbows, bends, and joints, trap-making, cisterns, filters, sanitary plumbing, ventilation, hot-water supply, testing drains, tanks and water pipes, soil-pipes and traps, waste-pipes, ventilation, closets, urinals, lead light and ss glazing. Mr. Davies, in his laudable efforts to give a work inclusive of all that shall be of value to the plumber, gives extracts from Acts of Parliament having to do with the supply of water and formation of drains, metropolis, a list of the turncocks of the various water companies, a series of examination questions for students of the craft, and a specification of work which he has kindly added for the use of the descriptions in which are ingeniously given references to the book itself.

All things indicate the care with which the book has been compiled, such as a list of books useful for reference, and a directory of the leading tradesmen. A portion of the work is pretty well known from having already appeared in print, though we may remind that it contains an immense amount of really valuable information, replete as it is with tables and receipts of considerable value.

To see that Mr. Davies is a safer instructor in plumbing than in questions of sanitary engineering is called. On the subject of the size of soil-pipes, for instance, he says that his practice is, for any building not more than from fifteen to thirty feet high, to lay a 6-inch drain if laid with a good fall, otherwise a 4-inch. For houses with from thirty to eighty rooms, he says to lay a 6-inch drain, or 12-inch otherwise! Has he considered what size sewer would be required to carry off a small town, for instance, if the drains were laid at this ratio.

There are very few works that are free from blemishes, and this work is no exception to the rule; though the fault we refer to is one that can be easily remedied in a new edition, if the energetic author has only courage to do so.

As to the fact of the personal ubiquity of the author, as Mr. Davies does, on almost every page of his work, from the title-page to the examination questions.

We are not allowed even to peruse the extracts without feeling in peace, for after many of the sections the author returns to comment upon them. All this arises, however, from a genuine desire to make all the world acquainted with the subject as Mr. Davies is himself. We think it will probably be found to weary the reader.

The book is profusely illustrated with 2,000 blocks, which might very well be improved upon, is supplied with a good index, and will, we doubt not, prove a valuable technical standard work.

CORRESPONDENCE.

Audi alteram partem.

[All communications must bear the signature of the writer and necessarily for publication.]

VENTILATION.

I trust that you will be able to grant me space for the following remarks in your valuable columns, the purpose of which is to ventilate ventilation.

I am writing specially in reference to the system of ventilation lately introduced and patented by Mr. F. H. Smith, 52 Queen Victoria Street, E.C.

My attention had been called to this system by a friend of mine, who knew that I took great interest in this subject, and am struggling to discover which out of all the various methods is the more perfect.

In the year 1734 Desaguliers invented a plan for ventilating which was by propulsion, it being a fan enclosed in a box; and since that period we have had all manner and shapes brought before us in fans, but so far as perfection or satisfaction is concerned the results have not been satisfactory, all systems of fan ventilation being, so far as I know, simply efficacious in creating draught.

Mr. Smith's system of ventilation is not in the strict sense of the term propulsion, and yet by the admission of the cold air close to the floor it is almost turned into one.

By referring to the drawings in your last number illustrating this system it will be seen that the air introduced by the 'fresh air inlet' strikes against a plate and is supposed to separate, part ascending to the outlet, the remainder taking, for some unknown reason, the contrary direction. The part which is supposed to go downward strikes against a flange plate, and is thus supposed to be guided into the outlet. Now, it appears to me that the air in the exhaust will simply be describing circles, the top of the exhaust being perfectly open, and little or none will ever find its way out, and certainly, from my own observations, not sufficient to be of any advantage to the room on which the exhaust is placed.

Mr. Smith and Mr. Barnes Austin were both exceedingly kind in trying to prove to me the marvellous efficacy of the system by means of the anemometer, which I told them conveyed no idea as to the actual working of the system to my mind. But if the anemometer be a fair test, it certainly proved their system, which has been so highly eulogised in the columns of the *Times* and your own journal, to be a complete failure.

In the first place, I would ask why does the anemometer remain motionless when on a line with the ceiling in the exhaust? Surely if any air were being extracted from the room the anemometer would revolve. Secondly, why does the anemometer remain motionless until above what in the section is termed the 'fresh air channel'? Thirdly, what is the reason of the anemometer revolving at such an increased rate when near the sides of the exhaust? I, in my ignorance, always believed that the air close to the sides, on account of the friction, had a less velocity than in the centre.

In Mr. Smith's system I can quite understand the reason of the increased rate at the sides on account of its being immediately above the 'fresh air channel'; proving thereby that the current which drives the wheel is caused solely by the air which is passing up the 'fresh air channel.'

There are yet other points which I should like explained. Referring to your article of March 16, I should like to know the 'natural laws' upon which this system is based? and how is the hot air, which is the weaker, supposed to be able to battle its way through the cold? What is the meaning of 'all being performed automatically by natural law'? What is the meaning of the following passage? 'Syphonic action is at work constantly, regu-

J. H.

listed by the requirements of the room. Thus, if one person only is in the apartment, sufficient fresh air is provided for him; if the number of occupants be multiplied, so the action increases; each person gets a proper supply, while the extractor is multiplied in its work in a similar ratio.

The construction I place on this is that if one person enters a room he brings in by some miraculous means sufficient air for his requirements, and that each successive person brings in the air he requires according to the time he is to remain in the room. Were this possible, it would be a most convenient arrangement, and would do away with one of the most serious difficulties in the way of ventilation; but until doors can be given the power of calculating, or each person is provided with an air-bag, I fear it cannot be.

Again, why should Mr. Smith's apparatus be imbued with reason more than any of the other exhausts invented, and be capable of exerting its energies according to the work required of it? If it be the case that it does so, Mr. Smith has proved that that which was considered inanimate is animate.

During the time that I was in the room, as further proof of the marvels performed by this apparatus, a series of gas-burners were lighted; and although the room is only about $15 \times 12 \times 10$, and the exhaust of a sufficient size for a room (according to Mr. Barnes Austin) $40 \times 40 \times 15$, the temperature increased at quite as rapid a rate as I have known it in rooms unventilated, and the air had as vitiated and exhausted a feel as in the most stuffy and unventilated drawing-room.

WALTER HENRY DRAKE,
Civil Engineer.

Bognor, April 10, 1885.

DRAINAGE VENTILATION.

Messrs. Sharp's system of 'house-drain ventilation' and illustrative diagram (No. 2) is nearly a facsimile of one I saw at the International Health Exhibition, hung up over Stand No. 468, Class 22, South Annexe. The only difference is that the anti-vacuum pipes to the closets are extended direct into the soil-pipe, which I think is a bad arrangement, as the soil passing from the upper closet is liable to choke them up. Secondly, a 'single' instead of a 'double' main trap. If sewer-gas is absorbed or driven by pressure into the house-drain, what becomes of the 'single' trap. It is immediately blown out, and sewer-gas passes freely into the system. Surely a trap that effectually keeps it out, which the 'double' trap does, is far preferable, never mind how complete a system of ventilation you have. With the exception of these two matters the diagram was exactly similar in principle, application, and illustration.

Bristol, March 27, 1885.

H. C. B.

THE VENTILATION OF HOUSE-DRAINS.

Upon reading Sharp & Co.'s illustrated paper upon a system of house-drainage ventilation in your issue of March 15, it struck me that sanitary schemes, like history, often repeat themselves. I suppose it can hardly be otherwise, for Solomon in his wisdom said there was nothing new under the sun; but although I claim, myself, to be the original inventor of the system illustrated in your paper, and shown as the double check system, I daresay if a search were made houses have been fitted in the same manner years and years ago; if so, I must content myself by claiming the merit of restoring a good system.

If your readers waded occasionally through the early numbers of the *Builder* paper, they would be surprised to find that many appliances—such as traps, single and double, air-pipes, syphonage, drain-ventilation, and other matters that are continually cropping up every day as novelties—have all appeared in that journal. The

Builders of 1846 and 1847 are especially interesting, and many of the papers that appeared in those years could hardly be better written in the present day; but we are so slow to learn, and so deficient in observation. Coming back to where I started, Messrs. E. & F. N. Spon published for me in 1876 a small book entitled 'An Architect's Letter about Sewer-gas and House-drainage,' which passed through two editions, but is now out of print, and a more full description has since been published, and I enclose copies, and if you compare them with Sharp & Co.'s drawings, you will see that the principle claimed is identical to that illustrated by me. I admit that, reading my book by the light of the present day, I find that it may have been better and more fully expressed; but the principle of a U-shaped arrangement is unmistakable, and this, taken with my letter in your issue of Jan. 15, page 338, will make very clear that the action in a downcast or soil-pipe has been anticipated, not only by my publication, but by actual examples in operation many years before my first book was published. Experience has proved that the system is not continuous, but intermittent.

Upon the principle of giving credit to whom credit is due, I trust you will find room for this letter.

Clifton, March 26, 1885.

HENRY MASTERS.

'A NEW DEPARTURE IN HOUSE-DRAINAGE'

I think Mr. Ebbetts, on p. 427, makes some mistakes. He refers to his article on p. 253 as a 'humble contribution.' I think he might with more truth have used another adjective. He also says I am the 'maker' of a certain trap. Now I am not the maker, but the patentee of it. Mr. Ebbetts, in trying to still hold forth his supposed 'new departure' as an original idea, discovered a few months since by himself, says that in cases he has inspected his new departure was only applied to the soil-pipe and not to the drain. But had he looked at my March 1883 drawing he would have seen that I illustrated the principle as applied to both drain and soil-pipe, and in the way he has done, only I prefer, when allowed to do so, to keep the waste-water pipes from sinks and basins apart from the soil-pipe. I here give a sketch of my

Ventilation with the Stream.

1883 drawing, which can be compared with Mr. Ebbetts on p. 253, when it will be seen that I showed how the fresh air could be carried down the soil-pipe and along the drain, and then up a special blow-off ventilating pipe led back from the house side of the interceptor trap, which pipe is surmounted by an exhaust ventilator, all as Mr. Ebbetts now also shows. I would not like, however, to mislead people by hinting that the water-traps at the closets and sinks, &c., are superfluous, as Mr. Ebbetts virtually does on p. 386, when he says, 'I was convinced that if the traps were emptied there would always be a current of air passing from the house down the waste-pipe.' Now, I am convinced that that idea is wrong, and Mr. Ebbetts has been misled by his experiments not being properly and more fully conducted.

Glasgow, March 31, 1885.

W. P. BUCHAN

THE DOGMATISM OF SANITARY REFORMERS.

The criticism of the Model By-laws under the above heading by Mr. Ebbetts on p. 397, although smart in some respects, is, on the whole, rather superficial. Laws have to do with generalities, and require to be dogmatic. 'Thou shalt not kill' is a law which all may be said to agree to—at least in a civilised country. Mr. Ebbetts, however, objects to this as being too dogmatic, on the plea that in certain exceptional circumstances it may be necessary to kill, and not be fairly unlawful so to do. The circumstances, however, require to be really exceptional, and so with Mr. Ebbetts' objection to the dogmatism of the Model By-laws in asserting or recommending that cisterns used for closets should not be also used as drinking-water cisterns.

To most sanitary plumbers Mr. Ebbetts' question 'whether it were not permissible to connect a valve water-closet direct from a drinking-water cistern?' would likely meet with a negative reply, as the expression 'valve water-closet' would generally call up the idea of a Bramah or some other water-closet, with a valve on its outlet, and with a valve inside the cistern for its supply. With this latter there is danger, as referred to in the Model By-laws, of bad air going up the service-pipe, and of water in the cistern being contaminated by water washed into it through the air-pipe when the valve is opened. There are thousands of various sorts of closets so fitted up throughout the kingdom. What Mr. Ebbetts meant by a valve water-closet was one with a cock below the seat, the service-pipe to which came from a cistern. In this special case there would not be the same chance, of course, as Mr. Ebbetts has explained, of bad air going up the service-pipe. There is still, however, the same risk of contamination from other causes connected with the use of water-closets, and one which in many cases is the most dangerous, viz., that the closet-cistern in one flat or house is often right underneath the closet above, and so is liable—as has happened in thousands of instances—to be fouled by the urine and feces from the closet above. People have so often unknowingly drunk this fouled water that the framers of the Model By-laws deserve our earnest thanks for a little extra precaution here, instead of the captious criticism awarded them by Mr. Ebbetts. For all he knows, this By-law he attempts to ridicule may have saved his own life. But ingratitude is as old as the hills.

W. P. BUCHAN.

PARKS AND OPEN SPACES.

** God Almighty first planted a garden, and indeed it is the purest of all pleasures.**

MISS DUTHIE, of Ruthrieston, who munificently gave the Duthie Park to Aberdeen at a cost of £60,000, died at the end of last month, and by her will bequeathed £2,000 towards the maintenance of the park, and £1,000 towards the formation of a carriage drive along the bank of the River Dee.

Considerable progress has been made by the Corporation of South Shields in laying out the Marine Park at the entrance to the River Tyne, which when completed will make this one of the most enjoyable and popular resorts on the north-east coast—a fact already appreciated by discriminating visitors. Few towns have made such a rapid extension in house-building as South Shields has done within the last few years, and happily convenience and taste has not been ruthlessly sacrificed to economical expediency. The business premises recently erected in the Queen Anne style at the corner of the Market Place and King Street, as well as others in the same street, may fairly challenge comparison for good workmanship and artistic taste in design with any similar buildings erected elsewhere in the kingdom.

The Corporation of Newcastle has formed a skating pond out of the old reservoir belonging to the water company, and situate on the Town Moor. The lake is pear-shape, and covers about 1½ acres.

SANITARY JOTTINGS.

YELLOW FEVER ON A WEAR STEAMER.—The screw-steamer *Rimpha*, of Sunderland, arrived in the Tyne on the 6th inst. The captain reports that yellow fever broke out on board during the outward voyage, resulting in six deaths. On arrival in the Tyne the vessel was boarded by the officers of the Port Sanitary Authority, who took possession of the clothes of the deceased men for the purpose of disinfection.

PENNY DINNERS.—The Rev. W. Moore Ede, the rector of Gateshead, has purchased the old Primitive Methodist Chapel in Nelson Street, Gateshead, with the intention of converting it into a cheap restaurant.

EXCESSIVE INFANTILE MORTALITY IN SUNDERLAND AND NEWCASTLE.—Considerable alarm is felt in both Sunderland and Newcastle at the continued spread of the epidemic of measles, which is now very prevalent in both these towns, particularly the former, where the death-rate for the past few weeks has exhibited a very high average, more than once reaching 40 in 1,000. The authorities are doing all they can to prevent the spread of the epidemic, but, unfortunately, their best efforts are too often thwarted by the gross ignorance or culpable neglect of parents, who persist in continuously and needlessly exposing their children to the risk of infection. The School Board cannot be held entirely blameless in the matter, as their earnest co-operation is necessary in support of remedial measures for the prevention of the spread of the disease. Unfortunately School Boards, as a rule, do not seem fully alive to their grave responsibility in these matters.

NOTICES OF MEETINGS.

THE PARKES MUSEUM,

74A Margaret Street, W.

SIR SPENCER WELLS, Bart., will deliver an address on 'Cremation,' at the Parkes Museum, on Thursday, April 23, at eight o'clock. The chair will be taken by the Right Hon. the Earl of Shaftesbury, K.G.

VACCINATION OFFICERS' ASSOCIATION.

THE next meeting of members of this Association will be held on Saturday, April 18, at 2.30 P.M., at the Charing Cross Hospital Medical School, 69 Chandos Street, Strand, W.C. Agenda. 1. To read minutes of last meeting. 2. Correspondence. 3. Report of committee. 4. Election of members and honorary members. 5. To consider the best means of securing the vaccination of children born in public institutions. 6. To discuss recent events in opposition to vaccination.

C. O. ELKERTON, Hon. Sec.

COMPETITIONS.

THE POLLUTION OF RIVERS.

THE Royal Academy of Sciences of Belgium has issued a notice with reference to an extraordinary competition for the year 1887. The Government has proposed, and the Chambers have adopted a law having for its object the preservation of fish and their restoration to the rivers. The main obstacle to this end is the pollution of the waters of small unnavigable streams by solid and liquid matter poured into them by various industries, which render them unfit for the breeding and existence of fish. The Academy, therefore, calls on science to aid the public authorities. One of its members has placed at its disposal the sum of 3,000 francs, which it has decided to spend in giving a prize for a thorough study of the following questions, at once biological and chemical: (1) What are the special substances in our principal industries which, when mingled with the water of small streams, render them incompatible with the existence of fish and unfit for the consumption of man and beast? (2) Investigation and indication of practical measures for purifying water as it leaves manufactories, so as to render it innocuous to fish without interfering with the industry, combining the expedients offered by decanting basins, filtering and chemical agents. (3) Separate experiments on the substances which in each special industry kill fish, and on the degree of resistance which each species of edible fish offers to this destruction. (4) A list of the rivers in Belgium which are actually depopulated by this state of things, with an indication of the special industries in these rivers, and a list of the edible fish which inhabited them before the establishment of the factories. If a memoir is judged satisfactory for the solution of the two first points, a prize of 1,000 francs will be given, even though the two latter questions are untouched. Papers should be legibly written, and should be addressed to M. Liagre, Perpetual Secretary, au Palais des Académies.

Brussels, before October 1, 1887. Quotations are to be made with great exactness, and authors should therefore mention the edition and page of works cited. A motto must be selected, and the names inclosed in a separate sealed envelope, with the motto superscribed. The papers sent in will remain in the archives of the Academy.

APPOINTMENTS.

MEDICAL OFFICERS OF HEALTH.

ANDERSON, William H., M.B.C.M.Univ.Glasg., has been re-appointed Medical Officer of Health for the Hoxne Rural Sanitary District, Suffolk, at £60 for one year.

BROWNE, George Henry, L.R.C.P.Edin., and L.M., L.F.P.S. Glasg., L.A.H.Dub., has been appointed Medical Officer of Health for the Brynmawr Urban Sanitary District, at £40 for one year, *vice* Skrimshire.

BYLES, Henry, M.B., C.M.Univ.Edin., has been appointed Medical Officer of Health for the Eccleshill Urban Sanitary District, Yorkshire, at £40 per annum for three years, *vice* Aston, resigned.

CARSON, Stewart, M.B., C.M.Univ.Edin., has been re-appointed Medical Officer of Health for the No. 1 Division of the Alston-with-Garrigill Rural Sanitary District, Cumberland, at £20 for one year.

COLLINGRIDGE, William, M.D., S.S.Cert.Cantab., has been re-appointed Medical Officer of Health for the London Port Sanitary District for the ensuing year.

COVERNTON, Charles James, L.R.C.P.Edin., M.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Knighton Urban Sanitary District, Radnorshire, at £20 for one year.

EATON, James William, L.R.C.P.Lond., M.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Bingham Rural Sanitary District, at £50 for one year.

FOSTER, Henry George, L.R.C.S.Eng., L.S.A.Lond., has been appointed Medical Officer of Health for the Giltcross Rural Sanitary District, Norfolk, at £40 per annum, *vice* Gurdon, resigned.

GARLICK, Edward William Bennett, L.R.C.P.Edin., M.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Cheshunt Urban Sanitary District, at £40 for one year.

HARDWICKE, Ernest Henry, L.R.C.P.Edin., and L.M., L.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Hospital for Infectious and Contagious Diseases of the Solihull Rural Sanitary Authority, Warwickshire, at £50 for one year.

HARPER, Robert, L.R.C.P.Edin., M.R.C.S.Eng., L.S.A.Lond., has been appointed Medical Officer of Health for the Holbeach Urban Sanitary District, at £15 for one year, *vice* Robert Russell Harper, L.R.C.P.Lond., M.R.C.S.Eng., L.S.A.Lond., resigned.

HERBERT, Johnson, L.R.C.P.Edin., L.R.C.S.Eng., has been appointed Medical Officer of Health for the Whitby Urban Sanitary District, at £25 per annum, and for the No. 1 Division of the Whitby Rural Sanitary District, at £35 per annum, *vice* John Taylerson, L.R.C.P.Edin., M.R.C.S.Eng., deceased.

HERRING, John Francis, L.R.C.P.Edin., L.R.C.S.Eng., S.S.Cert. Cantab., has been re-appointed Medical Officer of Health for the Bulth Rural Sanitary District, at £30 for one year.

JACKSON, Thomas, L.R.C.S.Eng., L.S.A.Lond., has been appointed Medical Officer of Health for the Holbeach division of the Holbeach Rural Sanitary District, Lincolnshire, at £20 for one year, *vice* Harper, resigned.

JONES, William Rees, M.B.C.M.Univ.Glasg., has been re-appointed Medical Officer of Health for the No. 2 division of the Brecknock Rural Sanitary District, at £40 for one year.

KENYON, George Arthur, M.B.Univ.Lond., L.R.C.P.Lond., M.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Chester Port Sanitary District, at £20 for one year.

MACKINTOSH, Angus, M.D.Univ.Glasg., L.F.P.S.Glasg., and L.M., has been re-appointed Medical Officer of Health for the Chesterfield Rural Sanitary District, at £40, and for the Newbold and Dunston Urban Sanitary District, at £36, and for the Dronfield Urban Sanitary District, at £20, all for one year.

MARSHALL, John Ingham Fearby, M.R.C.S.Eng., L.S.A.Lond., has been re-appointed Medical Officer of Health for the York Rural Sanitary District, at £80 for one year.

MASTERTON, John, M.B.Univ.Edin., L.R.C.P.Edin., L.R.C.S.Eng., has been appointed Medical Officer of Health for the No. 2 Division of the Alston-with-Garrigill Rural Sanitary District, at £20 for one year, *vice* Walker, whose appointment has expired.

MURPHY, William Ponsonby, L.R.C.S.Irel., and L.M., L.A.H.Dub., has been re-appointed Medical Officer of Health for the Wigton Rural Sanitary District, at £80 for one year.

NORMAN, John William, L.R.C.P.Edin., L.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Ross Urban Sanitary District, at £15 for one year.

PRIEST, James Damer, M.R.C.S.Eng., L.S.A.Lond., has been appointed Medical Officer of Health for the Waltham Holy Cross Urban Sanitary District, at the rate of £30 per annum, until Sept. 20 next, *vice* Arthur Priest, L.R.C.P.Edin., M.R.C.S.Eng., L.S.A.Lond., resigned.

REES, David Valentine, L.R.C.P.Lond., M.R.C.S.Eng., has been re-appointed Medical Officer of Health for the No. 1 division of the Brecknock Rural Sanitary District, at £40 for one year.

RENTON, William, L.R.C.P.Edin., L.R.C.S.Eng., L.S.A.Lond., has been re-appointed Medical Officer of Health for the Knarborough and Tentergate Urban Sanitary District, at £60 for one year.

ROBERTSON, John, M.D.Univ.Edin., L.R.C.S.Eng., and L.M., has been re-appointed Medical Officer of Health for the Cocke Rural and Urban Sanitary Districts, at £150 and £40 per annum.

SHADWELL, St. Clair Brockway, L.R.C.P.Lond., M.R.C.S.Eng., has been appointed Medical Officer of Health for the Wigton Urban Sanitary District, at £75 per annum, *vice* resigned.

SMITH, Mr. Edward James, Manager of the Bridlington Bank, the York City and County Banking Company, has been appointed Treasurer to the Bridlington Guardians and Rural Sanitary Authority, *vice* Harding, resigned.

SMITH, William John, L.R.C.P.Edin., and L.M., L.R.C.S.Eng., L.S.A.Lond., has been re-appointed Medical Officer of Health for the Rawmarsh Urban Sanitary District, Yorkshire, for one year.

VERITY, Abraham John, M.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Bridgend Urban Sanitary District, at £25 for one year.

WHITCOMBE, Philip, M.R.C.S.Eng., L.S.A.Lond., has been appointed Medical Officer to the London Port Sanitary Authority, Infectious Diseases Hospital, Gravesend, for the ensuing year.

WILLIAMS, James, F.R.C.S.Eng., has been re-appointed Medical Officer of Health for the No. 3 division of the Brecknock Rural Sanitary District, at £40 for one year.

WOTHERSPOON, Thomas Allan, M.D.Univ.Edin., L.R.C.S.Eng., has been re-appointed Medical Officer of Health for the Linton Rural Sanitary District, Cumberland, at £60 for one year.

YATES, James, M.R.C.S.Eng., L.S.A.Lond., has been re-appointed Medical Officer of Health for the Newcastle-under-Lyme Urban Sanitary District, at £40 for one year.

PUBLIC ANALYSTS.

ALLEN, Mr. A. H., has been re-appointed Public Analyst for the Borough of Sheffield for one year.

HEISCH, Mr. Charles, has been re-appointed Public Analyst for the Parish of St. John, Hampstead, at £50 for one year, *vice* analysis of Food or Drugs up to fifty, and 5s. each beyond 4s. for each analysis of Water.

SURVEYORS, CLERKS TO GUARDIANS, INSPECTORS OF NUISANCES, &c.

BARTLETT, Mr. Robert V. O., has been appointed Surveyor of Highways and Inspector of Nuisances for the Wilton Rural Sanitary District, at £105 and £60 per annum, *vice* Matthews.

BISHOP, Mr. William, has been re-appointed Inspector of Nuisances for the Elham Rural Sanitary District, Kent, at £10 per annum.

BLOOD, Mr. John, has been re-appointed Inspector of Nuisances for the Newcastle-under-Lyme Rural Sanitary District, at £10 per annum.

BOOR, Mr. G. C., has been elected a Member of the Horsey Board and Urban Sanitary Authority.

BOWEN, Mr. Edward Palmer, Bank Manager, has been appointed Treasurer to the Leominster Guardians and Rural Sanitary Authority, *vice* Daggs, deceased.

CHATHAM, Mr. John Parke, Solicitor, has been appointed Clerk to the Scolcoates Guardians and Rural Sanitary Authority, at £200 per annum as Clerk to the Guardians, £20 per annum as Clerk to the Rural Sanitary Authority, such remuneration as Clerk to the Assessment Committee and School Attendance Committee as may be fixed from time to time and fees as Superintendent Registrar of Births, &c., and £10 per annum, *vice* Mr. William Chatham, deceased.

COOPER, Mr. John Richmond, has been appointed Town Clerk to the Urban Sanitary Authority of Walsall, at £4 per annum, and £125 per annum for clerks, *vice* Wilkinson.

COWDEROY, Mr. John Tatem, has been appointed Inspector of Nuisances for the Kidderminster Urban Sanitary District, at £120 per annum from year to year, *vice* West.

CROSTHWAITE, Mr. Joseph, has been re-appointed Inspector of Nuisances for the Wigton Rural Sanitary District, at £10 per annum.

DARLINGTON, Mr. Ralph, Solicitor, has been appointed Town Clerk to the Urban Sanitary Authority of Wigan, at £10 per annum and costs out of pocket, with offices, *vice* resigned.

DAVY, Mr. John, has been re-appointed Inspector of Nuisances for the Hoxne Rural Sanitary District, Suffolk, at £60 for one year.

FISKE, Mr. William, Bank Manager, has been appointed Treasurer to the Chestport Local Board and Urban Sanitary Authority, at £100 per annum, *vice* resigned.

HARDACKER, Mr. Samuel, has been appointed Collector of Rates for the Eccleshill Local Board and Urban Sanitary Authority, at £100 per annum, *vice* Metcalfe, deceased.

HARPUR, Mr. S., who will resign as Surveyor to the Merthyr Local Board and Urban Sanitary Authority in June, has been appointed Consulting Engineer, at £150 for one year for date.

HARSTON, Mr. William, has been appointed Surveyor, Inspector of Nuisances, Collector, and Superintendent of the Cemetery, for the Guisborough Local Board and Urban Sanitary Authority, at £120 for one year, *vice* J. Hyslop and Metcalfe.

HARVEY, Mr. Thomas Fletcher, has been appointed Engineer and Surveyor to the Merthyr Tydfil Local Board and Urban Sanitary Authority, at £100 per annum, *vice* J. Hyslop and Metcalfe.

Authority, at £350 per annum, with the assistance of a book-keeper and the use of a horse, *vice* Harpur, resigned, and appointed Consulting Engineer.

CLMF, Mr. H., has been appointed Surveyor to the Workop Local Board and Urban Sanitary Authority, at £150 per annum, with office, *vice* Turnbull.

LIFFE, Mr. William, has been appointed Collector to the Swindon New Town Local Board and Urban Sanitary Authority, at £100 per annum, *vice* Mr. John William Jolliffe, deceased.

ARSDEN, Mr. Henry, has been appointed Surveyor and Inspector of Nuisances to the Sowerby Local Board and Urban Sanitary Authority, Yorkshire, *vice* Lumb, resigned.

ASON, Mr. William, has been appointed Surveyor and Collector to the newly-formed Ambleside Local Board and Urban Sanitary Authority, at £31 per annum.

ILES, Mr. Edward Lomas, has been appointed Surveyor to the Belgrave Local Board and Urban Sanitary Authority, at £75 per annum, *vice* Draper, resigned.

ALDER, Mr. George Bellamy, Solicitor, has been appointed Town Clerk and Clerk to the Urban Sanitary Authority of Huddersfield, at £800 per annum, clear, with offices and clerks, *vice* Batley, deceased.

IBORNE, Mr. William Robert, has been appointed Surveyor of Highways for the No. 2 Division of the Elham Rural Sanitary District, Kent, at £90 per annum.

ARKER, Mr. John, has been re-appointed Inspector of Nuisances for the Birmingham Urban Sanitary District, at £200 per annum.

ERICVAL, Mr. James, has been appointed Inspector of Nuisances for the Runcorn Urban Sanitary District, at £100 for one year, *vice* Barker.

EAY, Mr. James, has been re-appointed Inspector of Nuisances for the Brampton Rural Sanitary District, Cumberland, at £40 for one year.

RES, Mr. Thomas, has been re-appointed Inspector of Nuisances for the Guildford Rural Sanitary District, at £130 for one year.

TEEN, Mr. William, has been appointed Collector to the Northfleet Local Board and Urban Sanitary Authority, at 5d. in the pound commission, *vice* Sunnucks, resigned.

EMPMON, Mr. John, jun., has been appointed Surveyor to the Matlock Local Board and Urban Sanitary Authority, at £100 per annum, *vice* Bourne, appointed Surveyor and Inspector of Nuisances to the Shepton Mallet Local Board and Urban Sanitary Authority.

MALLWOOD, Mr. George, has been re-appointed Inspector of Nuisances for the York Rural Sanitary District, at £120 for one year.

NOWDEN, Mr. David, has been re-appointed Collector to the Louth Town Council and Urban Sanitary Authority, at 4d. in the pound commission.

TEPHENS, Mr. John T., has been re-appointed Inspector of Nuisances for the Leominster Rural Sanitary District, at £70 for one year.

THOMAS, Mr. Thomas Lloyd, has been appointed Inspector of Nuisances for the Builth Rural Sanitary District, at £25 for one year.

WOPF, Mr. Septimus James, Solicitor, has been appointed Town Clerk and Clerk to the Urban Sanitary Authority of Bury, Lancashire, at £400 per annum, with offices and clerks, *vice* Bull, resigned.

ALTON, Mr. Joseph, has been re-appointed Inspector of Nuisances for the Alston-with-Garrigill Rural Sanitary District, Cumberland, at £20 for one year.

AYE, Mr. Henry, has been re-appointed Inspector of Nuisances for the Millom Urban Sanitary District, at £80 for one year.

YELLER, Mr. Harry Wray, has been appointed Sanitary Surveyor and Inspector of Nuisances for the Chesterfield Rural Sanitary District, at £150 per annum, from year to year, *vice* Butterworth, resigned.

HARTON, Mr. Hugh, has been re-appointed Inspector of Nuisances for the Chester Port Sanitary District, at £10 for one year.

ILKINSON, Mr. John, has been appointed an Assistant Inspector of Nuisances for the Blackpool Urban Sanitary District, at £60 per annum.

ILKINSON, Mr. Samuel, upon resigning as Town Clerk and Clerk to the Urban Sanitary Authority of Walsall, has been appointed Legal Adviser, at £200 per annum.

ILLIAMS, Mr. Evan, has been re-appointed Inspector of Nuisances for the Bridgend Urban Sanitary District, at £30 for one year.

COLLETT, Mr. George, has been appointed Surveyor of Highways for the No. 1 Division of the Elham Rural Sanitary District, at £110 per annum.

RIGHT, Mr. John Wilkinson, has been re-appointed Inspector of Nuisances for the Bingham Rural Sanitary District, at £70 for one year.

VACANCIES.

MEDICAL OFFICER OF HEALTH AND EXAMINER OF GAS for the Parish of St. Pancras, Middlesex: £300 per annum. Application, 16th inst., to T. E. Gibb, Vestry Clerk, Pancras Road.

MEDICAL OFFICER OF HEALTH for the Portsmouth Urban Sanitary District. Application to Alexander Hellard, Town Clerk.

MEDICAL OFFICER OF HEALTH for the Mutford and Lotherland Rural Sanitary District, Suffolk: £50 per annum. Application to T. S. Allerton, Clerk to the Authority, Lowestoft.

PUBLIC ANALYST for the Borough of Nottingham. Application to Samuel G. Johnson, Town Clerk.

CLERK to the Pudsey Local Board and Urban Sanitary Authority. Application, stating salary required, 20th inst., to J. A. Lawson, Clerk.

SURVEYOR for the East Kensington District, under the Metropolitan Building Act, 1885. Application, 22nd inst., to J. E. Wakefield, Clerk to the Metropolitan Board of Works, Spring Gardens.

SURVEYOR AND WATER WORKS MANAGER to the Frome Local Board and Urban Sanitary Authority. Application to G. W. Bradbury, Clerk.

SURVEYOR to the Longwood Local Board and Urban Sanitary Authority. Application to W. H. Taylor, Clerk, Golcar, near Huddersfield.

SURVEYOR to the Broadstairs and St. Peter's Local Board and Urban Sanitary Authority. Application to W. S. Barwick, Clerk.

REPORTS OF PUBLIC ANALYSTS.

MR. OTTO HEHNER, the Public Analyst for the Southern Division of the county of Derby, in his last quarterly report stated that the total number of samples analysed during the quarter was nineteen, viz., seventeen of milk, one of butter, and one of coffee. The number of samples adulterated was four, viz., three of milk and one of butter. Mr. A. H. Allen, for the Northern District, reported on sixteen samples. Of two of butter, one was genuine, while the other consisted of butterine. A sample of coffee was found to consist of a mixture of coffee and chicory. A specimen of gin proved to be adulterated with water. Of three samples of milk two were adulterated with water, while one was of suspiciously poor quality, but scarcely bad enough to justify its condemnation as adulterated.

Mr. T. A. Pooley, the Public Analyst for Essex, in his report for the last quarter, stated that during the past three months ninety-eight samples of food and drugs had been submitted to him for analysis by the following persons:—Inspectors in the fourteen districts of the county, fifty-nine samples; inspector Metropolitan Police District, thirty-eight; private individual, one; total, ninety-eight. There was a very considerable diminution in the number of cases of adulteration. Of the ninety-eight samples analysed only thirteen were adulterated—viz., twelve of milk and one of gin. The percentage of adulterated samples had thus fallen to the lowest point Mr. Pooley had yet had to record, a satisfactory result no doubt largely due to the persistent purchase of samples by the respective district inspectors. The rural districts of the county now appeared to be almost free from adulteration, but in the metropolitan district a very large proportion of the milks tested (twelve in thirty-eight) were found to be diluted with water.

Mr. W. W. Fisher, the Public Analyst for Oxfordshire, in his report for the last quarter stated that he had analysed twelve samples of bread, three of lard, and one of coffee, in all sixteen samples, which were brought to him by the Inspector of the Headington Rural Sanitary Authority. Five samples of bread were found to contain alum in proportions varying from 25 to 40 grains per 4 lb. loaf. The specimens of lard were all pure, but the coffee contained 40 per cent. of chicory. He had examined eight samples of well water from localities within the county, of which three were unfit for use as drinking water. Two specimens of wall paper sent to him for analysis were found to contain considerable quantities of arsenic.

LOCAL INTELLIGENCE.

THE Rawmarsh Local Board and Urban Sanitary Authority appointed Mr. James Whitehead, jun., Inspector of Nuisances, *vice* Train, resigned (see SANITARY RECORD for Aug. 15, 1883, p. 96), and re-appointed him for one year in June 1884 (see page 619); but it appears that the Local Government Board did not confirm either appointment; and they have now written to the Authority stating that as they had decided that Mr. George Train had been appointed for the three years ending March 1885, no one else could be elected until after the date named, and they could not, therefore, sanction the repayment of any portion of his salary out of the Parliamentary grant for the half-year ending Michaelmas last.

The Torrington Town Council and Urban Sanitary Authority have increased the salary of the Surveyor £30 per annum.

At the meeting of the Carmarthen Guardians and Rural Sanitary Authority on March 21, Mr. J. Hughes in the chair, a solid silver salver and an illuminated address were presented to Mr. John Lewis Phillips, upon his resigning as chairman, each bearing the following inscription:—Presented to J. L. Phillips, Esq., of Bolahaul, late chairman of the Carmarthen Board of Guardians, on his resignation of that office, by his fellow-guardians and other friends, in recognition of the assiduity, ability, and courtesy with which he conducted the proceedings of the Board for twenty-three years.

The Westbury-on-Severn Guardians and Rural Sanitary Authority, at their meeting on March 24, upon the motion of the vice-chairman, seconded by Sir T. Crawley Boevey, passed the following resolution unanimously:—“That this Board, having heard with great regret, the announcement of Major Probyn that, as his residence in the county is about to cease, he will be unable to continue the chairmanship of the Board, to which he has been successively elected during the past ten years, begs to record its sense of the patience, courtesy, and ability with which he has uniformly conducted the business of its meetings during his term of office; and further, that the above resolution be entered on the minutes of the proceedings of the Board.”

The Llandysilio or Menai Bridge Local Board and Urban Sanitary Authority have increased the salary of Mr. Thomas Hughes, their clerk, from £40 to £60 per annum, upon the understanding that he takes charge of the Water-works.

The Leominster Guardians and Rural Sanitary Authority, at their meeting on the 3rd inst., passed the following resolution unanimously: 'That a vote of thanks be given to Dr. Sandford, as Medical Officer of Health for the past twelve years, in recognition of the valuable services rendered by him in the reduction of the death rate in this and other authorities in the county.'

The Port of London Sanitary Committee entertained the Lord Mayor and Sheriffs, and a numerous company at dinner on March 24, Mr. W. A. Plunkett, the chairman of the current year, presiding, after which Mr. Washington Lyon, the late chairman, was presented with a silver incense box and dish, contributed for by the members of the committee, as a small token of esteem, and approval of the manner in which he had discharged the duties of his office.

We reported the position of the apparently interminable discussion as to the salary of Dr. Mackintosh, Medical Officer of Health for the Chesterfield Rural Sanitary District, in page 392. At a subsequent meeting a letter was read from the Local Government Board, adhering to their previous decision not to recommend the repayment by the Treasury of half the salary if it were reduced below £400. It was then agreed to adjourn the matter until the next meeting, and the clerk was instructed to write to the various Local Boards in the district to ascertain whether they would be willing to appoint the same gentleman as the authority, so as to make his total salary £350 (£200 from the Authority, and £150 from the Local Boards). One of them, the Dronfield Local Board and Urban Sanitary Authority, promptly put their veto on the proposal, for at their meeting on March 11, upon the reading of the letter from the clerk to the Chesterfield Rural Sanitary Authority, they unanimously condemned the action taken by the Chesterfield Rural Sanitary Authority, as Dr. Mackintosh had discharged the duties of medical officer of health in the most efficient and satisfactory manner. The result of such interference, and the appointment of another officer, would be, if sanctioned, as requested, a considerable increase in the amount paid by the Board towards the medical officer of health's salary. It was resolved: 'That the Clerk of the Board inform the Rural Sanitary Authority that the Board unanimously declined to sanction the appointment of another medical officer of health in place of Dr. Mackintosh, and greatly regretted the action they had taken in the matter.' The other Urban Sanitary Authorities also deprecated the action of the Rural Sanitary Authority, the result being that Dr. Mackintosh has now been re-appointed by the Chesterfield Rural, and the Newbold and Dunston and Dronfield Urban, Sanitary Authorities for one year, as reported in another column. The Whitlington appointment will not expire until June next, the Brampton and Walton until March 1886, and the Clay Lane until April 1886.

The Northfleet Local Board and Urban Sanitary Authority have increased the salary of Mr. S. Honeycombe, the Surveyor, to £150 per annum, and that of Dr. John E. Crook, the Medical Officer of Health, to £50 per annum (from £30).

The Sevenoaks Local Board and Urban Sanitary Authority have increased the salary of Mr. Amos Pett, the Collector, from £60 to £70 per annum.

The West Worthing Improvement Commissioners and Urban Sanitary Authority have increased the salary of Mr. W. W. Smith, the Clerk, from £50 to £100 per annum, in consequence of the great increase of his duties, as evidenced by the fact of the rateable value of the district having more than doubled since his appointment in 1876.

A deputation from Churwell, representing ratepayers and owners, waited upon the Town Council and Urban Sanitary Authority of Leeds at their Quarterly Meeting on the 1st instant, in support of an application already made, asking if the Corporation would be willing to incorporate the township of Churwell as a portion of the borough, and, if so, on what terms. The deputation comprised Mr. Benjamin Keightley, the chairman, Mr. Gill Armitage and Mr. John Walker Wood, members, and Mr. Steward, clerk, of the Churwell Local Board, and Mr. John Burton and Mr. William Cheesborough, representing the ratepayers. On the motion of Alderman Ensley, the question was referred to the Parliamentary Committee.

Mr. Arthur Birks, the Chairman of the Feeton Local Board and Urban Sanitary Authority, stated, at the meeting on Tuesday, the 31st ult., that he should like to leave behind him some memento of his connection with the Authority, upon the expiration of his three years as Member, and begged their acceptance of a flag and flag-staff. He was thanked for his offer, which was accepted, and the Surveyor was instructed to make arrangements for the fixing of the flag-staff on the Public Hall.

The Warrington Guardians and Rural Sanitary Authority have been invested with the rights, powers, &c., of an Urban Sanitary Authority under Sects. 157 & 158 of the Public Health Act, within the contributory places of Rixton-with-Glazebrook, and Cuedley. The Order is to come into operation on the 21st inst.

At a special meeting of the New Swindon Local Board and Urban Sanitary Authority on the 28th ult., to appoint a Summoning Officer in the place of Mr. James Copleston Townsend who had died suddenly, Mr. James Holden, the Chairman, said he thought that before proceeding to business he should be consulting the wishes of every member by proposing the following resolution: 'This Board desires to record its sense of the loss it has sustained by the death of Mr. J. C. Townsend, who has, from the formation of the Board, acted as Clerk and Legal Adviser, and to express its profound sympathy with Mrs. Townsend and the members of the family.' The resolution, being formally seconded, was carried unanimously, and a copy of it was directed to be sent to Mrs. Townsend.

NOTES AND QUERIES.

Having for some time back been in the receipt of Queries relating strictly to sanitary work, and which it would be easy to answer without having to refer our correspondent to competent professional advisers, we have opened a column in which to register such Queries. Replies thereto as can fairly be expected from us, and our subscribers and readers are invited to make such use of this column as will benefit themselves and the community. Both Queries and Replies, however, be subjected, if unnecessarily long, to a strict censure.

146. REPRESSION OF ADULTERATION BY LOCAL AUTHORITIES.

The Local Government Board have recently issued a circular to local authorities to procure samples for analysis under the Food and Drugs Act. Will you kindly answer the following questions which arise on that circular: 1. Can a local authority appoint a police constable, under section 21 of the Act, to procure samples for analysis at his discretion, or must he in a separate case obtain the directions of the local board? 2. An inspector of nuisances, under the General Order of March 1880, can procure samples, must his directions from the local authority be renewed in each case, or can the authority authorise him to act whenever he suspects adulteration? ANSWERS. [A general authority appears to be sufficient in the first case, in the second special directions must be sought for before an inspector can take action.—Ed.]

147. DEFINITION OF NEW BUILDING.

Please advise whether in the circumstances stated, a re-erected building can properly be regarded as a new building subject to the provisions of the by-laws framed on the model of the Local Government Board. The same person is owner of two adjoining houses. One has pulled down one of the houses to the ground, the part between the houses being left standing. On the site he has built a new house, but, on the ground that the party wall was part of the old house pulled down, he has objected to be under the by-laws relating only to new houses. He made a communication to the local authority, and alleged that the new building was merely an addition to the former, but has now set the local authority to a separate tenant. The sanitary authority have insisted that the new house was a new house within the Public Health Act, and require him to comply with the by-laws. Are they within their power in compelling the owner to alter it so as to comply with the by-laws? ANSWERS. [Yes. The new building is clearly subject to the by-laws. The fact that there is a mode of communication between it and the old building is not sufficient to exempt it from the operation of the by-laws.—Ed.]

148. DEFINITION OF ANNUAL VALUE.

Please give your judgment as to the proper definition of the 'annual value' in sections 68 & 109 of the Waterworks (Clayton) Act of 1847. ANSWERS. [In attempting to answer this question, some allowance must be made for the wording of the local Act or provisional order relating to the water undertaking in the particular district. It is commonly found that the Act or order specifies a particular standard. In the celebrated struggle of Mr. Dobbs at the Grand Junction Waterworks Company the House of Lords down that the phrase 'annual value' in that company's private Act meant what it was defined to mean in the Parochial Assessment Act (6 & 7 Wm. IV., cap. 96), viz., 'the rent at which the premises might reasonably be expected to let from year to year, free from usual tenant's rates and taxes and tithe commutation rent-charge, and deducting therefrom the probable average annual cost of the repairs, insurance, and other expenses, if any, necessary to maintain them in a state to command such rent.' Although decision governs only the charges of one particular company, it is taken to have universal application. In the Public Health Act 1875, Section 56, the difficulty is got over by assessing the rate on the 'net annual value,' which is defined by Section 4 of the Parochial Assessment Act above quoted.—Ed.]

149. HOSPITAL PROVISION BY LOCAL AUTHORITIES.

Section 131 of the Public Health Act, 1875, gives power to local authorities to 'provide for the use of the inhabitants of their hospitals or temporary places for the reception of the sick. Could an authority lawfully provide and maintain a general infectious hospital under the powers of this section? ANSWERS. [Section 131 is one of a number coming under the general title 'Infectious Diseases and Hospitals,' and would seem, therefore, to apply to infectious hospitals only. But we rather think it is the authority of a town in Lancashire, where a good many are run by workpeople in factories, has provided an accident hospital out of the rates under the powers of this section, and we have heard of the legality of that act being questioned.—Ed.]

150. THE POLLUTION OF RIVERS.

Can you refer me to any source where I can read the full of medical evidence given at the late trial against the Local Board for pollution of a lake or stream? This case is important in a sanitary point, and the evidence given in the papers was very much condensed. ANSWERS. [We do not think the evidence was anywhere reported. No doubt a short-hand note was taken, and the reporter probably agree to publish it, if he thought the public was interested.—Ed.]

ORIGINAL PAPERS.

THE REPORT OF
THE ROYAL COMMISSION ON THE
HOUSING OF THE POOR.

A long-expected, greatly-canvassed, and much-accounted report of the Royal Commission appointed by Her Majesty to inquire into the Housing of the Working Classes, has at length been given to the world. It is a document of profound and pathetic interest. If it is possible to imagine anybody in these latter days coming to the consideration of the dwellings' problem with an absolutely fresh and uninstructed mind, the perusal of this report would infallibly disturb the nervous centres of such a one to an unexpected and even painful extent. If it unfortunately happens that such of the community as had not been already acclimatised by official or philanthropic intermingling with the poor, at their susceptibility to heart-flutters over this question during the great epidemic of popular notion that swept over the country when the 'sister cry' made itself articulate in the autumn of 1833. If the present report, signed by some of the ghost-born and clearest-headed in the land, could have taken the place of Mr. Mearns' discursive pamphlet and Mr. Sims' sensational descriptions, as a spark that kindled the flame of national anger, it might by this time have been well on the way towards drastic and organic reforms. The flame is now gone out, however. It will be difficult to light it, impossible to make it blaze again with equal fury. The report of the Royal Commission, arriving at the present juncture, when the fickle public have other things to pre-occupy their vagrant minds, will, of course, be received with a certain morose distaste, as revealing a state of things pitiable and shocking; but we much fear that it will not sear, as it ought to do, the conscience of the nation, and rouse it to a determination that, at whatever cost, this plague-spot shall be rooted out of our midst.

Motive Power wanted rather than Legislation.—Are it not for the respect that we owe to the eminent men who compose the Royal Commission, might we feel disposed to sum up their report in a single sentence of their own using:—'The Commissioners are of opinion that there has been failure of administration rather than in legislation; what at present time is specially required is some motive power.' This is the key-note of the report. But what is to get the motive power? Here the Commissioners are not so helpful as they might be, contenting themselves with the trite remark that 'probably there can be no stronger motive power than public opinion.' And as to public opinion we must wait for the creation of a healthy activity in this matter, it will be necessary to educate it by referring in detail to the Commissioners' recommendations. We pass over the sketch of the existing law on the subject that monopolises the first few pages of the report, which to our mind is inferior to our own summary printed in the SANITARY RECORD of 15, 1884.* And for much the same reason, that we have ample materials of the kind in our own times, we treat very briefly the descriptions given of the actual state of things existing as to the dwellings of the poor. It is useful, however, to have this

solemn and official confirmation, under the hand of men of the highest eminence and undoubted integrity, of facts which at the time of their first telling were denounced by the unbelieving public as lurid and distorted phantoms of the imagination. No one can in the future plead ignorance of how the poor live, for lack of unbiassed and trustworthy information on the subject. There is enough in the report to condemn every one of us for shameful indolence and laxity in letting things drift until they have reached their present acute stage of misery and disgrace. Let us hope that the bottom has now been reached, and that our public men will find it impossible to relegate this report to the dusty shelf on which repose in undisturbed slumber the recommendations of commissions and committees on a hundred other subjects. Here, however, is a matter which affects the new electors to a very personal and immediate degree, and if they do wisely, they will make the proper housing of the poor a hustings question, to which no Parliamentary candidate, charm he never so wisely, can escape committing himself.

Causes of Overcrowding and Insanitary Conditions.—The central point upon which most of the evidence turned was, of course, overcrowding. But overcrowding is in reality an effect, and not a cause. Lord Shaftesbury, with his unequalled experience of sixty years, declared that, however great the improvement of the poor had been in other respects, 'the overcrowding has become more serious than it ever was.' (See SANITARY RECORD, page 389.) But why? For the reasons amongst others that rents are high, that wages are precarious, that workers must live near their work, that reckless demolitions of poor houses have been made for municipal and railway 'improvements'; that the houses are in the hands of rapacious and unscrupulous middle men, and that local authorities are inert and careless. The consequences of this complication of disasters are not only overcrowding, but bad drainage, imperfect closet accommodation, polluted water supply, filth of person and of habitation, sickness, depression of spirits, intemperance, immorality, and their congeners. All this is thoroughly well recognised and understood by our readers. Let us therefore turn to the recommendations which the Commissioners make for removing all these dangers from the community.

By-laws as to Houses Let in Lodgings.—Sect. 35 of the Sanitary Act of 1866, giving power to sanitary authorities under certain conditions to make by-laws as to houses let in lodgings, has admittedly been more honoured in the breach than in the observance. One vestry clerk probably spoke the mind of many of his fellows when he said that his vestry 'had never turned their attention to the 35th section of the Sanitary Act. Of course it was amongst the Acts in the office, but they had never turned their attention to it, and consequently had never considered the effect of a particular clause' (Q. 17,483). One reason for the little use that has been made of the clause is the necessity for applying to the Local Government Board for an order to put it in force. The Commissioners, in recommending that the metropolitan authorities which have not already made and enforced by-laws should proceed to do so (the Local Government Board having of its own motion declared the clause in force throughout the metropolis at the end of 1883), suggest also that all urban authorities should be empowered to make

* Vol. XX, p. 437.

by-laws without any previous action at Whitehall. The Commissioners are not very sanguine about this recommendation, however, for they remark that 'it is not likely that such action will be taken until the people show a more active interest in the management of their local affairs.'

Consolidation and Amendment of Sanitary Acts.—The Commissioners observe that 'if efforts have been made in Parliament to improve the dwellings of the poor, the result has been to make knowledge as to the remedies for the evils attainable only by a very difficult and elaborate study. . . . It is not surprising that local authorities, who have sometimes strong motives for inaction, should plead their want of knowledge as an excuse for not putting in force the powers that they possess.' Mr. Boodle, the agent for the Duke of Westminster and the Marquis of Northampton, and a solicitor of great experience, said of the Sanitary and Artisans' Dwellings Acts that 'they were almost as complicated as the Church Buildings Acts, which nobody has as yet understood!' Accordingly a consolidation of the sanitary laws of the metropolis is recommended. If such consolidation were to be undertaken, provision should be made for the general erection of mortuaries. In the event of a death from infectious disease, and in cases where the body lies in a room used by other persons, removal to the mortuary should take place at once. The Commissioners recognise, however, that there would be great difficulty in carrying out an absolute rule in such cases which would interfere with the habits and feelings of the people. The provisions of the Acts should be also amended with a view to securing in future dwellings in the metropolis greater height above the level of the street and larger areas in front of the windows of all cellar dwellings. It is recommended that the duty of discovering and reporting illegally inhabited cellars should be taken away from the district surveyors of the Metropolitan Board of Works, upon whom it has been improperly thrown, and should be placed in the hands of the inspectors of the local sanitary authority.

Building By-laws.—Upon the question of the amendments as to height of buildings and open spaces about buildings, which are desirable and practicable in the Metropolitan Management Amendment Act of 1862, and the Metropolitan Building (Amendment) Act of 1878, the Commissioners recommend:—

(a) That upon the lines of the existing enactments in the Acts of 1862 and 1878 rules of more general application be framed to control the height of buildings in relation to the open space which should be required to be provided in front of the buildings, either in the form of land exclusively belonging to each building and kept free from erections or in the form of an adjoining street;

(b) That in the rear of every new dwelling-house or other building to be controlled by rules ordinarily applicable to dwelling-houses, and whether in old or in new streets, there be provided a proportionate extent of space exclusively belonging to the dwelling-house or building; that this space be free from erections from the ground level upwards; that it extend laterally throughout the entire width of the dwelling-house or building; that for the distance across the space from the building to the boundary of adjoining premises a minimum be prescribed; and that this minimum increase with the height of the dwelling-house or building.

Sanitary Inspection and Sanitary Staff.—All these improvements in Acts of Parliament without a sanitary staff to work them and see that they are carried

out, would be of no avail. Accordingly, the commissioners recommend that—

Advice should be given to metropolitan sanitary ties to increase in some cases their staff of inspectors in all cases to select persons acquainted with the principles of sanitation and of building construction. While impressed with the importance of this, they are prepared to recommend so centralising a measure of appointment of such inspectors by the Local Government Board, but they are of opinion that the Local Government Board might, pending future legislation with reference to London government, be provisionally entrusted with the appointments of inspectors.

Another important point is concerning the duties of medical officers, their residence within the parishes of their districts, and the devotion of their whole time to their official work. In some of the worst quarters of London the medical officers in a distant part of the town; and in very many cases they are allowed to continue in private practice. Both these arrangements the Commissioners regard as mischievous; but, at the same time, looking to the excellent work which in some parishes has been performed by medical officers of health who have had private practice, they do not recommend the imposition of a positive restriction by law. They recommend, however, that the residence of medical officers in their districts, or within a mile of their parishes, should be made compulsory, and that the sanitary authorities should be advised to stipulate, as far as possible, that the medical officers should devote their whole time to their official duties.

The Artisans' Dwellings Acts.—The question of the borderland of action between the Metropolitan Board of Works and vestries and district boards is stated to require immediate attention with reference to the carrying out of the various Artisans' and Labourers' Dwellings Acts. Places notorious for the prevalence of these dwellings remain so because each authority maintains its own ground, and the other ought to deal with them, the real question being whether the improvement acknowledged necessary ought to be carried out at the expense of the metropolis or of the immediate locality.

To prevent the continuance of this state of things the Commissioners suggest that in all those cases where the question has been passed over by either the Metropolitan Board of Works or the vestries and district boards on the one hand or the vestries and district boards on the other, the ground that the other authority ought to deal with them, the Government should appoint an arbitrator to decide under which set of Acts the case should fall. It is suggested that the expense ought to be divided between the local authority and the Metropolitan Board, and should be given to him by law to recommend in his report a division of the burden, and to report accordingly to the Home Secretary, who should lay the report before the House of Commons.

In cases where a local authority neglects to proceed with a scheme under Cross's Acts, they recommend that in the case of the metropolis, the Secretary of State should be empowered, if after inquiry and satisfaction that the local authority ought to exercise their powers in respect of the area to which the official representation relates, to make an order requiring the local authority to discharge their duty in the matter, and that if such order is not complied with, it should be enforceable by an order of the High Court of Justice.

With regard to Sect. 13 of Mr. Torrens' Act of 1868, which empowers the central authority to obtain representations by householders to direct

authority to proceed under the powers of Mr. Torrens' Acts, and provides that such direction shall be binding, the Commissioners recommend that this provision should extend to 'obstructive buildings' as well as to premises which are in a condition dangerous to health so as to be unfit for human habitation, and that any such direction by the Secretary of State in the metropolis shall be enforceable by the High Court.

They also recommend the repeal of Sect. 5 of the Artisans' and Labourers' Act Amendment Act of 1879 (42 & 43 Vict., cap. 64), which provides that an owner who has been required to execute works in order to put his premises into proper sanitary condition or to demolish premises may require the local authority to purchase such premises, as it puts a premium upon neglect of duty by the owner.

Local Government of the Metropolis.—The Commissioners remark that it is evident that the remedies which legislation has provided for sanitary evils have been imperfectly applied in the metropolis, and that this failure has been due to the negligence, in many cases, of the existing local authorities. 'It does not appear that more satisfactory action on their part can be secured without reform in the local administration of London.'

With the view of bringing specially under public attention the sanitary condition of the different districts in the metropolis, the Commissioners recommend that the Secretary of State should be empowered to appoint one or more competent persons for the purpose of inquiring as to the immediate sanitary requirements of each district, having regard to the several powers intrusted to the local authority, whether the Metropolitan Board of Works, or the vestry or district board; that the local authority should be empowered to nominate members of their own body to act with the officers so appointed, and that the reports of the result of such inquiries by the officers appointed should be transmitted to the local authorities, and should also be laid before Parliament.

This appears to us the most stupid and unworkable of all the Commissioners' proposals. The healthy public opinion which is to act as the motive power is not likely to be stimulated by a device of this sort.

Removal of Prisons.—A great deal of the overcrowding and other evils found in the housing of the working classes in the worst districts of London is owing to insufficiency of accommodation in those parts of the town where the demand for dwellings is greatest. Such districts are so densely built over that there is no probability of finding space, save by the removal of existing buildings. Now, as Mr. Torrens astutely pointed out some time ago, Her Majesty's prisons occupy no less than 45 acres in the metropolitan district, some of the establishments, Coldbath Fields, Pentonville, and Millbank, being in the most densely populated districts. The Commissioners suggest, therefore, that the sites now occupied by Millbank, Coldbath Fields, and Pentonville Prisons should be conveyed to the Metropolitan Board of Works, in trust for the benefit of those portions of the town which are most overcrowded.

In fixing the price at which the sites should be so conveyed, due regard should be had to the purposes for which they are so required. To carry into effect the object of securing additional land where most required in the metropolis for building room for workmen's dwellings and for open spaces connected therewith, power should be given, previous to their acquisition by the Metropolitan Board of Works, to sell or exchange, with the approval of

the Home Office, any portion of the sites referred to, that the areas obtained instead should be devoted in proportions, to be fixed by the confirming authority, to these uses and to no other.

Loans for Artisans' Dwellings from the Treasury.—There is a good deal of special pleading in this part of the report, and the probable loss to the Treasury of advancing money for artisans' dwellings at lower rates of interest is discussed at length.

The general principle the Commissioners lay down is that the State should lend at the lowest rate possible without loss to the national exchequer, and that in making the necessary calculations ancient losses should not be brought into account. In the case of public bodies, where the security of local public income in addition to that of land and buildings can be given, a scale lower than the present one might, they think, be established. Where, after investigation, the security appeared complete, this rate might be a reduction of $\frac{1}{2}$ on the $3\frac{1}{2}$ per cent. which at present forms the lowest charge, inasmuch as the rate of $3\frac{1}{2}$ per cent. apparently would cover expenses and leave a small margin. They are of opinion that the prolongation of the term of repayment and the readoption of the mode of repayment by way of annuity would still more facilitate borrowing, especially by the smaller corporations.

Municipal Provision of Workmen's Dwellings.—

What is, perhaps, the most important recommendation of all is wrapped up in ambiguous language which diverts attention from its significance. It happens that the first Artisans' Dwellings Act ever passed—the Labouring Classes Lodging-houses Act of 1851—contained clauses which enable the Commissioners, by a skilful use of proposed amendments to that Act, to recommend the provision by the municipality of proper houses for the poor at the charge of the ratepayers. This is, we are convinced, the only way of dealing with the dwellings problem in the case of the abject poor. Lord Shaftesbury had, in 1851, the phenomenal gratification of personally conducting this Bill through both Houses of Parliament. It has been an absolute dead letter ever since; partly because its very existence was generally unsuspected, and partly because its elaborate procedure, needful in those early days of sanitary reform, is now unnecessarily cumbrous and troublesome. But in this Act are powers for local commissioners to borrow money on the mortgage of the rates for the erection, purchase, or lease of lodging-houses for the working classes, to be managed under local by-laws which may, among other things, fix the rent. The Royal Commissioners recommend that a trial should be given to this Act, if amended in certain respects to make it effective. They suggest that the Act should be made in London metropolitan instead of parochial.

As long as the government of London remains in its present form, the Metropolitan Board of Works should be the body invested with the execution of the Act. In the provinces the sanitary authorities, rural as well as urban, should be the authority for the purposes of the Act. Another reason given why the Act has remained a dead letter is that it has failed for want of more expeditious powers. The somewhat elaborate machinery devised for carrying it out was no doubt thought to be a safeguard against an unduly burdensome scheme being placed upon the ratepayers. The local authorities may, however, be considered competent to protect the interests of the ratepayers, and if any further precaution against an imprudent scheme be needed a local inquiry might be required before sanction was given to the borrowing of money for the purposes of the Act. The Commissioners further recommend that the local authority should be empowered to adopt the

Act by a majority of votes of the members present and voting, and that the consent of the ratepayers should not in any case be required for the adoption, and that the objections of ratepayers should not postpone the consideration of the question of adoption.

Messrs. Goschen, Lyulph Stanley, and Samuel Morley object to give local authorities these powers to provide houses, on the ground that 'the action of private builders and private companies will be proportionately discouraged.' 'Are builders likely,' they ask, 'to push the erection of large blocks of tenements if, in order to reduce their rents, the municipality take action largely under the Act of 1851?' The question is, no doubt, a very important one, admitting of large differences of opinion; but no private enterprise that we know of, except the malevolent enterprise of house-knackers, has attempted to grapple with the question of housing the very poor—those with no regular occupation, and living from hand to mouth. It is for these that municipal intervention becomes necessary.

Local Taxation.—So far the Commissioners have been on fairly safe ground, but they now plunge recklessly into social questions of grave importance on which the greatest variance of opinion is at present manifested. For example, in discussing Lord Shaftesbury's Labourers' Act of 1851, they say of it, and of nearly every proposal for improving the dwellings of the working classes as well as of other local improvements, that the present incidence of local taxation stands seriously in the way of all progress and reform. They think that until some reform is introduced which shall secure contribution to local expenditure from other sources of income, received by residents in the locality in addition to the present rateable property, no great progress can be made in local improvements. Considering the debate on the subject of May 5, and the narrow escape of the Government from defeat, this *pronunciamiento* of the Commission will be a little embarrassing for the Cabinet. Attention is called in the report to the fact that land available for building in the neighbourhood of populous centres, although its capital value is very great, is probably producing a small yearly return until it is let for building. The owners are not rated in relation to the real value, but to the actual annual income. If the land were rated at 4 per cent. on its selling value, the owners would have a more direct incentive to part with it for building purposes, and the community would reap the advantages of diminished burdens on the rates and of a less sum for ground rent. It is recommended that all these matters should be dealt with when the law of rating comes before Parliament.

Valuation; Arbitration; Betterment.—To these important financial questions considerable attention is devoted. The report supports the principle that in a purchase by a local authority of land in an unhealthy area, for what are recognised by the Legislature to be great public purposes, they ought to be entitled to purchase upon terms that will secure the fair market value and no more to the owners of the property, and it is recommended that future legislation should prevent the excessive assessment of the damage done to trade profits. Appeals should only be allowed on an order, after leave obtained from a superior court, on grounds which shall satisfy the court that a failure of justice has taken place. **Opposition to the confirmation of a provisional order should be confined to the single statutory ground**

that the area is not an unhealthy area within the meaning of the Acts, and, in cases only where lands are proposed to be taken not included in the area in respect to which the official representation was made, that such lands are not required for the purpose of the scheme.

Other Recommendations of the Commission.—There are a great number of further—perhaps minor—recommendations to which all the Commissioners agree; and there are others which certain members of the Commission put forward on their own responsibility. Some of these we may find it necessary to enlarge upon at a subsequent date. At present we must be content with mentioning them. In the first category are recommendations that the Settled Land and other Acts be amended so as to apply trust funds to improvements in towns and the erection of artisans' dwellings, and that legal expenses be curtailed. The whole subject of the relations between the railway companies and the working classes, both with regard to the demolition of houses and to cheap or workmen's trains, is dealt with at great length. The Commissioners think that water companies should be deprived of their summary power of cutting off the water [this will be done by Lord Camperdown's Bill, see page 505], and that there should be a simple power by civil procedure to proceed for the recovery of damages against owners or holders of property by those who have suffered by their neglect in sanitary matters. It should be declared by statute to be the duty of the local authority to put in force such powers as they are by law intrusted with, so as to insure that no premises shall be allowed to exist in an insanitary state.

Recommendations of Individual Commissioners.—Ten of the fourteen Commissioners (Sir Charles Dilke, chairman, the Prince of Wales, Lord Salisbury, and Sir R. Cross not joining in the recommendation) give it as their opinion that legislation favourable to the acquisition on equitable terms of the freehold interest on the part of the leaseholder would conduce greatly to the improvement of the dwellings of the people of this country. Lord Salisbury adds a memorandum of his own, dealing especially with the overcrowding in the interior of London. He suggests that if the sites of the prisons mentioned in the report are sold at cost price to some authority or trust that will build workmen's dwellings upon them, or upon other similar sites obtained by exchange for portions of them, the result will be so far to satisfy the special wants under which, on account of its peculiar circumstances, the interior of London labours. He also takes exception to any proposal for enabling the holder of a long lease to force the freeholder to sell his freehold to him at an arbitration price. Mr. Goschen and the Hon. E. L. Stanley, while generally agreeing with the recommendations of the report for improving existing house accommodation, record their opinion that no real progress in this respect can be expected in London until reforms in the local government in London have created a strong central municipal authority of a genuinely representative character. They suggest that municipal action as to the providing of houses should, as a rule, be limited to cases where the municipality is itself making a sudden disturbance in the accommodation of the working classes by clearing large areas in the making of new streets or other similar improvements. Sir Richard Cross objects to the local authority taking upon itself the duty of providing for

using of the poor, save under exceptional stances. Mr. Dwyer Gray contributes a 1d, it must be confessed, very clever argument in favour of the advanced doctrine that 'the rough remedy is to enable the local authority of town to acquire the fee simple of the entire district compulsorily.' Mr. Broadhurst makes suggestions, in which six other members for a land registry by local authorities. Mr. Collings is critical on a number of points, makes some sensible remarks about rural districts, a point not much noticed in the report proper; Mr. George Godwin draws attention to the working of the co-operative system of the dwellings known as the 'Familistère de

cannot profess, even with this considerable amount of space, to have exhausted the points very suggestive report. It is a little rambling, and a little out of proportion in some parts; but it is honest and painstaking, going as far as it can, it could be expected to consider the diversity of opinions represented before the Commission, and offering a basis for and useful legislation. But let not our rulers, local or municipal, fall into the error of imagining that the Royal Commission has reported, that they have no personal duty to perform in the matter. There is a temptation to regard the Commissioners' revelations as merely an interesting bit of historical reading. It needs to be urged again that the state of things which they see is just as bad, if not worse, at this present time as it was when the witnesses gave their evidence at Richmond Terrace. It is of no use to say we get more laws, before attempting to use which we have already. 'Motive power' is at a desideratum, and every citizen must bear his share in creating and supplying that motive power without which the most perfect machinery is of no use whatever.

JAMES B. PETTER, of Yeovil, the patentee of the Smoke Grate, which has gained so much public favour since its introduction at the Smoke Abatement Exhibition, has issued a new catalogue, in which several new designs of improvements on the original will be found. Mr. Petter draws our attention to the fact that this time of year is one for fixing the Nautilus Grate; a tiled hearth necessary adjunct, which may be utilised for the display of ferns and flowers during the summer months, in place of the ordinary stove-grate ornaments.

VARNISHING TOMATOES.—Three Parisian manufacturers, in order to make tomatoes appear redder than as coloured them, have been varnishing them with a red compound and selling them as 'best quality.' These ingenious falsifiers have been condemned to pay a fine of one franc; not a very deterrent

consideration that Mr. Cecil Napier Hake and Mr. Wilson Hake, Ph.D., formerly of Queenwood House, both of whom have had much chemical practical experience, have recently opened a Laboratory for the purpose of commercial and other analyses at 10, Parson's Green, Fulham, S.W. Mr. Cecil Hake for several years been working in the Laboratory of the Ministry of Agriculture. Messrs. Hake propose to start courses of instruction for Medical Officers of Health and are desirous of acquiring chemical knowledge in relation to sanitation.

THE METROPOLITAN WATER COMPANIES.

No one has ventured to accept our challenge of last month as to the generic impotence and idiocy of Parliamentary Returns. It is perhaps lucky that no one did so, for we have meanwhile fitted into our sling a stone much more hurtful to the hypothetical unbeliever than any that we had in our wallet at the time of writing. About fourteen months ago, Mr. Firth, searching about for figures wherewith to convict the Metropolitan Water Companies, prevailed upon his colleague in the representation of Chelsea to assent to a return giving a variety of particulars as to number of houses, and rentals, and rates of dividends, and allotments of new capital, and market values, and a good deal more, about each of these companies. After a year of incubation, the return has at length appeared; and we have no hesitation in describing it as one of the most stupidly compiled and misleading Parliamentary papers of recent times. (If the condemnation which this remark implies can only be gauged by the select few who make Government Returns their study, so much the better for the general comfort.)

It is apparently of no use to inveigh against the lamentable ignorance of statistical science which the great majority of Parliamentary Returns reveal on the part of their compilers. But if the Government do not see their way to the appointment of a competent statistician to edit and correct the crudities of returns ordered by Parliament, they might at least see that such returns are prepared by some one with an elementary knowledge of the subject on which he is writing. In the return with which we are at present concerned, conclusions are established with the sublimest disregard not only of the recent history of the water companies, but of the rule of three, and even of common sense.

We are no special admirers of the water companies, who have, we think, used the powers which Parliament in its unwisdom has given them in a harsh and grasping spirit. But from the point of view of strict law, they are no doubt entitled to do many of the things which the envious world outside has scolded them for doing. We are not now going into the equities of 'back dividends,' which the New River Company, for example, assessed at the insignificant sum of 15,000,000*l.* for their own undertaking, or into the quiet allotments of new stock at par, which one of the companies' advocates strenuously asserts to be the only legal mode of procedure. If the companies could be lured into the Palace of Truth, they would probably admit that in equity much of their procedure was indefensible; but as they had the advantage of a strong position, they would only yield to the enemy in proportion as they found their main fortress in danger. If the conscience of the average payer of water-rates is soothed by Mr. Dobbs' victory over the Grand Junction Waterworks, by all means, say the companies, let us keep up the illusion by some apparent (perhaps real) concession which, after all, will not much affect our income. And as soon as Lord Camperdown showed fight with his Select Committee, the companies were ready to express their willingness to adopt the essential principle of his Water-rate Regulation Bill. Short of out-and-out purchase of the undertakings, which must in any case be made sooner or later, this is the only way in which the water companies can be

brought to reason. Storm one position after another, and they will in the end be obliged to capitulate.

We cannot congratulate Mr. Firth upon the information which his return is likely to give him. For instance, there is a fallacy connected with the very first table, which the companies have not been slow to point out. A table is given, which shows in respect of each of the companies, the maximum number of houses or other buildings supplied with water in the years 1872 and 1883, and the total amount of the rates, rentals, and other charges for the supply of water to houses or other buildings during the financial years 1872 and 1883, as follows:—

Number of Houses and Water Rentals.

Name of Company.	Number of Houses or other Buildings supplied in		Increase per Cent.	Water Rentals from Houses or other Buildings in		Increase per Cent.
	1872.	1883.		1872.	1883.	
Chelsea	27,949	32,430	16.0	£ 70,963	£ 103,704	46.1
East London	204,637	141,738	33.5	152,655	238,939	56.5
Grand Junction ...	33,500	45,517	38.9	92,168	150,015	62.8
Kent	39,425	58,784	49.1	47,594	79,927	67.9
Lambeth	48,588	75,623	55.7	89,551	167,455	87.0
New River	120,662	140,353	16.3	274,386	419,090	50.2
Southwark and V. ...	79,075	100,854	27.5	103,215	179,528	73.9
West Middlesex ...	43,930	62,950	43.3	117,745	173,399	47.3
Totals	497,736	659,249	32.4	948,277	1,505,057	58.7

Thus, between 1872 and 1883, the number of houses or other buildings supplied with water by the companies rose from 497,736 to 659,249, an increase of 32.4 per cent., while the water rentals rose from 948,277*l.* to 1,505,057*l.*, or 58.7 per cent. The average rental appears thus to have increased from 1*l.* 18*s.* 1*d.* per house in 1872 to 2*l.* 5*s.* 8*d.* in 1883, or 19.9 per cent. But, as the companies very fairly remark, the houses newly erected are for the most part of a superior class, and those rebuilt are generally much larger than those which they replaced. In many cases, owing to works of public or private improvement, two or three houses have been converted into one; and thus, while the number of houses in the most densely populated parts of London has diminished, the value of property has increased commensurately with the increase in size.

In this explanation the compiler of the return detects special pleading, which he is at pains to rebut. Accordingly, he adds, from the Registrar-General's annual summaries, some statistics which show that in six of the eight companies the average number of gallons supplied daily to each house for domestic purposes was smaller in 1883 than in 1872. But has this ingenious gentleman ever heard of the Metropolis Water Act, 1871, and the regulations made under it for the prevention of waste? The diminution in the number of gallons supplied, on which he bases so subtle an argument, is probably fully accounted for by the stoppage of the waste, which formerly went on unchecked. Certainly it is a novel suggestion that the companies are now behind their practice in 1872 as regards the quantity of water they furnish. What has Sir Francis Bolton to say as to this discovery of his colleague?

The compiler of the return is on stronger ground in dealing with the companies' distributions of profits. The aggregate amount of dividends received by the shareholders during the period 1872-83 was 8,501,486*l.*, on a share capital which increased from

7,955,578*l.* in 1872 to 10,344,313*l.* in 1883. The rate per cent. of the dividend paid by each company was higher at the end than at the commencement of the period, notwithstanding that by far the greater part of the new capital created was issued to the shareholders or their nominees at par, an arrangement by which the dividend-bearing capital was, of course, increased to a greater extent than would have been necessary if it had been raised in the open market. The following table shows the rates per cent. of dividend paid by the several companies in the first half-year of 1872 and the last half-year of 1883, respectively, the amounts paid by the several companies by way of dividend, and the amounts of share and loan capital paid up during the period 1872-83 in respect of capital taken up at par by the shareholders and their nominees:—

Name of Company.	Rate per Cent. of Dividend in		Amount of Dividends.	Amount of capital paid up during the period 1872-83, allotted by shareholders at par.	
	First Half-year of 1872.	Last Half-year of 1883.		Share.	Loan.
Chelsea	6	7½	£618,080	£341,928	£63,000
East London	6	7½	1,256,218	—	150,000
Grand Junction ...	8	8½	793,601	213,600	50,000
Kent	6½	8½	602,170	174,712	—
Lambeth	6	7½	810,861	557,840	207,000
New River	7½	11½	2,356,719	366,040	225,000
Southwark and V. ...	5½	8½	852,804	251,803	40,000
West Middlesex ..	9½	10	1,011,013	295,535	—
			£8,501,486	£2,200,433	£715,000

The value of the premiums which would have had to be paid upon this 2,202,433*l.* share capital and 715,000*l.* loan capital, if it had been disposed of at the market price, is not given in the return, and indeed would be somewhat difficult of calculation; but it must have amounted to some hundreds of thousands of pounds.

It is where the return comes to deal with the market values of the undertakings, as assessed by the price at which their shares stood on the Stock Exchange list at the end of 1871 and of 1883, that it goes most hopelessly astray. In the preparation of this part of the return the Local Government Board invoked the assistance of the Share and Loan Department of the Stock Exchange, who appear to have furnished figures showing the nominal amount of each stock of the several undertakings existing at the date of the companies' reports for the second half-years of 1871 and 1883, and its estimated value at the market price on December 31, 1871, and December 31, 1883, respectively. But the compiler of the return sees nothing incongruous in placing the market values of the share and loan capitals at the end of 1871 in juxtaposition with the amounts of stock existing half a year later. An example of the way in which this is likely to mislead the reader is seen on page 10 of the return, where, under the heading of the East London Water Company, the nominal amount of the loan capital at the end of the first half of 1872 is given as 199,600*l.*, whilst the value of the loan capital at December 31, 1871, is given as 102,000*l.* only. It is not shown in the return upon what amount of stock the calculation as to market value was made, and the inference obviously is that the two figures given in the return bear some relation to one another—that the value, namely, of 199,600*l.* loan capital, was 102,000*l.* only.

increase in the amount of the East London capital is given on page 7 of the return as 37.1 per cent., but the increase in its value as 371.8 per cent., or a net increase of 284.2 per cent. In words, we are invited to believe that 100*l.* of East London loan capital was worth two ree-quarter times as much in 1883 as in 1871! Under that the secretary of the Share and Department is wroth at this perversion of his. A similar criticism might be made (though discrepancy in these cases is not so large) as to an capitals of the Lambeth and New River companies and their apparent market value as in the return.

loan capitals of all the companies for the first 1872 and the second half of 1883—an interval years—are added up, and an increase in the amount is shown of 18.8 per cent. Side by side with these figures are the market values at the 31st, 1871, and December 31, 1883—and of twelve years, during which period there increase of 42.3 per cent. In the summary marked that 'the increase in the amount of capital has been comparatively small, but the increase in its value has been considerable,' the intention being to compare the two periods above given with one another. But they are different periods, and it so happens that, the half-year immediately following that on the basis of which were based the calculations as

the return as published and the more accurate figures are not so serious; but the ratio of increase in the twelve years under consideration should more properly be 32.1 per cent. of capital and 101.8 per cent. of value, instead of 30.0 and 101.1 per cent.

The market values of the entire undertakings of the several companies at the end of 1871 and of 1883 appear from the Stock Exchange return to be as follows:—

	1871.	1883.
Chelsea	967,633	1,855,597
East London	2,072,991	3,093,735
Grand Junction	1,495,302	2,419,600
Kent	669,390	1,704,058
Lambeth	1,098,402	2,600,491
New River	4,881,229	9,882,012
Southwark and Vauxhall	1,555,784	2,860,934
West Middlesex	1,734,365	2,828,625
Total	14,475,096	27,933,052

Thus, assuming for the moment that the value of money was the same at both periods, it would have cost 13,457,956*l.* more to buy up the undertakings at the market price at the end of 1883 than at the end of 1871. In the interval, a total amount of 2,524,400*l.* more of share capital (nearly all allotted to the shareholders at par) and 516,813*l.* more of loan capital had been issued. Deducting these figures, as representing moneys spent in extensions and improvements, from the increase above shown, the sum of 10,416,743*l.* appears to show the net appreciation in value of the undertakings between 1871 and 1883,

Name of Company.	SHARE CAPITAL.				LOAN CAPITAL.			
	Amount in Sept. or Dec.,		Increase in Amount.	Estimated Value at end of	Increase in Value.	Amount in Sept. or Dec.,		Estimated Value at end of
	1871.	1883.		1871.		1871.	1883.	
Chelsea	967,633	1,855,597	887,964	1,855,597	887,964	170,000	150,100	170,000
East London	2,072,991	3,093,735	1,020,744	3,093,735	1,020,744	200,000	394,440	102,000

market values at the earlier period, a considerable amount of money was borrowed by at least two companies. The misconception likely to arise from this juxtaposition of figures that are not comparable has induced the secretary of the Share and Loan Department to publish in the 'Official Intelligence' of the Stock Exchange a corrected table, in which the nominal and their estimated values are compared at the same interval of twelve years. The principal of this table we reprint above. It will be seen that the true ratios of increase during the years from 1871 to 1883 were 23.9 per cent. of loan capital, and 42.2 per cent. in value, or a net increase of 18.3 per cent. in value—a disproportion which represents more than the appreciation of value of the share capital of all sound and established joint-undertakings during that period. Thus the London and North Western Railway Four per cent. Debenture Stock was about 101 at the end of 1871, whereas at the end of 1883 it had risen to 101.8, the difference as to the share capital between

the extra sum which the ratepayers would have had to pay at the end of 1883 for delaying the purchase of the undertakings for twelve years.

At present the project of purchase appears to be in abeyance. Meanwhile, London is in the shameful position of being dependent for its first necessity of existence upon the good-will of eight companies, with no co-ordination except in defence of their own 'interests.' Liverpool, Manchester, Birmingham, Edinburgh, Glasgow, and even Dublin have long ago taken the administration of their local water supply into their own hands. Is it not discreditable that the first city in the empire should lag behind? Sir William Harcourt, when asked to help Londoners in regulating their water supply and water-rates, has ostentatiously turned them over to the new Municipality which he has unsuccessfully attempted to create. But the mere creation of this new body will evidently be a work of time, and when at length it is duly constituted it will have many arrears to make up in other departments than that of the water supply. The taking over of the water undertakings on behalf of the

public is a foregone conclusion. Time must necessarily be consumed in the reorganisation of the water supply administration and rearrangement of the works, consequent upon the uniting of the undertakings; and it appears, therefore, to be very desirable that a temporary intermediate public authority should be established to acquire and hold the water-works in trust for the Central Municipality until it can make arrangements for taking over the duties. It is well to remember that (according to more than one high authority) every year's delay in the acquisition of the companies 'involves an enormous pecuniary loss and serious disadvantage to the rate-payers of the metropolis.'

THE SANITARY STATE OF WATERING-PLACES.

By a SANITARIAN.

THE sanitary state of watering-places and health-resorts is a matter of national importance. We go to the seaside in search of health and recreation, but do we always succeed? We get recreation, but do we get health? The elixir of life, for which the ancient philosophers sought so persistently, is now discovered to consist of an admixture of pure air and pure water. They are the very essence of life, and are far more valuable than the famous, and somewhat mythical, philosopher's stone. But these two essentials of human life are just what we do not, as a rule, get, especially at a seaside lodging-house. The proof of it is shown in the fact that while people return home with their faces tanned by exposure to the sun, and present all the outward appearance of being in robust health, they are often not really in so satisfactory a state as when they went to the watering-place for improvement. This is proved by the fact that in London and other large towns at no period of the year is illness more prevalent than at the close of the holiday season; and among no class is it more rife than among those who have just returned from an outing at the seaside.

Pure air and pure water are the two things most difficult to get at a seaside lodging-house. In the daytime, it is true, the windows are thrown open, and the pure air is freely admitted. But at night, when the doors and windows are closed, the house is pervaded by the faint odours of sewer-gas and other deleterious emanations from the kitchen, while the ventilation of the bedrooms is stopped, as far as possible, by the chimneys being stuffed with bags of straw.

As to the water, the chances are that there is but one cistern, and the water is used for domestic purposes as well as flushing the water-closets. But even when there is a separate cistern, it is seldom that this is cleaned out. The water supplied to the town may be perfectly pure when it is delivered into the house; but it deteriorates if it is allowed to remain long in the cistern, however carefully a tank or a cistern may be closed; if it is situated out of doors, sundry vegetable and animal matters are sure to find their way in, and the result is decay and putrefaction. Leaves of trees, live and dead insects, excreta of birds, soot from chimneys, and other various substances of organic origin, are almost invariably found in these receptacles. If the cistern is not frequently cleansed, the obnoxious deposit soon taints the water and renders it unwholesome.

If complaint is made, if the lodger is not shut up entirely by some rude remark, all the redress he gets is, 'Well, perhaps the drains do smell a little at times, but it's only in the morning, and it goes off as soon as the windows are opened.' But this does not recompense the lodgers, who have been all night inhaling this subtle poison. So the good which the sea air and the breezes of the day have done is lost, and a little poison is taken into the system, which, when the lodger returns home, it is the doctor's business to eradicate.

Lodging-house keepers are, to a great extent, in fault, but the authorities of the town, whose business it is to look after the sanitary condition of the locality, are infinitely more to blame. In a very large number of watering-places where there is a system of main drainage, there are a number, if not a majority, of the houses which are not connected, and where if investigation took place it would be found that the only means of drainage is a cesspool in immediate contiguity with the house.

There are, too, towns where there is no system of main drainage, and where cesspools in consequence abound. Diphtheria, typhoid, and bad, especially cesspool, drainage, are almost synonymous terms, and the sooner the public are imbued with this idea the better. Numbers of cases could be adduced, some of which were legally investigated and the facts proved, where fatal cases of diphtheria, typhoid, and other zymotic diseases arising from drain poisoning have occurred solely from this cause. In one case there were two cesspools each in a state of overflow, communicating with the water-closet, and these again communicated with the water-cistern, from whence the domestic water supply was obtained, and thus the water was made the agent for ventilating the cesspools, through which the gas was seen to bubble up and escape.

At the time these cases created a scare, and it was hoped that the authorities of the towns would bestir themselves, and that in one case they would institute a system of main drainage, and in the other insist on all the houses in the district being connected with the sewer. But time has passed and nothing has been done, and, as far as I can see, nothing will arouse them but a serious epidemic, one sufficiently pronounced to kill a number of the inhabitants, and to frighten away all the visitors.

To these and other errors of omission and commission are to be attributed the sickness which follows the return from the holiday trip, the heavy doctors' bills we have to pay at Christmas, and at least some of the many gaps in the family circle too often painfully recalled to our mind by this festive season.

Much has been said, but more remains behind.

Most persons when they go to the seaside indulge in a sea-bath, therefore the purity of the water in which they bathe is another very important matter. The increasing pollution of tidal rivers, and the sea, by the discharge into them of sewage and other noxious matter, is a subject of deep importance. The evil is one which has largely increased of late, and will continue to increase as seaside towns are better drained, and the houses connected with the sewer become more numerous. The nuisance will continue to increase in direct proportion to these improvements, and as the drainage of seaside towns is at present but partially carried out, the evil arising from the discharge of crude sewage into the sea, already sensibly felt, will be increased fourfold.

Some years since the idea was current, and is not entirely dispelled, that all that was necessary was discharge the sewage into the sea, and there was an end of it; but such a consummation, though devoutly to be wished, has proved fallacious. For any reasons the sea refuses to have anything to do with the more solid portions of the sewage, and casts it up upon the shore. Another evil is that when sewage, or water highly charged with organic matter, mixes with sea-water, sulphuretted hydrogen is evolved, which accounts for the stench arising from harbours and foreshores wherever the sewage of a town discharges itself into the sea. The result is not only highly disagreeable, but it is also highly poisonous, and consequently detrimental to health.

There are other evils and nuisances connected with this practice which sooner or later will make themselves apparent in an exceedingly unpleasant manner. When people talk about throwing the sewage of a town into the sea, they have very little idea of the amount of solid and liquid matter they have to deal with. To convey some idea of this let us take the sewage of a town, say in the height of the season, of 50,000 inhabitants; such a population exclusively using water-closets, and with all the houses connected, would produce, on an average, 1,250,000 gallons of sewage daily, more rather than less. A gallon of sewage weighs 10 lbs.; 1,250,000 gallons, therefore, will be equal to 12,500,000 lbs., or 5580 tons of contaminated water, which is poured out to the sea daily; and we are asked to believe that this can be done without causing a nuisance or being detrimental to health. To illustrate this evil a little further, let me say that in a mixed population of both sexes and all ages, it has been found by experiment that the excreta of each person per day is equal to $2\frac{1}{2}$ lbs., that of a population of 50,000 persons would consequently be 125,000 lbs., or 55 tons daily, every pound of which is highly putrescible, prejudicial to health (and which may, and more often than not does contain, the germs of disease), mingling with the water on the foreshore, and in which we are asked to bathe. This 55 tons of excrementitious matter may be divided into two parts, the solid and the liquid. The solid is to the liquid as 1 to 16, rather more than less. Thus the solid portion would amount to 7,810 lbs., and the liquid 117,190 lbs. Human feces, however, have been found by experiment to contribute only one-fifth of the solid putrescible matter which is contained in sewage. This being the case, it appears that a population of 50,000 would produce a mass of over 15 tons of solid manurial matter daily.

Seaside authorities would have us believe that all this is held in suspension and is carried away by the tide; but such is not the case. First, then, as to the latter being held in suspension. Modern scientific search teaches us that matter which would remain suspended for many days in fresh water is immediately precipitated when the water is saline. In the case of sewage discharged into salt water, cohesive traction comes into play at once, and the minute particles of suspended clay adhering to the organic waste particles are carried to the bottom of the sea, or the river, where they form pestiferous banks of ooze, emitting offensive gases, which at health resorts foul the water of the bathing ground, and then communicate disease to the bathers. Anyone who will take the trouble to ascertain the saline constituents of salt water will see at once that must

be so, as it contains many of the salts used by chemists for the purpose of precipitation.

Secondly, as to the action of the tide, it is an entire misconception to imagine that the tide proper has any effect on floating bodies, or matter suspended in the water. A tide is a vertical rise, or upheaving of the sea, which as it travels along the coast causes the phenomena of high and low water. This tidal wave or impulse travels at the rate of from twenty to a thousand miles an hour. In the English Channel it travels at the rate of about sixty miles an hour. The water under this impulse, has no horizontal movement, it being of form and not of substance, and it travels in one direction only, as may be seen on reference to the Admiralty Tide Tables. It enters the channel at the Land's End and proceeds through the straits of Dover, and meets the North Sea tide at the mouth of the Thames; but this movement, unlike that of the tidal current, never changes its direction. The motion of the tidal current is horizontal, and by it floating objects are impelled backwards and forwards, in the direction in which the current runs. It is this misconception as to the action of the tide, this confusion of ideas as to the progress of the tidal wave, which passes never to return, and the tidal current or horizontal movement, which is imparted by it to the water, which has led so many people into error. The water forming the tidal wave being raised, by the attractive power of the moon, above its ordinary level, is impelled by its natural gravity to return to its usual level; that is to say, the particles of water successively finding themselves under the progressive force of the wave, start along in the same direction with it, and endeavour, but in vain, to keep pace with it. Gradually they lose the influence which has dragged them along; the force of gravity predominates, and they retrace their steps backwards, descending the inclined plane they had previously ascended, till they reach their original position, again to come under the influence of the succeeding tidal wave. It seems, therefore, that the movement of the water under the tidal influence is one of constant oscillation, so that objects floating on its surface, or held in suspension, are carried a certain distance and then brought back again. The difference between the velocity of the currents and the motion of the tidal wave is so marked that it shows unmistakably how entirely distinct they are. Supposing the tidal impulse acted on the water horizontally instead of vertically, and carried it along at the same rate, navigation would be, except in one direction, an impossibility.

From what has been stated it must be evident that the discharged sewage, instead of being carried away never more to be heard of, as some have fondly hoped would be the case, becomes subject to the oscillatory movement of the tidal currents, and the solid portions, after a certain period, are gradually deposited in the bights of rivers, and quiet nooks and bays of the shore, somewhat removed from the more active influence of the current. From this gradual deposition and the chemical action of the salt water on the sewage results the offensive smells which at low water pervade the shore and harbours of ports, and the watering-places where sewage is discharged into the sea.

There is yet another and more deadly evil arising from this practice. A sea-outfall must for a certain time during each day be tide-locked. It is an evil for which there is no remedy, and the further the

outfall is carried into the sea the worse the evil becomes. The meaning of tide-locked will be better understood if it is explained that, as the tide rises, it enters the culvert and forces back the sewage, which in consequence becomes stagnant. During this time the sea-water mingles with the sewage, decomposition and precipitation set in, and gases of a highly deleterious character are generated. As the tide rises these are also forced back, and, having no other vent, find their way up the various drains and subsidiary sewers into the houses. It follows, therefore, that if sewage discharged into the sea was carried away by the tidal currents, the evils arising from a sea-outfall would only be mitigated and not overcome. I have studiously avoided mentioning towns where these evils exist. Were it not that I have no desire to injure certain health-resorts, it would be easy to point out examples of the entire failure of sea-outfall to improve the sanitary state of a town. The only real remedy is to cease to discharge the sewage into the sea, and either put it on to the land, or treat it by some of the many processes in vogue for precipitation. It may be urged that this will cost money; but the annual expenditure in either case would be small in comparison to the good that would accrue.

The perfect sanitation of a watering-place may be beset with many difficulties; but they are by no means insuperable. Authorities anxious to attain this most desirable end must understand that sewage is a nuisance which cannot be got rid of without cost. But the expenditure of money will not in all cases suffice. Care and constant supervision is also necessary. To start fair, a proper system of main drainage must be adopted, the sewers and drains should be well laid, and must be self-cleansing. Sewers of deposit mean the decomposition of putrid matter and the formation of sewer-gas; this gas being constantly formed, it as constantly escapes through the gratings and ventilators into the streets, or through imperfectly-trapped sinks and openings into the houses. Again, during a storm complaints are made that the drains smell. The cause is easy to find; the storm-water, unless there is a storm-outfall, accumulates in the low-level sewers, and the sewage heads up. As the sewage rises, the gas becomes more and more concentrated, and if it cannot find vent in any other way it is forced up the private drains, and is discharged into the dwelling-houses through the traps. The only remedy for this is to see the outfall is not tide-locked, and that the sewers are self-cleansing.

The contamination of the subsoil from false levels, leaky pipes, and defective main sewers is another evil to be especially guarded against. If the saturation of the soil is allowed to continue, sooner or later some deplorable catastrophe must follow.

House sanitation is a large subject, and one that has been very much neglected, but till this has been thoroughly attended to, no town or community of people can expect to be truly healthy. House drains, even of modern construction, are often very faulty, but the older ones are simply abominable. Many of them are in a very dilapidated state, and more often than not with insufficient falls; some are square-shaped, and far too large. It is impossible that such drains should be self-cleansing, so that they are constantly silting up, and eventually become choked with a large quantity of foul-smelling deposit. In these and other foul drains large volumes of sewer-gas are generated, and furnish a constant supply both

to the houses to which they are attached and the sewer with which they are connected.

Water-closets are, as a rule, defective; the old pan-closet is especially objectionable. There are plenty of good patent closets, which may be obtained at a reasonable cost, but it is not my business to advertise them.

Finally, a model health-resort should have a system of sewers extending to all the outlying portions of the town, so that the whole of the inhabited parts of the district may be effectively drained. The suburbs of a watering-place are, as a rule, inhabited by the poorer class, and are often not drained at all. These are the places where infectious diseases are bred, and from whence they are disseminated by means of germs contained in the atmosphere. The distance to which, under ordinary circumstances, these deleterious emanations are carried, is from six hundred to a thousand feet in a horizontal direction; but when strong winds are in operation, the distance to which these poisonous germs may be transported is unknown.

For the majority of watering-places to remain in their present unsanitary state is the height of folly. The first and most important thing is that a health-resort should be healthy. Medical men and physicians in London know more about the sanitary state of watering-places than do most of the inhabitants themselves, and it is not to be expected that they will send their patients to a place which is only partially drained or honeycombed with cess-pools, as are too many of our seaside towns.

Lodging-house keepers will perhaps say that they find it hard to pay rent and taxes, and make both ends meet, and they may ask how are they to live if the rates are increased by the outlay of large sums of money for drainage purposes; but these good people should remember that the health and comfort of the visitors means the prosperity of a watering-place.

THE rebellion in British America is calling out all the troops stationed in Canada. It was found that the medical organisation is nearly useless, and it has been entirely reorganised. The long marches and bad weather will probably incapacitate many soldiers.

DAMAGES FOR DEFECTIVE DRAINS.—A case of considerable sanitary importance (*Chichester v. Lance*) has been recently tried before Mr. Justice Wills and a special jury. The action was to recover damages from the defendant, who was said to have permitted the drains of the house he let to the plaintiff, to remain in a dangerously defective condition. The case does not seem to have been a bad one as against the landlord, who had not been in possession of the house a long time, and he did not decline to recognise his responsibility. But the repairs, when undertaken, were alleged to have been imperfectly executed, and an illness ('typhoid') resulted, an illness which the medical evidence went to show, and the jury found, was directly attributable to the insanitary condition of the drains. The damages were assessed at 45*l*. Owners of house property, and owners especially of unhealthy houses, would do well to take note of this decision, which is not likely to be forgotten by persons who may have the misfortune to find themselves in occupation of defectively drained houses, and to be sufferers in consequence. The decision cannot fail to have good results, and we hope, with Dr. Dudfield, of Kensington, that it will hasten the time when it will be recognised as a principle of English law that there is an implied warranty when a house is let that it is in a proper sanitary condition, and fit for human habitation.

TRAPS FOR YARD AND AREA DRAINS.

By FRANCIS VACHER.

Medical Officer of Health, Birkenhead.

ordinary sanitary appliances few are more utterly imperfect than the traps provided for yards and areas of town houses. Yet this is from want of attention to the subject, no dearth of various devices, displaying more or less of knowledge, have been invented and improved, and re-invented; so that the number of traps granted for these drains in recent years may be counted by the score.

Among yard and area drains, though at present universally required, has but lately been recognised as a matter of first importance, and even now none to time one sees inlets to such drains closed by a grating only. Some of the oldest have been seen in such situations are so-called traps, which, if thoroughly well made with cement and a sufficiently deep seal, may be efficient. As usually found they are useless. Son's trap, which under any circumstances takes time to make, is now less in favour than the D trap, made of iron or earthenware, with a seal from a quarter to three-eighths of an inch. It is so readily that it is commonly placed in a drain, without any setting, to permit of its being lifted and emptied. It is probably the cheapest trap, which may account for its popularity. I have no other recommendation. Bell traps, so easily fitted to sink-pipes, are only rarely met with in yards. However, in the areas and yards of tenement houses one sees the dish trap which is a bell trap inverted, fouling as easily and with no deeper seal. Valve traps are as a rule better than other traps, and perhaps owing to their defects, they are little in use in yards and area drains. They soon get out of order from no care and attention will prevent it. The trap, which one may yet occasionally see in yards, would really be a very efficient trap, but that it is difficult to cleanse and readily passes solids into the drain. The small gully trap, which one may see as an S trap with a catch-pit, is or may be a very efficient trap, and is, I am pleased to say, coming more and more into use. I have at times recommended these traps, but finding that many of those provided had fixed gratings or shallow seals, or were flawed castings, I thought it necessary in all instances when requiring a trap to specify that it should be approved. I have decided the settling of a minimum standard of requirements.

I need hardly add that I lay no claim to having invented anything about this trap. I have no interest in its being sold, and anyone is quite at liberty to make it. However, it is a simple fact that a short time since I did not know where to buy a yard trap with a deep enough seal, and in other respects satisfactory. The price of the trap here figured is 7s., with either long or short discharge pipe. An additional charge is made for galvanising.

In most situations the 2½ in. seal will be found sufficient. When, however, the trap does not receive from a sink-pipe, bath waste, &c., and when it is in a yard, which is not regularly sluiced down, a deeper seal may be desirable. But in such a situation no water-trap affords any security. Where the loss by evaporation is not frequently replaced, a 4 in. seal is only better than a 2½ in. inasmuch as it will not fail quite so soon.

It is hardly necessary for me to insist on the necessity of all traps being set level, as a slight slant forwards will convert a deep seal into a shallow one.

The trap may be obtained of Messrs. Hinson & Co., Limited, Birkenhead.

be square or round, but I prefer the latter. The whirl of the water in a round box tends to wash the sides, and a round box with a round bottom is certainly more easily emptied and cleansed than a square one. A semicircular iron tool, made to size, should be provided to scrape the inside of the box, and lift the solid contents.

The illustration represents a gully-trap of the size and shape which appears to me well suited for yard and area drains. The principal dimensions are given in the cut. It retains 8½ inches of water, 2½ of which is seal.

It is made either with a short or long discharge pipe, for areas where the drain is near the surface *short*, for yards where the drain is usually several feet deep *long*. The short is cut off at an angle of 80° with the horizon, the long at an angle of about 15°.

I need hardly add that I lay no claim to having invented anything about this trap. I have no interest in its being sold, and anyone is quite at liberty to make it. However, it is a simple fact that a short time since I did not know where to buy a yard trap with a deep enough seal, and in other respects satisfactory. The price of the trap here figured is 7s., with either long or short discharge pipe. An additional charge is made for galvanising.

In most situations the 2½ in. seal will be found sufficient. When, however, the trap does not receive from a sink-pipe, bath waste, &c., and when it is in a yard, which is not regularly sluiced down, a deeper seal may be desirable. But in such a situation no water-trap affords any security. Where the loss by evaporation is not frequently replaced, a 4 in. seal is only better than a 2½ in. inasmuch as it will not fail quite so soon.

It is hardly necessary for me to insist on the necessity of all traps being set level, as a slight slant forwards will convert a deep seal into a shallow one.

The trap may be obtained of Messrs. Hinson & Co., Limited, Birkenhead.

A COMMON CASE.

THE possession of a house in Regent's Park was secured with the full confidence that the systems of drainage and water supply were in perfect order, because the house was in excellent general and decorative repair, and the late occupant was a member of a representative firm of builders.

The main drain was found to be an old brick sewer, one foot in diameter, the gradient nearly flat throughout, improperly laid, and the flow very defective. This was at once separated from the common sewer, and then removed. A drain of six-inch glazed stoneware socket-pipes was laid from the front of the house to the back area upon a bed of Portland cement concrete. The course of this drain was intercepted by three man-holes and inlet ventilators. Two of the closets were found supplied with D traps, which were removed; and lead syphon traps substituted, each being ventilated at the crown by means of 1½-inch pipe. The closet in the basement was separated from the drain, and connected by means of glazed stoneware pipes with the man-hole. The safes under the closets were untrapped and communicated directly with the drain. This connection was cut, and the discharge was directed into the open air. Two of the soil-pipes were within the house, and were used as rain-water pipes—one of them opening beneath the eaves, and close to a bedroom window. New rain-water pipes were supplied, and the soil-pipes were prolonged nearly vertically and with undiminished diameter above the roof, and away from any window or chimney of this or the adjoining house. The cisterns were five in number, and all these (with one exception) were directly connected with the drains or soil-pipes: the exception supplied the scullery sink and boiler. All were furnished with overflows discharging into the open air; and each cistern that supplied a closet, which had been hitherto available for common domestic requirements, was rendered incapable of being used for any other purpose than that of flushing. The rain-water pipes, excepting those that had served also as soil-pipes, led into an underground cistern which communicated with the main drain through the medium of a waste-water pipe. This cistern and the pump above it in the scullery were removed, and all the rain water was conveyed to the gratings of syphon gullies, and then made to pass through four-inch stoneware pipes into a man-hole. Originally the waste water from the bath, as well as that from the safe, flowed directly into the soil-pipe; so that sewer-gas was effectually laid on, and freely introduced by means of two orifices into the very heart of this dwelling. The waste from both sources was diverted through one of the rain-water pipes into the open air. All the sinks were in immediate communication with the drains or soil-pipes; they were cut off, and made to discharge into the open air or a rain-water pipe. The bell-traps were also all replaced by stoneware syphon gullies.

ALL rags sent to New York are disinfected in the following manner:—The rags are arranged in bundles and placed in an impermeable receptacle into which superheated steam is introduced (330° F.). In about five minutes the temperature of the bundles is so high that in two hours it does not fall below 100°. The experiments that have been made prove that this process destroys completely all germs contained in the rags, whereas sulphurous acid is not so successful.

DRAIN-TESTING WITH 'SANITAS' OR 'TEREBENE' OIL.

By CHARLES MACMAHON.

Sanitary Inspector, Torquay.

DURING the last five years I have used 'sanitas' and 'terebene' oils for the purpose of testing drains and soil-pipes with considerable success. My method of applying the test is as follows. Into the uppermost water-closet, or head of the system of drainage of the house to be examined, pour about 4 ozs. of 'sanitas' oil, or about double the quantity of 'terebene,' after which throw down a pailful of very hot water; shut the seat lid and the door of the compartment; then leave the house for about ten minutes, in order that the fumes may be blown from the clothing, and that the power of smelling may be keener; re-enter, and smell carefully along the whole line of the house drainage, particularly at the various sinks, scullery, pantry, housemaid's trough, lavatory, bath, waste-pipe of water-closet supply cistern, &c., and if the slightest odour of the testing oil is found, mark where it is first perceived. I consider it advisable to go out again, and return in a few minutes to verify any results obtained. Of course the place where the test was applied must not be re-entered, and the window should be closed before testing; in fact, the water-closet or other place should be as air-tight as possible. Wherever the odour first escapes there is undoubtedly a defect close by, and a search should be made at that spot for it.

The advantages of this mode of testing are:

1. That no apparatus of any kind is required; a small bottle of the oil suffices.
2. That no assistant is required.
3. That if carefully applied, not only is the fact of a defect existing made known, but the very point where it lies is invariably indicated.

Case No. 1.

- A. The soil pipe of the w.c., into which the test oil was poured.
- B. The spot under the floor where about two feet of saturated earth and the broken collar of a pipe was discovered.
- C. D. Places where also the odour of the testing oil was perceptible.
- X. The house in which the cases of illness and the deaths occurred.

Of course, a keen sense of smell is absolutely essential to the operator. If no result is obtained within twelve hours after the application, the drains, &c., may be pronounced sound. I beg to narrate an

nance of successful drain-testing, which is mentioned in my recent 'Report upon Seven Years' Sanitary Progress in Torquay.' In August 1879 there was some illness and complaint of bad smells from a house on Victoria Parade. I tested the drains of the house carefully, and made an examination of the sanitary arrangements, but neither succeeded in discovering any cause for the bad odours, which the pier was convinced proceeded from drains. I needed the adjoining occupier's consent to test his drains, which, however, he maintained was unnecessary as he was sure they were right, having been lately laid. The test was applied, with the result

Case No. 2.

pipe into the w.c., at the head of which the test was applied. The spot where the smell of the testing oil was first found, and where under the floor and three feet of earth besides was discovered a pool of sewage, caused by a defective junction of the drains.

The odour escaped near the door of the second

It was unmistakable in the first, and in a yard of No. 2 shop, in a direct line with the places, it was also found. The drain was under the spot where the smell first escaped, about two inches of the collar of a pipe was broken off, from which, through earth and party sewer gas found its baleful way to the house. The unfortunate occupier had suffered illness in family, and some deaths also occurred, which to some extent, doubtless, due to the cause brought to light. I forward two sketches. The first illustrates the case just related; perhaps No. 2 sufficiently explain itself.

MARY JUPE, a dairyman, has been fined £5 and costs by Newport magistrates for supplying adulterated milk from the Isle of Wight Union Workhouse.

• Reviewed in the SANITARY RECORD of March 15.

THE SANITARY RECORD.

MAY 15, 1885.

The Editor will be glad to receive, with a view to publication, announcements of meetings, reports of proceedings, and abstracts or originals of papers read before the members of any sanitary or kindred association.

Local Authorities throughout the country would confer a favour on the EDITOR of the SANITARY RECORD by forwarding to him all documents relative to Water-supply, Sanitation, and Health matters generally, which come under their notice. He would also be glad to receive reports from Engineers of Waterworks, Sewerage Projects, and Domestic Drainage Improvements for notice, comment, and illustration.

DISQUALIFICATION BY MEDICAL RELIEF.

OUR readers are accustomed by this time to see sanitary considerations insinuating themselves into almost every department of social life and organisation; but they might have been forgiven if they had passed by the Irish Registration Bill on the other side, as a thing in which they had as sanitarians no sort of interest. Lurking, however, in Clause 3 of that Bill is a medico-sanitary point of the utmost importance. The clause provides that 'medical or surgical assistance, or the giving of medicine under any Act relating to medical charities in Ireland, shall not be deemed to constitute relief under the Acts for the more effectual relief of the destitute poor in Ireland, within the meaning of the Representation of the People Acts.' In other words, no one in Ireland will be deprived of the franchise, because he accepts medical assistance free of cost to himself. It is noteworthy that a clause similar in its object to this was proposed last June in Committee of the Franchise Bill itself by Mr. Commins, and was then rejected by Sir Charles Dilke as being too wide in its scope, and as taking away inducements to people to join friendly and provident societies. But when the Irish Registration Bill came up for discussion on the 24th ult., the Government were found to be supporting the clause removing electoral disqualification by the receipt of medical relief in Ireland. It was argued by Irish members that the circumstances of England and Ireland are, in the matter of medical relief, wholly different; and in the end the clause was adopted by 76 votes to 20. It was felt, however, by certain English members that what was right for Ireland could not be wrong for England; and, accordingly, in Committee of the English Registration Bill on the 7th instant, Mr. Davey attempted to get a similar clause approved by the House. It was opposed by the Attorney-General

mainly on technical grounds, and was in the end rejected by 170 votes to 102.

But, nothing daunted, Mr. Davey raised the question again on the Report of the Bill on the 12th inst., and was then successful in getting, by a majority of 37 votes, the receipt of medical or surgical relief, and the giving of medicine in England exempted from the definition of parochial relief within the meaning of the Representation of the People Acts.

It may not be amiss that the question of disqualification by medical relief having been thus raised, we should look into the present position of the law in the matter, and endeavour to ascertain what amendments are needed to secure his equitable rights to the artisan elector, compelled by circumstances over which he may have no control (as for example the outbreak of infectious disease in his house), to bring himself into relations with medical or hospital relief agencies that may invalidate his voting capacity. Now it is an ancient canon of our law that no pauper is entitled to vote at elections, and this canon has been crystallised in the 14th section of the Divided Parishes and Poor Law Amendment Act of 1876 (39 & 40 Vict., c. 61) as follows; 'No person shall be entitled to vote . . . in the election to an office under the provisions of any statute who shall be in receipt of relief given to himself or his wife or child, or who shall have been in receipt of such relief on any day during the year last preceding such election.'

It was decided in 1878, by the Revising Barrister of the Tower Hamlets, that the claim of a man to vote at a Parliamentary election must be disallowed on the ground that he had received relief by his children having been treated for small-pox in the Homerton Hospital, though they had been removed thither against their father's wish.* The obvious importance of encouraging the use of these hospitals as much as possible by the independent poor, and the difficulties which would be thrown in the way of their free employment by such a decision as the above, induced Sir Charles Dilke—then a private member—Mr. Rathbone, and others, to introduce, in the autumn session of 1878, a Bill 'to remove disqualification by medical relief for infectious or contagious disease.' That measure proposed that no person should be deemed to be disqualified to be registered as a voter, or to vote at any election of a member or members to serve in Parliament for any county or borough, by reason only that he or any member of his family, or any person whom he is liable to maintain, had received medical treatment or relief for any infectious or contagious disease as an in-patient or out-patient of any hospital, infirmary, or dispensary established or maintained by any sanitary authority, or poor-law authority, or at which he had been so treated or relieved by the order or with the sanction of any such authority, or the medical officer thereof. This Bill got successfully through its various stages in the House of Commons; but the amendments proposed in the House of Lords by the Lord President of the Council so far emasculated it that its promoters thought it best to abandon it. Since then the question has more or less slept until the recent debates have brought it again into prominence.

The elections more particularly contemplated by the Act which prohibits paupers from voting, are parliamentary, municipal, local board, and poor-law

guardian elections. Except in the case of the former, the qualification for a voter is practically the same. The voter must be a ratepayer rated to the relief of the poor in the district or part of a district for which he claims to vote, for the space of one whole year immediately preceding the day of tendering his vote. But whilst as regards the metropolis, and local government and rural sanitary districts, there is an enactment defining the 'relief' which disqualifies, as regards boroughs *quod* municipal elections, recent legislation has put this matter upon a proper footing.

Sect. 9 of the Municipal Corporations Act of 1882 (45 & 46 Vict. c. 50), provides that 'A person cannot be enrolled as a burgess if he is (a) an alien; (b) has within the previous twelve months received union or parochial relief or other alms, or (c) is disentitled under any Act of Parliament.' Sect. 33, subsection A, of the same Act goes on to provide that 'A person shall not be disentitled to be enrolled as a burgess by reason only (a) that he has received medical or surgical assistance from the trustees of the municipal charities, or has been removed by order of a justice to a hospital or place for the reception of the sick at the cost of any local authority, or (b) that his child has been admitted to and taught in any public or endowed school.'

The word 'union' in Sect. 9 is new, and was introduced, at the instance of the Local Government Board, to avoid any difficulty that might arise from the relief given having been a charge on the common fund of the union, under the Union Chargeability Act (28 & 29 Vict., c. 79). The whole of Sect. 33 is also new. The only persons who can be removed by the order of a justice to a hospital at the expense of the local authority are those who are suffering from a dangerous infectious disorder, and who are without proper lodging or accommodation, or are lodged in a room occupied by more than one family, or on board any ship, or in a common lodging-house (Sect. 124 of the Public Health Act).

The term 'without proper lodging or accommodation' is an elastic one, and admits of many definitions. Some justices have granted orders of removal on grounds which had reference not so much to the welfare of the patient, as to the fact that the patient was so placed as to be a probable source of infection to others. In cases of this kind it would be obviously unjust to deprive a citizen of his civil rights because he happened to be suffering from an infectious disease and because a justice thought that, in the interests of his family, he should be removed to hospital; whilst in the case of a patient who voluntarily isolated himself for the benefit of others, the deprivation of these rights would be a greater hardship. It is open to grave doubt whether this could be legally effected, since it has been held that an inhabitant, in the ordinary sense of the word inhabitant, does not cease to be within the purview of Sect. 131 of the Public Health Act 1875, by becoming destitute and receiving poor-law relief.

The wisdom of the retention of the words 'by order of a justice' in Section 33 of the Municipal Corporations Act of 1882 is therefore questionable. It is highly important that no impediment should be placed in the way of the isolation of persons suffering from infectious diseases, and the clause with these words omitted would have rendered it clear that a burgess would not lose his vote by voluntarily allowing himself to be removed to a hospital. 'Perhaps,' as a commentator on the clause ob-

* See SANITARY RECORD, Vol. ix., p. 259.

the clause as it stands saves the right of steer, for it would be contrary to common hold that a volunteer, who confers a benefit immunity, should stand in a worse position obstinate neighbour, who has to be compelled to take the law. At any rate, this is the view which people would take of it.

principle above indicated received renewed force in the Diseases Prevention (Metropolis) Act which contained a clause—designed to enable the use by the independent poor of the hospitals established under the Act—providing that ‘the right of a person suffering from infectious disease to enter any hospital ship provided by the Metropolitan Asylums District, or to receive the maintenance of any such person therein, shall not be considered to be parochial relief, alms, or charity, and no allowance to any person, or to the parent or guardian of any such person, or to the parent or guardian thereof be deprived of any right or privilege, or be subject to any disability or disqualification, on account of such admission.’ And such an immunity ought certainly to be the basis of general application throughout the country.

stated that the House of Lords may throw
 clauses in the Registration Bills of which
 spoken above. If so, disqualification by
 relief may yet become a party watch-word ;
 use of its intrinsic importance (which is
 not because it chances to affect a ques-
 tion to the electorate. Sir Charles Dilke ex-
 to Mr. Commins in the course of the Fran-
 chise Bill of last June, his willingness to support
 for removing the existing disabilities in re-
 to certain kinds of medical 'relief,' though
 I not assent to the insertion of a clause
 with the matter in the Franchise Bill.
 any mishap prevent the clauses in question
 appearing in the Registration Bills as they
 the Royal Assent, it would seem well to
 place on the authority of the Government
 Charles Dilke's Bill of 1878. The present
 nature of the law is a legitimate grievance to
 an voter, who may be compelled to accept
 of himself or his family the benefits of isolation in
 at the public expense. It was found neces-
 sarily to state in the Vaccination Act of
 that the performance of vaccination at the
 cost was not to be considered as 'parochial
 relief, or charitable allowance,' and no one was
 privileged on that account of 'any right or pri-
 vilege to be subject to any disability or disquali-
 fication.' It cannot be seriously contended that
 any difference in principle between the pre-
 caution of vaccination and the precaution of isolation,
 one certainly ought to be as free from the
 pauperism as the other in the eye of the law.

DEFECTS IN WATER LAW.

PATCHED AND UNPATCHED.

THE question of the law governing water companies has of late achieved a quite phenomenal importance. For well nigh forty years water consumers have been putting up with the antiquated and imperfect regulations imposed by the Water Works Clauses Act of 1847, and it was not until the indomitable Mr. Dobbs gained his signal victory over the Grand Junction Company that public attention was seriously directed to the subject. Last year Lord Camperdown made a spirited attempt to obtain legislative relief as regards particulars of the companies' demands, and the cutting off of water supplies; and Mr. Torrens sought to make the dictum of the House of Lords as to the meaning of 'annual value' have universal application. Both Bills perished in their birth last year; but they have been resuscitated this session with some success and with strong expectation of their ultimate vitality. For Lord Camperdown has engaged single-handed—with the fitful exception of Lord Bramwell's peculiar vein of criticism—in a seven days' conflict with the representatives of the water companies, and has emerged less damaged than might have been expected, though with his beloved Bill changed beyond recognition in the process. A blue-book of considerable size has been issued, which is called by courtesy 'The Report of the Select Committee of the House of Lords on the Water Companies (Regulation of Powers) Bill.' It really consists of a faithful microphonic reproduction of the whole of the talk that went on during the seven days that the Bill was on its trial. Anyone who has the patience to read 170 pages of diluted Ollendorff may gain from this 'report' an idea of the mode of transmutation of the several clauses in the Bill.

Lord Camperdown's object was to say plainly in the Bill what he wanted—viz., that the companies should give to consumers particulars of the claims made upon them, and that a stop should be put to the arbitrary cutting off of the supply for neglect to pay the water-rate. As may readily be conceived, this was much too direct for the companies; and accordingly the Bill as amended contains fourteen clauses instead of five, and is more than four pages long instead of one and a half. It is not easy to make its exact purport clear in a short abstract; but its essence is, that after next Christmas every water company trading for profit (Scotland and Ireland for some inscrutable reason are omitted from the operation of the Bill) will be obliged to deliver to every person liable to the payment of water-rate a demand note.

Such note must contain a statement of the particulars of the demand, including the rental, annual value, or other basis on which the premises are assessed, and the percentage on such value, together with all additional items of the amount claimed. These particulars are to be repeated at intervals varying with the value of the premises. Within twenty-one days it will be in the power of the consumer to object to any part of such demand, but he must specify his objections and the sum which he is willing to pay. The admitted portion of the claim he will be bound to pay forthwith, and if after fourteen days' notice he does not pay it, the company will no longer be bound to supply him with water. As to the disputed portion of the claim, the case will have to be taken for decision by a court of summary jurisdiction.

For the Sewage Farm last year showed a balance of £1,600. The thirty-eight acres cost the town £3,600 per acre purchase money. The working expenses were: horse labour, £31; manual labour, £155 9s. 10d.; repairs, £10; auctioneer's commission, £24 5s. 2d.; total of £320 15s. The receipts were for: 52 6s. 7d.; carrots, £15 7s. 3d.; hay, £3 15s.; 189 1s. 11d.; rent of field, £27; sand and gravel, £10; being a total of £509 12s. 6d. This leaves a balance of £188 17s. 6d., or £7 9s. per acre for interest and apparently also for management.

mary jurisdiction. These provisions apply only to the ordinary supply of water, and not to water supplied under agreement.

Section 74 of the Act of 1847 provides that if any person supplied with water or liable to pay water-rate neglect to pay such water-rate at any of the said times of payment, the water company may stop the supply of water by cutting off the pipe, or by such other means as they may think fit, and may in addition recover the rate, together with the expenses of cutting off, as well as the costs of recovery. This clause has undoubtedly been grossly abused in the past. Under the modified plan approved by the Select Committee, where the owner and not the occupier is liable by law or by agreement to the water company for the payment of the water-rate, it will not be competent to the company to cut off the supply on any ground whatever. The water-rate is, however, to be a charge on the premises, and the occupier will be authorised to pay the rate and deduct it from his rent. This will provide against the very serious inconvenience now suffered by many poor tenants whose landlord undertakes to pay the water-rate but fails to do so. At present the unfortunate tenants are deprived of the first necessary of life because their landlord and the company happen to fall out with one another. If Lord Camperdown's Bill should pass, this will no longer be the case. It is made unlawful for the company to cut off the water supply except as expressly provided by the Act; and in all cases when they may lawfully cut off the supply, the company is given a power of entry upon the premises between 9 A.M. and 4 P.M.

Mr. Torrens' Bill is in a somewhat different case. It has met with a certain amount of opposition in the Commons, but was pressed gallantly forward through committee at something past three in the morning on May 1. This Bill also is barely recognisable in its amended shape. As originally drafted it proposed that the words 'annual value' in Sect. 68 of the Waterworks Clauses Act of 1847 should mean the 'net annual value,' as settled by the local authority. There is no need for us again to set forth in orderly array the arguments upon which the House of Lords finally declared for Mr. Dobbs. The essential justice of that decision has been made abundantly manifest; and Mr. Torrens' Bill, which has the support of the Government, is a natural corollary to it. In committee some sweeping amendments were made; and the Bill now provides that the 'annual value' in Sect. 68 shall within the metropolitan area mean 'the rateable value as settled from time to time by the local authority as duly constituted.'

Sir Sydney Waterlow, in suggesting the substitution of 'rateable' for 'net annual' value, as originally proposed, pointed out that the local authority—acting through the assessment committee—had no power to assess the annual value, but they were called upon by the Act to fix gross value and rateable value. This object was to place the water-rate on the same basis as other rates, and that it should be fixed by an authority which had no interest in the matter—viz., the assessment committee. 'Net annual value' could only be defined by the water companies, and contentions would constantly arise between the companies and the shareholders; but if the words 'rateable value' were inserted there would be an assessment which could be easily understood.

Mr. Firth would have added a proviso that 'where on any re-assessment of the metropolis under the

provisions of the Metropolis Valuation Act, 1869, the assessed net annual value of any tenement was increased by the assessing authority, no water company should be entitled to charge any higher or further rate in respect of such increase, except where such increase is in respect of structural or other alteration of the premises, or in respect of other matters than unearned increment of value.' The House of Commons was too tired, however, to go into the ethics of this question of re-valuation, and rejected Mr. Firth's proposal, and rejected the clause.

It would seem from the above that we have really some solid grounds for hoping that certain of the grosser anomalies and deficiencies of our waterworks law will be rectified this session. But at best Lord Camperdown's and Mr. Torrens' Bills will be but patchings; and the general question of the privileges and responsibilities of companies who deal for their own profit in an article of prime necessity to every householder is left practically untouched. We have no space on the present occasion to deal at large with the defects of water law; but there are two points that have recently cropped up in connection with it which may profitably engage our attention for a few moments.

Half a million people in South London had a narrow escape in the third week of April from a water famine, the mains of the Lambeth Company having in some extraordinary manner both burst almost at the same time. It appears, from the explanation of the matter given by the officials, that the company have recently laid down a third 30-inch main from their filtration and pumping works at Long Ditton to Brixton, so as to ensure an ample supply of water in the case of accident to either of the other two 30-inch mains. The third main is nearly finished, and the first main was stopped on Monday, April 21, in order that connection might be made between it and the new main. This work occupied about two days, but as the reservoirs were full, and the second main was at work, no difficulty in giving the supply either in town or country was apprehended. On the following Tuesday, at eleven o'clock in the day, the second main burst, and this was not repaired until eleven o'clock on the Wednesday. The connection having been finished on Tuesday at ten at night, the first main was pumped through, but at one o'clock on Wednesday morning that also burst, and was not again available until three o'clock on the Thursday morning. It was some days after this, however, before the water consumers of the district got their normal supply.

It would be idle to speculate how far this untoward accident, which might easily under different circumstances have become a very serious matter for the extensive district served by the company, would have been preventable if proper precautions had been adopted by the officials. Doubtless Sir Francis Bolton, the Government water examiner, will make such inquiry into the matter as is now possible. But the incident gives rise to unpleasant speculations as to the helplessness of Londoners in the event of their water supplies failing for a period sufficiently long to cause more than discomfort and annoyance. The company would, we suppose, hold themselves protected by the last clause of Sect. 36 of the Waterworks Clauses Act of 1847, which saves them from any penalty for not supplying water for domestic purposes, 'if the want of such supply shall arise from frost, unusual drought, or other unavoidable cause or accident.' The same phrase appears in Sect. 13 of

Waterworks Clauses Act, 1863, with regard to pipes for other than domestic purposes, as well as Sect. 15 of the Metropolis Water Act, 1871, which regard to constant supplies. Probably the neglect of a main must be regarded as an 'unavoidable accident'; but, the main being burst, for how long would the company be held protected by Sect. 36 of the Act of 1847, if they could not or would not immediately repair the mischief?

Let us suppose the flow of water through the pipes stopped for a fortnight, but the water-rates running as of time. Who is to gauge the responsibility of the company for the delay, and to bring them to account?

It may be answered: the Government water engineer. But the water examiner's duties are very limited by statute, and he could only report to the Local Government Board, who might not be ready to press for penalties against the company. While the water-cisterns in the houses would get empty, and there is apparently no power on the part of anybody to insist upon water from some company's mains being supplied to the sufferers. As to what constitutes an 'unavoidable accident or accident,' there is no legal precedent before us. We have searched Michael and Will's *relating to Gas and Water* and other authorities for information on this point, but in vain. It can be said is that the whole question of control of the joint-stock water companies is in a highly unsatisfactory position, and ought to attract the speedy attention of Parliament.

There is another legal question connected with water undertakings to which a recent epidemic of diarrhoea at Hull gives some interest. Between ten and twenty thousand people in that town died a few weeks ago from diarrhoea, undoubtedly due to the drinking of water polluted by sewage-fed beck, and there is some talk of action on the part of the sufferers suing for damages. We have often been asked as to the liability of companies for supplying polluted water that may have been the cause of an epidemic of specific disease; and a correspondent asks us the question this very day. The point will not be found discussed in the books, for the reason, perhaps, that there is no liability. Theoretically, no doubt, it would rest that Lord Campbell's Act (9 & 10 Vict., c. 3) must apply to cases of this sort—that actions for damages are maintainable against water companies by the families of persons whom any wrongful neglect, or default of such companies has killed; and, of course, that the person himself, if injured but not killed, can have his own action for damages. There are difficulties in taking any such course at law that would be extreme. The proof generally as to negligence might be complete; it might be shown to the satisfaction of a jury that a fever or cholera outbreak in mass had been caused by the distribution of certain water, which the company had suffered to be polluted with sewage; but with all this clearly established as to the epidemic generally, it might still be very difficult possible for any individual victim of the company's malfeasance to prove (if this had to be done) that his particular attack came from the operation of that and no other cause. The question is a highly important one from the point of view of the consumer; and, in any proposal for the amendment of the law that governs water undertakings, a useful or neglectful distribution of polluted water to the public ought to be made punishable in a much greater degree than at present.

BURIAL SOCIETY INSURANCE.

INDUSTRIAL insurance, and especially the insurance of infants, is a social question which is daily assuming greater importance, and which must, sooner or later, be made the subject of a searching and thoroughly independent investigation. The abuse of the present system, which mainly exists for the benefit of rival companies whose agents carry on such reckless competition in their struggle for new business, is patent to all who know how the system is worked. It is, however, only now and then that the public conscience is awakened and shocked by such revelations as those at the recent criminal trials at Liverpool, Durham, and Warrington. In a recent lecture on Life Assurance, Mr. Arthur J. Cook calls attention to some of the unlawful acts which result from the excessive competition which prevails. The proposal-forms for membership of the industrial companies and burial clubs contain questions which should be answered, and signed, by the person whose life is to be insured. Mr. Cook, however, expresses his conviction, from personal knowledge acquired in many parts of the country, that 'the lives of thousands of husbands have been assured by their wives for sums up to the limit for which a medical examination is not required,' the supposed signatures, or marks, of the husbands upon the proposal-forms being those of the wives, when they have not been written by the agents themselves. The recent notorious case at Liverpool, in which the two women, Flannigan and Higgins, were convicted of assuring the husband of the latter for several sums, and then poisoning him, threw much light upon this vicious and dangerous system. Under the present state of the law, a policy effected by persons having no interest in the life assured is null and void; but this does not check the kind of insurance that led to the Liverpool murders. Mr. Cook suggests that the effecting of an insurance by an uninterested person should be made illegal.

The connection, if any, between infant insurance and infant mortality has been much and frequently discussed, and at the Social Science Association meeting at Birmingham, last autumn, very strong opinions were expressed as to the effect of infant assurance. The extent of competition in this kind of assurance may be judged by the following fact, quoted by Mr. Cook, in his lecture above referred to. Some time since the *Sheffield Independent* announced that a woman in the district had given birth to three children. Two days afterwards the same journal stated that it had received a letter, advising that in future a similar event should not be so announced, as the announcement of the birth of the three children led to more than one hundred agents calling at the house of the parents to assure the lives of the children.

It is very seriously to be regretted that thoroughly trustworthy mortality statistics of insured infants are not available, and, we had almost said, are not possible. The wholesale 'surrender' of industrial insurance policies appears to vitiate all attempts at such calculations. Such statistics as have been published have usually been issued by the societies doing this kind of business, which financially is as immoral as socially it is dangerous. In connection with this subject our attention has been called to some statistics prepared by Mr. R. Farrow, of Leek, and produced by him at the annual general meeting of the Leek Benevolent Burial Society, which ap-

pears to have done an increased and profitable business during last year, 1,534 additional policies having been issued. The subject recently attracted considerable attention, owing to the assertion of Mr. Ritchie, the medical officer of health, that infant mortality in the town had increased in a startling degree since the insurance of children's lives had become common. Mr. Farrow, it appears, had obtained permission to examine the books of the Leek Burial Society, and had computed statistics of the mortality of insured infants since the society commenced insuring infants in 1880. The result of Mr. Farrow's investigations he stated as follows:—In 1880 the mortality of insured infants was only 88 per 1,000, against 175 in all Leek; in 1881 it was 90, against 137; in 1882 it was 148, against 193; in 1883 it was 104, against 118; and in 1884 it was 112, against 185 in all Leek. This statement seems almost too favourable to infant assurance to be trustworthy, and is still more remarkable than the statement put forward on the same subject a few years ago by the Prudential Society. The subject is one of so much importance that we should be glad to have further information as to Mr. Farrow's method of calculation, including a statement of the manner in which lapsed policies were dealt with.

NOTES OF THE MONTH.

HIGH BUILDINGS AND PUBLIC HEALTH.

IN the great cities of America, particularly in New York, where by reason of the position of the city an all-round extension is impossible, the tendency to build very high structures is naturally strongly marked, and the use of the lift or elevator materially lessens the discomfort necessarily entailed upon those who would otherwise have to reach the upper stories by means of a staircase. A Bill is being considered by the 'Cities Committee' for the regulation of the dwelling-houses in proportion to the width of the streets, the Bill providing that buildings of this class shall not be higher than 70 feet in streets of a width of 60 feet, and not higher than 80 feet in streets exceeding 60 feet in width. Builders and manufacturers, of course, oppose the restrictions, and the supporters adduce the usual arguments as to the danger of infectious diseases, danger from fire, and the exclusion of light and air; on the other hand, several New York physicians are of opinion that the sanitary arrangements of the modern buildings known as apartment-houses (or as we term them 'flats') are equal or superior to those of houses generally in the City of New York, and that houses with elevators have not only proved to be a great convenience but of material benefit to both men and women afflicted with diseases which are aggravated by going up and down stairs, and that any statements made to the effect that the erection of tall apartment-houses has materially injured, or is likely to materially injure, the health of the public by obstructing the sun-light, and thus fostering malarial and other diseases, are largely fanciful and not justified by the facts. Although there is a certain amount of danger to health in these high buildings, it must not be assumed that in our own country the danger increases in inverse ratio to the altitude, as it can be clearly shown that even from the speculative builder's point of view, apart from the regulations of the Building Act, an appreciable amount

of light and air must be preserved to induce people to occupy such apartments, and it is an admitted fact that our flats are, as a rule, sanitariously speaking, by far the best arranged of all residences. Another point which prevents extravagant altitude is the vested right to light and air usually enjoyed by the opposite neighbours, and they are always keenly alive to their position, and protect themselves accordingly, so much so that an *ex parte* injunction to restrain the building operations is very easily obtained, and such an injunction can be made permanent if fair grounds are shown for its desirability. As regards danger from fire, it is proved that 75 feet is a limit beyond which the firemen cannot reach with any hope of success in saving life or subduing the flames. This seems to be the most serious aspect, but fires in flats are comparatively few and unimportant, owing to the precautions hereafter stated. In these cases fireproof construction, partial or whole, is enforced by the Metropolitan Building Act if the building exceeds a certain size, not that fireproof construction implies a fireproof building in reality; the materials being iron, concrete, brick, or stone will not, of course, ignite, but they may be slowly consumed if the amount of inflammable material contained in the building be sufficient to destroy its surroundings. A building to be absolutely fireproof should bear somewhat the same structural proportion as an ordinary domestic fire-grate does to the coal fire contained therein, that is to say, it must be able to hold the mass of burning material harmless and safe for an indefinite time; however, the space occupied by such construction and the expense also must ever prevent such a result being obtained. But to return to the mitigation of the danger as provided for in the Act. In every public building, and in every other building containing more than 125,000 cubic feet, and used as a dwelling-house for separate families, the floors and the lobbies, corridors, passages, and landings, and also the flights of stairs, shall be of stone or other fireproof material, and carried by supports of a fireproof material. Thus, a building 75 feet high, 40 feet frontage, and 42 feet depth (by no means a large or unusual size), would contain 128,000 cubic feet, exceeding the above limit by 3,000 feet, and would therefore be constructed of so-called fireproof material in respect of the items enumerated, but wooden floors to the rooms would be allowed. This, however, would generally be met by the further provision that separate sets of chambers or rooms tenanted by different persons, shall, if contained in a building exceeding 3,600 square feet in area, be deemed separate buildings, and be divided accordingly, that is to say, each tenement or set shall be divided from the adjoining one by a party wall (which is to be of the same thickness as the external wall of the building, this in turn being regulated by the height to which the wall is carried) and each such tenement or set to be divided horizontally from the adjoining one by party arches or fireproof floors. For instance, a block of flats being 100 feet long and 37 feet in depth (irrespective of height) would exceed the limit by 100 feet, and would accordingly come under the above regulations; in addition to this the form of construction must meet the approval of the district surveyor, and in the event of disagreement the decision of the Metropolitan Board of Works is practically final.

With regard to the areas for ventilation and light, the Act somewhat favours the builder, as until 1882

t of lighting area bore no proportion to the building, for where all the rooms be lighted from a street or alley, an open area of 100 square feet was required at the (and belonging exclusively to) the building taking into consideration the size of the

This portion of the Act received an Act in 1882 in which it is enacted that a building having a frontage of 15 feet shall have an area (at the back or side) of 150 feet, and proportionate extent until the frontage exceeds 30 feet, and above 450 feet shall be provided, this last limit that is specified, and here again it is in direct proportion to the height. In dwellings the poorer classes these restrictions are sufficient from a sanitary standpoint, but in such work it is usually found profitable to resort to more liberality of surrounding may be concluded that these high building care and common sense in their regulation need not be supposed that builders can go their own way unchecked, the restrictions and laws being such that a very unsanitary state cannot therefore be so readily brought about as are sometimes asked to believe.

AS AN ECONOMISER OF COAL.

Question of the coal supplies of the country has been the subject of discussion in some of the daily papers between Mr. Ellis Lever, of Cheshire, and Mr. Thomas Newbigging, the President of the Gas Institute. Mr. Lever is a waste in getting the coal and in using it whilst Mr. Newbigging is of opinion that the supply is not so close upon the point of exhaustion as many people suppose. Replying to Mr. Lever offers a sum of 20*l.* for the best essay to be read at the forthcoming meeting of the Gas Institute in Manchester, on the 'Economising Coal by the more extended use of gas for domestic and manufacturing and for the generation of steam.' Mr. Newbigging in his official capacity, has accepted this challenge. The proprietors of *Gas and Water*, rightly concerned to be one of vast importance, must be carefully considered, are doubtful whether a premium of 20*l.* is a sufficient inducement to the preparation of an exhaustive paper. They, however, liberally propose to supplement that sum, or, alternatively, give a premium of 50*l.* for the paper, when the 20*l.* offered by Mr. Lever is awarded as a second prize.

THE PERILS OF PLATE GLASS.

It might seem strange that a man should be crushed to death by plate glass, but such accidents have occurred ere now. In the time of the late Queen this material was very difficult to cast, and a piece of 5 or 6 superficial feet was the largest that could be made; at the present time, however, it is nothing to find a number of sheets or plates each as large as much as 140 superficial feet, packed in boxes, each plate representing perhaps 5 cwt., and our such plates will weigh a ton. These are supported against 'horses,' or strong wooden frames, inclined on each side, so that the plates are kept out of the perpendicular—say 3 or 4 inches—shifted one by one as they are required for

use. It becomes evident that care must be exercised in their handling, and in shifting them over from side to side; also the danger of attempting to deal with more than one at a time becomes obvious. The difficulty may be compared to a man attempting single-handed to move a heavy ladder from one side of a street to the other. In trying, as men sometimes will do, to 'steady' several plates at one time perpendicularly, perhaps to examine one nearest the 'horse,' the centre of gravity is overcome, and the crushing weight of the falling glass gives no chance of escape unless the man be sufficiently quick to jump aside and let the glass fall. An escape of this kind recently came to notice, and 150*l.* worth of glass was destroyed, but a similar case previously resulted in loss of life. In another instance, the glass from the first 'horse' fell against the second, which in turn carried away the next, and so on through the series, like a house of cards, the damage being estimated at 1,000*l.*, but fortunately causing no serious injury to the workers. Workmen employed in these warehouses often get severely cut, but of which they seem to take but little notice, except in cases of great severity, which sometimes happen. In domestic use the danger of this material has been instanced some time ago by the fact of a man having walked through a plate glass door separating a conservatory from the main portion of a house at Kensington, the door being foolishly constructed in such a way that the impediment would not be noticed by a casual observer, and in this case the unfortunate being paid the penalty with his life. Here, as in other improvements in manufacture, the 'inevitable tribute' must be paid, and that, too, without a moment's warning.

PREVENTION OF FIRES IN THEATRES.

FOLLOWING up the remarks in the SANITARY RECORD of March 15 (p. 408), it may be useful to call attention to the hints given by Captain A. W. Shean, the consulting engineer to the Metropolitan Fire Brigade, for the prevention of fires in theatres. In the first place, it is argued that at any moment the audience should be able to quit the building in three minutes, and *this must be known*. 'If thousands of pounds sterling can be expended on the production of a single piece, a few hundreds, it can be argued, may very safely be expended in rendering such safety as alone will prevent panic—that is, a sudden conviction of danger produced by fear, aided by alarm, and preventable by an indisputable knowledge of personal safety.' Rapid egress must necessarily be rendered palpably easy, and it is suggested that instead of doors there should be substituted curtains of carpet. Such doors as must of necessity be used should open outwards, and be lightly constructed of wood and glass; but the breaking of these materials, or anything likely to increase terror, must, of course, be carefully studied. Draught would be prevented by these carpet-curtains, and if wetted they would resist the fire better than wood; the expense need not be considered. It is pointed out that the seats at many theatres, notably the stalls, are dangerously close together; and if perfection is to be approached, all seats should be licensed. An overcrowded theatre is more dangerous than an overcrowded vessel; although the danger of the former is not so apparent, it is none the less formidable. As the fire usually makes its appearance first on the stage, the scenery should be

rendered non-inflammable by the application of a solution of tungstate of soda, made of 1 lb. of the salt to one gallon of water. This invaluable agent appears to have been used at only one theatre in London. Another recipe from the *Chemists' and Druggists' Diary* is given as follows:—Four parts of borax and three parts of sulphate of magnesia, mixed together just previous to being required—otherwise, insoluble borate of magnesia is formed too early—and then dissolved in from twenty to thirty parts of warm water, into which the fabrics are to be immersed, next wrung out, and then dried. For coarse fabrics a mixture of sulphate of ammonia and gypsum may be used. Mr. A. J. Martin, of Paris, has succeeded in rendering textile fabrics—even such materials as muslin, tarlatan, and lace curtains—uninflammable by the application of the following mixture:—Sulphate of ammonium, 80 parts; carbonate, 25 parts; boracic acid, 30 parts; borax, 17 parts; starch, 20 parts; water (distilled or rain), 1,000 parts. The first four ingredients are to be dissolved in one-half of the water, while the starch is boiled in the remaining portion until fully gelatinised; the two solutions may then be mixed, raised to the boiling-point, and then, while hot, applied to the fabrics, or to wool or paper. Wood may be rendered incombustible by soaking for four or five days in a solution of one pound of alum and one of sulphate of copper in 100 gallons of water. The fireman in attendance is considered to be underpaid, and further encouragement generally should be offered him. The heavy premiums paid for fire insurance in these cases point to the conclusion that it would be wiser for theatrical managers to combine and form a 'mutual fire insurance,' as ten years' insurance premium of every London theatre would be sufficient to build a very handsome structure. Captain Shean further states that all the suggestions made could be carried out free of cost out of the premiums now paid to companies, in the success of which the managers do not participate, and in a few years a very handsome bonus might even be divided. Ways and means being thus considered, there should not, under the pressing necessity, be any difficulty in finding a response.

THE SWEATING SICKNESS.

AN antiquarian correspondent, who has more sympathy with the conservancy of the Grecian camp before Troy, and with the personal habits of St. Simeon Stylites, than with the sanitary problems of the present day, reminds us that this year is the quadcentenary of the first invasion of England by the 'sweating sickness.' Happily this is one of the epidemics that have now no more than an historical interest for us.

It seems to have prevailed on its first appearance in 1485 mainly in Lancashire, though it was also recognised in other parts of the kingdom. It made its appearance about the middle of September, and happily had run its course before the end of October in the same year. Lord Verulam described it as follows:—'The complaint was a pestilent fever attended by a malign vapour, which flew to the heart and seized the vital spirits, which stirred nature to strive to send it forth by an extreme sweat. If the patient were kept in an equal temperature, both for clothes, fire, and drink, moderately warm with temperate cordials, whereby nature's work were neither irritated by heat nor turned back by cold, he commonly recovered, and the danger was considered as

past in twenty-four hours from the first attack. But infinite persons died suddenly of it before the manner of the cure and attendants were known. It was conceived not to be an epidemical disease, but to proceed from a malignity in the constitution of the air gathered by the predisposition of seasons, and the speedy cessation declared as much.'

GAS SUPPLY BY POOR-LAW AUTHORITIES.

A GREAT deal of unnecessary fuss appears to have been made about the decision of the Holborn guardians to construct gas-works at Mitcham for the purpose of lighting the large workhouse to accommodate one thousand paupers, which they are building on the land adjoining their district schools at that place. As a matter of fact, large institutions all over the country are accustomed to manufacture gas for their own consumption, although, perhaps, this is the first occasion on which a board of guardians has gone into the gas trade. It is commonly supposed that a gas company, having once received powers to supply a certain district with gas, has the monopoly of supplying that district. No doubt such a company is practically secured from competition by the necessity which exists for a rival company to apply to Parliament for the necessary powers; and except in the most aggravated case of neglect on its part to fulfil its obligations, no other company would probably be authorised by Parliament to supply gas within the same area. But it is competent for any individual or body of persons without Parliamentary authority to set up gas-works, and to supply gas within an area already occupied by a company. In such a case the sanction of the road authority in whom the streets and roads are vested must be obtained, and the undertakers who open the streets to supply gas without Parliamentary authority must be prepared for an indictment for nuisance whenever the pavements are disturbed, in order to lay a supply pipe for the use of any consumer. The High Court of Justice would not interfere by injunction to prevent the establishment or working of such a company on the motion of any individual or company, but would allow the law to take its course in each individual case of nuisance. Great employers of labour, or great companies, such as railway companies supplying gas to their own works and their own employes, and having a surplus supply, without in any way acting *ultra vires*, not infrequently step over the boundary of their own property and supply inhabitants of adjacent districts with gas, although within the limits of supply of an authorised gas company. Perhaps the Mitcham pauper gas may be so good and so cheap as to encourage the local residents to transfer their custom from the gas company to the Holborn Guardians.

GIPSIES AND SMALL-POX.

It was recently asserted with some show of authority that gipsies were, for reasons which were not explained, specially insusceptible of small-pox. This we believe to be contrary to all recorded experience, though the facts are not very numerous to support either contention. Dr. Thursfield, who has a large district in Shropshire, says that he is unable to endorse the theory that gipsies have any special immunity from the infection. A few months back a small tribe of gipsies, encamped in a part of his district where at the time there were some cases of

small-pox, were reported to have small-pox in the camp. The tribe, possibly hearing of an intended visit from the sanitary officials, suddenly decamped, and continued moving from day to day until compelled by the spread and severity of the disease to halt some days after at a distant spot in an adjoining county. Here there was no doubt as to the nature of the disease; one case proved fatal, and the necessary measures to efficiently isolate the camp entailed considerable expense on the local sanitary authority.

A PHYSICAL TEST FOR BUTTER.

M. RABOT, a chemical expert, affirms in a communication to the Société d'Encouragement des Sciences, on butter analysis, that all the chemical processes of ascertaining the falsification of butter are unsatisfactory, excepting that of a thorough analysis, which is a long and delicate process. M. Rabot indicates a special physical character which enables the observer in a few minutes to distinguish pure butter, unadulterated butter which has been melted, butter mixed with margarine, pure margarine, also tallow which is often mixed with butter, and oleine instead of margarine. The crystals of solid fatty acids depolarise the sun's rays; these crystals are not found in natural unadulterated butter, they belong to more solid acids and are luminous and are differentiated from the surrounding substance, which is non-luminous. Butter becomes rancid when it contains butyric acid—a volatile fatty acid, which has no influence on polarised light. Chemical analysis is now necessary only to determine the extent of adulteration. M. Rabot also suggests improvements in the analytical process.

THE DISUSED BURIAL GROUNDS BILL.

THE London, Tilbury, and Southend Railway Company, which, as stated in the SANITARY RECORD of April 15, proposed to acquire the disused burial-ground of the Mill Yard Chapel as a site for a shunting-shed, siding, &c., has been foiled in the attempt to override the provisions of Mr. Hollond's Act. The promoters gave way before the serious opposition which they met with in the House of Commons, when the motion for the rejection of their Bill was supported by Mr. Hollond, Mr. Ritchie, Mr. Bryce, Colonel Makins, and other members. There is a clause in the Disused Burial Grounds Bill which prevents the application of the Act in any case where Parliamentary powers have been sought for before the passing of the Bill, and the company believe that this renders their conduct and that of the trustees, who are anxious to sell the ground, legal. At the present time their powers have lapsed, but it is not unlikely that they may again apply for power to take the disused burial-ground for railway purposes, notwithstanding the likelihood of being thereby involved in serious litigation.

WORK FOR THE UNEMPLOYED.

THOSE who may wish to see some seventy or eighty men, who have been without employment through no fault of their own, but only from the general slackness of work and the surplus number of workmen, busied once more in a most useful and steady manner, should visit the grounds now being laid out by the Metropolitan Public Garden Association.

Through the benevolence of one lady this association has started a special fund for giving work to the unemployed labourers of London, thereby relieving some of the present distress, and at the same time carrying out the various schemes on hand. The services of Mr. Arnold White, whose great experience in such matters is well known, have been secured, and under his guidance suitable men have been selected. They are engaged at 4½ per hour, and work for eight or nine hours daily; they are easily instructed in the arts of painting railings, digging and levelling ground, &c., and, in each place, are under the control of a competent foreman.

Mr. Arnold White, after a series of minute investigations, has ascertained that 40 per cent. of the so-called 'unemployed' are quite unwilling to work, and find it more pleasant and more lucrative to remain without any occupation. He estimates that another 40 per cent. are physically unable to work; they are too old or too sickly. This leaves only 20 per cent. both willing and able to be regularly employed, and, small as the percentage may seem, it is nevertheless a correct estimate. From this class the association has naturally drawn its labourers, but it is also employing, as night-watchmen, &c., a few of the second class, the men who are willing to work but are physically disabled. In this way a double blessing is conferred upon the poor of London; occupation is being given to those who deserve it, and recreation-grounds are being made for those who so sadly need them. When it was known that a few hands were wanted at Wilmington Square, Clerkenwell, 800 men, at less than a day's notice, applied for the work. There are, at the present time, many thousands of men, often fathers of families, who have been seeking for work for months past without being able to find it, and the number is unfortunately daily added to by those who flock into the metropolis from the country parts of England, and who find out, only too soon, the great mistake they have made.

Among the places which the association is now laying out, and where the 'unemployed' may be seen at work, are Canonbury Square; Wilmington and Northampton Squares, Clerkenwell; Trafalgar Square, Mile End; and the ground attached to St. Paul's Chapel and Schools, Rotherhithe. In Red Lion Square, Holborn, and the East London Cemetery, the work will shortly be commenced, and, as soon as the faculties are obtained, it is hoped that the churchyards of St. Peter, Walworth, and St. James, Bermondsey, will be laid out. In each case a band of deserving workmen, under an experienced foreman, will be employed to make such alterations and improvements in the several grounds as are considered necessary in order that they may be opened to the public as gardens for adults or playgrounds for children.

RAILWAY EXTENSIONS IN THE METROPOLIS.

THERE is now before Parliament a Bill which, if it should receive the Royal Assent, will help to double the facilities for artisans to live out of London proper. This Bill is one giving power to the Regent's Canal, City, and Docks Railway Company to pay interest on the capital required for its undertaking during the construction of its lines, which are to run from Paddington in the west to the Barbican in the City, and thence eastwards to the Docks. As

to the scheme itself, we have nothing to object, but rather everything to approve. The building of the line would no doubt afford employment to a great many people who are now out of work; and, when constructed, it would possibly assist to widen the area on which it is now possible for the working-man to seek a home, whilst keeping in view the paramount necessity of being within reasonable hail of his work. But we cannot forbear a criticism on the absolute unreality of the debate on the second reading of the Bill which took place on the 1st instant. Be it remembered that the question was not whether the line might be authorised (that was settled three years ago), but whether there was sufficient force in the contention of the directors that they could not raise the necessary capital, unless they were allowed to pay interest on it while the line was building and therefore unproductive. Certain philanthropic members (who chanced also to be directors of the great trunk lines) had interested themselves in the cause of the innocent and childlike investor, and sought to prevent his (more frequently her) falling a prey to the sophistries of those bold, bad men who offer to pay interest on capital during construction. In opposition to these were arrayed all the benevolent persons who desire to find labour for the unemployed, and who repine that mouldy traditions of Parliament should prevent work in plenty being given to thousands because the capital required for an undertaking cannot be raised unless interest is allowed to be paid while the line is building. The arguments of the railway members on either side were equally insincere. There is no valid reason why a Company already established should be allowed to raise money for new lines, and pay at once interest on it by thinly disguising the capital as preference, or some device of that kind, whilst a new Company is not allowed to do the same thing. On the other hand, it must be pointed out that a group of astute financiers will be in difficulties under their agreements for buying properties unless they can make a start without delay on the construction of their authorised lines, and so they set up the cry of work for the unemployed. Whilst we have little or no regard for the *bona fide* investor, who sins quite as often as he is sinned against, we have the keenest sympathy with the unemployed poor who have now so desperate a struggle for existence. We are glad, therefore, that the Bill has been allowed to pass the Committee; though we hope some clause has been inserted that will pin the directors to a practical exposition of the desire to benefit the poor, which they find so useful and efficacious in their Parliamentary log-rolling.

It is significant of the growing interest which is being taken in sanitary matters in the States, that *Bradstreet's*, a well-known financial paper of New York, devotes three and a half columns of a recent number to the discussion of the sanitary and quarantine administration of Baltimore. The sanitary staff seems, from this account, to be more or less under political influence, and its powers to be in many respects insufficient. The 'greatest curse' of Baltimore is its privy pits, which number between seventy and eighty thousand, and are of all depths, from 3 to nearly 100 feet. Baltimore does not maintain constant street quarantine; this is only enforced from May to November. For disobedience of quarantine there is a fine of 500 dols. The station takes notice of yellow fever, typhus, small-pox, and cholera, and every immigrant is required to show a certificate of vaccination before landing.

THE PUBLIC HEALTH

DURING APRIL 1885.

THE mean temperature during the month of April at the Royal Observatory, Greenwich, was $47^{\circ}7$; it was $1^{\circ}7$ above the average April temperature in one hundred years, and exceeded that recorded in the corresponding month of any year since 1852. An excess of temperature prevailed on fifteen days of the month, while on the other fifteen days it was below the average. The warmest day of the month was the 21st, when the mean was as high as $58^{\circ}7$, and showed an excess of $10^{\circ}5$; the coldest day was the 4th, when the mean did not exceed $39^{\circ}3$, and was $7^{\circ}1$ below the average. Rain was measured at Greenwich on nine days during the month, to the aggregate amount of 2.0 inches, which exceeded by 0.3 of an inch the average April rainfall in sixty-one years. During the first four months of this year the rainfall amounted to 7.3 inches, which was more than half an inch above the average for the corresponding period in sixty-one years. The sun was above the horizon during 414.9 hours in April, and 160.1 hours of bright sunshine were recorded at Greenwich; this amount exceeded that recorded in the corresponding month of any year on record. Easterly winds prevailed during a great part of the month.

In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, which list an estimated population of nearly nine millions of persons, 23,590 births and 15,832 deaths were registered during the four weeks ending the 2nd inst. The annual birth-rate, which had been 36.4, 35.6, and 34.2 per 1,000 in the first three months of the current year, rose again to 34.6 during April, but was below that recorded in the corresponding month of either of the three preceding years 1882-84. The lowest birth rates in these twenty-eight towns last month were 26.1 in Brighton, 27.3 in Huddersfield, and 32.4 in Bradford; in the other towns the rates ranged upwards to 42.9 in Preston, 43.0 in Newcastle-upon-Tyne, and 46.6 in Cardiff. In London the birth-rate last month did not exceed 32.6 per 1,000, whereas in the twenty-seven provincial towns it averaged 36.2.

The annual death-rate in the twenty-eight towns, which had been 21.2 and 22.5 per 1,000 in the two preceding months, further rose to 23.2 in April, and exceeded by 1.1 per 1,000 that recorded in the corresponding period of 1884, which was 22.1 per 1,000. The lowest annual rate of mortality last month in these towns was 17.0 in Derby. The rates in the other towns, ranged in order from the lowest, were as follow:—Purton, 18.8; Hull, 19.0; Brighton, 19.3; Nottingham, 20.3; Norwich, 20.7; Leicester, 20.9; Bolton, 20.9; Salford, 21.2; Birkenhead, 21.7; London, 21.9; Lough, 22.2; Birmingham, 22.6; Wolverhampton, 22.7; Bradford, 23.2; Sheffield, 23.6; Halifax, 23.9; Oldham, 24.7; Liverpool, 24.8; Bristol, 25.3; Huddersfield, 25.4; Plymouth, 26.1; Blackburn, 27.2; Cardiff, 29.0; Sunderland, 29.1; Preston, 31.7; Manchester, 33.4; and the highest rate during the month, 36.0 in Newcastle-upon-Tyne. While the death-rate in London during April, as above stated, did not exceed 21.9 per 1,000, it averaged 24.3 in the twenty-seven provincial towns. The 15,832 deaths from all causes in the twenty-eight towns during the four weeks of April included 1,940 which were referred to the principal zymotic diseases, of which 748 resulted from measles, 490 from whooping-cough, 164 from small-pox, 153 from diarrhoea, 139 from 'fever' (principally enteric), 137 from scarlet fever, and 109 from diphtheria. These 1,940 deaths were equal to an annual rate of 24.4 per 1,000, which showed a further increase upon the rate recorded in the three preceding months, though it was below that returned in the corresponding period of 1884, when it was 3.3 per 1,000. The death-rate in London from the principal zymotic diseases was equal to 3.0 per 1,000 during April, and slightly exceeded the average

twenty-seven provincial towns, among which the death-rates ranged from 0·7 in Derby and 0·8 in Brighton and in Wolverhampton, to 0·6 in Manchester, 5·6 in Cardiff, 7·4 in Sunderland, and 10·1 in Newcastle-upon-Tyne.

Measles was the most fatal zymotic disease in the thirty towns during April. The rate of mortality from this disease, which had risen from 0·42 to 0·91 per 1,000 in the first three months of this year, further increased to 1·10 during April, and exceeded the rate in any record. In London the death-rate from this disease was equal to 1·16 per 1,000, and slightly exceeded the rate in the twenty-seven provincial towns, among which the highest measles rates were recorded in Manchester, Cardiff, Sunderland, and Newcastle-upon-Tyne. The death-rate from whooping-cough, which had been 0·71 per 1,000 in the two previous months, rose during April to 0·72, which was, however, slightly below that recorded in the corresponding last year. In London the whooping-cough was slightly below the average rate in the provinces, among which this disease showed the highest fatality in Manchester, Bristol, Blackburn, and Bolton. The mortality from diarrhoea somewhat exceeded the average in recent corresponding periods. The rate from 'fever' (principally enteric or typhoid), which had been 0·21 per 1,000 in each of the three previous months, declined during April to 0·20; in London the mortality from this disease did not exceed 0·15, while in the twenty-seven provincial towns it averaged 0·25; this disease was proportionally most fatal in London and Norwich. The rate of mortality from scarlet fever, which had steadily declined in the five months from 0·45 to 0·21 per 1,000, further declined in April to 0·20, and was the lowest on record; it was last month twice as fatal in the provincial towns as in London; for while the scarlet fever death-rate in London did not exceed 0·13 per 1,000, it averaged 0·26 in the twenty-seven provincial towns, and the highest rates were returned in Preston and Liverpool. The mortality from diphtheria showed a decrease upon the rate recorded in the previous months; this disease was proportionally much more prevalent in London than in the provincial towns. During the four weeks of April 164 deaths from small-pox were recorded in the twenty-eight towns; the fatality of this disease showed an increase in London, while it had declined in the provincial towns. Of these 164 deaths from small-pox during April, 148 were registered in London, 16 in Manchester, 4 in Liverpool, 3 in Sunderland, 1 in Halifax, and 1 in Leeds. Judged by the results of the Metropolitan Asylum Hospitals, the prevalence of small-pox in London showed a marked increase during the four weeks of April, the number of patients under treatment in these hospitals, which had been 1,147 and 1,103 in the two preceding months, rose to 1,282 in April. The average weekly number of new cases admitted to these hospitals, which had been 248 in the two previous months, rose to 273 during April, a higher number than in any month since June.

The rate of infant mortality in the twenty-eight towns, by the proportion of deaths under one year of age registered, was equal to 156 per 1,000 during April, which exceeded that recorded in the corresponding period of either of the two preceding years 1883 and 1884. In the rate of infant mortality did not exceed 1,000, whereas in the twenty-seven provincial towns it averaged 165, and ranged from 104 in Hull, and 120 in Portsmouth, to 218 in Wolverhampton, 220 in Manchester, and 230 in Preston and in Huddersfield. The death-rate from diseases of the respiratory organs, as shown by the metropolitan returns, was below the average during April. The weekly number of deaths from these diseases in London averaged 420, and the annual death-rate was equal to 5·4 per 1,000.

In Liverpool the annual rate of mortality from these diseases was last month equal to 6·5 per 1,000.

The causes of 380 of the 15,832 deaths registered in the twenty-eight towns during the four weeks of April were not certified, either by registered medical practitioners or by coroners. These uncertified deaths were equal to 2·4 per cent. of the total deaths, which showed a decline from the proportion in the preceding month. In London the proportion of uncertified deaths was only 1·3 per cent., while in the twenty-seven provincial towns it averaged 3·3 per cent. All the causes of death were duly certified throughout the month in Portsmouth, and only one was uncertified in Plymouth; while the proportions of uncertified deaths were largest in Halifax, Salford, Oldham, and Hull.

Among the population living in the outer ring of suburban districts around London, estimated at rather more than a million persons, the annual death-rate from all causes during April was equal to 18·9 per 1,000, against 19·0 and 17·6 in the corresponding periods of 1883 and 1884. During the four weeks ending the 2nd inst., 126 fatal cases of small-pox, 38 of measles, 32 of whooping-cough, 27 of diphtheria, 15 of 'fever,' 7 of diarrhoea, and 6 of scarlet fever, were recorded in the outer ring. These 251 deaths are equal to an annual rate of 2·9 per 1,000, which corresponded with the rate in the preceding month. The fatality of small-pox and measles showed an increase during the month, while that of scarlet fever, whooping-cough, and 'fever' declined. Of the 126 deaths from small-pox recorded in the outer ring during April, 102 occurred in West Ham district (including 6 of London residents registered in the Metropolitan Asylum Hospital at Plaistow), 11 in Edmonton, 5 in Croydon, and 4 in Romford. Of the 27 fatal cases of diphtheria, 8 occurred in Edmonton, 4 in Kingston, and 3 in Hendon districts; and the 38 deaths from measles included 11 in Croydon, and 10 in Hornsey sub-districts.

NOTIFICATION OF INFECTIOUS DISEASES.

IN a table on page 514 are published uniform statistics relating to sickness and mortality in thirty-one of the thirty-nine urban sanitary districts of England and Scotland in which the notification of infectious diseases is compulsory. The estimated population of the thirty-one districts for which we are enabled to publish complete statistics for the month of April is rather more than three millions of persons. The annual rate of mortality from all causes per 1,000 persons estimated to be living in these towns, which had been 21·03 and 22·05 per 1,000 in the two preceding months, further rose during April to 22·66. In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return the death-rate during April averaged 23·20 per 1,000, and was therefore slightly above the mean rate in the thirty-one towns in the accompanying table. The rates of mortality last month were considerably below the average in Hartlepool, Lancaster, Edinburgh, Rotherham, and Burton-upon-Trent; while they showed an excess in Oldham, Blackburn, Preston, Manchester, and Jarrow. The death-rate from the eight infectious diseases dealt with in the table averaged 0·58 per 1,000 in the thirty-one towns furnishing this information, showing a further decline from the rates recorded in the six preceding months, which had steadily fallen from 0·98 to 0·65 per 1,000. No death from any of these infectious diseases was recorded last month in Burton-upon-Trent, Derby, Jarrow, Lancaster, Leek, or Warrington; while they caused the highest rates in Halifax, Salford, Portsmouth, Bury, and Preston. Small-pox caused 5 deaths in Manchester; scarlet fever was proportionally most fatal in Bury, Halifax, and Preston; diphtheria in Portsmouth; enteric fever in Salford and Portsmouth; and measles in Huddersfield, Manchester, and Jarrow. In the last-mentioned town a serious epidemic of measles

revails, no less than 36 deaths from this disease having been registered there during the past month, equal to an annual rate of 12·52 per 1,000. Three deaths from pueral fever were recorded in Bradford, and 2 in Salford. With reference to the notified cases of infectious disease in the thirty-one towns, it appears that the proportion of the population reported to be suffering from one or other of the eight diseases was 4·60 per 1,000, which almost corresponded with the proportion in the preceding month. No case of any of these diseases was notified in Warrington during the month, and the rate did not exceed 2 per 1,000 in Aberdeen, Accrington, Bolton, Hartlepool, Leek, and Oldham; while in the other towns it ranged upwards to 6·23 per 1,000 in Burnley, 6·32 in Portsmouth, 6·94 in Reading, 7·18 in Manchester, 9·00 in Barrow-in-Furness, 10·53 in Rotherham, and 10·72 in Leicester. The high rates in nearly all the last-mentioned towns were due to the excessive prevalence of scarlet fever. Ninety-three cases of small-pox were notified in Manchester, 6 in Jarrow, and 4 in Salford; scarlet fever was proportionally most prevalent in Halifax, Burton-upon-Trent, Reading, Bury, Rotherham, and Leicester; diphtheria in Edinburgh; typhus in Greenock and Dundee; and enteric fever in Burnley, Leicester, Nottingham, and Portsmouth. With reference to the epidemic of measles in Jarrow, Dr. Campbell Munro, D.Sc., the medical officer of health, states that no fewer than 212 cases of that disease were notified during April, and that, in consequence of the prevalence of measles, all the schools in the borough have been closed.

SPECIAL REPORTS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

At the meeting on Friday, April 17, T. Orme Dudfield, M.D., President, in the chair,

A paper by Dr. Thomas Stevenson was read on—

SEWAGE DISPOSAL.

The author commenced his paper by expressing regret that the possibility of dealing with excreta directly on the soil with Arcadian-like simplicity was confined to a very few. He said that the processes, inorganic and organic, by which effete matters are got rid of by the soil are but feebly imitated by man. Yet it is by the study of these processes and their more exact imitation that we must look for a more satisfactory disposal of sewage in the future.

The author traced the different methods of excrement disposal from the primitive privy to the introduction of the water-closet in 1810, since which time the latter has become the common, although by no means universal, method of removal, notable exceptions being found in large towns, such as Leeds, Bradford, and Birmingham, in which there were many houses without water-closets, while in Stafford a water-closet was phenomenal.

Directing his observations more particularly to the metropolis, he showed that at the beginning of the present century, and for long afterwards, cesspools were universal in London, and, although sewers existed, it was penal to use them for sewage. At this time the river water at London Bridge was drinkable, and many persons still living remember the waterworks opposite Fishmongers' Hall, which were used for the supply of the City. The use of water-closets increased the volume of water in the cesspools, and necessitated an overflow to the sewers, so that in a few years the state of the law underwent a complete reversal, and now, instead of the discharge of sewage into sewers being a punishable offence, it is penal not to drain into a sewer, if one be accessible. The author said that the composition of sewage varied much less than might be expected, and that the difference was one of degree rather than of kind; that there was

little difference between the sewage of a water-closeted town and a non-closeted town. Taking the average of the community, the dry, solid excrement is 1 oz. per head per day, which is distributed through 300 lbs. of water, say 15 grs. per gallon, and as for the urine, whilst the major portion of that of adult males never finds its way direct to the sewers, of the 2½ oz. of solids, distributed through 300 lbs. of water, 1½ oz. only is organic, one-half of which, urea, is speedily converted into innocent carbonate of ammonia. Although the solid excrement forms the most important polluting agent of sewage, it is by no means the greatest in aggregate amount, and, indeed, forms only a small fraction of the total polluting material which comes from the innumerable articles of domestic economy. Speaking of the more immediate subject of his paper, the disposal of sewage, the author referred to the difficulties that had to be encountered in the metropolis, the sewage of which might, for purposes of illustration, be regarded as a typical sewage. He thought that in no British town could the difficulties be greater than those which presented themselves in London. A site, much of which was below river level, an immense area, a city remote from the sea, with no available area close to its boundaries, and a situation near the upper end of the tidal reaches. He considered that a very large amount of credit was due to those who had hitherto dealt with the disposal of the sewage of London, and shame be to those concerned now, who, if after being unwillingly convinced, or if not convinced, convicted of neglecting to do all that is possible, do not at once manfully set themselves to do all that can be done to mitigate and abate the nuisance of the Thames, a river which has so lately raised its filthy stench in cry to heaven for a remedy. He pointed out how prone sewage was to putrefaction, and how by the mutual interchange of the decomposing organic matters and some of the mineral constituents of water—viz., sulphates—that sulphuretted hydrogen gas was generated, that sewage contained not only organic but organised bodies, and these in such a state of unstable equilibrium that their molecules readily rearranged themselves under the agency of external influences, and always to form simpler bodies; the tendency being to revert to those simple chemical compounds which serve as pabulum for the support of the higher forms of plant life. These agents, the bacteria, are the connecting link between the animal and the vegetable kingdom, the apex of the V, one link of which is crowned by the lordly tree, the other by man, the lord and master of the earth.

When fresh and freely exposed to air, as in sewers only partially filled, sewage has little odour, and can scarcely be considered as offensive; but, once let it accumulate in large quantities and come to comparative rest, putrefaction sets in, and it becomes vilely odorous; a seething mass full of those minute organisms which live and grow and multiply in an airless—a deoxygenated—medium. To prevent this, sewage must be dealt with in one of three ways:—1. The sewage may be at once thrown into a large volume of water—a river or the sea—where it can be carried away by currents, diluted by diffusion, and oxygenated by the dissolved oxygen, without appreciable nuisance; 2. It may be applied directly to land if sufficient area can be obtained to dispose of the sewage without offence; 3. It may be treated with chemical agents, such as either destroy the organic matter, or those that destroy the agents of putrefaction—the lower organisms. The author briefly discussed the first method, but only to condemn it as causing nuisance and danger to health.

In speaking of the second method, utilisation on land, he said that while in principle this was no doubt the right one, the fertility of the land being dependent on the restoration to it of the mineral constituents of the food grown upon it, the method from a pecuniary point of view could rarely be profitable and commonly entailed loss. He estimated the value of a ton of London sewage (the quantity yielded per head of population per week), if its manual constituents were in a solid and portable form, at two-

pence; but when sewage had to be utilised on land in a highly diluted form and in all weathers, the actual value was found to be only a halfpenny, and this leaves no margin for cost of transport, so that, when sewage had to be pumped, the cost of pumping exceeded the value of the article pumped.

There was, however, no agent which so effectually deodorises sewage as the soil, which acts not only as a checker of putrefaction, but also absorbs the gases of sewage, and further is the nidus of the well-nigh demonstrated nitrifying agent—*i.e.* the bacterial organism by which ammonia and nitrogenous organic matter immediately, or through the immediate stage of ammonia, are converted into nitrates. The author referred to the researches of Scloosing and Müntz, and of Warington, to show that it is probable that such a bacteria does exist and plays some such part in nitrification as yeast in a saccharine infusion does, in setting up alcoholic fermentation. A point of great practical importance referred to in this connection was that the nitrifying action is limited to the superficial layers of soil, decreasing as we descend, until at eighteen inches below the surface the action entirely ceases. This points to the possibility of economy in the cost of carrying out the process of intermittent downward filtration, as by keeping the superficial layer of the soil in good condition for nitrification, the great expense of deep excavation and preparation of the soil may be saved.

While broad irrigation, where a sufficiency of land is available, offers a satisfactory mode of sewage disposal, and is one which holds out more likelihood of realising some portion of the value of sewage than any other, it is seldom applicable to the sewage of large towns, on account of the difficulty of procuring a sufficiency of suitable land, porous, undulating, and at such levels as obviate expensive pumping.

There was a vulgar but erroneous notion prevalent that sewage can be effectually treated by means of chemical substances alone. Any chemical which effectually destroys the spores of bacteria, or deprives them of potential life, will certainly render the sewage unfit to be disposed of anywhere, for by such addition it becomes a poisonous fluid.

Chemical treatment, directed to the end of clarifying sewage, but not of rendering it non-putrescent, was a great advantage; for the suspended solids of sewage are the chief source of difficulty in treating sewage. As to the agents to be used for clarification, the author said if sewage is to be used for broad irrigation, simple straining will suffice. When land filtration is the plan to be adopted, something more is advisable, and where the effluent is to be turned into a stream without any other treatment than a chemical one, efficient clarification is indispensable—such a clarification as leaves less than a grain of suspended solids in each gallon of effluent—and even with this degree of efficiency no effluent ought to be turned into a stream unless the volume of running water is enormous in proportion to the sewage it is to receive.

The chemicals to be used for precipitating sewage may be varied. Of these lime has been largely used, both on account of its being reasonably effluent, but also on account of its cheapness. Skill is needed in the use of lime; it should be dissolved previous to its use, it being four times as efficient in this state as when used as milk of lime. Fifteen grains of lime to each gallon of sewage is an ordinary proper proportion, but it is better to accurately adjust the quantity to the degree of hardness of the water of the district, and it should not exceed this:—*i.e.* one grain of lime per gallon of sewage for each degree of hardness of the water supply. No appreciable excess of free lime will then be left in the effluent. An excess of lime is hurtful, for subsequent putrefaction is apt to occur; it may kill fish, and according to Warington may entirely prevent nitrification. The addition of a little sulphate of alumina is beneficial, as it carries down a flocculent precipitate entangling the lower organisms and their spores, difficult to remove by lime alone. Moreover, the use of alum

neutralises any excess of lime which might occur in the effluent. Sulphate of iron is another salt which may be employed, but it was questionable whether this was a useful addition when sewage is subsequently applied to the land.

The author concluded his paper with the following remarks:—So far as I can foresee, the sewage disposal of the future for our large towns will be one whose application to land supplements a preliminary precipitation process, and the land treatment will be a filtration process by which the area of land requisite will be limited. Such a combined process fulfils all the requisites of good purification, and is based upon these fundamental data. The sewage must be dealt with speedily before putrefaction has begun, and the agents of putrefaction, the bacteria, must be removed by clarification, which secures the removal of most of the bacterial organisms. The precipitated and clarified sewage is then to be brought as speedily as possible under oxidising influences, and nothing more effectively does this than the nitrifying organism. Putrefaction and nitrification are antagonistic processes, and so long as nitrification is going on putrefaction is, I believe, impossible. Sewage, when clarified by any simple process—and the simpler perhaps the better—and then passed through land, is odourless, and this cannot, strictly speaking, be said of sewage simply precipitated, and it is then also insusceptible of putrefaction.

Anything that falls short of the results obtained by the combined process I have referred to cannot be considered a very desirable mode of sewage disposal, albeit a less efficient process may, under certain circumstances, be permissible.

The President, in moving a cordial vote of thanks to Dr. Stevenson, said that they would all be sorry to hear of the author's indisposition, which prevented his attendance that evening. The subject was one of great importance, and he hoped an instructive discussion would follow.

DISCUSSION.

Dr. Edmunds did not consider the sludge valueless, as at Aylesbury he was informed that it sold for 3*l.* 10*s.* 1*d.* per ton. The result of the Aylesbury process was to produce a beautiful colourless liquid. He thought a precipitating process acted better than Dr. Stevenson gave it credit for. At Aylesbury no lime was used, and the effluent had an acid reaction. The materials used were alum, blood clay, and charcoal. He spoke of a visit he had paid to the Berlin Sewage Farm, where the soil was light and permeable.

Dr. Drysdale said they were all chemists enough to know that the nitrogen in their food had been stored up for long years, and afterwards was discharged into the ocean by the present method of the metropolitan sewage disposal; that was an important problem for the human race. If they sterilised Canada and America, they would in the long run find themselves not getting food. They had a great quantity of nitrogen sent to them, and it was now proposed to take it to the seas to increase the fisheries. If that was all they could do, the resources of science were not very great. The sewage farms of Paris produced an effluent that was actually drinkable, and what was to prevent that being done in respect of London. Professor De Chaumont had stated that there was quite enough land on the northern shores of the Thames for the purpose, and he believed that they would be obliged to dispose of the whole of the sewage by passing it through the land.

Dr. Bernays said there was nothing more barbarous than the present treatment of London sewage. He believed in the treatment of sewage on land. Some very absurd experiments had been made upon land which was not suitable and under impossible conditions. The method adopted at Birmingham was an admirable one—a combination of precipitation and filtration through land—the result being a very pure effluent. What was wanted for land filtration was a sandy loam, and there was plenty of it at the mouth of the Thames. His remarks as to soil would apply to cemeteries; in a stiff soil the body did

y for many years, but in a porous soil it was and completely oxidised. He had known very applications of lime, and agreed with the author per as to the importance of applying it, in solution in a limited quantity. In a solid form a large lime facilitated nitrification but not in solution. Rogers Field thought that the extravagant notions of value of sewage had done much to hinder a disposal of sewage. There had been all sorts of forms to utilise sewage, but none of them had been successful. He was aware that the proprietors of the process said they got 3*l.* 10*s.* per ton for the sewage manufactured from sewage, but there was redundancy about this amongst competent judges. An important component of sewage he thought had been neglected—viz., paper; there was an enormous quantity used in water-closets, and this, when dissolved, was one of the causes of the slimy nature of the sewage, which was such an intractable and difficult matter to deal with. One remark in Dr. Stevenson's report might easily be misunderstood, and lead to bad practice—viz., that the researches of Warrington pointed to a great economy in the preparation of intermittent downward filtration by employing a depth of land than had hitherto been deemed sufficient. As to nitrification, he was not able to give an opinion; but, looking at the question practically, the depth of three feet was not sufficient to prevent sewage passing directly to the land drains in an unimproved condition. The drains ought to be five or six

feet in exceptional cases when it was necessary to go to the subsoil, an economy might no doubt be made, although the drains should still be five or six feet deep. In ordinary cases, however, where surface preparation and deep drainage were the chief expense, he did not see how the economy was effected. Dr. Frankland had stated in the report of the Royal Commission that the sewage of a village could be disposed of on an acre of suitable land. This had been very much questioned. It was, however, a positive fact that a result almost equal had been obtained at Kendal ten years ago, and as he himself carefully investigated the details, the society was able to know them. The population of Kendal at that time was 13,700, and the average quantity of sewage as only about half the strength of London sewage) was about 1,000,000 gallons a day. The net quantity of land on which the sewage was applied was only 4 acres, and 25 perches, giving 2,942 people per acre. The sewage of Kendal was disposed of, on a small quantity of land for upwards of three years, and more land was used. Before this was done he had seen the influence of the sewage had effected the soil below a depth of about 6 inches. The sewage was of a very fine, free character, and the sewage was well clarified. The growing crops were very profitable and considerable returns were yielded. The sludge was deposited in tanks and mixed with ashes, or dug and used. That was easy at Kendal, but in the case of a large town, with four millions of inhabitants, it would be a question. As to the filter-presses, he had been asked about these being brought up now as something new, in fact, they were to his knowledge in use at thirty years ago. The sewage was there treated, and the result was satisfactory so long as the sewage was applied in proper quantities—one ton per million or 15½ grains per gallon. The filter-presses, however, did not pay, as they only added to the cost of the sewage without improving the sale. Mr. Blyth said that if the author of the paper presented he would have criticised one point,

where he doubted whether sulphate of iron was of manurial advantage. He must have overlooked a very good paper read at the Chemical Society by Dr. Griffiths, of Manchester, on sulphate of iron as a manure. The paper of Dr. Stevenson was a very hopeful one, and had impressed him with the importance of the researches upon nitrification.

Mr. Corner was not satisfied that Dr. Stevenson's suggestions could be practically applied to the metropolis. The soil must be of a proper description, and there must be other advantages to carry out the system.

Dr. Edmunds spoke of the unsatisfactory results at Wimbledon, where the authorities had been proceeding against for creating a nuisance, and considered that these were due to the land not having been properly prepared, and to its having to receive sewage in all seasons.

Mr. Jacob, as representing an extra metropolitan district, in which there were several small towns, saw a difficulty in the treatment of the sewage over the land for the reason that in one portion of the district the land was open and porous, and in another portion it was not so. He wished to know what was the best process where there was a stiff soil at the lower end of a district. Local bodies looked to their medical officers, their chemists, and their engineers for advice on the subject, but there was still a very great haziness over the question.

It was here suggested, in answer to Mr. Jacob, that if there was a suitable soil at the upper end of the district, the sewage from the lower end could be pumped up, as had been done in other cases.

Dr. C. E. Saunders said that, in his opinion, the solution of the sewage-treatment difficulty had been much obscured by the question of cost, and it was not fair to make science responsible for a failure, which was largely one of pounds, shillings, and pence. If sanitary authorities would carry out the scheme best adapted for their respective districts, and one of the best was that advocated by the author of the paper, there would be little difficulty in obtaining a satisfactory effluent. He thought he could answer the question of Mr. Jacob as to whether collecting sewage in tanks without chemical treatment, and then passing it through land, would suffice. It would certainly not; for sewage stagnating in tanks, intensified the rankness of sewage, and the effluent from the tanks was more offensive than the incoming sewage. For land treatment, the fresher the sewage was taken on to the land the better. There was no need to go to a patented process like the A B C system, and he always advised its non-adoption.

Mr. Rogers Field, in response to a request of the President, said with reference to Mr. Jacob's remarks, that it was impossible to advise as to particular localities, and each case must necessarily be dealt with itself when upon the ground. As to the advisability of having a chemical process applied before putting the sewage on the land, that would vary with circumstances. He did not think it was necessary in the case of small populations. He agreed with Dr. Saunders that it was a mistake to retain sewage in tanks unless a chemical process was applied.

In answer to a question, he said that evidence had been given that there was a sufficiency of land of the required quality for sewage disposal in the valley of the Thames.

The meeting then adjourned.

THE INTERNATIONAL INVENTIONS EXHIBITION, 1885.

THE first question which naturally suggests itself with regard to this, the third of the series of Exhibitions inaugurated by H.R.H. the Prince of Wales in 1883, is—In what respect does it differ from the preceding ones in structural arrangement, scope, and classification?

First of all, then, with regard to arrangement, the Inventions Exhibition, or, as it has already been popularly christened, the 'Inventories,' shows a striking re-adjustment of the space occupied by the former Exhibitions—

the 'Fisheries' and the 'Healtheries'—by which the ground enclosed has been rendered capable of affording greater room for exhibits, and at the same time has been simplified in its general plan by the enlargement or absorption of many of the previous smaller courts and galleries and by the removal of isolated buildings. Let us take, for instance, the main gallery, which faces the visitor as he stands on the steps after entering from the Exhibition Road and passing through the vestibule. It will be observed that by simply removing the walls of what were last year the dining-rooms on the one side and a series of small annexes and separate buildings on the other, a magnificent open space, consisting of three parallel galleries, has been obtained. The rest of the building remains more or less as it was, with the exception of the east and west sides; and here, again, we find considerable alteration and improvement, either by the absorption of narrow dividing walks or by the opening out of annexes formerly separate. Thus, in the west gallery, where machinery in motion was exhibited last year, as it is this, we find courts on either side in place of partitions by which spaciousness, effect, and improved access have resulted. On the eastern side a middle court has been erected over the path that formerly led up to the gardens which connects the east gallery with the east arcade, the three forming one large court. Although a considerable amount of ground has been enclosed by these additions and alterations, it is pleasant to discover that the upper gardens have not only not been trenched upon, but that actually more outdoor space has been provided for the public. The beautiful grass-plot with its flower-beds in front of the clock-tower and electric mast light, which was formerly square, has been made semi-circular, gaining thereby in beauty and affording a far greater space for the walks approaching and around the large pond in which the illuminated fountains play.

Another open space which has been converted into an exceedingly pretty garden lies to the north of the main gallery, between what was last year the water pavilion, and which is now the Austrian Court and the printing office of Messrs. Clowes. Along one side of these are large coffee rooms of tasteful design, and the terrace above this garden has been left quite clear of buildings. Returning again to the upper gardens, to where the Indian and Ceylon tea and coffee-houses stood last year, we find a really admirable alteration. A series of kiosks, five in number, have been erected between the trees that stand at the back and close to the West Gallery, and in these tea, coffee, and ices will be served. In front of them is a broad gravelled walk, and from this point the best view of the grounds and illuminations can be obtained. We have only to remember how this site was cut up by buildings and machinery last year, to say nothing of its being used as a road by which coal and the various material for the machinery gallery were brought in, to realise the change for the better. To sum up, we may say that the re-arrangement of the buildings and gardens and open spaces has been based on simplicity, which is the fundamental principle of invention.

We now come to the scope of the Exhibition, and we cannot do better than quote the words of H.R.H. the Prince of Wales at the closing ceremony of the Fisheries Exhibition, when he said of the present one that it was designed to show the progress of invention, especially to labour-saving machinery, since 1862—that is to say, since the last great International Exhibition held in this country. As the scheme of the Inventions came to be more fully considered, it was determined to include music, and this division was to embrace not only modern instruments, but a loan collection of appliances, pictures, and instruments of any date not earlier than the beginning of the present century. Considerable difficulties presented themselves at the outset with reference to the scope of the Exhibition, since it was no easy matter to define what was included under the term 'invention.' Ultimately the council decided to be bound by the limitations of the patent law. It was found, however, that even these did not afford

sufficient restriction, so great has been the progress of science and art. There was only a certain amount of space at command, and experience showed that to accommodate even those who applied to exhibit their inventions would have required five times as much space. It was, therefore, determined to be very chary of admitting inventions of the nature of those shown in the Smoke Abatement Exhibition of 1881, in the Fisheries Exhibition of 1883, or in the Health Exhibition of 1884; and to these were added such inventions as had been shown at the annual exhibition of the Royal Agricultural Society.

We next come to the classification, which includes thirty-one groups exclusive of music. These groups are further subdivided into one hundred and sixty-five classes.

Much more might be said with regard to the admirable arrangements for the refreshment of all classes, for the general amusement of the public in the way of music and fountains, and especially with regard to the increased facilities of traffic. The most striking addition to the last-mentioned subject is the construction of the subway, nearly a quarter of a mile in length, from the South Kensington Station into the Exhibition. But on these matters we are content to leave the public to judge for themselves. We can, however, assure them from personal inspection that they will find no mere repetition of former exhibitions, but an entirely novel arrangement in every respect of inventions that are bewildering in their variety and extent. At one end of the Exhibition air and electric engines will be seen in full work, whilst at the other soft music and sylvan surroundings are there for those to whom the whirl and noise of machinery is distasteful. Even the frequenters of the Healtheries will for some time be at fault, so utterly different is this Exhibition from any that has preceded it. In conclusion, we can say with much satisfaction that the first care of the Executive Council has been to thoroughly examine and improve where possible the drainage of every part of the grounds and buildings. Mr. Bennison has wisely completed what was partially done at the Health Exhibition, in applying the Banner system to the whole of the drainage of the Exhibition, by carrying up ventilating shafts from all the principal drains, and fitting the same with 'Banner' extracting ventilators and 'Banner' down-draught ventilators as required, to obtain the most perfect results. These ventilators have also been used for the ventilation of the staff rooms.

Owing to the state of unpreparedness of the exhibit, it is not proposed to attempt a detailed description of many of them in this issue of the SANITARY RECORD.

HEATING APPLIANCES.

The Eastern Gallery is mainly devoted to electrical apparatus and appliances, a large proportion of them for lighting purposes, other illuminants composed of gas appliances, oil lamps, &c., and a few cooking and heating stoves.

Messrs. Steel & Garland, Holborn Viaduct, exhibit their Wharnccliffe Grates in a few different patterns, the central figure in the display being a Wharnccliffe with an entire brass front, wood mantel and over-mantel, and complete suite of fireplace appendages; but there is nothing new in principle in the exhibit as it now stands.

The Wilson Engineering Company, High Holborn, are close to the last-named with one of their Prize Medal Kitcheners, the small allotment of space only enabling one of these excellent kitcheners to be shown.

Mr. Thomas Fletcher, of Warrington, through his London agents, Messrs. Deane & Co., London Bridge, has a general collection of his gas-heating and cooking apparatus on view. The incandescent gas-fires exhibited are notable, and the increased size of the fronts and the introduction of tiles give additional importance to them. One of the newest additions to Mr. Fletcher's appliances is a small instantaneous water-heater, intended to be fixed over the basin in a lavatory, capable of delivering hot water at the rate of one quart per minute. It is compact, and can be arranged to supply the gas or deliver water at either end of the apparatus, as desired.

rs. Brown & Green, Finsbury Pavement, and Beds, the Gold Medallists at the Smoke Abatement Exhibition, are in close proximity, with but a mere of space, and, in looking at the little 'Gem' Cook-stove, awarded a Gold Medal at the Health Exhibition, many persons may be inclined to ask what as in such an unpretending little apparatus to cause tain such a distinguished award. Our illustration simile of the one to which the medal was awarded. ade in a variety of sizes, from 16½ inches wide s, and, it will be observed, is complete in itself, y no setting. It is admirably adapted for the use

merely a pipe to carry the smoke to the chimney. It has fire-brick back and sides, a wide open fire, very shallow from back to front, by which a joint may be roasted, and the top can be utilised for boiling or stewing, and for heating irons. A new large cylindrical stove, adapted for church heating, is also shown, and, for its size, is perhaps the cheapest to be obtained. It has a strong fire-brick lining, a feeding-door, another on a level with the bottom of the grate for removing clinkers, and a lower one for clearing out the refuse, and a valve to regulate the heat. This stove will burn from twenty-four to forty-eight hours, according to the rate at which it is allowed to

cottager or artisan, being of a most economical er, cooking admirably, and presenting the largest r boiling and frying possible to obtain for its size. ode of heating the oven in the Gem ranges is differ- that generally employ-d. Instead of having a flue and it for the heat and smoke from the fire to pass h, it is, so to speak, jacketed with a hot-air er, to which the heat is imparted by conductivity, y so dispensing with flues, the trouble of cleaning is

work, and it may safely be left alight the entire winter, whenever a uniform and constant heat is required.

Messrs. Stott & Co., Fleet Street, and Oldham, show a collection of their patent gas governors, which have often been mentioned in the SANITARY RECORD in connection with the great saving of gas effected by their use. One of the most recent testimonials received by the firm is from the lessee of the Cirque at Glasgow and Liverpool, in which a tabulated statement is given of the saving of gas effected in both the establishments in a given time after the Stott governor had been fixed. There is no doubt that Mr. Stott's gas governor is a valuable invention—not only as regards its economy to gas consumers who adopt it, but in the regulation of undue pressure at the burners, to the comfort of the occupants of a room in which gas is burned.

Another gas governor, called The Safety, is shown by Messrs. Carter & Lees, of the same town (Oldham). It differs from that of Messrs. Stott & Co. mainly in one point, and that is in the addition of a metal weight of quadrant shape, fixed in connection with the float in a vertical position, the narrow end of the segment pointing downwards. This is called an automatic weightier, or compensator, the idea being that an alternative pressure is necessary, as the float that rests in the mercury rises or falls, or as the pressure of gas, or the requirements for its use become greater or less. Hitherto, after the fixing of a governor, and the regulation of the lights has been effected, it has been left to its own otherwise unaided action, and it is contended that this pressure is unequal, acting in an inverse ratio, whereas the compensating balance which moves backwards and forwards with the rise and fall of the float, adds to or

d. In the tests at the Health Exhibition, a leg of weighing nine pounds was well cooked with an six pounds of coke and one pound of wood, ng lighting the fire and heating up the oven, he Gem may fairly be called the poor man's *par excellence*. A very useful stove, suitable for a room or a variety of uses, is the 'Radiant,' as illus-

It will be observed that it requires no setting, but

decreases the weight on the float, according to the number of lights in use and the consequent quantity of gas required to pass through the governor. The idea is ingenious, but practical tests are required before it can be pronounced as much superior to the ordinary system.

ELECTRIC LIGHTING AND APPLIANCES.

Messrs. Sellars & Co., Canning Street, Birkenhead, show a cheap and ingenious mode of laying electric wires underground, which it is claimed can be carried out for quantities nearly as cheap as overhead wires, with the advantage of preventing danger from the snapping of wires, or to the men engaged in fixing them. The mode of procedure is to cut a trench under the street or pavement, lined with a thin wood casing, into which the wires are laid in the form of a belt or cable, viz., a number of wires are laid in a parallel line interwoven with a specially made cloth insulated with a bitumen compound. A concrete cover is placed over this, and the earth is then filled in and the street repaved. The concrete cover is made so that it can be easily removed, and the cables exchanged or increased in number. By this plan two or more belt cables can be laid over each other, a division between each being formed by means of slabs of tarred or creasoted wood, with narrow slips of similar wood laid between the cables at the edges, the whole being nailed or screwed together. It is also suggested by the patentees that to save the cost of laying underground, belt cables may be cased with tarpaulin, painted canvas, Willesden paper, or even thin sheet metal or wood, and fixed along the face of buildings, in side streets, or in country districts under the eaves of cottages. It is likewise suggested that local companies may be formed, or corporate bodies, or local boards may acquire the sole right to use this patent exclusively in their districts. The invention appears to be one worthy of consideration, as with the constant addition that is being made to telephone and telegraph wires, the increase of overhead wires will have to be stopped. The firm also exhibit a solution for damp walls, which, being of the colour of water, does not stain carved work.

Messrs. Harrison, Cox-Walker, & Co., Darlington, exhibit a small incandescent electric lamp for examinations of the mouth, throat, teeth, &c. It is very nicely got up, fitted with an ebonite handle and silver-plated clip and switch, and is illuminated by four large Leclanché cells of special construction. It can also be adapted for a temporary night light, six small cells giving a $2\frac{1}{2}$ candle-power light for about twenty minutes, and can be illuminated or turned off at a moment's notice. This will be found a very useful apparatus either for professional or domestic uses. The firm are also making a special feature of small electric motors for temporary purposes. They are arranged to screw against a wall or to stand firmly upon a table or bracket, and are intended for mechanical or other purposes where light is only required for short spaces of time. If exhausted by too continuous use they will recover power if unused for a short time, and may be looked upon as most serviceable articles. Fire alarms in connection with electricity are also shown. These consist in actuating the electric current by the rise in temperature of a strip of white metal, a mode of action that has already been mentioned in the *SANITARY RECORD*.

THE ANTWERP EXHIBITION.

(FROM OUR OWN CORRESPONDENT.)

ANTWERP this year plays the host to all the world of Art and Industry willing to come and show itself in the great Exhibition building the city has erected on a large site near the landing-place of the English steamers which place Antwerp and Harwich in daily communication. But in this new Exhibition life the great cities of the nine-

teenth century are leading, as in private intercourse of old, when the world—or anything little that thinks itself large enough to form any considerable part of the world—issues its invitation to 'Come and show what you have,' it implies 'Come and see what I have.' Hence it happens that every International Exhibition consists mainly of exhibits of the products of the country in which it is held. Another circumstance that has more of late contributed to this result is the growing conviction among manufacturers, especially those of England, that exhibiting their goods at exhibitions abroad is only to teach Continental manufacturers how to make them, and as they can be made at first hand more cheaply on the Continent than in Great Britain, the British competitor cannot compete abroad, and so stays at home. Though there is another view of the subject, English makers are more and more losing faith in it, and, as many English manufacturers know to their cost how ingenious the Belgians are in copying and applying to their own use the mechanical skill and patented products of other lands, it comes that Belgium has the greater part of the International Exhibition at Antwerp all to itself, and English requirements are accommodated in a very small space. The contrast between the two is especially striking in the two great industries of both nations—iron making and machinery. England has no representative or representation worthy of distinct mention in these matters at Antwerp, while the great Belgian iron and machinery-making firms show more largely than ever. The great house of Cockerell & Co. has exhibits on a scale which it is computed will cost them 150,000 francs to make them. And the works are, comparatively speaking, next door to the Exhibition building. What would it have cost any English manufacturer, then, to have made such a show? The Germans and the French, who have easy access, are making exhibits on a scale which show how much such Belgian firms as Cockerell & Co. have to compete with in iron and machine trade upon the Continent.

But in writing, even thus vaguely and generally, of the exhibits at Antwerp, I write more by faith than by sight, for though the Exhibition was formally opened on the 2nd inst., and I have deferred writing this until the last moment that the printing requirements of the *SANITARY RECORD* will permit, the larger part of the exhibits is yet unseen, and very few indeed of the exhibitors have yet concluded all their arrangements. Yet I do not speak without book, for, strange to say, the catalogues, which at most Continental exhibitions are the last things to make their appearance, were at Antwerp the first. Perhaps after all this was to be looked for there, where the first most celebrated printer in the world—Pantin—flourished: where his labours are so much appreciated that the local authorities have bought the house, the printing-office, and all its presses, types, &c., and converted it into a museum, which is unique in its character and historic worth, and marvellously interesting, especially to an Englishman, for there Tyndal's first full and comprehensive translation of the Bible into English was printed. One need not go to Antwerp to compare what was then printed by the Flemings and what is now spoken in England to learn how much the English language has changed since then. Of course the Flemings are not responsible for the different forms the types take in English printed Bibles in these days from that they put on in the edition that Pantin printed of the first English Bible; but the Flemings are responsible for the changes our mother tongue has suffered at the hands of the printers who have put it into the type of the catalogue of the English section of the Antwerp Exhibition.

Thus, while it would be all the same to a Belgian ignorant of English, no Englishman on the Continent would think of ordering from John Moir & Son, Limited, of Leadenhall Street, London, anything like 'burries,' 'sams and sellies,' 'jart fruits,' 'devilled meats,' 'jenned fowls,' 'jomatoes,' 'paches,' 'jamarinds,' and 'cords and milk.' Fancy an enterprising Belgian writer anxious

the English names for things edible and of general demand, looking into a dictionary for is! Here I may give a list of English exhibitors appertaining to food and health and

Robinson & Co., Rawmarsh, Rotherham, Yorkshire. Original spiced vinegar.

G. Soutter & Co., St. Mary Axe, London.—Paints, and sanitary appliances.

Queensland Meat Export Company, Fenchurch Street, London.—Preserved meats.

West & Son, Sheffield.—Furniture and other appliances.

Watt, Liverpool.—Scotch whisky and British

Co., London.—Mineral and aerated waters.

Gibbs, Mill Street, Liverpool.—Heating and gas apparatus.

Anderson, Erith Iron Works.—Patent re-purifier, as used by the Antwerp Waterworks purifying water from the river Nethe for the town of Antwerp, duplex pumps, and hydraulic.

Id. Smith & Stevens, Battersea.—Patent door

ne-Throwing Sun Company, Dundee.—Ship-signalling and throwing lines for saving life. Murray Braidwood, M.D., Birkenhead.—Designs of ships.

Smith & Sons, Stockport.—India pale and ales, and Imperial stout.

Bermondsey.—Ship-biscuits, and food medicinal appliances for dogs, game, poultry, and other

Manure Company, Fenchurch Street.—Artificial and chemical manures.

British Syphon Manufacturing Company, London.—And seltzogenes for aerated waters.

Walcot, Sheffield.—New inventions of household

& Harrison, London.—Ship, dog, and other and poultry food.

Meyers, Hull and York.—Cattle and poultry pig powders.

Bradford & Co., London and Manchester.—Mashing machines, and machines for dairies.

& Co., Gloucestershire.—Ale and beer.

Erskin & Smith, Norwich.—Poultry food.

Ke & Co., Stratford.—Ale and beer finings.

& H. O. Wills, Bristol.—Tobaccos.

Milting Company, London.—Extract of malt.

& Co., Houndsditch.—Preserved Meats.

Kennington.—Decorated tables.

Maignen, London.—Filters.

Mer, Dublin.—Irish whisky.

Phosphor Guano Company, Seacombe.—Phosphor

artificial manures.

Patent Agency Company.—Life-saving apparatus.

Brownlow, Manchester.—Filters.

See & Sons, Leeds.—Thus described in the 'Furriers, curriers, leather belt manufacturers, and general will (sic) furnishers.'

Sydney, London.—Improved system of gas-

Clark & Sons, London.—Dog and poultry

niloe & Son, London.—Water-closets and lava-

& Paget, Keighley.—Washing and wringing

Sanitary Compounds Company, London.—Dis-soaps, sheep dip, &c.

General Fibre Company, London.—Rice and grain deco-ticators.

Id. & Bland, London.—Annatto for colouring butter, rennet, &c.

T. Farmer & Co., London.—Artificial fertilisers, and the raw materials used in their manufacture.

Voile & Wortley, London.—Liquorice manufacturers.

F. Selby & Co., Birmingham.—Patent safety and other kinds of axles, coach springs, and general saddlers' ironmongery.

Most of these enumerations speak for themselves and need no further description. Those about which there is something more to say will, ere the next issue of the SANITARY RECORD appears, have been made more patent to my eyes than they are at present; and hundreds of exhibits of other lands will have been telling of matters of interest to my readers.

ARTISANS' DWELLINGS IN DUBLIN.

THE visit of the Prince of Wales and Prince Albert Victor to the slums and to the improved labourers' dwellings in Dublin, as well as the approaching meeting in that city of the Royal Commission on the Housing of the Industrial Classes, has directed considerable attention to the domestic condition of the poorer classes in the metropolis of the sister country.

There is no doubt that within the past decade there has been a considerable improvement in the direction of providing new dwellings for the working classes, the number of families thus accommodated within that period being over 2,000; but much remains to be done by the municipal authority in actively dealing with 'unhealthy areas,' and in preventing the wholesale adaptation of private dwellings to tenement houses without any structural alterations.

The buildings visited by their Royal Highnesses in the Coombe are those erected by the Dublin Artisans' Dwellings Company, Limited, in 1881. The area on which they are built is one of the nine unhealthy areas reported to the Corporation in 1876,* and comprises 4½ acres. It was cleared under the provisions of Sir R. Cross's Act of 1875, at a cost of 24,000*l.*, and was leased to the company at a rent of 200*l.* per annum. This does not seem an encouraging financial result, but when it is considered that the average rates paid by the old buildings were about 60*l.* per annum, and that they now amount to over 600*l.* a year, it will be evident that the ratepayers of Dublin have made a very sound investment, altogether apart from the question of improved health.

The area is laid out in two main thoroughfares, 40 feet in width, intersected by four avenues leading into large squares. In the main thoroughfares are two-storey cottages, letting at from 5*s.* 6*d.* to 7*s.* per week, and in the squares one-storey cottages rented at from 3*s.* 6*d.* to 4*s.* The entire surface of the streets, avenues, and squares is laid down in asphalt. These are in all 100 two-storey, 104 one-storey cottages, and six shops, the erection of which, including all expenses, cost slightly over 26,000*l.*

The two-storey cottages are of two kinds, one (letting at 7*s.* per week) is 15 feet in frontage, 24 feet in depth, and 19 feet high, exclusive of yard: the accommodation consists of living-room and parlour on ground floor, and two bedrooms upstairs; the other (5*s.* 6*d.* per week) is 13 feet 6 inches in frontage, and 19 feet in depth, with one living-room downstairs and two bedrooms above.

The one-storey cottages which are confined to the squares are also 15 feet in frontage, 21 feet in depth, and 10 feet high; they contain a living-room and one or two bedrooms, according to plan.

All the living-rooms in the site are laid down in concrete, and also the sculleries, yards, coal store, and closet.

The front walls of all two-storey cottages are red brick, backed with concrete, and the rear and cross walls are concrete, as are all the walls of the one-storey cottages.

* See report on THE PRESENT SANITARY CONDITION OF DUBLIN, by our Special Correspondent. SANITARY RECORD, Nov. 11 and 18, 1876, pp. 306 and 321.

The closets are on the dry system : they are only large enough to contain one week's refuse, and are regularly emptied from cleansing passages at the rear : they were adopted, after considerable inquiries, from the plan of the closets at Ripleyville, Bradford, where the water-closets at first in use had to be removed ; and work very satisfactorily.

The population in the dwellings at present is 1,020, as compared with 960 before the clearance of the area.

The death-rate over the entire population housed in the company's dwellings was, for the year 1884, at the rate of 18·3 per 1,000, which compares very satisfactorily with that of the city. In comparing the mortality of persons living in improved dwellings with that of an unhealthy city containing those dwellings, allowance must be made on the one hand for the facts that mortality among artisan classes is higher than that of the superior social grades, and that in artisans' dwellings is always to be found an undue proportion of children, and, therefore, of lives at unhealthy ages ; and, on the other hand, consideration should be given to the circumstance that inhabitants of artisans' dwellings are carefully selected from a class who in their turn are entitled from their aspiration for improved dwellings to rank a 'peg' above their fellow-workmen, content with their homes ; and also that there is a large proportion of inhabitants of artisans' dwellings in the healthy age-periods of twenty to forty years.

The Dublin Artisans' Dwellings Company own twenty-three acres in all, and when their present engagements are completed, will have provided within ten years of their formation cottage accommodation for about 1,050 families, and block buildings for 200.

Their Royal Highnesses, after having visited one of the slums in Golden Lane, drove up to the Coombe, attended by Mr. Francis Knollys, private secretary, and Captain Hammond, R.N., naval aide-de-camp to Lord Spencer. They were received by Mr. Richard Martin, chairman, and Mr. Edward Spencer, secretary to the company, and by them conducted into one of the one-storey cottages in Reginald Square.

Their Royal Highnesses spent about ten minutes in the cottage, inquiring the position and wages, &c., of the tenant's husband, and then examined the yard and closet.

The Prince of Wales was pleased with the concrete walls and expressed a favourable opinion as to their durability : he also approved of the sanitary arrangements, and thought the dry system preferable to water-closets for such dwellings.

On leaving the cottage the Princes were surrounded by a large and enthusiastic crowd, amid the cheers of which their Royal Highnesses drove away.

SANITARY MATTERS IN FRANCE.

(FROM OUR OWN CORRESPONDENT.)

A PREFECTORAL circular, lately issued in Paris, directs that dead bodies are not to be conveyed beyond the limits of the prefecture, unless inclosed in an oaken coffin, of which the planks are 0·m. '027 thick, the iron bands 0·m. '03 wide, and 0·m. '004 thick. If the body has to be removed to a distance exceeding 200 kilomètres (133 miles) the coffin is to be made of lead 0·m. '002 thick. It sometimes happens that when bodies are removed to a distance of 200 kilomètres (133 miles) fluids and gases escape from oaken coffins ; this unseemly sight and overpowering odour have vividly impressed the municipal authorities who have loudly called for a reform. The Préfet of Police, adopting the advice of the Conseil d'Hygiène, has decreed that henceforth dead bodies, removed to a distance of 200 kilomètres, must be placed in a coffin lined with India-rubber or cardboard steeped in tar.

The Préfet of Police has requested the Conseil d'Hygiène to examine the subject of the boat-washhouses on the Seine, and to consider the desirability of dirty linen

being washed in the river. A commission has been named consisting of M. Sax, M. Riche, Baron Larrey de Luynes, M. Lagneau, and M. Jungfleisch to report on the question.

M. Brouardel, Professor of Medical Jurisprudence and Lecturer on Hygiene, has been promoted to the rank of Commander of the *Légion d'Honneur*. Dr. Proust, General Inspector of Health, has been named *chevalier* of the same order.

M. Bouchardat, the Veteran Professor of Hygiene at the Paris Medical Faculty, has resigned. It is rumoured that Dr. Proust will be his successor.

M. Gérin-Roze and M. Duguet, at a meeting of the *Société Médicale des Hôpitaux*, described three cases of lead-poisoning resulting from handling chemical *braise*. *Braise* is a special kind of charred wood, sold only by bakers ; it is merely the burned wood left in their furnaces when the fires are extinguished. The women attacked by lead-poisoning dried and packed *braise* which had been steeped in lead nitrate. All the workers were perfectly healthy before working in a factory of chemical *braise*, and most of them continued in a good state of health until the workshop, which was a large airy room, on the third floor, was removed to a small ill-ventilated room underground. People who eat meat grilled over fires of *braise* thus prepared are liable to lead-poisoning, also tailors, who use this *braise* for their hollow irons. M. Labbe has observed lead-poisoning produced by eating bread which had been baked over wood painted with lead pigments.

The Préfet of Police has issued the following decree. A special service is to be organised for inspecting houses and apartments let furnished within the limit of the Prefecture of Police ; the territory included in the Prefecture and situated outside the fortifications is divided into four districts. A health inspector of furnished apartments is appointed to each district, and is obliged to visit at least once a year all furnished houses and apartments in his district. All furnished houses recently put on the list must be visited by the health inspector, also all lodgings which pass from the hands of one landlord to another. In the case of infectious disease breaking out in a lodging-house, the health inspector pays a visit of inspection without loss of time, and makes the necessary arrangements to ensure the safety of the public health. In case of illness or forced absence on the part of the visiting inspector he is replaced by a colleague. After each visit a report is sent in to the Préfet of Police. A general report is sent in by every inspector in the month of October.

Le Conseil d'Hygiène et de Salubrité de Paris has raised the question whether in the interest of public health isinglass ought to be used by pastry-cooks in making creams. In France, an article called 'Japanese Pearls' (*Perles Japonaises*), made with isinglass, is sold for making a soup which is highly esteemed. As isinglass is perfectly innocuous, the Conseil decided that it is not necessary to prohibit its use ; nevertheless, when used in the preparation of creams and jams, the public are to be made aware of the nature of the article they buy.

Le Conseil d'Hygiène et de Salubrité Publique of the Seine discussed at a recent meeting a report on the danger of infectious diseases being propagated by workshops where bedding is purified and the wool recarded. It was decided that such establishments should be included in the second class of unhealthy establishments and not in the third, as at present ; therefore, when the Minister of Commerce has sanctioned this change, the above operations will be carried on in houses where hygienic precautions are more rigorously observed. It is also forbidden to recard the wool of mattré-ses, to beat that material or horsehair, in the streets of Paris.

M. Ch. Girard, the principal of the Paris Municipal Laboratory, has sent in his report to the Préfet of Police. It constitutes a handsome volume in quarto, numbering 816 pages. ['Documents sur les Falsifications des Matières Alimentaires et sur les Travaux du Laboratoire Municipal.' Deuxième Rapport. One vol. Paris : G.

isson. 1885.] The chapters on mineral waters, wine, beer, vinegar, milk, contain full information concerning their production; also the different methods of falsification, and the means of discovering them. The same information may be gathered concerning cheese, meat, fat, lard, oils, cereals, bread, macaroni, vermicelli, &c.; flour, cocoa, chocolate, sugar, syrups, tinned meats, and vegetables and fruits. Nearly all hair dyes sold as infallible vegetable preparations contain mineral poisons. Antiseptic milk contains either nitrate of silver, sulphate of copper, lead acetate, or mercuric chloride. Lead carbonate or subnitrate of bismuth are used in rouges and powders; sulphide of arsenic and lead monoxides are used in epilatory pastes and powders. The chemical inspectors of the Municipal Laboratory paid in 1883, 340 visits of inspection to the Paris markets, 22,312 to be restaurants, 2,065 to beer shops (*brasseries*) and coffee-shops (*cafés*), 1,488 to pork-butcher's shops, 4,574 to other shops, 7,433 to grocer and fruit shops. Honest tradesmen approve of the Laboratory surveillance, and dishonest tradesmen have somewhat abated their fraudulent practices since it has been instituted. Many of the principal French towns have established municipal laboratories on the model of the Paris Laboratory.

The April number of the *Revue d'Hygiène* has several very interesting articles. One by M. Vallin, in which the author treats of the connection between the use of sewage for agricultural purposes and the incidence of typhoid fever, is of general interest. It appears that the deaths from typhoid fever in the French army have always been much more frequent in the southern garrisons than in the northern. For instance, dividing the corps d'armées into three groups, we find the following proportion of deaths from typhoid fever for every 10,000 soldiers:—

	1866.	1867.	1868.
Northern Garrison	18'30	14'10	19'80
Centre Garrison	17'90	28'10	43'20
Southern Garrison	20'00	29'50	49'00

The figures may differ year by year, but the Northern Garrison has always the greatest immunity from this disease. We are told that M. Brouardel attributed the great mortality in the south to the fact that sewage was there freely used on the fields in proximity to the barracks. M. Vallin roves, as we think satisfactorily, that this assumption of M. Brouardel cannot be supported, and that the comparative healthiness of the northern garrisons must be attributed to other causes, which at present he does not attempt to specify.

Another article consists of the report of MM. Vallin and Hudelo on the question of the propriety of allowing sewage matters to enter sewers when properly constructed and sealed. The Commission de l'Assainissement of Paris, in its sitting of July 5, 1883, adopted a resolution authorising the discharge of sewage matters into suitable sewers. But, arising lest later experience and fuller knowledge of the subject might have discredited to some extent their use, M. Vallin and Hudelo, the secretaries of the two sub-commissions, were requested to prepare reports upon the subject.

The reports, which treat the subject from the hygienic and technical points of view respectively, both support the use of proper sewers.

Now that the Commission has, with due deliberation arrived at this opinion, it is to be hoped that they will initiate with as little delay as possible a thorough system of main drainage, and relieve the city from its myriad septic, fixed or movable. There are other well written papers and reviews, which make up altogether a decidedly interesting number.

THE Corporation of Richmond (Yorks) are providing a new cemetery at an estimated cost of about 2,000*l.*; one of the laudable features of the plan is that as a precaution against infection the mortuary is divided from the rest of the chapel by a glass screen.

FOOD THRIFT.

THE cheap and nutritious meal given to the unemployed in Lisson-grove, by Dr. Norman Kerr, having proved a most successful experiment, the committee of the Emmanuel (Maida-hill) branch of the Church of England Temperance Society organised, by desire of Mrs. Tanner, the vicar's wife, a Penny Supper for about 160 poor people living in the vicinity of Edgware-road. The Misses Cameron, of the South Kensington School of Cookery, prepared the haricot stew, which formed the supper, and which was well tasted and apparently much appreciated. After the soup hot coffee and brown rolls were served to each person, free of charge. Dr. Norman Kerr gave an introductory address on behalf of Miss Cameron, and also stated the object of the Society, which was to demonstrate that palatable and nutritious food could be obtained at a very trifling cost. He said it was a common error to suppose that meat was the only or the most nutritious food; here, for instance, was an excellent soup, made from the simplest and least costly ingredients—haricot beans, onions and potatoes, which absolutely contained three times the amount of nutrition of the same quantity of lean meat. People appeared to imagine that if any were sick they needed 'nourishment,' and were ready to force them to eat meat; but invalids were more likely to be injured than benefited by such a course of treatment. Miss Cameron explained how she had made the soup, which contained the three necessary constituents of human food, namely, nitrogen, carbon, and mineral salts. This could be made at a cost of about a penny per head, for four persons—a pint of haricot beans 2½*d.*, ½ lb. onions ½*d.*, 2 lb. potatoes 1*d.*, and seasoning ½*d.* At the termination of the proceedings every one present was offered some of the soup to take home, and received clearly-printed instructions for making it.

SANITARY MATTERS IN AMERICA.

(FROM OUR OWN CORRESPONDENT.)

TENEMENT-HOUSE INSPECTION.

THERE is attached to the Health Department of the City of Chicago a bureau for the inspection of tenement-houses, dwellings, and factories. It is in charge of Chief Inspector W. H. Genung, and, as showing the practical workings of such a department, some of the features as presented in the superintendent's report for the year 1884, just made public, will be mentioned.

There were 28,092 inspections made during the year, and the following information concerning each building is on file in the Health Office.

Date; location; ward. Owner or agent, address; description of the building, storeys, size, material. Number of families in building, rooms, persons, males, females, boys, girls. Is there a store, workshop, or factory on the premises? If so, where? Kind of business; employer. Number of employees; males, females, boys, girls. Are there any dark, damp, filthy, or unventilated rooms? Are the water-closet rooms clean and properly ventilated? Description of out-houses and barns, and how used? Is the surface of lot below street-level, and how much? Are the plumbing works in good repair, and well trapped? Are the buildings and yard properly connected with the sewer? Is the cellar well ventilated? Is it clean and dry? What part of the premises need lime-washing? Sanitary condition of space under building, yard, alley, street gutter, corner catch basins, and vicinity. Number and location of catch-basins, water-closets, and privies, and their sanitary condition. State what nuisances exist. Is the water supply adequate and on each storey? Any violation of ordinance? Action taken by inspector, and remarks.

From the above abstract of an inspector's blank, it may be seen that the sanitary information concerning the tenement-houses is reasonably complete in Chicago. Beside

the 28,092 examinations made under city ordinances, there were 3,240 examinations made under the state law, of buildings in process of construction. The owners or occupants of 1,932 and 483 shops and stores complained of sanitary defects in the plumbing, drainage, or ventilation in such buildings, special examinations being made and the defect corrected.

The employment of children under fifteen years of age for more than eight hours a day is forbidden, and the ordinance pretty generally obeyed.

Improvements of a permanent character were made in 4,229 buildings of all classes, and included such repairs and construction of catch-basins, trapping and ventilating house-drains, sewers, and soil-pipes; ventilating bedrooms, work-rooms, bath and water-closet rooms, supplying light and ventilating shafts, providing adequate water supply, supplying proper traps for plumbing and drainage; guarding dangerous machinery; providing egress from buildings likely to burn, &c.

It is recommended that the law be changed so as to compel all plumbing to be constructed in plain sight. This provision, Mr. Genung believes, would encourage the plumbers to do better work and to use better material; would educate the public to know good plumbing and material when they see it; it would greatly improve the sanitary condition of houses, and make repairs easy to perform, and defects easy to locate.

The following is an instructive summary of what one department, with an entirely inadequate force, can accomplish:—

Factories and workshops examined	8,808
Stores examined	9,162
Miscellaneous places of employment examined	3,848
Total examinations made.....	21,819
Number of males employed	217,335
Number of females employed.....	46,196
Number of boys under 15 years employed in stores..	619
Number of girls under 15 years employed in stores..	346
Total number of persons employed in above places	263,491
Notices served in factories, &c.	421
Tenement-houses examined.....	4,394
Rooms in said houses	42,994
Families in said houses	10,445
Males in said houses	24,815
Females in said houses	23,528
Boys under 15 years in said houses	7,755
Girls under 15 years in said houses	7,822
Total number of persons occupying said tenement-houses.....	48,343
Notices served in above houses	2,670
Special examinations in factories, workshops, &c. ..	483
Notices served for same	346
Special examinations made in habitations	1,932
Notices served for the same	1,541

SANITARY SUPERVISION OF HOTELS.

It has remained for the Sanitary Protective League of New York city to originate an entirely new sanitary movement. It has prepared a Bill, which it will try and get passed by the State Legislature, which provides that in all towns and cities in which there are boards of health, the owners or keepers of all hotels and lodging-houses shall apply to such boards for sanitary certificates, which shall certify to the good sanitary condition of their houses. These certificates shall not be granted to houses which have not freedom from dampness of site or cellar, proper drainage and plumbing, absence of foul and noxious odours, adequate supply of water, direct light in sleeping rooms, and at least 600 cubic feet of air-space for each occupant. Each innkeeper must obtain and display this certificate, as failing to do so subjects him to damages for sickness of occupants during such negligence, and, in case of death, the executors of the deceased have cause for action.

STATE SANITARY SURVEY.

By far the most ambitious piece of sanitary work being accomplished in the States at the present time is the sani-

tary survey of the State of Illinois. Blanks have been provided to every health officer, and he is expected to see that a complete sanitary survey of his locality is made and sent to the secretary before warm weather sets in. The tabulated returns will make an invaluable reference for the study of epidemics.

EMPLOYERS AS LANDLORDS.

MESSRS. CHUBB'S NEW DWELLINGS.

AN illustration of the protective interest which employers are again beginning to show towards their workpeople will be found in the dwellings which have just been completed and opened for the well-known firm of Messrs. Chubb in connection with their works, Glengall-road, Old Kent-road, S.E. The wishes of the workpeople were consulted before the scheme was put into effect, and a committee of the employes will undertake the general details of management, as it is usually admitted that the interested parties generally are the best judges of their own requirements. The buildings, so far as they at present extend, consist, on the ground floor, of a large dining-hall, 60 feet by 28 feet, in which 150 persons can dine, and twice that number can be accommodated when the hall is used for concerts or meetings, a coffee bar, reading-room, kitchen and offices; above are three floors of dwellings, nine rooms on each floor, so arranged as to be let in tenements of one, two, three, or four rooms, without alteration. All room doors open to an external gallery, so that the possibility of foul air passing from room to room is avoided. Access is given to them by a stone staircase open to the air on one side and the balconies or galleries on the front elevation, so that the air cannot be conducted from floor to floor. The floor is flat, of Portland cement concrete on iron joists, serving as the customary drying ground.

Each tenement is provided with a cooking-stove by Barnard & Co., or the Carron Co., cupboard and coal-locker, and each room has two ventilators out of sight, formed in the meeting rails of the sashes. The usual form of dust-shoot, with self-closing door on each floor is also adopted here, receiving the ashes and smaller kinds of refuse, conveying it to the basement, from which it can be removed without entering the building; this shaft is also carried up and ventilated above the roof. A laundry is provided on each floor of dwellings, so that the tenants need not be far from their rooms and families when washing. Coppers and sinks are also provided, the waste-pipe of the latter discharging over a grating in the open air. W.C.'s are provided on each landing, and are assigned to the separate tenements, the tenants being furnished with their own keys. Doulton's Lambeth closet has been used with his vacuum waste-preventer, a very efficient and economical combination. The soil-pipes are of iron, and are carried down outside the building into manholes, the upper ends being continued above the roof for ventilation. They are jointed in red lead, and tested by being plugged and filled with water.

The drains are of grey stoneware pipe laid in straight lines, and with regular fall from manhole to manhole, no bend or junction being used. All drain-pipes are jointed in Portland cement, and have been tested by having been filled with water after the lower ends had been plugged with clay. The bottom of the manhole in each case has been formed in cement concrete to the contour of the pipes connected to it. In the last manhole, before the drain reaches the sewer, a glazed stoneware capped syphon-trap has been inserted to shut out foul air from the sewer. The drain is ventilated from end to end by pipes carried above the roof. Doulton's grease-trap has been fixed outside the building to receive the wastes of bar and kitchen sinks.

The water supply is on the constant system, and no water can be drawn except direct from the main. The water for supplying the w.c.'s is stored in a cistern above them, and

is entirely independent of the drinking water. Tylor's 'waste not' tap, which will allow one bucket of water to be drawn and will then close itself, unless turned again, has been used to check waste at the pail services. The ventilation of the hall is effected by large inlet-ventilators placed under each window (see diagram), which admit the air from the outside into a chamber under the window-cill, from whence it can be passed into the room by lifting

Section of Air Inlet at Window Cill.

the window-board which is hinged as a flap (shown by the dotted line). As these cills are high, and the air has an upward tendency, no draught results. A series of outlet ventilators have been formed in the cornice, communicating with special flues, which are carried up in the walls of the building.

The Dining Hall, Coffee Bar, and Reading Room are heated by steam, which is conveyed by wrought-iron pipes round the walls.

All the cooking is by gas, the apparatus being supplied by Mr. Thomas Nock, of Birmingham. The fumes from this gas apparatus are collected in a large iron hood immediately above it, which terminates in flues carried up to the top of the building. This iron hood is covered externally with looking-glass panels in ebonised wood frames, and forms the show case behind the bar, being furnished with shelves which carry glasses and ornaments.

The flooring of the entire ground storey is composed of Lowe's wood-block paving, and consists of a bed of Portland cement concrete, six metres thick, covered with a layer of asphalt, on which the wood blocks are laid while it is hot. They are thus securely held in their places, damp is prevented from rising, and a warm noiseless wood floor of good appearance is obtained, without any air space below in which dust or objectionable matter can accumulate.

Except in the living rooms and bedrooms, the brick-work has been 'worked fair' and left unplastered; and in the ground storey a pleasant decorative effect has been obtained from the natural colours of the pine ceiling; the red-brick walls and the high Portland cement dado being finished at the top by one course of glazed bricks with a scroll pattern.

The ground-floor water-closets and urinals are easily accessible from the dining hall, but are isolated by an open area, which must be crossed before they can be reached, thus preventing any accumulation of foul air in close proximity to the building. All the staircases are of York stone, and the balconies are formed of wrought iron chequered plates. The ground storey and staircases are lighted by gas, which it has not been considered advisable to bring into any of the living rooms.

Picturesqueness has been considered by fencing in a space of ground in front of the building, and it will be laid out as a garden for the use and enjoyment of the tenants. The work has been designed by Mr. E. Hoole, F.R.I.B.A., who has previously given much study to the practical working of the question in more or less similar shapes; and it is intended, if the present experiment should meet with the success it undoubtedly deserves, to extend the buildings—provision having been made in the plan to enable this to be accomplished when necessary.

BRICK v. STONEWARE SEWERS.

FOR some years past it appears to have been the practice for the Vestry of Paddington to put in large brick sewers in all cases, without regard to the number of houses to be drained. The erection of ten new houses in Manor Place, a short road with only one outlet, and in which not more than thirty houses can be built, recently led the Vestry to resolve to put in its regulation brick sewer of sufficient capacity to drain a town. A tender of 987*l.* was accepted, and this came up for sealing on Tuesday, April 21, Sir Charles Locock, Bart., in the chair. The Rev. Mitchell Cox proposed that the seal of the Vestry be affixed to the contract, whereupon Mr. Mark H. Judge, A.R.I.B.A., proposed the following amendment:—'That inasmuch as there is no evidence that the existing 12 inch pipe sewer in Manor Place is defective, and as a 12-inch sewer is of sufficient capacity to drain more houses than can possibly be erected on the one side of Manor Place which can be built on, this Vestry is of opinion that it would be an unwarrantable expenditure of money to lay any new sewer in this road, and that to put in a brick sewer 3 feet 9 inches by 2 feet 6 inches, as proposed, would not only be a gross waste of public money, but would require, in addition to the cost of the sewer, 987*l.*, a further outlay in the erection of a tall ventilating shaft to prevent the sewer from becoming a nuisance and danger to the neighbourhood, including the new recreation-ground, which has been laid out at so great a cost; it is therefore resolved that before voting on any proposal to fix the seal of the Vestry to the contract for a new sewer in Manor Place, the opinion of a sanitary expert be obtained upon the following points:—

1. Whether the existing 12-inch pipe sewer is of sufficient capacity to drain the existing houses in Manor Place?
2. Whether, if all the land which can be built over in Manor Place should be covered with houses, a larger sewer will become necessary?
3. In the event of a new sewer being considered necessary, should such sewer be a 3 feet 9 inches by 2 feet 6 inches brick sewer, or a glazed stoneware pipe sewer of some smaller capacity?
4. What provision should be made for the ventilation of the sewer recommended? And that it be referred to the Highway Committee to submit these four questions to one of the following authorities, viz., Mr. H. H. Collins, Fellow of the Royal Institute of British Architects; Dr. W. H. Corfield, Professor of Hygiene and Public Health, University College, London; Mr. Rogers Field, Member of the Institution of Civil Engineers; Capt. Douglas Galton, C.B., F.R.S., Chairman of the Council of the Parkes Museum of Hygiene.' This amendment was seconded by Mr. James E. Hill, and on a division was carried by 27 to 17 votes. Mr. Judge received the support of Col. Burchard, C.B., Dr. Bush, Mr. Collins, M.P., Mr. Edmeston, F.R.I.B.A., Mr. Fardell, Mr. Overseer Mills, Rev. R. F. Spencer, LL.D., Dr. Danford Thomas, Dr. Willis, and Dr. Parker Young. Strange to say, the construction of this enormous sewer was supported by an architect, Mr. H. Wilkinson.

THE last quarterly report of the medical officer for the city of Durham states that of the four fatal cases of small-pox that occurred during the thirteen weeks, it was found that none of the victims had been vaccinated.

MUNICIPAL FINANCE.

LOCAL TAXATION.

LOCAL taxation is intrinsically hardly so fascinating a subject for discussion as Members of Parliament appear to find it. It is a question involved and difficult beyond belief; yet there is scarcely a single member who is not ready to talk glibly about it, as though he were complete master of all its intricacies. There is endless variation in the suggestions made for the reform of local taxation, but the practical outcome of them all is the same: that the particular industry in which the suggestor is interested must be relieved. Radicals are at one with Conservatives in holding that the incidence of local taxation is unjust; but while the Conservative looks upon the landowner as the person whose imposts must be decreased, the Radical is eloquent about the burdens of the urban taxpayer. The divergence of opinion upon these points was strikingly brought out in the debate upon the general subject, into which the House of Commons was betrayed on the 5th instant on Sir Massey Lopes' amendment with reference to the expenses of registration. The amendment was to the effect that, as registration is a matter of imperial rather than local concern, the expenses connected therewith should not be imposed upon ratepayers in counties and boroughs, and levied in respect of the occupation of a single description of property. This was aimed at the proposal of the Government to make a temporary advance of 20,000*l.* towards the increased expenses of registration in counties this year, and was only defeated by 2 votes. We are not concerned for the moment with the merits of the proposal, or with the question whether the occasion was a legitimate opportunity for raising anew the whole subject of local taxation. But we may properly insist on the great injustice of the present mode of levying local imposts, and the need which exists for its reform being speedily and closely grappled with. As has been well said, at present honourable members 'throw the whole question of taxation into the crucible at once, without any clearer idea of what is to come out than that they want their own burdens reduced anyhow.' The President of the Local Government Board has more than once given an alluring sketch of the great measure of local government which he has in his despatch box, all ready for production as opportunity serves. In 1881 the Government announced that they were about to consult Parliament on the whole subject of local taxation in a comprehensive manner. In the Queen's Speech of 1882 the House was invited to consider the most equitable form of contribution from imperial rates in relief of local charges; and the Government were only saved from defeat on a motion of Mr. Paget by undertaking to deal with the whole question. In 1883 Mr. Pell urged that no further delay should take place, and the Government had a bare majority of 12 votes. On a subsequent occasion Mr. Pell obtained a majority for a similar motion, and now the Government have barely escaped an adverse vote on a resolution which inferentially raised the whole question again. There is no hope that the matter can be settled this year; but it will obviously be one of the very first subjects to which the new Parliament must set its hand, even if, as suggested by Sir Charles Dilke, a whole session has to be devoted to its solution.

NOTE.—The Stocks marked with an asterisk (*) are transferable in books kept at the Bank of England; those marked with a dagger (†) at other London Banks. The rest are transferable by deed in the usual way, and the Agents are officials of the several Corporations.

REPORTS OF MEDICAL OFFICERS OF HEALTH.

'Something attempted, something done.'

AYLESBURY RURAL.—Dr. Harvey Hilliard's report for 1884 is in every respect satisfactory. He records a distinct improvement in the general aspect of the district, although no works of importance were carried out, the inhabitants in many localities have been more attentive to the purity of their wells and to the disposal of sewage, and removal of offensive accumulations. Moreover, there was a notable decline in the mortality from zymotic diseases, the deaths numbering nine as compared with twenty-seven in 1883 and thirty-seven in the previous year. The general death-rate was also below the average. Forty-seven cases of scarlatina were investigated by Dr. Hilliard, four of which at the beginning of the year proved fatal. The disease threatened to become epidemic at Whitchurch, where twenty-four cases occurred within a few days, but it was fortunately stamped out by prompt action on the part of the sanitary officials, assisted by the inmates of the infected cottages. An outbreak of diphtheria also occurred at the beginning of the year, the circumstances of which were specially investigated. Five cases of typhoid fever were heard of during the year, none of which proved fatal, and neither measles nor small-pox contributed to the death-roll. The district, however, was visited on two occasions by this last-named disease, which was imported from London. The immediate performance of re-vaccination, together with prompt isolation and disinfection, prevented any spread of the infection, and Dr. Hilliard regrets that the public cannot be persuaded that the universal adoption of vaccination and re-vaccination would soon completely relegate this fatal and foul disease to the archives of the past, to keep company with the agues, spotted fevers, and black deaths 'of the good old times' before sanitation was so much thought of.

BARNSTAPLE.—Mr. Henry Jackson, the new health officer for the borough of Barnstaple, appears to have turned vigorously into the sanitary work of his district. His report for the last nine months of 1884 (the period since his appointment as medical officer of health) shows a district to have been generally fairly healthy, the death-rate from all causes for that period being 19.4 per 1,000 (including a 'zymotic' death rate of .82 per 1,000) among a population of 12,493. The principal sanitary defect, which was brought out in connection with some of the enteric fever cases that occurred, seems to be that of tilting of the sewers and drains. The entire system of sewers is stated, however, to be now receiving the consideration of the sanitary authority, who have adopted the advice of the medical officer and consulted an eminent engineer on the subject. Mr. Jackson gives the further advice that the action to be taken should be carried out before the warm season sets in. Another matter to which the medical officer of health has given particular prominence is the supervision of the slaughter-houses. Having received information that considerable traffic was going on in meat unfit for human food, he instructed the sanitary inspector to exercise great vigilance in this matter, and, as a result, no less than 102 visits were paid to the slaughter-houses in the borough during the last half of 1884. On five occasions unwholesome food (meat and fish) was seized and condemned, resulting in four prosecutions and three convictions. The water supply of the town, which has been very good, is being augmented to meet the requirements of the increased population. By-laws for the regulation of common lodging-houses seem to be required; and it is to be hoped that the endeavours to find a suitable site for a small-pox hospital or sanatorium will soon result in success.

BATH.—In his account of the precautions adopted during 1883 for restricting the spread of infectious diseases this city Dr. Brabazon was loud in his praises of the

statutory hospital, which was largely appreciated by all classes. He also referred to the mistaken efforts of a local body of anti-vaccinators, and placed on record some figures indicating the value of vaccination as a prophylactic of small-pox, which the agitators will find difficult to dispute. Both in 1883 and in the past year the importation of a case of the disease led to the adoption of the usual precautionary measures, and with complete success, for no further illness was heard of. An outbreak of measles (fatal in 39 cases) increased the zymotic death-rate from 0.3 per 1,000 to 1.1; but the health officer points out that, as in 1883 when whooping-cough was very destructive, the large proportion of the mortality arose—not from the existence of sanitary defects, but from want of care and from unnecessary exposure. The report does not contain any account of the circumstances attending the eleven deaths ascribed to typhoid fever in 1884, but the prevalence of scarlatina is attributed principally to school influence. As compared with the previous year, there was a considerable decline in the mortality from chest affections, notably phthisis, and there were eleven fewer deaths from cancer.

GLOUCESTER.—The sanitary authority of this important city and port district will do well to carry out without delay the sanitary improvements which their health officer lays before them in his annual report for 1884, more especially as his recommendations are all reasonable, and can be effected without difficulty. Finding that a considerable proportion of the houses in the town derive their water supply from pumps and shallow wells which are more or less exposed to pollution, he urges that every house in the district should be connected with the city water system, and that wells should be closed. He also points out that a flushing box provided with water from the city mains should be secured for every water-closet; and that every house should be connected with the city sewers. At considerable length Mr. Wilton enters into the important question of hospital provision for infectious diseases, laying stress on the insufficiency and inadequacy of the present accommodation in the Stroud Road, and he expresses, in effect, a hope that will be generally shared, that the necessary 'sufficient and efficient' hospital accommodation will soon be provided for the city and port. With this view he concurs in the recommendation of Dr. Biazall, who recently visited the district on behalf of the Local Government Board, that a hospital provided for the joint use of the urban, port, and rural districts of Gloucester would best meet the requirements of the case. The necessary watchfulness over lodging-houses, bake-houses, milk shops, and meat and fish markets was not neglected by Mr. Wilton during the year. The general death-rate of the city was 17.2 per 1,000, reckoned on a population of 39,373.

HANLEY.—Dr. Walker has taken considerable pains in working out the statistical portion of his annual report for 1884; but it has been to the exclusion of any general statement of his own work during the year or of the sanitary condition of his district. Nor does he indicate the directions in which the sanitary authority should put forth their energies; but he has possibly availed himself of other opportunities of doing this. The inspector's report which is appended, shows that the work of nuisance inspection, &c., is not at all at a standstill, 10,000 houses, &c., having been inspected during the year (468 by the medical officer of health himself), 500 re-inspected, 3,000, cleansed, &c. The general death-rate is somewhat high, being 21.0 per 1,000, and includes a zymotic rate of 3.6 per 1,000. A high rate of infantile mortality has prevailed in Hanley for some years past.

TORQUAY.—The sanatorium which was opened at Torquay in 1883 seems to have proved a great boon to the district, as was to have been expected. Mr. Karksek gives numerous instances of his having been able by removing the first case in a locality to prevent the spread of infection. This he has been especially in a position to do during the past year, as scarlatina was always present.

During the twelve months 53 patients were admitted to the sanatorium; and the medical officer of health records the satisfactory experience that parents are becoming less opposed to their children being removed to that institution. They find that their children are well cared for there, whilst, by the removal, the bread-winning in the family is saved from disastrous interruption. The water supply of the district has been considerably increased by the opening of a new reservoir an important matter in case of the recurrence of such a dry summer as was experienced in 1884. The dangers to which the public are unconsciously exposed, through the reckless use of doubtful water in manufacturing processes, is exemplified by a case, recorded by Mr. Karkeek, in which a well, long closed on account of pollution by sewage, was found to have been re-opened, and its waters used for washing bottles in a house where artificial drinks were made. There is always more or less difficulty in estimating properly the death-rate of a seaside resort, but, after deducting the mortality among visitors and strangers, the death-rate for the year was only 13.5 per 1,000 from all causes.

WALSALL.—The details of the sanitary work done in this borough, with its 60,000 inhabitants, are given in the tabular statements of the inspectors of nuisances, appended to the annual reports of the medical officer of health. It would be more satisfactory if the medical officer of health's report afforded a better index to the sanitary condition of the district. The death-rate in 1884 was 21.14 per 1,000, as compared with 20.03 in 1883, 18.4 in 1882, and 17.08 in 1881. The zymotic death-rate was 4.03 per 1,000. Scarlet fever and diarrhoea have been exceptionally prevalent and fatal during the last two years. In connection with an epidemic of small-pox in 1883, which caused 14 deaths, Mr. MacLachlan remarks that the effective manner in which the epidemic was stamped out should be recognised. Why, he asks, did the epidemic which, during 1872-3, carried off no less than 450 of the population of the borough, and caused the illness of 1,600, subside in 1883 with so comparatively slight a loss of life? Increasing care as to vaccination doubtless must be credited with some proportion of this result; but the confidence of the general public in the Infectious Hospital is the chief factor, and the prompt isolation of infected patients, which this confidence enabled the inspectors to secure, was rewarded by the safety of hundreds of lives.

WATFORD.—Dr. Brett's Annual Report for 1884 shows that he has not been idle as regards sanitary work in his district, although he has no striking sanitary defect to report upon at the close of the year. The need for a suitable hospital for infectious non-pauper cases is again brought forward by Dr. Brett, who points to the recent experiences of his district as sufficient evidence of the want of such provision. There is little in the water supply for the health officer to find fault with, but having regard to the fact that the supply is not unlimited, he remarks that there is still a great waste of water in the town. The sewers, he adds, must be ventilated, and 'the best means of effecting this is by open gratings in the road.' During the year many courts and yards were much improved, but still some of the houses 'are hardly fit for human habitation.' The death rate was 17.8 per 1,000 (including a zymotic rate of 1.6 per 1,000) reckoned on an estimated population of 12,950.

WEDNESBURY.—Mr. Garman does not devote any portion of his report to an account of the action taken for improving the sanitary condition of the district. In speaking of the decreased mortality from typhoid fever, however, he observes that it is a source of gratification to know that this disease of late years has only appeared in a sporadic form, which, he thinks, indicates a general improvement. The good water supply which the town possesses, more scrupulous attention to the midden system, frequent emptying of ashpits, and the complete supervision of all nuisances injurious to health, have done much,

whilst the inhabitants have become so reconciled to the sanitary officers and their duties in pursuing home-to-home visitations that people have become, so to speak, educated to cleanly habits and keeping their houses in order. All these circumstances tend materially to minimise the chances of any serious spread of typhoid fever. There were in all 88 deaths registered from the principal zymotic causes, against 121 in the previous year. Scarlet fever seems to be endemic in the district, having been more prevalent since 1877. In 1878 the great wave was reached, when scarlatina was responsible for 90 deaths. A declension was experienced in 1879, but another surge of the wave occurred in the following year. From that date the mortality has steadily declined, and Mr. Garman hopes that, now the disease has shown signs of abating, further progress in the sanitary improvement of the district may be the means of completing its entire exhaustion and effacement. Of the 21 deaths registered from diphtheria, 17 occurred in children under five, though Mr. Garman, in recording this mortality, protests against its being regarded as of a zymotic origin. Whooping-cough, a disease over which sanitary authorities can exercise but little control, was unusually fatal, and there was some prevalence of diphtheria which was concurrent with scarlet fever. Several cases of small-pox appeared in the district, and there was a mild epidemic of measles. Pulmonary affections were much more fatal than in the previous year, but the mortality amongst infants was below the average.

WITHINGTON.—In reporting on the sanitary condition of this growing district during 1884, Dr. Railton remarks that in view of the prevalence of cholera in Europe the local board last year issued a useful circular urging owners and occupiers to put their houses in order, and pointing out the essentials of a healthy house and the directions in which they should criticise their dwellings. This seems to have had the beneficial effect of arousing an anxiety among many householders to ascertain the sanitary deficiencies of their dwellings and have them remedied. The keeping of pigs seems to require regulation in Withington, and the medical officer of health suggests the adoption of a by-law on the subject. He observes that 'there can be no doubt that pigs create a disgusting nuisance, however clean their styres may be maintained, and it appears to be an injustice to others that the law should permit persons to keep them within a certain distance from the house.' The death-rate from all causes was only 13.0 per 1,000, but this includes a somewhat high infantile mortality which is evidently a source of anxiety to the medical officer of health. He, however, looks on diarrhoea among infants as more generally attributable to improper feeding and careless treatment than to bad sanitary conditions. The advantage of the removal to hospital of early cases of infectious disease was demonstrated in connection with the outbreak of scarlet fever in the district during 1884. Sixteen cases in all were removed to the Monaldi Hospital, and the extension of the disease was thereby undoubtedly limited.

A NEW feature in sewage treatment is that just opened at Burton, where a superior sample of effluent water is being discharged from settling tanks in which precipitation is effected by a process hit upon by a happy accident and the ingenuity of Dr. Thresh. Defecation is accomplished by a natural chalybeate spring flowing out of a damped mine; and this mixed with milk of lime is stirred into the sewage, and not only sends down all the visible impurities in a flocculent precipitate, but also removes a considerable proportion of the dissolved organic matter. The resulting sludge is declared to be of higher value than the majority of manures made from water-carried sewage. The chalybeate stream contains about two grains of carbonate of iron and ferric oxide per gallon, also fifty grains per gallon of mixed crystalline sulphates, or salts of alumina, magnesia, lime, and soda.

SURVEYORS' AND SANITARY INSPECTORS' REPORTS.

BARTON ECCLES.—Mr. Heywood, the surveyor of this district, commences in his report the number of streets which were sewered and paved in 1883, and records how many plans of new buildings were passed. Four additional connections were made between the shallow sewer and the deep one in Eccles to prevent the flooding of cellars, and a number of storm and other grids were fixed during the year. The report of the sanitary inspector, Mr. Lee, indicates that particular vigilance was exercised in securing the trapping of gullies and the fixing of ventilating shafts to soil-pipes. A distinct improvement was the diversion of the drains of a considerable number of houses, which had been so constructed as to allow the sewage to flow into watercourses, and their connection with the main sewer. The removal of refuse seems to have been fairly well performed; but Mr. Lee regrets that the inhabitants cannot be persuaded to exercise more economy by consuming the cinders and keeping the rubbish out of the ash-pits, which would considerably reduce alike the nuisance and expense.

BLACKPOOL.—Mr. MacDonald's report consists of a statement of the nuisances abated by him in 1883, which amounted to no less than 29,395. In this number, however, the inspector includes the emptying and purifying of 22,081 ash-pits and tubs, and the removal of 6,564 loads of refuse. The principal work of the year included the draining of thirty houses into the main sewers, the trapping of thirty down-spouts, the disconnection of forty stopstone pipes, the furnishing of eighteen houses with a proper supply of water, and the erection of twenty closets. Fifty manure middens were removed, twelve cellars were drained, and twenty ash-pits were reconstructed. On the whole, the routine work seems to have been satisfactorily performed, but in future reports Mr. MacDonald would do well to supplement his statement with some comments or explanatory remarks.

CHELTERHAM.—Mr. Long reports that in 1883 he issued a large number of notices, of which 172 required the opening, cleansing, or trapping of drains, 75 the removal of pigs, 120 the limewashing of cottages and closets, 13 the abatement of overcrowding, 17 the repairing of pumps, and four the provision of water. It would be desirable, however, that the report should state the result of these notices, as in the absence of this information it is impossible for the uninitiated to appraise the value of the inspector's work. The sanitary organisation of Cheltenham is, as a matter of fact, particularly good; but it is better to put the results of work upon record.

DUNDEE.—In his report for 1883, which is well and practically written, Mr. Kinnear dwells at length upon the evils arising from defective plumbing which were observed by him during the year. Altogether there were 180 dwellings examined on this account, and with but five exceptions all were found in need of improvement through defective material, and sometimes through the carelessness or maliciousness of the occupants. In twelve of the houses it was necessary to replace the existing water-closets with new ones, and eighteen old dwellings, which formerly had no conveniences whatever, were provided with closets on the wash-out principle. The cesspools or water-seals under, and the soil-pipe piping from a number of closets and sinks within houses, were badly perforated with holes, leaving a free passage for gas from the sewer to enter the houses. The complaints lodged at the office were principally from this cause. In a large proportion of the lead-piping and cesspools, or water-seals taken out, numerous corroded holes were found, clearly traceable to the action of sewer air. Tradesmen, Mr. Kinnear adds, were not altogether free from blame for the imperfect workmanship and light lead material which was frequently

observed when the old piping was removed. Considerable improvements were effected in the drainage. Out of a total of 170 dwellings examined, five only were found in anything like a wholesome condition. The drains of the other 165 were so imperfect in workmanship as to necessitate considerable repairs or total reconstruction. To do this, 1,613 yards of new glazed fire-clay 4, 6, and 9-inch pipes were used, and 894 yards relaid and properly jointed. In addition, 98 ventilating traps, having fresh air perforated iron inlet plates, were placed upon the drains, to isolate the buildings from all direct communication with the main sewer. In other respects sanitary improvements were rapidly pushed on, whilst the dairies and milkshops, common lodging-houses, &c., did not escape a close inspection, regard also being had to the abatement of smoke nuisances. The year under notice seems, indeed, to have been a laborious one for Mr. Kinnear.

GOVAN.—The yearly statistical tables prepared by Mr. McKay, the sanitary inspector for the Burgh of Govan, present a great variety of work performed by the department. The report is divided into nine different heads, beginning with infectious diseases, of which there were 349 cases registered, 430 apartments fumigated and white-washed, the clothing of 250 families washed and disinfected, 2,058 visits made to houses in infected localities, and 259 notices sent to School Board and teachers regarding infected houses. There were 1,107 nuisances removed, of which 452 refer to drainage. Sixty-one new houses have been placed on the register of 'houses let in lodgings,' while 652 daily and 307 nightly visits were made to enforce ventilation and cleanliness and prevent overcrowding; 5,263 reports were sent to the cleansing contractor, and 348 occupiers in tenements were notified to sweep and clean back courts. Under the heading of 'Unwholesome Food and Sale of Food and Drugs Acts' we find 21 inspections under the former and 7 samples procured under the latter. There seems to have been a great amount of alterations effected under the provisions of the Cattle Sheds Act in providing or repairing floorings, grippes, drainage, &c. The smoke test seems to be pretty well employed, as 178 houses had their drainage tested, resulting in the removal of offensive smells and other defects. A very important suggestion has been made by Mr. McKay in effecting an arrangement whereby every death from infectious disease should be daily reported to him, which we believe has received the sanction of the Council.

HERDEN BRIDGE.—Mr. Smith reports that the structural works carried out during 1883 for improving the sanitary condition of this district were of more than usual magnitude and importance. The most conspicuous and costly undertaking of this kind was the draining and paving of several streets; whilst in a number of others, in which the drains were laid in a very imperfect manner, the pipes were taken up and larger ones fixed in their place. In addition to this, 57 house-drains were repaired or entirely replaced, 46 were trapped and 18 disconnected. The number of nuisances dealt with amounted to 169, of which 50 arose from offensive accumulations, 23 from defective privies, and 81 from choked or otherwise imperfect drains. The scavengers emptied 2,606 closet-tubs, as against 2,080 in the previous year, and removed 360 loads of ashes and other refuse. Frequent visits were paid by the inspector to the common lodging-houses, and in two some important improvements were carried out.

ISWICH.—Mr. Moss reports that in 1883 he inspected 3,844 houses and premises, and issued 341 notices for the removal of nuisances or the execution of minor sanitary improvements, all of which were attended to. As many as 333 private drains were reconstructed, repaired, cleansed, and trapped, and a considerable number of privies were altered for the better. In nine cases the public supply of water was laid on to dwellings, and two polluted wells were closed. Some trouble seems to have

been caused by the improper keeping of animals; but in no case, either as regards these or other nuisances, was it necessary to resort to legal proceedings to secure compliance with the inspector's requirements.

KNARESBOROUGH RURAL.—In his annual statement for 1884 Mr. Gray, the sanitary inspector, reports that 634 nuisances had been recognised and 634 formal notices issued, 66 houses disinfected, 109 complaints registered, 14 wells cleaned out and effectually covered, 4 new wells sunk in pursuance of Water Act, 615 nuisances removed, and 1,385 yards of new drains had been laid. Four samples of milk had been tested by the public analyst and found pure. Certain minor matters, to which the attention of the authority was directed in the report, appear to have been satisfactorily disposed of.

LEEDS.—That a very large amount of work was got through by the officials of the Sanitary Department of this borough in 1883, the fact that something like 15,000 houses were inspected sufficiently proves. Yet the superintendent, Mr. Newhouse, confesses that he does not feel satisfied with this return, large though it be, for there can be no doubt, he states, that it is in the house itself that the most serious evils which the department has to contend with arise. He thinks, however, that with the limited power local authorities possess under the present Acts, more cannot be done; but he hopes the time is not far distant when their powers in this respect will be enlarged. Another difficulty is met with in dealing with the drainage of houses both old and new. A dwelling-house, to be properly drained, should have the connection with the sewer completely cut off by running the sink-pipe on to the surface, and then near to, but not into, a gully with intercepting ventilators. In Leeds, however, this object can rarely be attained, owing to the existing plan of back-to-back houses, which are flush with the streets. Extended powers are needed to compel owners of property to make improvements in this direction. While admitting that the Order in Council for the Inspection of Cowsheds, Dairies, &c., is right in making it incumbent upon local authorities to inspect such places, and order the alterations required to put them into a proper sanitary condition, Mr. Newhouse is of opinion, at the same time, that it is a great injustice to the occupiers to make him, and not the owner, responsible for the carrying out of the necessary alterations and repairs before the premises can be registered.

LEEK.—The epidemic prevalence of scarlet fever in this district entailed considerable labour on Mr. Farrow, who had to see to the removal of 212 cases of this disease, and the disinfection of 33 houses and of 1,112 articles of clothing and bedding. In addition to this, a large number of nuisances were abated, which arose for the most part from defective drainage. In 19 houses the closets were improved, and in 9 a proper supply of water was provided. The contractor for the removal of refuse and night soil seems to have done his work well, but several nuisances arose from the carriage of offensive matter through the streets. The report concludes with some tables of local interest, including the number of admissions to the hospital and a statement of the number of interments in the town.

NEWCASTLE.—The annual report of Mr. W. T. Clark, chief inspector of nuisances, presented to the Town Improvement Committee of the Corporation, shows that during the past year 1,344 complaints were received, 9,879 notices were served, exclusive of 2,063 letters written, and 3,918 special inspections were made. The number of streets inspected was 532; houses, 10,821; and tenements, 14,899. There arrived and were inspected during the year 236 boats, with 39,932 packages of fish, being a considerable increase on the previous year. We also learn with much satisfaction that it has not been found necessary to institute magisterial proceedings during the year, as owners and agents of property have, upon full explanation of requirements being given, willingly done all the necessary works. May we add—Other districts, please copy.

SALTLEY.—Mr. Payne's report, which is in the form of a statement, shows that sanitary work was actively carried on in this district during 1883. The public water supply was extended to 43 houses, and 36 drains were connected with the main sewer, 57 being cleansed, altered, and repaired. Proper regard was had to the removal of refuse, 946 privy pans and 740 ashpits having been emptied during the year. Mr. Payne issued 124 notices for the abatement of nuisances, which, with four exceptions, received attention. The plans for the building and alteration of 43 dwellings were approved, and the slaughterhouses and bakehouses were periodically inspected.

SCARBOROUGH.—Few sanitary inspectors have been able to record the performance of so much useful and permanent work as Mr. Finlay chronicles in his last report on this popular health-resort. Especial attention was directed to altering the defective sanitary arrangements of private dwellings, and the inspector observes with satisfaction that there are now many persons who recognise the need of sanitation. Out of a total of 1,854 houses inspected, 72 certificates of sanitary excellence were granted to lodging-house keepers. As many as 500 pan-closets were altered on an improved plan, and a large number of soil-pipes were brought outside and properly ventilated. In 432 houses sanitary gullies were fixed in the place of old and dilapidated brick ones, nine large cesspools and three wells were abolished; upwards of 50 rain-water cisterns under dwelling-room floors were done away with, and 20 old brick drains were destroyed, and sanitary pipe-drains laid in their place. Care was taken to strictly enforce the by-laws relating to slaughterhouses, bakehouses, &c., and a sharp look-out was kept on offensive businesses. Mr. Finlay's report, which deserves a word of praise for its excellent arrangement, concludes with an account of the system of refuse removal and street watering and cleansing, and some useful statistical tables.

SHIPLEY.—Mr. Smith seems to have been unusually active in this district, and his report for 1883 contains a lengthy list of the improvements effected during the year. Thus he records that as many as 987 sink-pipes were either trapped or disconnected, and that a change for the better was made in the drains of 50 houses. A large number of nuisances arising from offensive accumulations were immediately abated, and 2,000 notices were issued to the inhabitants, warning them of the danger of permitting masses of filth near their dwellings. In common with many other inspectors, Mr. Smith found that many of the better-class houses were in a far worse sanitary condition than cottages, as for the most part they had dangerous soil-pipes inside the dwelling, which had become perforated, worm-eaten, or so destroyed as to readily permit of the escape of sewer-gas. There were 246 notices issued during the year for the abatement of nuisances, of which 222 had been complied with at the date of the report.

TODMORDEN.—In reporting that the sanitary condition of his district was fairly satisfactory at the close of 1883, Mr. Blackburn notes with satisfaction that some of the owners of property, as well as the occupiers, have co-operated with him in removing, and in a number of cases preventing nuisances. As many as 21,460 privies were emptied during the year, but the mode of removal does not seem of the best. Five street sewers were laid or repaired, and 27 house drains were cleansed and otherwise improved. As in the previous year there were several cases of typhoid fever which arose from the consumption of polluted water, and scarlatina assumed at one time the proportions of an epidemic. Proper regard was had to the disinfection of infected houses, and in other respects the sanitary welfare of the district received attention.

WALSALL.—An enormous number of nuisances were abated in this borough by the sanitary inspectors, Messrs. Stephens and Harries, whose joint report consists of a number of statistical tables with occasional comments. In

on to the removal of unsanitary conditions, 287 s were supplied with water, 1,644 yards of new drains laid, 14 privies, 32 ashpits, and 107 water-closets erected, and 168 house drains trapped. A systematic tion of the borough involved the visiting and nation of no fewer than 8,889 dwellings, and led to rrying out of many useful sanitary improvements. ask of collecting samples of food and drugs seems to been efficiently performed, and an examination of the supply led to the detection and destruction of much ras unwholesome and unfit for food. The borough naded with a serious epidemic of scarlatina, and in onnection a warm tribute is paid to the inspectors health-officer who observe, that he cannot ade- ly express his admiration of the zeal with which, an anxious period, these officers laboured night and prevent the infection spreading.

ARINGTON.—The scavenging of this borough rel- particular attention in 1883, and there now remains le cause for complaint, which in previous years was ntly heard. This end has been largely brought by the gradual extension of the pail system, which rst commenced in August 1872, when there were losets of this kind in the town. There are now 7,537 in use, the number of midden-privies having been ed to 99. As many as 402 nuisances were abated byorman, the inspector, whose vigilance in the de- n of unwholesome meat deserves a special word of . An inspection of the common lodging-houses led punishment of nine owners for infringing the by- by the infliction of fines amounting to 10*l*. The , which concludes with some information of local st, does not deal so fully with the nature of the ces abated as could be wished.

DNESBURY.—This report is above the average, for, lition to recording the actual work performed during ear, Mr. Coney appends some remarks as to the of the various improvements. He reports that on encing his duties he found a large number of ash- rom which liquid filth was leaking. He therefore ed special attention to the matter, with the result of ng a more systematic emptying and cleansing. The n of lending whitewash brushes was much appre- by the inhabitants, as many as 481 brushes having lent and re-lent during 1883. The markets, common g-houses, and slaughter-houses were periodically d, and found to be in a fairly satisfactory condition. ge number of minor improvements, such as the trap- of drains, repairing yards, altering ashpits, &c., were d out during the year, and Mr. Coney reports that e most part he found owners of property quite willing nply with the notices served upon them, and although uisances were registered and 270 notices issued by in no case was it necessary to resort to legal pro- ce.

EXHAM UNION (RURAL) NORTHERN DIS- ts. In his annual report for 1883 the inspector ly district, Mr. H. Davies, states that the greatest lity which he has to contend with is the removal gnant water. It is evident from this statement the district is very imperfectly drained, and that is urgent need for an improved system of sewers. satisfactory to find that some efforts were made is direction during the past year; and that, in on to 167 houses being connected with the main s, 124 notices were given to make, repair, or alter , and that 32 new drains were actually made, while me of the other cases improvements were effected. remaining work comprised the condemnation of y houses as unfit for habitation, the erection of y-two new privies, and the conversion of seventeen es into pan-closets, the removal of eighteen pigsties, he cleansing of some half a mile of ditches where e had lodged. Notices were served to construct s, and to provide ventilation; but without detailed ras very little (the inspector states) can be enforced.

ILLUSTRATED SANITARY PATENTS.

1,520. (1884.) IMPROVEMENTS IN WATER-WASTE PREVENTERS. B. HAIGH, Cubitt Town, Middlesex. [6*d*.]—This contrivance consists of a syphon arrangement for the ordinary flush, and also for an after flush where required. A draw chain working over a pulley raises a plunger within a cylinder. On the top of this plunger a

loose disc lifts the water in the cylinder into the discharge-pipe, and then opens the passages in the plunger by the current of water, thus making the syphon and discharging the required water, the plunger and disc then dropping back to their original place. The small syphon-pipe for after-flush is within the main discharge-pipe, and is set in motion by the vacuum formed in the main pipe from the ordinary flush.

3,347. (1884.) IMPROVEMENTS IN THE CONSTRUCTION OF STENCH-TRAPS FOR SANITARY AND OTHER PURPOSES. T. S. TRUSS, Chiswick, Middlesex. [6*d*.]—These improvements relate to the construction of stench-traps with spindle-valves that form the seal for such traps independent of any liquid, and also prevent any fluid entering such traps by their outlet-pipes from ascending through such traps. Fig. 1 is a longitudinal section of a stench-trap constructed according to the first part of the said improvements, in which *a* is the box, and *b* is the outlet pipe, and *c* is the cap on the top of the box *a*, and *d* is the socket formed in such cap for the spindle *e*, attached

to the valve *f*, to work in, and *g* is the end of the inlet pipe *h*, that is within the box *a*, on which end of such inlet-pipe the valve *f* acts, and *i* is the end of the inlet-pipe *h*, that is outside of the box *a*. Figs. 2 and 3 are longitudinal sections of the two parts of the body core for forming the interior of the box and outlet-pipe and the exterior of the inlet-pipe that is within the box; and fig. 4 is a longitudinal plan of the core for forming the interior of the inlet-pipe, in which figs. *k* is one-half of such body core, and *l* is the other half of the same, and *m* is the recess therein for the print *n* on the end of the inlet-pipe core *o* to rest in; and *p* is the space in the parts of the body core *k* and *l*, that forms the end *g* of the inlet-pipe *h* that is within the box *a*.

3,754. (1884.) IMPROVEMENTS IN ATTACHING WATER-CLOSET BASINS TO THEIR TRAPS: H. CONOLLY, London. [6*d*.]—The object of this invention is to attach

water-closet basins to the separate traps thereof in such a manner that the trap can be fixed in any required position in respect of the basin, thereby allowing one to place and erect the said basin in that position in regard to the soil-pipe as may be necessary or convenient in each particular case without it being obligatory, as is usually the case, to form the trap in a special particular manner for each apparatus. This object is carried out by interposing between the water-closet basin and the separate trap thereof a collar or short piece of pipe of the required shape and length and size in cross section and the several parts of the basin and the collar and the trap are connected and attached together, as is hereinafter described. Fig. 1 is an elevation of the closet, and fig. 2 is a horizontal section thereof taken at *a b* in fig. 1. A is the closet basin,

between which basin and the separate trap B thereof he interposes the collar or short piece of pipe C of the required dimensions, in which collar C is the bottom valve of the closet basin actuated by the lever D. On each end of this collar C he forms a flange, and the upper flange E is made of the same shape as the ordinary or other flange formed on or fitted to the bottom or neck of the basin A, and the said flange E is secured thereto in any convenient and suitable manner, preferably by screw bolts and nuts, as shown in the drawing. The lower flange F of the collar C is made of a circular or annular shape, and is secured to a corresponding and similar flange G formed on the end of the separate trap B in any convenient manner, to allow the said trap B to be fixed in the required position in respect of the basin A, so as to lead direct to the soil-pipe. These two flanges F and G may be secured together by clips on their outer peripheries or otherwise, but he prefers the method shown in the drawing. According to this method he forms in one of these two flanges F and G, preferably in the flange F on the collar C, a series of slots H and the bolts I, which are passed through holes in the other flange, preferably in the flange G on the trap B, pass also through these slots H, and can travel along the same, being secured above by screw nuts. Thus and in this manner the trap B can be fixed in any required position in respect of the basin A.

3,814. (1884.) IMPROVEMENTS IN DRAIN TRAPS, GREASE TRAP, &c.: W. H. TYLOR, London. [6d.]—In the drawings hereto annexed fig. 1 illustrates an ordinary disconnector trap, to the socket-branch (A) of which definite extension pieces may be applied. Figs. 2, 3, 4, 5, and 6 show various forms and arrangements of the extension pieces, and figs. 7 and 8 show ventilating gratings applicable for use with the said extension pieces. Fig. 2 shows a plain extension piece, the lower end of which is adapted to be placed in the socket A of the disconnector trap (fig. 1), the upper end being provided with socket or recess (B) to receive the usual air inlet grating (fig. 7 or 8), or another similar extension piece (fig. 3) above it, according to circumstances. Fig. 4 shows a similar extension piece, provided with a socket (C) for an air inlet pipe at its side or other position. Fig. 5 shows a

similar extension piece adapted to receive a leaden soil-pipe direct into its socket (D) at the top. This extension piece may also be provided with a socket or other pro-

paration (C) to receive an air inlet pipe or other ventilating device. Where it is desired to run the wastes of baths or sinks into disconnector traps he uses special pieces, such as that shown at fig. 6, provided with a downwardly bent pipe (K), shown in dotted lines, connected with the inlet opening (F) by which the waste enters from the bath or sink; C in this figure represents the socket or other preparation for the air inlet pipe, as in figs. 4 and 5. When the soil-pipe discharges into an open extension piece the notched grating (fig. 8) is employed, instead of that shown at fig. 7. By these arrangements disconnector traps can be connected with the surface, or otherwise ventilated with great facility, as the extensions are adapted to fit into one another, so that if one piece is not sufficient two or more can be combined together. The improvements, so far as they relate to traps for separating fat from liquids, are shown in figs. 9 and 10. A is a box with a cover, B, fixed airtight thereto. C is a partition crossing the box, A, and extending upwards from the bottom to a height about equal to or a little higher than that of the top of the outlet opening D. The inlet E to the box is bent downwards inside the box, and made oblong at the lower end, as shown in fig. 10, or it may be made otherwise. The liquid with the fat enters at E, and strikes the separating plate F, causing the fat to be broken up into small pieces, detached from the liquid and allowing it to float to the top. The liquid then passes under the separator plate (F) towards the outlet, and strikes the above-mentioned partition C, causing still further separation of fat, which rises to the top of the liquid, and the latter flows over the top of the partition C, to the outlet opening D. This outlet opening, D, for liquid is placed near the bottom of the box, A, at the end opposite to that at which it entered, and is trapped by the trap, G, the overflow pipe, H, from which is placed, as shown, at a somewhat higher level than the opening, D. I is a handhole for cleaning out the trap, G, which handhole may be closed, when not in use, by the plug, J. The fat, being retained floating on the surface of the liquid in the box, A, cannot escape by the opening, D, because the surface of the said liquid is maintained above it by the trap, G, and can be removed at pleasure after lifting the cover, B.

6,014. (1884.) IMPROVED VENTILATOR: W. COWELL, Blackburn, Lancashire. [4d.]—Fig. 1 is a front elevation showing four vanes, and Fig. 2 is an end elevation

on of fig. 1. This improved ventilator consists of a like form A, open towards the back; to the front are four flaps, B, with air spaces, C, between each vane or the flaps or vanes are at an angle, and the bottom of vane or flap projects below the top of the next lower

FIG. 1

FIG. 2

or flap, and the bottom flap passes below the bottom box or frame of the ventilator, and so, whilst admitting cold air, or allowing the escape of warm air, excludes all rain and moisture. The ventilators are made in earthenware, and are used for cellars and other buildings, outside or in; for outer walls they are suitable, as it is impossible for the rain to be driven in, there is also a much stronger ventilation or indraught fresh air, also by placing them near the ceiling they will get off the hot and foul air.

1268. (1884.) AN IMPROVED CONSTRUCTION OR ARRANGEMENT OF APPARATUS FOR VENTILATION OF TUNNELS, TUNNELS, AND CULVERTS, AND DISINFECTION OF SEWAGE AND OTHER GASES: E. MIDGLEY, London. [6d.]—The patentee describes and uses an apparatus for containing a disinfecting liquid capable for use in the manhole of a ventilating shaft of a sewer, or for fixing directly over the shaft of a cesspool.

FIG. 1.

FIG. 2.

figures 1 and 2 show its application to a soil-pipe to the outside of a wall such as that of a dwelling-house. In this case the valve H is arranged at the top of pipe G and is made to open inwards so that at each lag of either of the closets, the down rush of water

causes the valve to open for air to pass down with it. He has shown the apparatus A about level with the lower closet and on an elbow or branch of the soil-pipe, but it may be placed at any convenient position or on the outside trap, or the branch and disinfecting vessel may be within the closet if desired.

10,301. IMPROVEMENTS IN APPARATUS FOR SUPPLYING DISINFECTANTS TO WATER-CLOSETS &C. G. SKUDDER. London. [6d.]—The object of this invention is to provide an apparatus which shall work automatically, shall be more simple in construction, and shall give more perfect results than any now in use. The chief feature of the invention consists in the arrangement of tubes and case, by means of which he passes a portion of the flushing water directly through the disinfecting material used.

FIG. 1

FIG. 2

To charge the apparatus the cap G must be unscrewed and the disinfectant placed in the tube F. The action of the apparatus is as follows. When the water for flushing is turned on in the flush water supply main or pipe, part of it rushes through the supply pipe I into H, from which it passes through the small perforations A into the cylinder F which contains the disinfectant (thus before it can pass to the case C it must pass directly through the disinfectant used), and thence through the holes F' to the outer case or chamber C. From C it flows to the water-closet, urinal, or drain, after being thoroughly charged with the disinfectant. As a small quantity of the disinfectant may pass through the small perforations in the cylinder F and settle at the bottom of C, a few small perforations are made in the bent tube H at or near its lower end, and thus the water which has been standing in case C is stirred up by the rush of the flushing water, and any disinfectant contained therein made use of.

15,068. (1884.) A CLEANSING-PIPE TO OVERFLOW OF WATER-CLOSET BASINS. A. EMANUEL. London. [4d.]—This invention consists of a cleansing pipe to overflow of water-closet basins. This cleansing pipe A B is attached to top of supply pipe C, and is carried round side of closet basin to overflow pipe D, the water from supply pipe keeping the overflow fully charged with pure water each time the closet is used, thus insuring a perfect trap to

overflow when one is fixed to it, and also cleansing the overflow from any of the contents of water-closet that may have escaped down it. This cleansing pipe is fixed at top of supply pipe and not at the bottom, so if valve at supply

FIG. 1.

FIG. 2.

FIG. 3.

leaks the water does not escape down the cleansing pipe but runs through the supply pipe into the water-closet basin, and is thus able to be detected. The cleansing pipe can be placed from any portion of an outer flushing rim or from the supply pipe to overflow, whatever their position on the water-closet basin may be.

AMERICAN.

293,305. ATTACHMENT FOR WATER-CLOSETS: LUTHER H. BURNETT, Chicago, Ill. Filed April 4, 1883.

Claim.—1. In a water-closet, the combination of a chamber to receive a suitable chemical, and having a perforated bottom, and a pipe for conducting water to the chamber to dissolve the chemical, with a box which is filled with charcoal, through which the dissolved chemical

flows into the waste-pipe. 2. The combination of a chamber to receive a chemical, and having a perforated bottom, a pipe for conducting water into the chamber for the purpose of dissolving the chemical, and a chamber, F, for receiving powdered charcoal, and which is connected at its lower end with the waste-pipe, with a chamber, H, through which the gases are conducted from the waste-pipe into the chamber containing charcoal.

303,430. SEWER-TRAP: JOHN W. GRIFFIN, Buffalo, N.Y. Issued August 12, 1884.

Claim.—1. The combination, with the receiver A, provided with the discharge-opening B, of a ball-valve, H, seated in an annular plate, F, arranged below the discharge-opening B. 2. The combination, with the receiver A, provided with a discharge-opening, B, having an elevated mouth, b, and bell C, of an annular ring, F, suspended from bottom of the receiver A by bolts g and screw-nuts g', and a ball-valve, H, seated in the annular ring F, below the discharge-opening B.

303,640. SINK-TRAP: BENJAMIN HOLLAND, Jr., Providence, R.I. Issued August 19, 1884.

Claim.—1. In a sink-trap, provided with the chamber A, the pendent pipe B, and the discharge pipe C, the partitions D D, extending from said pipe B to the walls of the chamber A, and from the lower end of the pipe B to or above the lowest side of the mouth of the pipe C, and an opening in the side of the pendent portion of the pipe B for the escape therefrom of air above the lower edges of and between the partitions D D. 2. The combination of the chamber A, the discharge pipe C, the pendent pipe B, having a portion of its circumference made shorter at its lower end than the other portion, and the partitions D D, connecting said pipe B with the wall of the chamber A, and extending downward to the end of the longest part of said pipe B, and enclosing the cut away or shortened side of said pipe.

303,858. BASIN TRAP CLEARER: JAMES E. KELSEY, Brooklyn, N.Y. Issued August 19, 1884.

Claim.—1. A clearing pipe for basins, consisting of the flexible pipe G, provided at one end with a hollow tapering stopper, whereby the waste pipe and faucet may be connected. 2. A clearing pipe for basins, consisting of the flexible pipe G and the disk I thereon. 3. A basin trap clearer, consisting of a flexible tube (G) for connecting the faucet with the outlet or waste pipe, provided at one end with a hollow flexible stopper H, and near its other

end with a flexible disk I, whereby the clearer is adapted to be applied to basins having large or small outlets by simply reversing the tube.

303,822. SAFETY FLUID TRAP: RUDOLPH D'HIVERREUSE, New York, N.Y. Issued August 19, 1884.

Claim.—1. A trap for waste-pipes, wash-basins, &c., combined with a close or air-tight vessel for water or liquid disinfectant or deodoriser, and provided with a discharge outlet, which communicates with the interior of the trap between the overflow or discharge level and the sealing or safety level thereof, whereby the water in the

vented from falling below the danger line, sub-
y as described. 2. In combination with a trap,
el E, constructed as described, and having a dis-

outlet which communicates with the interior of the
ween the overflow and the danger levels, and pro-
ith a water-supply pipe and devices whereby water
admitted thereto and air discharged therefrom
eously, substantially as and for the purpose set
Also other claims.

36. ANTI-SYPHONING TRAP: FRANCIS WILLIAM
Minneapolis, Minn. Issued September 9, 1884.

1.—The combination of the trap pipe C, having
ontal valve seat a, the valve chamber E over the
e seat, the overflow pipe B, leading from one side
valve chamber, the vertical valve seat b at the
into the overflow pipe, and formed to seat a ball
nd the ball valve D, whereby the valve is made to
several purposes of closing the trap pipe against
d flow, of closing the overflow pipe against
g the trap, and of rising into the chamber above
ve seats to allow a free discharge of liquid through

31. GREASE TRAP: NATHANIEL T. WHITING,
nisco, Cal. Filed September 23, 1883.

1.—A grease trap, consisting of a chamber having
pipe opening into it below the surface of the
n outlet pipe having its receiving end opening into
nber at a point below the level of the inlet pipe
ring upward, so that it discharges above the level
pipe, a removable perforated sediment chamber
g upwardly from the bottom of the main chamber
1, and a vent pipe extending upwardly within the
from the discharge pipe.

REVIEWS.

The Care of Infants: A Manual for Mothers and Nurses.
By Miss SOPHIA JEX BLAKE. London: Macmillan &
Co. 1884.

IN a compact useful little volume, entitled 'The Care of
Infants,' Miss Jex Blake has added to the already long list
of manuals on this subject. Unlike some of its prede-
cessors, if it contains sins of omission there are few of
commission. There is little said in it that had better be
left unsaid. The advice and directions, as far as they go,
are mostly excellent. Some of the questions connected
with infant life, which are but lightly touched upon, might
with advantage be more fully treated. For instance, in
the directions for bathing, the nurse is told that a new-
born child should be washed in a bath in which its whole
body is covered, and its head supported by the nurse's left
hand. This is undeniably true, and is the manoeuvre of
an experienced nurse, but how to achieve it without
receiving preliminary teaching or directions? These Miss
Jex Blake does not furnish. This omission, with some
others, may be considered only a minor defect, but never-
theless prevents the manual from being so thorough a
guide as its author is evidently capable of making it.
Again, that all-important question of infants' clothing,
which so loudly calls for reform, Miss Jex Blake, after
condemning the use of pilches, disposes of by saying
'the rest of the baby's clothing will probably follow the
prevailing fashion.' But from a medical point of view,
simplicity, lightness, and warmth are chiefly to be de-
sired; but how to attain these hitherto unattained
desiderata in infant management Miss Blake does not
venture to suggest, though our hopes were raised that she
would do so by seeing it announced on the title-page that
she holds the position of Lecturer on Hygiene at the
London School of Medicine for Women. New-born in-
fants are the only examples of living human beings which
are clad in the same fashion winter and summer—in their
airy trifles pleasing to the eye, but wholly unfit to
realise such conditions as 'simplicity, lightness, and
warmth.' That homoeopathic dose of cambric called a
baby's chemise—a fatal cold-giving piece of frivolity—
ought certainly to be replaced by one measuring a
sufficient number of inches to reach up to the tiny baby's
tiny throat. The same happy innovation might be intro-
duced among the remaining articles of infant clothing,
besides many others which it is not the critic's duty to
discuss, but would be a truly fit subject to be treated in a
manual on the care of infants. The all-important period
of infant life, that of teething, Miss Blake passes
over by saying 'that at the fifth or sixth month
the baby begins to dribble—it secretes saliva. The
teeth will soon be coming, but it is not necessary to wait
for their appearance, before giving small quantities of rusk
and tapioca.' These scanty data might perhaps help to
answer an examination question or two, but would be but
a poor guide and solace to an anxious ignorant young
mother, who, poor or rich, seeks for information beyond
that possible to obtain from a doctor's occasional visit.

Miss Blake's suggestion that 'except in severe weather
it is much better to secure a constant current of pure air
by keeping a window more or less open night and day,
except during the baby's toilet,' seems to us rather heroic,
and calculated to increase infantile colds and bronchial
affections. Perhaps Miss Blake in her practice has, in
exceptional instances, found this advice to be salutary; but
it would be dangerous to give it broadcast. The author
rightly objects to apertures being formed under the door
that air may flow in, because when children begin to crawl
about they are directly exposed to a strong current of air;
but a ventilator placed on the uppermost panel of the door
removes this danger, and permits a current of air to be
admitted or excluded at will, as circumstances require. It
is quite wise to condemn 'parents who are in a great hurry
to give meat and fish to their children;' but when Miss

Blake expresses her belief 'that those who have little or nothing of the kind until they are five or six years old,' are properly fed, and recommends that they have 'up to that age an abundant diet of milk and farinaceous food,' we would suggest that she goes to the other extreme, and is too tardy in supplying them with the requisite quantum of nitrogenous food.

If we have assumed the more disagreeable task of pointing out the deficiencies of this truly excellent little volume, we have done so in the interests of ignorant young mothers and novice nurses, hoping that in a future edition Miss Blake will fill up the now existing hiatuses, and thus render her manual as perfect as a whole as it is now in parts. In its present form, all who have the care of infants will do well to read it with attention; they will find in it much useful information and excellent advice which will carry them through many, if not all, the difficulties that beset infant life.

Dwelling-Houses; their Sanitary Construction and Arrangements. By W. H. CORFIELD, M.A., M.D., &c., &c. Second Edition. H. K. Lewis, Gower Street.

THIS is the second edition of Dr. Corfield's admirable little work. Expressed in plain terms without any elaboration of details, and fairly well illustrated, this is just the work for a popular handbook on the subject, and if it could be slightly abridged and brought out at a nominal charge it would be of great benefit to the public at large and would achieve, we believe, an immense sale.

The book before us is pretty well known to consist of the Cantor Lectures which its author delivered before the Society of Arts. The subject of house sanitation is treated of in a popular manner by a medical man of considerable experience. The engineer's point of view is, of course, not considered, and wisely so. For as there are many clever works written by engineers from their own standpoint, it is well that Dr. Corfield should have confined himself to his own view of the subject, which he has placed before us in so simple and effective a manner.

There are a few points that we should have been glad to have seen modified in this edition of the work. For instance, on page 52, Dr. Corfield says that with *constant service* 'it is not necessary to have cisterns or receptacles of any kind for the storage of drinking water, although this is frequently done.' Now, as it is certain that the company's mains have occasionally to be emptied for repairs and other purposes, it is necessary to provide some cistern storage if we are not to be left without water altogether. We may remind our readers that by the Metropolitan Waterworks Act of July 1852, consumers are bound to provide a cistern when called upon by the company to do so; also that by the Act of August 1871, the company is not to be subject to any liability for not giving a constant supply if the want of such supply arises from frost, unusual drought, or other unavoidable cause or accident. So that a cistern is necessary even with a constant service of water, though the cistern need not be a large one.

On page 82 it is said that all attempts to ventilate sewers in any other manner than at the level of the streets have been without exception signal failures. This is an expression which we think might have been slightly modified with advantage.

On page 113, Dr. Corfield says that lead soil-pipes are to be preferred even outside a house 'because when iron ones are used it is usually necessary to put lead pieces in to receive the lead pipe from the closet to prevent a joint between lead and iron being made inside the house.' Now, Dr. Corfield will pardon us if we object to the word *necessary* in this connection. Closets are sent out with cast-iron traps (they are described in the work before us); what is simpler than to connect a cast-iron trap with a cast-iron soil-pipe by means of a proper cast-iron branch piece and bend with lead caulked and absolutely air-tight joints?

To return to the general disposition of the work, we find

that it is divided into six chapters, treating respectively of the situation and construction of houses, ventilation, lighting and warming, water supply, removal of refuse matter, sewerage, main sewers, and house branches, traps, ventilation, &c.; water-closets, sinks, and baths, arrangement of pipes, traps, &c.

In the chapter on water supply we see that the author agrees with other authorities in placing the average quantity of water required in a community, for all purposes, at 30 to 35 gallons per head daily. This contrasts strongly with the estimate of M. Wazon (*see* SANITARY RECORD, April 1885) who considers that for Paris about 200 gallons per head should be delivered daily. This large quantity is actually provided in Marseilles, and when the new aqueduct is completed a similar quantity will be delivered in New York.

The work before us is one that should be in the hands of every one connected with building, and in fact of every household. The fact that it has so soon achieved a second edition testifies to its well-deserved popularity—a popularity which, we are glad to believe, is likely to increase rather than diminish.

London and Provincial Water Supplies: with the latest Statistics of Metropolitan and Provincial Water Works.

By ARTHUR SILVERTHORNE, A.M.I.C.E. Pp. 141.

London: Crosby Lockwood & Co. 1884.

WATER undertakings have lately been having a fair share (perhaps more than a fair share) of public attention. But there does not appear to be any disposition on the part of our legislators to look at the subject of water supply in its broad relations with the public welfare and the public purse. Mr. Silverthorne has done well therefore to follow up his previous book of 1881 on 'Purchase of Gas and Water Works,' by collecting together a mass of useful, interesting, and important information with regard to the districts, supply, revenue, rates, and the like of the water undertakings in nearly all the large towns of the United Kingdom. We do not, however, find in his book any comparative statistics such as would enable us to compare, let us say, the charges for water supply in one town with another. True, the admirably full and apparently exhaustive table as to each undertaking gives information of this kind in the particular form in which the water-rate is assessed in each place. But these are not reduced anywhere to a common denominator; so that it is difficult for example to say, without a calculation of one's own, whether an average house of 50*l.* rental, with a bath and water-closet, in the town of A, pays a water-rate higher or lower than a house of the same rental in the town of B. It would have been interesting, we think, to have compared the water charges in those towns still served by companies with the rates at towns like Liverpool and Manchester, where the water supply is a department of municipal responsibility—as it should be everywhere. Perhaps it is in connection with the purchase of water undertakings by corporations that Mr. Silverthorne is most practical and helpful. It is difficult to strike an average from the widely varying considerations that have been paid in different towns for acquiring the water supply; but, according to our author, 'where any success is expected to attend the transaction, nothing but the fair and honest value, as a going concern, must be paid.' Of the twenty-eight great towns whose mortality statistics are regularly published by the Registrar-General, seven are still supplied with water by private joint-stock companies. These are London (most important and most flagrant case of all), Sheffield, Newcastle, Bristol, Norwich, Portsmouth, and Sunderland. The last four of these appear to be very close corporations indeed, for no statistics with regard to them are given in the tables, and it must therefore be assumed that none are procurable. For the management of his figures Mr. Silverthorne must be accorded high praise; and if he leaves us to our own devices just when we are looking for teaching and guidance from him, he only follows the example of the majority of compilers of books on technical subjects.

House Sanitation. A General Survey for the Multitude, &c. By SEPTIMUS BEDFORD. W. Ridgway.

THE student of sanitary science has a library of valuable works to which he can refer. Douglas Galton, Baldwin Latham, Bailey Denton, Hellyer, Buchan, Davies, Dr. Corfield, and many others have supplied valuable textbooks for the professional reader, but there appears to be a real want of a cheap popular handbook on the subject. This want the author has endeavoured with considerable success to satisfy.

Mr. Bedford begins with a few simple remarks upon the selection of a site for a house, touches upon the relative advantages of different subsoils, and speaks of the necessity of ensuring dryness in the dwelling by using proper damp-proof courses and hollow walls. He then illustrates various kinds of traps and sinks, grease traps, closet traps, closets of different kinds, together with simple ways of disconnecting the feet of soil-pipes. Some clear information is given concerning the water supply of towns, and as to the use of waste-preventing fittings. A few pages of the pamphlet are devoted to the discussion of simple methods of ventilating ordinary dwellings, and an account is also given of the sanitary and insanitary houses at the Health Exhibition. The latter account may appear a little out of date, but it appears that the work before us was published last year. Of course in a work of this kind there can be nothing original; it aims only at being a fairly clear statement of the views of most of the leading authorities on the subject. It is illustrated with twenty-four woodcuts, and being published at an shilling it is likely to prove a useful and successful brochure.

Health and its Appliances. By DONALD NICOLL, Assoc. Inst. C.E. E. Duck, 12 Buckingham-street.

THIS work treats of Mr. Nicoll's 'Cloacina' system of disposing of sewage, which was illustrated at the Health Exhibition, and attracted some attention at the time. The author has felt very strongly the danger and disgrace of turning the raw sewage of four millions of people into the river to create an intolerable nuisance, when it might, in one form or another, be applied with the greatest advantage to suitable land.

Mr. Nicoll places an iron tank in a subway or cellar without each building in the town, to be drained, and directly under the footway. The drainage from the house falls into this tank, and after passing through two filtering layers, one of grit and one of charcoal, the liquid portion emerges at the bottom of the tank, to fall into a gully communicating with the ordinary public sewers, while the solids are retained. A manhole cover is provided in the pavement over each tank, and the dustmen and road scavengers are directed to place daily in each tank a portion of the refuse which they collect for the double purpose of assisting in the precipitation and defæcation of the solids. Vans containing clean tanks and provided with movable cranes will visit every house at regular intervals, and will raise up the partly-filled tank, replacing it with a clean one.

The contents of these tanks will be dried and converted into 'poudrette,' which the author has assured himself will prove of great commercial value as a manure. The effluent from the tanks he considers also will be perfectly innocuous.

The cellars and subways are to be ventilated into the street.

No one would wish to discredit a bold attempt of an engineer to grapple with a gigantic evil which the Metropolitan Board of Works has for years complacently declined to recognise, and which it is doubtful even now whether its officers are really prepared to deal with in a manner worthy of our present knowledge of the subject. This is hardly the place to enter into a lengthy criticism of the project before us, but we will name a few points to be considered in estimating the feasibility of applying a plan of this kind to a populous town.

They are the enormous expense of the subways, cellars

(for an ordinary cellar would not be at the proper level to receive the tank), manhole covers, tanks, vans, and apparatus, all of which our author does not attempt to estimate; the expense of maintenance, including collection of used tanks, drying of solid excreta, washing of filtering material, refilling the filtering chambers, and delivery of clean tanks. The offensive odours from the solids in the tanks which would have to remain in a putrefying condition for several days (relieved only by the occasional deliveries of ashes, &c., in the early morning) and which odours are conducted to the curb of the footway; the fact that the break in the line of drainage consequent upon the fixing of the tank would necessitate in most streets that the public sewers should be relaid at a much lower level.

There is also considerable evidence to show that the 'poudrette' would be of very little commercial value, and we doubt very much whether the effluent from the tanks would be anything like innocuous.

This work is not confined to the 'Cloacina' system of sewage treatment, but becomes most discursive, treating of dustbins, cisterns, ventilation, suggestions for amending the poor laws, land laws, cottages, tube wells, adulteration of food, lager beer for the million, and many other subjects of all kinds.

An account of the Sanitary House at the International Health Exhibition is extracted from the pages of the SANITARY RECORD, and a specification of the 'Cloacina' system, both in French and English, concludes the work. We can say but little in favour of the construction and execution of the work, which is most discursive. But it may interest some to know something of Mr. Nicoll's 'Cloacina' system, which would appear to have more chance of success in the country than in large towns.

Pocket Memoranda Relating to Infectious Zymotic Diseases. Arranged by MATTHEW ALGERNON ADAMS, F.R.C.S. London: J. & A. Churchill.

THIS card contains a wonderful amount of information about the zymotic diseases; first we have a series of heads of inquiry for investigating the source of contagion, then hints as to precautions against spread, by isolation, ventilation, and disinfection; next, on turning over the card, we find a very useful table showing the maximum, minimum, and average times of incubation, of fever before rash, of fever after rash appears, and of duration of infectivity after eruption. Under the latter head it may be said that twenty-one days is too short a time to allow for mumps, and fourteen quite short enough for German measles. The normal periods of latency, premonitory fever, duration of fever, and length of infectiveness of all the commoner acute specific diseases are also shown on a coloured chart. The card will be a useful addition to the pocket book.

NOTES ON BOOKS.

Sell's Dictionary of the World's Press. Henry Sell, 157 Fleet Street, E.C.

MR. SELL's annual, hitherto published as 'The Philosophy of Advertising and Newspaper Register,' is thoughtfully compiled, and very comprehensive. The home newspapers and periodicals appear under different headings; the number of the population of the places in which they are published being given. There is much useful information in the volume, amongst it being a list of the press agencies and associations, articles on the Copyright Act, Newspaper Libel Act, New Times and New Manners, Old and New Ways of Advertising, A Short History of the London Daily Press, &c., interesting alike to the general public and to advertisers, and particularly to those entering upon their noviciate in advertising. Mr. Sell is an advertising agent of large experience, and therefore a safe guide.

The Advertiser's Guardian. Louis Collins, Wine Office Court, Fleet Street, E.C.

'THE ADVERTISER'S GUARDIAN' is of similar character to Mr. Sell's compilation. It contains a large amount of matter intended to prove the advantages of advertising, which at the present day is perhaps scarcely required. A chapter is devoted to Australian and New Zealand and American advertising, useful to those who are interested in colonial trade. The list of papers, magazines, &c., although called 'siftings,' is extensive, and, besides prices and dates of publication, the date of their establishment is recorded.

NEW INVENTIONS.

THE PERFECT TUBE-CLEANER.

THERE can be no doubt that much of the infantile diarrhoea which swells the mortality rate is due to the accumulation of clots of sour milk and other impurities in the feeding-bottles, so constantly seen in the mouths of infants belonging to the poorer classes. The little tube-cleaner figured below, which is sold at an almost infinitesimal price by all chemists, is well calculated to remove this condition of things; and as the warm weather is *supposed* to be approaching we give publicity to this little invention, for the sake of the babes and sucklings. The woodcut will show how the tube-cleaner is used, and the directions appended will still further explain the matter.

DIRECTIONS FOR USE.

Remove the tube from the stopper, insert the cleaner (point end first) and draw completely through, as shown in fig. 1.

To replace tube in stopper pass the point through from the back, thread end of tube into loop, and pull it through, as shown in fig. 2.

* To clean the teat, pass the point of the cleaner through from the back as far as just over the loop, and turn the cotton brush round and round, as shown in fig. 3.

The patentees of the Perfect Tube-Cleaner are Messrs. Charles Richards & Co., of Seething Lane, E.C.

A NOVEL AMERICAN CLOSET.

THE w.c. apparatus which I propose to describe is the invention of Colonel Waring, a well-known American sanitary engineer, and I may as well say at once that I have not the remotest interest of any kind in the apparatus, nor have I any personal knowledge of its originator.

This closet appears to me to combine the advantages of a valve-closet with those of a good wash-out closet. In the valve-closet the use of a mechanical valve to close the outlet of the basin is very generally objected to for various reasons (which it is not necessary to dwell upon at present); but, on the other hand, it has the great advantage that the contents of the basin (say two gallons or more) are discharged with a powerful flush, which passes full-bore to

the soil-pipe, if the outgoing, &c., are of proper size. Now in the wash-out closet the mechanical valve is dispensed with, but the power of the discharge is comparatively feeble. The measure of the inlet of water is the measure of the discharge from the basin. If water is laid on with a $1\frac{1}{2}$ -inch pipe, the discharge can be only equal in amount. If this discharge enters a 4-inch drain-pipe, consider the small proportion that the sectional area of this stream bears to that of the drain-pipe itself—namely, that of $2\frac{1}{4}$ to 16. Instead of running nearly full-bore, the discharge from such a closet can only produce a small stream along the invert of the pipe.

Now if we examine the diagram of Colonel Waring's Dececo closet, we shall perceive that he has combined the advantages of the two closets which I have referred to by means of an ingenious adaptation of Mr. Rogers Field's flushing syphon.

All that portion of the apparatus which is above the floor is formed in a single piece of glazed earthenware. The remainder (or weir chamber) is made of cast iron, and in different forms, to accommodate it to various outlets. The reader will perceive that there are no joints, valves, or working parts to be disarranged.

It will be understood at once that the bowl A is carefully proportioned to its proper shape. Its back is nearly vertical, to avoid soiling, and the trap is deep, though this depth is confined to the rear portion of the bowl, where deep water is required to receive faecal deposits, while the bowl is of very shallow depth towards the front. The only trap also is open to view in the bowl itself. If

it seems right, it is right. The water is supplied from a waste-not syphon cistern through the flushing-rim B. The bowl, &c., is finished, white glazed inside and out, and it is intended that it should stand always in a free and open space, the floor and walls being by preference finished with tiles, the only woodwork used being the seat itself, which is hinged to the back wall and rests upon two side cleats.

If we examine its action it will be seen that the weir chamber F is in no sense a trap except during the operation of the discharge. It has a free air space, connecting the atmosphere of the soil-pipe with that of the outer limb of the syphon D. This weir chamber is ingeniously arranged, with a dip at E, so that when water is admitted to the bowl, and flowing over the syphon D raises the level of the water in the weir chamber, the dip is submerged and the syphon is s-aled. The stream of water continuing, the air is soon driven out of the syphon; and the whole volume of water contained in the deep bowl is drawn with great force over the syphon, and discharged into the soil-pipe until it has descended so low in the bowl as to admit air to the syphon at the intake C. Then the flow of the discharge ceases, though the supply of water to the apparatus is so arranged that it continues slowly to enter by the rim until the bowl is again replenished.

In the printed prospectus of this fitting, issued by the Drainage Construction Company, Newport, Rhode Island, we are told that it was invented in 1881, and that at least 200 of them have successfully been brought into use.

certainly appears to be an apparatus deserving of the careful consideration by all who are interested in the

A. Basin.
B. Flushing rim.
C. Intake of Syphon.
D. Long arm of Syphon.
E. Dip into Weir Chamber.
F. Weir Chamber.

H. Soil Pipe.

ct, and it is not perhaps surprising that the inventor ders it to be perfection itself.

appears to me that the apparatus may be objected being noisy. This is an objection that appears to be ttle heeded by sanitary engineers, but is certainly one eat importance to the ordinary householder. The ary syphon automatic supply cistern is a noisy though ious and thoroughly useful fitting, and has often to eplaced by other arrangements on account of this tion. The discharge flushing syphon must also be om quiet when in action; and the two arrangements ined would, I fancy, produce sufficient noise to r the use of the water-closet in an ordinary London e unpleasantly obvious to all the family. The iny which has devised so admirable a fitting will no t soon overcome this objection, should it prove to be ounded.

only remains for me to state that the closet is ited in England, and to hope that this clever contri e may soon have a practical trial here, as it appears e theoretically to satisfy nearly every requirement that en fairly insist upon. D. J. EBBETTS.

May 1, 1885.

A NEW READING STAND.

MRS. CORDEUX, SONS, & WERE, of Clifton, send us a little apparatus invented for the behoof of the solitary nt who is addicted to the bad habit of reading during s. The arrangement consists of a wire frame, intended upport newspapers, magazines, and books, fixed on a sufficiently heavy to ensure stability even if the stand laced at the extreme edge of a table. A wire cord a weight at the left side is so arranged as to lie over margin of a book and keep the leaves open. The side of the wire cord being lighter is easily raised he leaf in turning over, and thus only one hand need sed. The weight can, however, be moved on the if desired. The upper surface of the base is covered Utrecht velvet, which prevents the newspaper or from slipping. The wire frame is also made to fold flat for convenience of packing, and to slope back to be adapted for various sizes of books. The stand,

besides the use already indicated, is further eminently useful for supporting music, drawings, documents, &c., while being read or copied.

The price of this convenient little invention is very moderate, being from one shilling and sixpence upwards, according to design and finish.

A NEW LETTER-CLIP.

As a convenient adjunct to the writing-table, Iles's Spiral-Clip may be recommended to literary and business people who receive many letters. The clip consists of a coil of spiral wire fastened on to wooden frames of various sizes and shapes, according to price. The one figured below, the Rainbow Clip, in which the spiral is fixed to a neat ebonised frame, is sold retail for the 'splendid shilling,' and will hold a considerable number of letters, answered, unanswered, or for the post. Other forms of the same idea, such as the 'Castle,' hold a larger number of letters and memoranda, and cost rather more money.

All these clips, however, are neat, efficient, and remarkably cheap. This desideratum is, the inventor informs us,

obtained by the use of various ingenious labour-saving machines devised for the manufacture of these useful little clips. The inventor is Mr. J. Iles, of the firm of Iles Brothers, Unity Works, Highgate Street, Birmingham.

CORRESPONDENCE.

Audi alteram partem.

[All communications must bear the signature of the writer not necessarily for publication.]

VENTILATION.

MR. WALTER HENRY DRAKE, in the SANITARY RECORD of April 15, page 485, writing on the above-named subject, has apparently only selected the title he has adopted as affording him an opportunity of attacking the system of ventilation of which I am the inventor and patentee. With reference to Mr. W. H. Drake's visit to my test-room, the truth of all my statements can be tested *die in diem* by personal inspection, and have been verified time after time by numbers of scientific men, who have not hesitated to record their opinions of my arrangements in a visitors' book for that purpose. Mr. W. H. Drake's visit to my test-room I am informed only lasted ten minutes, the greater part of which was spent arguing with my representative and another gentleman upon the efflux of vitiated air up tubes of certain diameters, under varying atmospheric conditions. Mr. W. H. Drake endeavoured to comprehend in five to seven minutes a system that eminent architects, engineers, and members of the medical profession have spent hours in testing and investigating. In his description of the drawings he is entirely at sea; he says, 'it will be seen that the air introduced by the "fresh air inlet" strikes against a plate and is supposed to separate, part ascending to the outlet, the remainder taking, for some unknown reason, the contrary direction.' As a fact, the air is not supposed to separate, neither does part of it, for some unknown

reason, take a contrary direction; it is deflected and circulates where it is expected to circulate, and finds its exit where it was always intended it should. He then goes on to say that 'the air in the exhaust will simply be describing circles, the top of the exhaust being open, and little or none will even find its way out.' To show your readers the very perfunctory character of this gentleman's knowledge of my system, and the value of his personal inspection, I may inform you that there is an arrangement in my apparatus that prevents the very rotary motion on which he descants. And as regards the non-escape of the vitiated air, he would have proved the fallacy of his statement had he gone on to the roof, as the more conscientious investigators have done. Mr. Barnes Austin informs me that he told Mr. W. H. Drake he attached no importance to anemometrical tests in 'esting ventilators, but used one to demonstrate to visitors that there was no down-draught, and for this purpose an anemometer is invaluable. Mr. Barnes Austin and the other gentleman deny *in toto* using the anemometer as illustrating the excellent working of my system, other than for the reason above mentioned. The next query propounded by Mr. Drake is, 'Why does the anemometer remain motionless when on the line with the ceiling in the exhaust?' This query is badly worded, it is putting the cart before the horse. If the anemometer were to revolve on the ceiling-line it would demonstrate a sentient draught. In all human probability, if I had a few Tobin's tubes round the room, I should create a perceptible current; I wish to, and do ventilate with an insentient one.

He then goes on to ask, 'Secondly, why does the anemometer remain motionless until above what in the section is termed the "fresh air channel?"' For the same reason that anyone walking from one field into another under a bridge will be conscious of a draught, which he did not feel when out in the open. If Mr. W. H. Drake requires a practical demonstration of the fact, let him put his eye to the keyhole of his front door. If an open pipe were placed in my room, or same was capped with an Aldous ventilator under similar conditions, I have no doubt a perceptible draught of air upwards would be felt below the outlet-pipe on ceiling-line. With my aspirator it is not felt, although ventilation is always going on. Mr. W. H. Drake unintentionally proves my case, that there is no down-draught in my aspirator, when he asks how it is that the anemometer revolves when above the 'fresh air channel.' The third query, 'What is the reason of the anemometer revolving at such an increased rate when near the sides of the exhaust?' My answer is, after six months' daily experiments, that the anemometer works the same wherever it may be placed in the tube. If Mr. W. H. Drake will only exercise the brains with which Heaven has endowed him, he may be able to inform us 'that, given two circular plates with an angular space of one inch between them, arranged as they are in the construction of my aspirator,' the exact pressure and velocity of air on every inch of the square of same 144" that will pass into the outlet tube. I very much question if an anemometer held in the very centre of an outlet tube, say 2 feet in diameter, capped with Mr. Edgar Aldous's ventilator, would record any movement at all, centre or sides, as mine does. I wish it to be distinctly understood I demur to Mr. W. H. Drake's inference that to secure a movement of the anemometer it requires to be placed at the sides of the exhaust, for that is what he is seeking to prove. I will briefly refer to the two remaining paragraphs requiring notice in this letter. He asks what is the meaning of the following passage: 'Syphonic action is at work constantly, regulated by the requirements of the room.' After this follow some remarks about miraculous means of bringing in air, each person being supposed to bring in sufficient for his own requirements, &c. The syphonic action I mean is, that as fast as the impure air is carried off, the fresh air is syphoned in through the fresh air inlets to take its place.

To the final paragraph, 'The air had as vitiated and exhausted a feel as in the most stuffy and unventilated drawing-room,' I forbear to attach the proper words I ought to apply to the statement. I will merely say the five gaseliers were only lighted some four to five minutes on the occasion of Mr. W. H. Drake's visit. On other occasions I have had them alight with a coke fire burning at same time, eight and ten hours at a stretch. Even then it was remarked how thoroughly free from unpleasantness of any kind was the atmosphere. On no occasion of visitors coming were the gaseliers kept alight so short a time as they were during the visit of Mr. W. H. Drake. If after eight hours burning of gaseliers, &c., under such conditions, Mr. W. H. Drake had been the first and only one out of the number of visitors to my test-room to complain of the atmosphere therein, when the gaseliers were not alight as many minutes as they had been hours on other occasions, surely his statement, requires to be taken *cum multis granis salis*.

FREDK. H. SMITH.

52 Queen Victoria Street, E.C.

May 1, 1885.

In the April number of the SANITARY RECORD, p. 485, here appears a letter, signed by Mr. W. H. Drake, so antagonistic to the system of ventilation invented and patented by Mr. Fred. Henry Smith, of 52 Queen Victoria Street, E.C., and to your notice of it in a previous number, that I claim the right, as that gentleman has mentioned my name in connection with a visit he recently paid to the test-room of said system, when I received him, to reply to his statements. Before I proceed to discuss Mr. Walter Henry Drake's criticisms, permit me to refer to one fact, viz. that Colonel Sir Francis Bolton, C.E.—who certainly knows a good invention when he sees it—permitted Mr. Smith to ventilate the Island Room under the Fountains, at the Healtheries on his system. At this exhibition, ventilating engineers known to fame, gold medallists, &c., were there in scores, and yet a comparatively unknown man's system of ventilation was selected for trial. Why? because Colonel Bolton saw it had in it the elements of success, and the result proved the acumen and correctness of his judgment. I venture to say there was no other system exhibited at the Healtheries that could have been successfully applied for the ventilation of the Island Room, considering the abnormal conditions it presented, when Mr. Fred. H. Smith first took it in hand. Despite all this, Mr. W. H. Drake, in his enthusiastic, but indiscreet, eulogy of Mr. Edgar Aldous' System of Ventilation has allowed his feelings of partisanship to shipwreck his judgment, when men of mark in the professions, and experts sent by the *Times*, *Architect*, *Building News*, *Iron*, *Local Government Chronicle* are (after a personal inspection of the test-room) unanimously of opinion that the system which Mr. Drake condemns is one that fulfils all that is claimed for it by the inventor.

R. BARNES AUSTIN.

Heathfield, East Moulsey.

April 28, 1885.

THE VENTILATION OF HOUSE DRAINS.

I cannot see anything new in Messrs. Sharp & Co.'s illustrated paper on this subject. My model of a London House showed it plainly in the last Health Exhibition. The soil pipe was a 'down-cast,' and had a small 'up-cast' ventilating pipe of its own, with a Howarth's rotating cowl at the top, to insure its working. There was another up-cast pipe with a similar cowl, running up the front of the house with a down-cast fresh air pipe communicating with the drain system in the back yard. Although the jury did not seem to have taken much notice of the model, I know for a fact that its exhibition was not without good, as many houses have had their drains looked to, and many drains have been ventilated in consequence.

Torquay, April 25.

J. R. TURNBULL,
Lieut.-Colonel.

LAW REPORTS.

BACTERIA IN MILK.

How v. Piffards.

THE plaintiff, a dairyman, at Hemel Hempstead, sought to recover damages from the defendant, a gentleman resident in the same place, for libel contained in communications written by him to the local authorities and the local press, reflecting on the quality of the milk which the plaintiff served to the public, and so injuring him in his business. The defendant did not deny that he wrote and published the communications, but pleaded that they were written bona fide on a matter of public interest and were privileged.

What the defendant had alleged was that the plaintiff's milk contained impurities calculated to give the consumers typhoid fever. His own daughter had suffered from typhoid fever, and he attributed this to the milk supplied by the plaintiff to his family. He had some of the milk subjected to microscopic examination, and asserted that it was contaminated with bacteria. The milk was also examined by Dr. Saunders, the medical officer of health, and this gentleman pronounced it to be sound. The defendant, however, had medical evidence to show that the milk contained the living organisms called bacteria, and bore testimony himself to their lively action under the microscope as they 'moved about with their tails.' Dr. Mellor, who had microscopically examined a sample of the milk for the defendant, and against whom the plaintiff had brought an action in connection with the same matter, said that this sample contained bacteria in the form of the true germ of putrefactive decomposition, but not the germ of typhoid fever, which had never been seen. He had never told the defendant that the sample contained the germ of typhoid fever. In his cross-examination he referred to the organisms in their earlier life as 'the babies' of bacteria. Mr. Jarvis asked whether a baby bacterium was as dangerous as an old one. The witness replied that it showed that the process of putrefaction had begun.

The result was the jury found that one of the alleged libels was privileged, and as to the others they found for the plaintiff. Damages for two of them, £10; for one of them 40s.; and for two others, 12s. each.

ADULTERATION OF MILK.

Mr. C. A. Carter, from the Town Clerk's Office of Birmingham, appeared in support of the following case against Thomas Knight, farmer, of Kingswood, who had consigned ten gallons of milk to John Bevan, a milk seller, residing in Nel-on Street West. Mr. Carter explained to the magistrates that the milk in question had been taken while in course of delivery at Snow Hill Station by Mr. John Parker, the inspector of nuisances and inspector under the Food and Drugs Act, and in accordance with sect. 3 of the Sale of Food and Drugs Act Amendment Act, 1879. Mr. Parker proved taking the sample, and duly handing the same to Dr. Hill, the borough analyst, whose certificate showed that 16 per cent. of water had been added.

CANAL BOATS ACT (1877).

At the Birmingham Police-court the following persons were summoned by Mr. John Parker, inspector of nuisances and inspector under the Canal Boats Act, 1877 and 1884:—Thomas Ward, Stroud, near Gloucester, for using the boat *Garibaldi*, on the Birmingham and Worcester Canal, in contravention of the Act, the boat being in a filthy condition. The defendant was fined 10s. and 9s. 6d. costs. A like case was proved against Ambrose Webb, of Rudford, owner of the boat *Snowdrop*; he was fined 5s. and 1s. 6d. costs.

Nathan Buckler, owner, was fined 10s. and 11s. costs, and Thos. Proctor, the master, was fined 2s. 6d. and 11s.

costs, for using as a dwelling a canal boat which had not been duly registered.

SKIMMED MILK.

At Worship Street, several summonses under the Adulteration Act against tradesmen of Shoreditch parish were for hearing by Mr. Barstow, at the instance of the local vestry, represented by Mr. Walker, clerk. An important question was raised as to the operation of the 6th and 9th sections of the Adulteration Act. The summonses alleged the distinct offence, under the 9th section, of having sold milk from which butter fat had been abstracted. The section provides that the milk in question—known popularly as 'skimmed milk'—shall not be sold to the prejudice of the purchaser without a declaration of its altered state. A case had once been heard before Mr. Sheil, but inasmuch as the summons was then taken under the 6th section, which refers to adulteration, the magistrate dismissed the summons. The Court of Queen's Bench upheld that decision, adding that if there was any offence at all it must be under the 9th section, although the judges refrained from expressing an opinion as to the powers of that latter section. On behalf of the vestry, it was now contended that the skimmed milk sold was not 'milk' of the quality contemplated by the Act. The solicitors for the defendants submitted that the article sold was the milk of commerce, and was naturally somewhat deficient in fat. Evidence intended to prove the cases was called, and the certificates of an analyst were produced, indicating the deficiencies complained of. Mr. Ricketts, for the defence, objected, successfully, against the production of a copy of a card left by the inspector at the shops, the magistrate ruling that the original document should be produced. One summons was dismissed on account of the wrong date being inserted in the summons. Upon another the defence set up was that the case could not be brought within the 9th section. The words of the statute clearly indicated that the Legislature had provided for an offence of the kind under consideration only in the event of proof being given, either that the seller himself made the abstraction or that he had the knowledge of abstraction which he might make a declaration about. No seller of milk could disclose to a customer an alteration in its quality of which he was not aware. Beyond this, the principal objection, it was pointed out that in the prosecution no evidence was given that the sellers were told by the inspector that the milk was for public analysis, as set down in Section 14, the officer merely using the words 'for analysing.' Mr. Walker said the points raised were important as affecting the public, and the solicitors defending said the matter was quite as important for the trade. This was the first time that a case had been taken under the 9th section, it having been thought that an expression of opinion in the Court of Queen's Bench justified the parish in the course they were taking. Mr. Barstow said he had not particularly noticed the 9th section until his attention was called to it, and having read it he certainly agreed with the defence that the section contemplated that the seller must have abstracted some essential part of the article or must have knowledge of its alteration. The summonses then before him must be dismissed. The other summonses were abandoned.

SANITARY JOTTINGS.

PNEUMONIA has been unusually prevalent in nearly all the large American cities, and peculiarly fatal.

An American plumber has suggested the manufacture of lead-lined soil-pipe.

New State Boards of Health have been created in Kansas, Maine and Dakota.

At St. Albans, Vt., a cat and a dog died from scarlet fever contracted from a sick child.

Italy appears to be waking up to the necessity of housing her population in a proper sanitary fashion. The Communal Council of Foggia has resolved on offering a premium of 100,000 lire (4,000*l.*) to any society which will undertake the construction of dwelling-houses in that city to the amount in value of 1,200,000 lire. The houses are to consist of a ground floor and two upper stories, and certain other conditions are to be complied with.

Newcastle still continues to exhibit an excessively high death-rate, that for the week ending May 3 showing an average of 34 in the 1,000, that of the preceding weeks being somewhat higher. This great mortality is attributable in no small degree to a virulent epidemic of measles, which has swept off a large number of children. The medical officer of health and his staff have been most energetic in their efforts to stamp out the disease, but in many cases have found their labours neutralised by the gross ignorance or culpable neglect of parents, who personally show little regard for the safety of their children, but afford every facility for the spread of the disease, by allowing them to visit and mingle with their sick neighbours. In Sunderland the disease has greatly abated, thanks to the strenuous efforts of the sanitary authorities.

Owing to the great prevalence of measles and the excessive mortality resulting therefrom, the Corporation of Jarrow-on-Tyne, acting on the advice of their medical officer, Dr. Munroe, have recommended that all public and private elementary day and Sunday schools be closed after the 1st inst. until the committee see fit to remove the restriction, the committee being empowered to make the revocation order when it is deemed advisable.

At an inquest recently held at Durham, on the body of a man who had died suddenly on his way to the railway station, the Coroner said it was a disgrace to the city that no mortuary existed there, the body having to lie at the ticket office till claimed. The foreman of the jury, who was a member of the Corporation, said that the authority 'contemplated' providing a mortuary, when the Coroner rejoined more pithily than elegantly, that he would believe it when he saw it. It is evident that needful sanitary improvements are not adopted with desirable alacrity in Durham.

Complaints have been made of the want of a good model lodging-house for tramps at Darlington, which, being situated on the great North road, is much frequented by that fraternity. It has been proved that much of the infectious disease prevalent in that town was brought by these humble travellers, who introduced it into the various lodging-houses now scattered about Darlington, over which it is found somewhat difficult to exercise the necessary strict supervision.

At the last meeting of the Gateshead Town Council much regret was expressed at the continued high death-rate of the borough, which last month averaged 24.6 per 1,000. The authorities have been most energetic in their efforts to remove all causes which have a tendency to produce excessive mortality, but so far the result does not seem commensurate with their labours.

Apparently the Local Board of Stroud do not recognise anything improper or uncommon in the existence of a number of pigsties within 150 yards from the well supplying the town with water. The general feeling of the Board appears to be reflected by the remark of one member that 'if the water was regularly tested, and was at any time found to be polluted by the pigsties, that would be the time to stop them.'

WATER SUPPLY.

The Hexham Rural Sanitary Authority have signed an agreement which will enable them to provide a good supply of water from the Shaw Well, for the use of the inhabitants of the neighbouring township of Corbridge. The Parochial Committee of that place have also been directed to preserve to the village the water supply from Spout Well. These arrangements have tended to allay the anxiety which has long been felt as to the quality and sufficiency of the water supply.

THE HOUSING OF THE WORKING CLASSES.

*How best to help the slender store,
How mend the dwellings of the poor?*

WORKMEN'S DWELLINGS IN EAST STONEHOUSE.—We are glad to learn that within a very few months a large and substantial block of artisans' dwellings has sprung up in Stonehouse, where overcrowding prevails to a great extent, and will in a short time be ready for occupation. The dwellings, which consist of twenty-four apartments, of two rooms each (*i.e.* accommodation for twenty-four families) are contained in one block of buildings four stories in height. Each floor contains twelve rooms, and as all are precisely similar in arrangement the description of one will suffice for all. The central portion of each floor contains a stone staircase; landing at each storey on an open stone balcony, and immediately behind this staircase is a washhouse with copper furnace, and a range of fixed washing trays, with cold water laid on to each, and proper wastes discharging into an open iron trough gutter underneath. The water-closets for each floor are situated on each side of the washhouse, and enter from lobbies off the stair landing. On one side are two water-closets for women and children, and on the other side a water-closet and urinal for men, each side being entirely distinct as to the approaches. On each side of the central staircase and balcony a corridor branches off, giving access to three apartments in each wing of the building, and at the ends of these corridors are large windows, with the upper portions filled in with fixed louvres. The bedrooms are all situated on the sides of the corridors opposite to the living rooms, and in no case is there direct communication between bedrooms and living rooms. Each living room is fitted with a small cooking range with oven, and the bedrooms with ordinary mantel register grates. Each room has also a cupboard ventilated by air bricks, and in the living rooms the lower parts of the cupboards are fitted up as coal hutchies. In the floor from each room, close under the ceiling, is fixed a 'Boyle's Mica Flap Ventilator.' The water closets are all fitted up with pans and traps on the wash-out principle, and are connected on the outside of the building with stacks of galvanised iron soil-pipes, which are carried up at the top about 3 feet above the eaves gutter, and at bottom discharge into an 'intercepting trap' with an air shaft, so as to secure a constant circulation of fresh air through the soil-pipes. All the waste-pipes from washhouses and sinks are carried down in separate stacks of galvanised iron pipe, which discharge over gratings of large trapped and gullies. The water supply is from two large galvanised iron cisterns in the roof over the central staircase, one cistern being entirely reserved for the supply of the flushing cisterns of the water-closets, and the other being for washing and drinking purposes. The water for drinking is laid on to a separate sink in each washhouse, and waste from same is carried to the iron waste-pipes previously mentioned. The rooms have an area of about 120 superficial feet, and none are less than 8 feet 6 inches in height, the lower stories being about 10 feet. The whole of the corridors, washhouses, water-closets, lobbies, &c., have fireproof floors formed of Portland cement concrete on iron bearers, and are trowelled off to a smooth surface in neat cement. The balconies and staircases are all of York stone. The building is set back about 12 feet from the street, and has an open space, exclusively belonging to it, on every side. The scheme has been carried out by the Earl of Mount Edgcumbe and three other gentlemen as a private enterprise, and in the hope that decent and sanitary dwellings can be provided at a cost that will ensure a moderate return for the outlay. If this can be proved, no doubt the example will be followed by the erection of other similar dwellings, of which there is great need in the locality. The total cost, exclusive of site, is somewhat over 3,000*l.*

PARKS AND OPEN SPACES.

Almighty first planted a garden, and indeed it is the purest of all pleasures.

At the last meeting of the St. Giles's District Board of Health, it was resolved to spend a sum of £200 in planting trees along such portion of the new street (from New Road Street to Piccadilly), as is within the jurisdiction of the Board.

At the 4th instant the inhabitants of Bethnal Green and the Old Town were honoured with a visit from the Duchess of Devonshire, who, accompanied by the Marquis of Salisbury, went down to open two gardens which had been presented to the Metropolitan Public Garden Association for the use and enjoyment of the public. At five o'clock the distinguished visitors arrived in Carlton Square, and after a brief but pleasant enclosure near the Globe Road, where they were met by Lord Brabazon, the Bishop of Bedford, William Vincent, the Rev. J. F. Kitto, and other representatives of the association. The ceremony was an interesting one, and the appearance of the gardens was greatly enhanced by the presence of a corps of the Tower Hamlets Rifles, under the command of Lieutenant Kirby. Lord Brabazon explained the manner in which the association had gained possession of the ground, and how the expense of its conversion into a public garden had been met by one lady. At the close of the ceremony the Duchess and Lord Brabazon drove to the disused burial-ground of St. Barnabas's, Bethnal Green, also laid out as a garden by the association with the permission of the vicar, the Rev. MacGachen. The Princess graciously declared the garden open to the public, and expressed herself very pleased with its appearance. At both places the visitors were enthusiastically received; the surrounding streets thronged with the people of the neighbourhood, and with bunting and flags, crowds of heads were to be seen at all the windows, and ringing cheers greeted those who had so kindly paid a visit to the East End, and who represented the beneficent association.

NOTICES OF MEETINGS.

METROPOLITAN PUBLIC GARDEN ASSOCIATION.

A meeting of this Association was held on May 5, at 83 Lancaster Road, Brabazon in the chair. The Secretary announced that a plan of the garden had been given by the Skinners' Company, and that the site of the garden was in the parish of St. Martin in the Vintry, London-stone. Viscount de Vesci, Lord Ebury, Sir William Vincent, Mr. J. T. Bedford, and Colonel Boscawen were elected vice-chairmen of the Association, and Miss I. M. Boscawen was elected honorary secretary. It was reported that the garden, which is situated between the churchyard of St. Bartholomew's, and the churchyard of St. Martin in the Vintry, had been opened the previous day by the Princess of Wales, and that the improvement of Trafalgar-square, Mile end, Wilton, and Northampton-quares, Clerkenwell, and the ground between St. Paul's, Rotherhithe, were being proceeded with, and a conversion into open gardens of Red Lion square, the East End cemetery and the churchyards of St. Peter, Walworth, and St. Bernadette, would be commenced shortly. The Secretary announced that the owners of Nelson-square, S.E., the triangle between the garden of St. Paul's, Lorrimer-square, certain streets in New Kent-road, and of seven disused burial-grounds had asked to allow their grounds to be thrown open to the public. The most important questions considered at the meeting were proposed river recreation grounds in the Isle of Dogs and at the approach of the appropriation of part of the sites of the Houses of Parliament as open spaces, the throwing open of Stepney churchyard, the proposed boulevard on the Main Drainage Embankment. A motion took place upon the payment of the unemployed, over 100 of whom are now at work in the various gardens which are laid out by the Association.

EXAMINATION FOR LOCAL SURVEYORS AND INSPECTORS OF NUISANCES.

The Local Institute of Great Britain will hold its next examination for Local Surveyors and Inspectors of Nuisances on Thursday May, June 4 and 5, at the Parkes Museum, 74A Margaret Street, W. E. WHITE WALLIS, Secretary.

APPOINTMENTS.

MEDICAL OFFICERS OF HEALTH.

- ABBOTT, Charles Edward, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Brantford Rural Sanitary District, at £150 for one year.
- ALLEN, James, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Bollington Urban Sanitary District, at £50 for one year.
- ANGOVE, Edward Scudamore, L.R.C.P. Edin., and L.M., M.R.C.S. Eng., and L.M., has been re-appointed Medical Officer of Health for the Camborne Urban Sanitary District, at £50 for one year.
- BAILLY, Thomas Ridley, M.B., C.M. Univ. Edin., has been appointed Medical Officer of Health for the Bilton Urban Sanitary District, at £50 per annum, *vice* Gilbert, deceased.
- CHESTERMAN, Walter Henry, M.D. Univ. Durh., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Guiseley Urban Sanitary District, at £15 for one year.
- CLARK, William Thomas Marston, L.R.C.P. Lond., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Twickenham Urban Sanitary District, at £100 for one year.
- COKE, Wm. Harriott, L.R.C.P. Lond., M.R.C.S. Eng., has been re-appointed Medical Officer of Health for the Ashford Urban Sanitary District, at £30 for one year.
- DAVIES, David W., M.D., has been appointed Medical Officer of Health for the Llanharan division of the Bridgend and Cowbridge Rural Sanitary District, at £10 for one year.
- DAVIES, Howard, M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Pontypridd Urban Sanitary District, at £16 per annum, *vice* Hopkins, deceased.
- DAVIES, John, M.D. Univ. Glasg., has been appointed Medical Officer of Health for the Maesteg Division of the Bridgend and Cowbridge Rural Sanitary District, at £12 for one year.
- DAVIS, Evan Thomas, L.R.C.P. Edin., and L.M., L.F.P.S. Glasg., has been appointed Medical Officer of Health for the Cowbridge Division of the Bridgend and Cowbridge Rural Sanitary District, at £22 for one year.
- FORSYTH, Robert, M.D. Univ. Glasg., has been appointed Medical Officer of Health for the Birstall Urban Sanitary District, Yorkshire, at £25 for one year.
- HARPER, John William, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Stowmarket Urban Sanitary District, at £10 for one year.
- HASWELL, Narcis Richard, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Helston Rural Sanitary District, at £50 for six months, ending Michaelmas next.
- HEATH, Henry Thomas, L.R.C.P. Edin., L.R.C.S. Irel., L.A.H. Dub., has been re-appointed Medical Officer of Health for the Mansfield-Woodhouse Urban Sanitary District, at £55 for one year.
- HOLLAND, Henry Frederick, M.D. Univ. St. And., M.R.C.S. Eng., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Amphil Rural Sanitary District, at 50 guineas for one year.
- HOSGOOD, William, M.B., C.M. Univ. Edin., has been appointed Medical Officer of Health for the Cannock Rural Sanitary District, at £50 per annum, *vice* Taylor, whose appointment has expired.
- JAMES, Philip, L.R.C.P. Edin., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Western Division of the Bridgend and Cowbridge Rural Sanitary District, at £30 for one year.
- JONES, William Makeig, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Swinton Urban Sanitary District, Yorkshire, at £4 for one year.
- JOYCE, William, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Ashby-de-la Zouch Urban Sanitary District, at £40 for one year.
- LOWE, John, L.R.C.P. Edin., and L.M., L.R.C.S. Irel., has been re-appointed Medical Officer of Health for the Worthington Urban Sanitary District, at £60 for one year.
- RANDALL, Wyndham, L.R.C.P. Edin., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Bridgend Division of the Bridgend and Cowbridge Rural Sanitary District, at £35 for one year.
- ROBERTS, Arthur, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Bingley Urban Sanitary District, at £40 for one year.
- ROCH, Sampson, M.R.C.S. Eng., Deputy Surgeon-General, Army, on the Retired List, has been re-appointed Medical Officer of Health for the Cheltenham Urban Sanitary District, at £300 for one year.
- ROSS, Frederick Robert, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Diss Urban Sanitary District, for one year.
- STONE, Percy Butler, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Millom Urban Sanitary District, Cumberland, at £40 for one year, from the 7th instant.
- THOMAS, David John, L.R.C.P. Edin., M.R.C.S. Eng., has been appointed Medical Officer of Health for the Ogmorth Division of the Bridgend and Cowbridge Rural Sanitary District, at £15 for one year.
- WALKER, John Davidson, L.R.C.P. Edin., L.R.C.S. Edin., has been re-appointed Medical Officer of Health for the Fyde Rural Sanitary District, at £60 for one year.

WILKINSON, George Frederick Eachus, L.R.C.P. Edin., L.S.A. Lond., has been appointed additional Medical Officer of Health for the Lewisham District., at £100 per annum.

WILLIAMS, Augustus, Frederick, L.F.P.S. Glasg., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Brixworth Rural Sanitary District, at £5 5s. and fees for one year.

WILLIAMS, Robert, M.B., C.M. Univ. Edin., has been re-appointed Medical Officer of Health for the Leominster Urban Sanitary District, at £30 for one year.

YARROW, George Eugene, M.D., L.R.C.P. Lond., has been appointed Medical Officer of Health for the Parish of St. Luke, Middlesex, at £150 per annum, *vice* Pavy, resigned.

SURVEYORS, CLERKS TO GUARDIANS, INSPECTORS OF NUISANCES, &c.

ADDIS, Mr. Henry Arthur, has been re-appointed Clerk to the Usk Local Board and Urban Sanitary Authority, at £20 for one year.

ALGER, Mr. James, has been re-appointed Surveyor, Inspector of Nuisances, and Collect r to the Diss Local Board and Urban Sanitary Authority for one year.

BAKER, Mr. John, has been appointed Inspector of Nuisances and Assistant Surveyor for the Walton-on-the-Hill Urban Sanitary District, at £100 per annum.

BELLAMY, Mr. James William, has been re-appointed Clerk and Surveyor to the Rawmarsh Local Board and Urban Sanitary Authority, at £120 for one year.

BITHELL, Mr. W. E., has been re-appointed Inspector of Nuisances for the Flint Urban Sanitary District, for two years.

BOWLER, Mr. John, has been re-appointed Surveyor and Inspector of Nuisances to the Mansfield-Woodhouse Local Board and Urban Sanitary Authority, at £50 for one year.

BRETT, Mr. Frederick, has been appointed Inspector of Nuisances for the Stowmarket Urban Sanitary district. at £12 for one year.

BURGESS, Mr. Charles, Inspector of Nuisances for the Burslem Urban Sanitary district, has been appointed an Inspector under the Canal Boats Act.

CHRISTIE, Mr. Henry Francis (the Surveyor), has been re-appointed Inspector of Nuisances for the Maldon Urban Sanitary District, at £20 for one year.

CLARIDGE, Mr. William Palmer, has been re-appointed Inspector of Nuisances for the Loughborough Urban Sanitary district, at £90 per annum.

COCKER, Mr. James H., has been appointed Inspector of Nuisances for the East Medene Division of the Isle of Wight Rural Sanitary District, at £125 per annum, *vice* Bartlett, appointed Surveyor of Highways and Inspector of Nuisances for the Wilton Rural Sanitary District.

COOMBS, Mr. Henry, has been re-appointed Inspector of Nuisances for the Stratford-on-Avon Rural Sanitary District, at £90 for one year.

DIBBS, Mr. Thomas, has been elected Member for the Cottingley Ward of the Bingley Local Board and Urban Sanitary Authority, *vice* Laycock, deceased.

DRABBLE, Mr. John Edward, has been re-appointed Treasurer to the Swinton Local Board and Urban Sanitary Authority, Yorkshire, for one year.

EASTON, Mr. Charles I., has been appointed Inspector of Nuisances for the Tottenham Urban Sanitary District, at £150 per annum, *vice* Poulson, resigned.

EUVVREAN, Mr. Robert Philipps, Solicitor, has been appointed Town Clerk and Clerk to the Urban Sanitary Authority of Bodmin, at £80 per annum, *vice* Wallis, whose appointment has expired.

GILBY, Mr. Richard Henry, has been re-appointed Inspector of Nuisances for the Briarworth Rural Sanitary District, at £90 for one year.

GRIGGS, Mr. Benjamin, Branch Manager of the London and County Banking Company, has been appointed Treasurer to the Corporation and Urban Sanitary Authority of Reigate, *vice* Stenning, resigned.

HALL, Mr. Hawksley, has been re-appointed Treasurer to the Mansfield-Woodhouse Local Board and Urban Sanitary Authority, for one year.

HALLER, Mr. James Cracroft, has been re-appointed Surveyor and Inspector of Nuisances to the Swinton Local Board and Urban Sanitary Authority, at £45 and £80 for one year.

HARROP, Mr. Frederick Lee, Solicitor, has been re-appointed Clerk to the Swinton Local Board and Urban Sanitary Authority for one year.

HILL, Mr. Joseph, has been re-appointed Surveyor and Inspector of Nuisances to the Bollington Local Board and Urban Sanitary Authority, at £57 for one year.

HUMPHRIES, Mr. Josiah, Branch Manager of the London and Provincial Bank, has been re-appointed Treasurer to the Diss Local Board and Urban Sanitary Authority, for one year.

JACKSON, Mr. Edward, has been re-appointed Clerk, Surveyor, and Collector to the Greasborough Local Board and Urban Sanitary Authority, Yorkshire, at £70 (£60, £30, and £10) for one year.

JOHNSON, Mr. Samuel, of the Torquay Bank, has been appointed Treasurer to the Torquay Local Board and Urban Sanitary Authority, *vice* Kitson, deceased.

JOYCE, Mr. Thomas John, has been re-appointed an Inspector of Nuisances for the Helston Rural Sanitary District, at Ten Guineas for six months ending Michaelmas next.

LAWSON, Mr. J. E., has been elected a Member of the Buxton Local Board and Urban Sanitary Authority, to fill a casual vacancy for two years.

LEE, Mr. Robert William, has been appointed Inspector of Nuisances for the Southampton Port Sanitary District, at 30s. a week, *vice* Dacombe, resigned.

LEWIS, Mr. John, has been re-appointed Inspector of Nuisance for the Mountain Ash Urban Sanitary District, at £40 per annum, for three years.

LVUS, Mr. H. O., Solicitor, has been re-appointed Clerk to the Diss Local Board and Urban Sanitary Authority, for one year.

MACMAHON, Mr. Charles, has been re-appointed Inspector of Nuisances, and Surveyor of New Buildings, to the Torquay Local Board and Urban Authority, for the seventh time, for one year, from March 25, at £120 per annum.

MARSLAND, Mr. Ellis, has been appointed Surveyor under the Metropolitan Building Act for the East Kensington District.

METCALFE, Mr. J. K., has been elected a Member of the Liversidge Local Board and Urban Sanitary Authority, *vice* Jackson, deceased.

MULLEN, Mr. R. G. (who had previously been acting pro tem.) has been appointed Clerk to the Bromley, Kent, Local Board and Urban Sanitary Authority, at £300 per annum, and to the Bural Board at £50 per annum.

NAUNTON, Mr. George Thomas, has been re-appointed Surveyor to the Town Council and Urban Sanitary Authority of Southwold, at £10 for one year.

NEGUS, Mr. Thomas, has been re-appointed Surveyor and Inspector of Nuisances to the Camborne Local Board and Urban Sanitary Authority, at £107 10s. for one year.

PARR, Mr. Edward, has been appointed Surveyor and Inspector of Nuisances to the Hucknall-Huthwaite Local Board and Urban Sanitary Authority, at £7 10s. per annum, *vice* Hick, resigned.

PASCOE, Mr. Joseph, has been re-appointed an Inspector of Nuisances for the Helston Rural Sanitary District, at £15 for six months, ending Michaelmas next.

PATMAN, Mr. William, Branch Manager of the Halifax Joint Stock Bank, has been appointed Treasurer to the Hebbden Bridge Local Board and Urban Sanitary Authority, *vice* Harrop, resigned.

PORTER, Mr. William Henry, has been re-appointed Inspector of Nuisances for the Southwold Urban Sanitary District, at £10 for one year.

RAWLIN, Mr. George Richard, has been re-appointed Collector to the Swinton Local Board and Urban Sanitary Authority, at 2 per cent. commission for one year.

REDMAN, Mr. James, has been re-appointed Surveyor and Inspector of Nuisances to the H-worth Local Board and Urban Sanitary Authority, at £110 for one year.

REES, Mr. Thomas, jun., has been re-appointed Collector to the Usk Local Board and Urban Sanitary Authority, at £10 for one year.

ROWLANDS, Mr. Henry, has been re-appointed Inspector of Nuisances for the Cardigan Rural Sanitary District, at £40 per annum for three years.

SALISBURY, Mr. John, has been re-appointed Inspector of Nuisance for the Ashby-de-la-Zouch Urban Sanitary District, at £30 for one year.

SLADEN, Mr. Samuel, has been appointed Collector to the Guseley Local Board and Urban Sanitary Authority, Yorkshire, at 43 per annum, *vice* Pullan, resigned.

STANLEY, Mr. J., Inspector of Nuisances for the Thorne Rural Sanitary District, Yorkshire, has been appointed an Inspector under the Canal Boats Act.

SPRINGFELLOW, Mr. James, has been appointed Collector to the Hucknall-Huthwaite Local Board and Urban Sanitary Authority, at £7 10s. per annum, *vice* Hick, resigned.

THOMAS, Mr. Owen, has been appointed Surveyor and Inspector of Nuisances to the Beaumaris Town Council and Urban Sanitary Authority, at £42 per annum, *vice* Mr. Evan Thomas (his father), resigned.

TURNER, Mr. William, has been re-appointed Collector to the Rawmarsh Local Board and Urban Sanitary Authority, at £104 for one year.

WARNER, Mr. William Frederick, has been re-appointed Clerk to the Mansfield-Woodhouse Local Board and Urban Sanitary Authority, at £25 for one year.

WHITE, Mr. Henry, Solicitor, has been appointed Clerk to the Hursley Guardians, Rural Sanitary Authority, &c., *vice* Moss.

WHITEHEAD, Mr. James, jun., has been re-appointed Inspector of Nuisances for the Rawmarsh Urban Sanitary District, at £60 for one year.

WHITLEY, Mr. John Rhodes, Solicitor, has been re-appointed Clerk and Collector to the Haworth Local Board and Urban Sanitary Authority, at £110 for one year.

PUBLIC ANALYSTS.

ALLEN, Mr. Alfred H., has been re-appointed Public Analyst for the Borough of Sheffield, at £100 for one year.

HUGHES, Mr. Thomas, has been re-appointed Public Analyst for the Borough of Newport, Mon., at £40 per annum for quarterly reports and analyses of Food or Drugs; analyses of water to be paid for separately as private work; 10s. 6d. for each analysis of Food or Drugs for individuals.

MORGAN, Dr. William (previously appointed *pro tem.*), has been appointed Public Analyst for the County of Monmouth, at £10 per annum, and for 6d. for each analysis of Food or Drugs, and 2s. for each analysis of Water, *vide* Thomas.

VACANCIES.

MEDICAL OFFICER OF HEALTH for the Mutford and Lotheringland Rural Sanitary District and the Lowestoft Urban Sanitary District, at the rate of £130 per annum, for the Lowestoft Port Sanitary District at the rate of £30 per annum, and Medical Officer to the Lowestoft Urban Sanitary Hospital at the rate of £30 per annum, all for three months from June 14 to Sept. 19. Applications, 18th inst., to J. E. Cook, Clerk to the Joint Committee, 145 High Street, Lowestoft.

MEDICAL OFFICER OF HEALTH AND INSPECTOR OF NUISANCES for Llandysilio (or Menai Bridge) Urban Sanitary District: £5 and £12 per annum. Application, 18th inst., to Thomas Hughes, Clerk, Menai Bridge.

PUBLIC ANALYST for the County of Nottingham: £50 per annum, and for each analysis beyond fifty in each year. Application, 23rd inst., to Mr. Patchitt, Petergate, Nottingham (on behalf of the Finance Committee).

CLERK to the Bethesda Improvement Commissioners and Urban Sanitary Authority: £20 per annum. Application, 18th inst., to John Thomas, Clerk, Market Street, Carnarvon.

CLERK to the Carlisle Guardians and Rural Sanitary Authority.

CLERK, SURVEYOR, AND COLLECTOR to the Blackrod Local Board and Urban Sanitary Authority. Application, stating salary required, to James Eckersley, Esq., Chairman.

ARCHITECT to the Town Council and Urban Sanitary Authority of Norwich: £200 per annum, with offices, coal, stationery, &c. Application, 20th inst., to H. B. Miller, Town Clerk.

SURVEYOR to the Town Council and Urban Sanitary Authority of Blackpool: £300 per annum. Application, 20th inst., to Thomas Loftus, Town Clerk.

SURVEYOR to the Wednesbury Local Board and Urban Sanitary Authority: £200 per annum. Application to Joseph Smith, Clerk.

SURVEYOR AND INSPECTOR OF NUISANCES to the Sheerness Local Board and Urban Sanitary Authority: £70 and £80 per annum. Application, 20th inst., to Vincent H. Stallon, Clerk, Trinity Road, Sheerness.

SURVEYOR, INSPECTOR OF NUISANCES, AND WATERWORKS MANAGER to the Frome Local Board and Urban Sanitary Authority: £180 per annum. Application to George W. Bradbury, Clerk, Bath Street, Frome.

SURVEYOR to the Broadstairs Local Board and Urban Sanitary Authority.

REPORTS OF PUBLIC ANALYSTS, &c.

The Public Analyst for the Borough of Nottingham reported that he had analysed twenty-two samples of milk, four of which were adulterated.

Mr. H. F. Cheshire, the Public Analyst for Hastings, reported to the quarterly meeting of the Town Council on the 1st inst. that, during the last quarter, he had analysed nine samples, one of which was adulterated.

Mr. J. Carter Bell, the Public Analyst for Cheshire, reported that during the last quarter he had analysed 183 samples and found the following adulterated: 4 milks out of 39, 4 spirits out of 37, 1 butter out of 4, 1 coffee out of 11, and 1 cocoa. Amongst the divisions of the county Runcom sent up 34 samples, Hyde 23, Altrincham 20, Nantwich 18, Broxton 17, Northwich 12, Stockport 12, Eddisbury 22, Macclesfield 12, and Wirral 9.

Mr. J. J. Beringer, Public Analyst for Cornwall, reported that during the quarter he received thirteen samples for analysis. Some samples of spirit showed, as usual, great variations in alcoholic strength, one of them, a sample of gin, being diluted more than the law allows. It is a subject for congratulation that the adulteration of butter is so little prevalent in the county that none of the samples sent to him contained foreign fat. Some of them, however, were of poor quality.

The Police Committee of the Justices for Herefordshire reported to the Easter Court of Quarter Session as follows:—“In reply to the advertisement as to the vacant office of County Analyst, inserted in the local papers, only three applications have been received, the applicants, respectively, being resident in London, Cheltenham, and Bristol. From past experience the Committee feel that it is useless to appoint an analyst resident at such a distance, and they have directed a letter to be written to the Local Government Board to this effect. The Chairman said that, as the Court were aware, the office of County Analyst had been almost altogether a sinecure. Session after session the report was sent in with the word ‘nil’ written on it. At length it was thought that this was because the analyst resided at such a distance from the county, and the Committee were desirous, if possible, to get some gentleman appointed within the limits of the county, or close on the borders, but unfortunately, no such gentleman could be found. No answers had been received to the advertisements except from gentlemen resident quite as far off as the gentleman who had recently held the office. The Committee therefore thought it

was better to communicate with the Local Government Board with the view of escaping the necessity of appointing an analyst at all. The statute made provision for securing the services of the analyst for the adjoining jurisdictions when one was not appointed for a particular county. There was a County Analyst at Worcester and at Shrewsbury, and, he supposed, also one at Gloucester, and they were all as accessible as the gentleman who had acted as the Herefordshire County Analyst. It therefore seemed to him that the services of the analysts for the adjoining counties might be secured when required, and so avoid a waste of money in paying an analyst of their own. The Local Government Board had power to compel the Court to appoint a County Analyst, but he hoped they would not do so. The Court approved of the chairman’s suggestion, and resolved to adopt it, subject to the approval of the Local Government Board. The report was also adopted.

The committee of the Kent Justices on the Foods and Drugs Act stated in their report read at the adjourned General Session at Maidstone, on Tuesday, April 14, that during the past quarter 154 samples of food, &c., had been submitted for analysis, of which 28 were certified as adulterated. The total expenses amounted to £105 6s. 11d. Twenty persons were proceeded against, but only thirteen were convicted. Two cases were dismissed, and five were not proceeded with. The nine cases which stood over from last quarter all resulted in convictions. The twenty-two fines amounted to £25 13s. 6d. The committee could not hide from themselves, or from the Court, firstly, that their endeavours faithfully to carry out the provisions of the Act had not been successful, and, secondly, that that want of success had been largely in consequence of the want of zealous co-operation manifested at the various courts of petty sessions, sometimes one and sometimes another, and which had from time to time been adverted to by the committee, but unsuccessfully in most instances. In the last quarter three cases were brought before the bench at Rochester, one for coffee adulterated to the extent of 43 per cent., one for butter adulterated to the extent of 100 per cent., in each of which cases a fine of only 5s. was imposed, and one of mustard adulterated to the extent of 45 per cent., for which a fine of 1s. 6d. was imposed. They felt that it was perfectly useless to contend against such indirect upholdings of fraudulent practices committed for the most part on those who were unable to protect themselves. But notwithstanding the want of which they complain, the committee were willing for another quarter to carry on the working of the Act, trusting that justices of the peace would give them that moral and material support which the public had a right to expect them to give. After some little discussion it was determined, upon the suggestion of Sir J. Farnaby Lennard, Bart., the chairman, to send a circular letter on the subject to every bench of magistrates in the county.

LOCAL INTELLIGENCE.

At the meeting of the Whitchurch (Hants) Guardians and Rural Sanitary Authority on April 30, letters were read from Mr. Wyndham S. Portal, stating that, acting upon the advice of his medical attendants, he should retire from the Chairmanship at the end of the current parochial year, whereupon the following resolution was passed unanimously:—“That this Board learns with regret the nature of the communications they have heard read, involving, as they do, the severance of a connection with the Whitchurch Board of Guardians, extending over a period of forty years, during which time the management of the Whitchurch Union had been unremittingly and carefully supervised by Mr. W. S. Portal as chairman, to the credit and advantage of the Board and the benefit of the inhabitants of the Union generally, and that they venture to express an earnest hope that, by means of relief from pressure of work, their chairman’s health may be completely restored.”

The Devonport Town Council and Urban Sanitary Authority have increased the salary of Mr. Venning, the clerk, from £245 (£105 and £150) to £450 per annum, to include everything except Parliamentary costs, and the preparation of the Parliamentary Register, and work connected therewith.

At the annual meeting of the West Hartlepool Improvement Commissioners and Urban Sanitary Authority, on Tuesday, April 21, Mr. Thomas Furness was elected chairman, and, on assuming office, said that since he became a member of the Board twenty years ago, the rateable value of the district had increased from £51,000 to £130,600, and the population from 14,500 to 33,000, which was almost unparalleled.

The New Forest Guardians and Rural Sanitary Authority recently applied for urban powers, rights, &c., as to the making of by-laws respecting new streets and buildings, within the contributory places of Totton, Lyndhurst, Hythe, and Beaulieu, and at the meeting on April 13, a letter from the Local Government Board was read, stating that they were willing to accede to the application as regards Totton, Lyndhurst, and Hythe, but that as to Beaulieu they considered such powers were unnecessary.

Mr. Howel Gwyn has been re-elected Chairman of the Neath Guardians and Rural Sanitary Authority, for the thirty-second time in succession.

Mr. T. F. Twemlow has been re-elected Chairman of the Newcastle-under-Lyme Guardians and Rural Sanitary Authority, for the thirtieth time.

The Town Council and Urban Sanitary Authority of Reigate, in appointing Mr. Benjamin Griggs as Treasurer, *vice* Stanning, upon the recommendation of the Finance and General Purposes Committee in their report, which they adopted unanimously, added:—“And this Council cannot refrain from an expression of its regret at losing the services as treasurer of Mr. Stanning, who has performed the duties

of that office with so much diligence and exactness for the past twenty-one years.

A very painful incident occurred on the evening of Wednesday, April 19, at the close of the monthly meeting of the Kenilworth Local Board and Urban Sanitary Authority. A short meeting of the Highways Committee was held afterwards, at which Mr. Luke Heynes (one of the oldest and most respected members) was observed to be somewhat excited, and shortly afterwards left the table for the purpose it was thought of going home. The business was shortly afterwards brought to a close and the deputy clerk, on passing through the building preliminary to locking up, was shocked to find Mr. Heynes lying at full length on the floor of the lavatory apparently lifeless. He immediately sought assistance, and Dr. Atkinson and Mr. Bourne were immediately in attendance, but only to find life extinct. The deputy coroner was communicated with, but as the deceased gentleman had for some time been attended by Mr. Bourne for disease of the heart, he considered it was unnecessary to hold an inquest.

The Mountain Ash Local Board and Urban Sanitary Authority have increased the salary of Mr. S. O. Harper, the surveyor, from £200 to £250 per annum, from March 25 last.

Mr. Richard Welford, who for the past twelve years has been chairman of the South Gwent Local Board, has resigned his seat, in order to have more time to devote to other work. Mr. Welford's resignation was received with much regret by the other members of the board. Mr. S. H. Farrer was unanimously elected chairman in his place.

NOTES AND QUERIES.

Having for some time back been in the receipt of Queries appertaining strictly to sanitary work, and which it would be easy to answer, without having to refer our correspondent to competent professional advisers, we have opened a column in which to register such Queries and Replies thereto as can fairly be expected from us and our subscribers and readers are invited to make such use of this column as will tend to benefit themselves and the community. Both Queries and Replies will, however, be subjected, if unnecessarily long, to a strict censure.

151. HOSPITAL PROVISION.

Under Sect. 131 of the Public Health Act, 'a local authority may provide for the use of the inhabitants of their district hospitals or temporary places for the reception of the sick. Two or more authorities may combine in providing a common hospital.' Has an Urban or Port Sanitary Authority power to erect such hospital in the adjoining district of a rural authority without such combination or the consent of the latter? W. M. L.

[The words of the Act do not specify any particular locality for a hospital, and do not confine the local authority which establishes a hospital to its own district. No individual or local authority has a right to establish a hospital in a place where it is a nuisance, and the local authority of the district where such a hospital was established would have a right to object thereto, unless they are prepared to show that the hospital will be a nuisance, the rural authority cannot interfere to prevent its establishment.—Ed.]

152. PETTICOAT GOVERNMENT.

In your discursive remarks on page 456 as to the municipal privileges of women, you do not refer to the question of her eligibility for the position of Town Councillor or Alderman. Is there anything to prevent her election to either of these offices? GARY MARK.

[Yes. The Municipal Corporations Act of 1882 lays down by its 63rd section that 'for all purposes connected with and having reference to the right to vote at municipal elections, women in this Act importing the masculine gender include women.' If such a special provision had not been inserted, it might have been contended that as any person of full age and qualified by rating and residence, may become a burgess, and as the candidate for corporate office must be selected from the burgesses, there is nothing to prevent women upon the burgess roll serving any municipal office. And such a conclusion might have seemed inevitable, did not the Act distinctly declare that women should have only one municipal privilege viz., the right to vote.—Ed.]

153. DEFINITION OF DWELLING-HOUSE.

Can you refer me to any case in which the term 'dwelling house' has been legally defined? SURVEYOR.

[There has been no such case, as 'Surveyor' might have ascertained for himself if he had turned to page 63 of our present volume. Sir George Jessel, the late Master of the Rolls, once said in an appeal case with reference to the term 'dwelling-house,' 'What that means nobody can say.' And he went on to observe, 'I have tried, and tried in vain, to frame an exhaustive definition which is satisfactory to my own mind.' There is a so-called definition of the word 'house' in Section 4 of the Public Health Act, which is no definition at all, but only an extension of the term so as to include schools and factories. And there is a semi-official definition of dwelling-house in the Government Model By-Laws as to new buildings, where the term is described as 'a building used or constructed or adapted to be used wholly or principally for human habitation'—from which it would appear that the Legal Department of the Local Government Board have rushed in where Sir George Jessel feared to tread. The Model By-law definition would, of course, only apply in those places where by-laws framed upon the Government code have been adopted; but perhaps it may serve the purposes of our correspondent.—Ed.]

154. REGISTRATION OF HOUSE LET IN LODGING.

The landlord of a house let in lodgings within the meaning of Section 90 of the Public Health Act (which has been put in law in our district), refuses or neglects to register his house. How is he to be compelled to do so, and, if he is not compelled, what will you advise? C.M.

[Register the house yourself. There is no power in Section 90 corresponding with that in Section 77 (as to common lodging-houses) to forbid a person to keep a lodging-house or run a lodger therein, unless the house has been registered. The chief practical purpose of the by-law requiring registration in the Model Code issued by the Local Government Board, is to aid the local authority by rendering it the duty of the landlord to supply information which may facilitate their subsequent supervision of his premises. Though the landlord who neglects this duty may become liable to a penalty, the local authority would probably find that the reports of their own officers after inspection would amply supply the particulars necessary for the accurate keeping and correction of the register.—Ed.]

155. CISTERN SUPPLY OF WATER: REFUSE REMOVAL.

Sir,—Can you inform me, 1st, whether local boards have the power of insisting on a w.c. cistern supply of water in houses supplied by public water? 2nd, What is the law respecting the removal of refuse from private houses. Is the sanitary authority or town council responsible for its removal off the premises? 'SIR'.

[1st. This question is a little ambiguous. We do not understand whether the inquiry relates to the power of a sanitary authority (a) to compel the provision of a water-cistern, or (b) to require that a water-cistern already provided shall be furnished with a cistern apparatus for purposes of flushing. In the first case (a), a sanitary authority has no power to require the provision of any particular form of excrement receptacle. By Sect. 15 of the Public Health Act they may require a house to be provided with a sufficient water-cistern, earth-closet, or privy; the last two forms being then specifically recognised as permissible. In the second case (b) a water-cistern without a proper and regular supply of water would not only be a nuisance, but would, no doubt, come within the definition of a nuisance in Sect. 91 of the Act. 2nd. See Sects. 42 and 44 of the Public Health Act, the intention of which, read together, is evidently that in all places of any size the sanitary authority shall exercise the powers of Sect. 42 by themselves undertaking or contracting for the removal of house refuse from premises. But when for any reason they do not undertake this duty, they are empowered by Sect. 44 to make by-laws imposing upon occupiers the responsibility of removal, at such intervals as the authority think fit. If the local authority have neither arranged for the removal nor made by-laws under Sect. 44, the only power which they have is contained under Sect. 91 *et seq.*, where the accumulation of refuse has become a nuisance.—Ed.]

156. WATERING THE STREETS.

Under what Acts are local authorities bound to water the streets, and water companies to supply the water for the purpose? AQUARIUS.

[Local authorities are not obliged to water streets. Sect. 90 of the Public Health Act provides that the local authority may, and when required by order of the Local Government Board shall, themselves undertake or contract for the proper cleansing of streets, and may also undertake or contract for the proper watering of streets for the whole or any part of their district, so that what may possibly be obligatory in the case of cleansing is only optional in the case of watering. If our correspondent asks us the reason for this extraordinary distinction, we cannot tell him. The condition upon which water companies supply water for cleansing and watering the streets are laid down in Sect. 37 of the Waterworks Clauses Act 1847. In all the pipes to which any fire-plug shall be fixed the undertakers are bound to provide and to keep constantly laid on a sufficient supply for the above and other public purposes at all times, in such quantities, and upon such terms and conditions as may be agreed upon between the local authority and the undertakers, or in case of their disagreement, as settled by two justices.—Ed.]

157. 'A SIMPLE METHOD OF TESTING THE PURITY OF AIR.'

Would you kindly inform me in your next issue where I can purchase Professor Wolpert's apparatus figured at page 404, March number of the SANITARY RECORD.

R. BRYDEN HILL, M.D., &c.
Medical Officer of Health, Oldham.

[We have had many inquiries for this apparatus. It can be purchased from Messrs. Hill and Mey, Halifax, Yorkshire.—Ed.]

158. LIABILITIES OF WATER UNDERTAKERS.

Can you give information on the following legal point? Suppose a water company or a local board of health supplies a town with water, and charges a rate on every house using the water—continues to supply water they have been told is not pure, and the nature of its source is liable to dangerous contamination. Is the town liable to be called on to compensate any householders whose family may suffer from typhoid fever if supposed to have been caused by the water supplied? And further, is a sanitary authority justified in continuing to supply water from a source known to be liable to pollution by human excrement, trusting only to filtration to remove the danger? SANITARY.

[See on this subject the leading article on page 507. To continue the supply of water known to be liable to pollution by human excrement would be in the highest degree unjustifiable, and a moral, if not a legal, offence.—Ed.]

ORIGINAL PAPERS.

THE SELECTION OF DOMESTIC WATER SUPPLIES.

By

HERCY F. FRANKLAND, Ph.D., B.Sc., F.C.S., F.I.C.

SCARCELY a year passes by without the question of obtaining a new water supply for the metropolis being raised in some quarter. Novel schemes are from time to time proposed, or old ones, which have already received more than their share of attention, are redrafted, and again presented to the public. When it is remembered that the interests of four million human beings are directly involved in this matter, it is not surprising that it should continue to be discussed with unflagging zeal, and in all probability the end of this discussion is still very far distant, if, indeed, it will ever be reached.

The subject of water supply in general is so wide and many-sided that it is impossible for any one man to be perfectly conversant with all its various aspects, and it is, doubtless, on this account that such great divergence of opinion exists, where, in the interests of the public, it would be desirable that there should be unanimity. It is hardly to be expected that one and the same person can be an authority equally on the financial, engineering, and sanitary problems which present themselves in every question of water supply, and it is probably owing to the tendency which specialists exhibit of making authoritative utterances outside their own particular provinces that much valueless material has become incorporated in a discussion already sufficiently complex in itself.

Of the financial and engineering sides of the question, the public generally can have little or no knowledge, however important both, and especially the first, may be to them; but as to the sanitary part of the subject, it is desirable that every educated person should be well informed, for, although the inhabitants of large cities and towns have but little voice in the choice of their water supply, in rural districts, on the other hand, the important duty of selecting the best available water frequently falls upon the individual householder, whose ignorance may bring upon himself and his family consequences as disastrous as they are avoidable. Unfortunately, the highly conflicting statements with which the literature of water supply abounds, leaves the lay public who are seeking after truth in a state of darkness from which it is difficult to extricate themselves, hence it is hardly possible, without the expenditure of much time and trouble, to read between the lines of evidence, consisting as it generally does of skillfully manipulated facts and theories intended to present some particular point of view in its most laudable form.

In the following pages I have endeavoured to place before the reader, in as concise a form as possible, the present state of our knowledge concerning the sanitary aspect of water supply.

In judging of the fitness of a water for dietetic use, it is necessary that we should consider,

1. The Mineral constituents of the water.
2. The Organic constituents of the water.

1. *The Mineral Ingredients of Potable Water.*—It might have been anticipated that the investigation of the mineral constituents would offer but little difficulty, inasmuch as the precise mineral sub-

stances present in waters can be readily ascertained, and the effect upon the human organisation of these individual substances, in the proportion in which they exist, easily determined. As a matter of fact, however, it is one thing to determine the effect of a certain dose of a particular salt when this is administered on a few occasions, and a very different thing to estimate the effect of the same dose when taken daily for many years in succession, and in different states of health and disease. That this difficulty has, indeed, militated against the acquisition of any precise knowledge concerning the physiological properties of water containing different mineral ingredients is sufficiently apparent from the conflicting opinions of medical men with regard to the respective merits of hard and soft water for dietetic use. Not that medical men do not frequently hold very decided opinions on this subject; for, just as might be anticipated, the absence of any precise knowledge gives scope for the development of strong convictions possessing an imaginary rather than an actual basis.

That the presence of very large quantities of saline matters is capable of imparting marked physiological properties to water is evident from the medicinal use of natural waters strongly impregnated with salts.

All persons must be agreed that a water possessing distinct medicinal properties would be an undesirable water for ordinary and everyday dietetic use. Now there is every shade of gradation between waters of this distinctly medicinal character and waters which are in constant use for dietetic purposes, and it is consequently exceedingly difficult to draw a hard and fast line between waters which are suitable for ordinary, and those which are only fit for medicinal use. It must, however, be admitted by everyone that it is desirable to possess a water containing as little foreign matter as possible, so that the foreign matter introduced into the system may be, as far as possible, under the control of the individual. Thus, although we are unable to attribute any injurious properties to water containing even a very considerable proportion of saline matter, yet in the selection of a source of water supply there can be no doubt that, in the present state of our knowledge, a water containing a small proportion of mineral matter should, other things being equal, be preferred to one containing a large proportion of such matters.

The vast majority of the waters in general use for dietetic purposes in this country contain less than 50 parts of solid matter in 100,000 parts of water (35 grains per gallon), and there is little or no evidence to show that this amount is either desirable or undesirable; but when the proportion approaches to or even exceeds 100 parts in 100,000 (70 grains per gallon) then there would appear to be sufficient reason to inquire into the desirability and possibility of obtaining another source. Much must of course depend upon the actual constituents of this mineral matter, and where it principally consists of common salt, little or no cause of anxiety or suspicion need exist. When, on the other hand, the mineral matter is largely composed of salts of lime and magnesia, the possibility of these becoming converted into insoluble forms within the system must be borne in mind. It was given in evidence, before the Royal Commission on Water Supply, by the late Prof. Parkes, that a very marked difference exists between the so-called permanent and tempo-

rary hardness of water in respect to their influence on health. It was the opinion of Dr. Parkes that the bicarbonates of lime and magnesia, constituting the 'temporary hardness' of water, were in general innocuous, or almost so, whilst their chlorides and sulphates, constituting the 'permanent hardness,' could not be regarded in so innocent a light. Dr. Parkes did not state the exact grounds upon which his opinion was based, and I am not aware that any later evidence has further established this alleged difference.

In the absence, therefore, of any convincing evidence bearing upon the relative merits of hard and soft water for dietetic use, I think we shall do well to recognise our own ignorance, and avoid being carried away by any theories which are unsubstantiated by facts. For the present, then, although we may view waters of excessive hardness with suspicion, we must regard all waters, which are of only moderate hardness, as, *ceteris paribus*, equally fitted for ordinary dietetic use.

We must now turn our attention to

II. *The Organic Ingredients of Potable Water.*—This portion of our subject requires to be considered from two distinct points of view—1. *Chemical*; 2. *Biological*.

We shall presently see that it is of great importance that these two aspects of the subject be preserved quite distinct, and not confounded together.

In considering the organic ingredients of water from a chemical point of view, we are concerned in ascertaining not only the amount of the organic matter present, but also in discovering its origin, whether vegetable or animal.

Although we are unable by chemical analysis to determine the absolute quantity of organic matter present in water, yet we can compare the proportions of organic matter in different waters from the amount of organic carbon and nitrogen which they contain. Since the proportion of organic carbon and nitrogen in water can be determined with very considerable accuracy, the question arises whether it is possible from a knowledge of these ingredients to decide upon the fitness of the water for dietetic use. Now here we are at once met with the same difficulty which confronted us in the case of the mineral ingredients. And similarly, *no precise limit* can be fixed to the proportion of organic matter which may be present in water without interfering with its wholesomeness, just as no precise limit to the hardness and other saline matters could be decided upon. In the case of the organic matter, however, the practical limits of variation are very much more restricted, and not nearly so wide, as in the case of the saline matters, for the proportion of organic matter cannot rise above a very small absolute amount without impairing the palatability of the water.

Now it is often very doubtful whether the unpalatability of water renders it unwholesome, but it is always accepted on all sides that an unpalatable water is unfit for dietetic use. An unpalatable water will, in fact, be almost invariably condemned without the trouble of a chemical analysis being incurred at all, and no expert report, however confident and authoritative (and such reports are sometimes very confident and very authoritative) could shake the vulgar prejudice against an unpalatable water. But although the factor of unpalatability places an upper limit to the amount of organic matter which the popular taste will tolerate in water, this

by no means precludes the possibility of waters, which contain far too little organic matter to render them actually unpalatable, being yet of the most dangerous character. The proportion of organic matter in water is, in fact, when taken alone, of but little value in deciding upon the fitness of the water for dietetic use. It is essential that we should also take into consideration the origin of the organic matter present.

Organic matter that has been derived from vegetable substances can, when present in moderate quantity only, cause little or no anxiety, for it is possessed of no noxious properties that we are aware of. We may object to the slightly brown colour which such vegetable organic matter not unfrequently imparts to water, we may object also to the slightly bitter taste which it sometimes causes, but fear of its unwholesomeness we have no reason to entertain. The case is, however, entirely different with regard to organic matter which is of animal origin. The animal matters gaining access to water are almost exclusively the excrements of man and the lower animals: these, and especially the former, we know positively are capable of producing the most serious results in communicating disease, and, therefore, the presence of any organic matter of this kind in drinking water is justly viewed with alarm. It is thus evident that in the case of organic matter the question of *quantity* is to a great extent subsidiary to that of *quality*, and it will be seen how worthless must any comparisons between waters be which is based upon the relative proportions of their organic matter irrespectively of its origin. Thus how irrational it would be to compare the waters of the Thames, receiving as they do the drainage from vast tracts of manured land, and the sewage, either raw or treated, of numerous towns and villages, with the waters of Loch Katrine, which are derived from an upland area, unturbed by the plough and almost destitute of population. Yet, notwithstanding this great contrast in their origin, if the merits of these two waters were judged by the amount of organic matter which they contain, the balance would not unfrequently be in favour of the Thames water.

Fortunately chemical analysis furnishes us with other data for judging water than the mere aggregate amount of the organic matter it contains, for in proportion of organic carbon to organic nitrogen we possess some guide at least as to the origin of the organic matter in question. Thus, since animal organic matter is generally more highly nitrogenous than vegetable matter, therefore highly nitrogenous organic matter in water should be viewed with more suspicion than that which is less rich in nitrogen. It is necessary, however, to employ this criterion with great caution, as it is obvious that a comparatively small amount of animal pollution might be wholly masked and obscured by a relatively large proportion of vegetable matter. This source of error is, however, to a certain extent diminished, as substances exhibit when they are respectively subjected to decomposition by natural agencies. The highly nitrogenous animal substances in suffering decay yield a very notable proportion of ammonia in the first instance, which, under suitable conditions, is acted upon by certain definite ferments or living organisms with production of nitrates or nitrites. The vegetable substances, on the other hand, being relatively poor in nitrogen, yield

composition a very much smaller proportion of nitrogenous mineral compounds, and therefore nitrogenous mineral compounds, although absolutely distinctive of the decomposition of organic matters, are yet able in most cases to give important testimony as to the contamination of water by animal substances. Indeed, although in many waters of which it is extremely difficult to obtain chemical evidence alone to form an opinion as to the source of their organic matter, there is a very large number in which chemical analysis distinctly points either to a vegetable or animal source. In all cases, however, it is desirable that the purely chemical evidence should be supported by the light of a complete knowledge and understanding of the water's source.

We have already seen that we are unable to prescribe any fixed limit to the amount of vegetable matter which may be present in water without impairing its general wholesomeness, and we are unable to fix any exact limit to the amount of animal matter in water which may be consumed with impunity. For although we know that an enormous quantity of either vegetable or animal matters in drinking water is capable of producing proliarrhoea, the small proportions in which these matters are generally present in potable water themselves usually possessed of no toxic properties. Now although these small quantities of vegetable or animal organic matters are in themselves generally equally innocuous, we rightly give prominence to the presence of even the merest trace of organic matter in drinking water with alarm, and much larger proportion of vegetable matter is regarded with indifference. In order to understand this striking contrast in our views with regard to two different kinds of organic matter, we must go to the consideration of the subject from a different point of view.

Under ordinary circumstances a very small proportion of organic matter in water, whether vegetable or animal in origin, is living or organised. Organised matter consists of one or more of numerous minute forms, or micro-organisms, which are now frequently termed, which make their appearance and flourish in decomposing vegetable and animal substances. As far as our present knowledge extends, the micro-organisms which destroy vegetable matters are without danger to us, as are also those generally present in decomposing animal matters; but, under exceptional circumstances there is every reason to believe that these fuse animal matters, and notably sewage, accompanied by micro-organisms which are capable of inducing specific diseases. Thus the cases of patients suffering from certain zymotic diseases are known to possess the power of communicating the same diseases to persons drinking water which has been contaminated with such matters.

Thus, although the excreta of healthy persons gain access to drinking water without productive of any mischief; water which has been polluted, even to the smallest extent, may become dangerous to health, and is, therefore, rightly regarded with suspicion and alarm.

Evident, therefore, how utterly fallacious is the notion of water by actual results. We can easily deceive ourselves a completely isolated community, holding any intercourse with the outside world in which zymotic disease was unknown, and a community the contamination of water

with either vegetable or animal matters would be regarded with equal indifference; and it is probable that even the sentimental prejudice against drinking sewage-polluted water could there not have become developed by evolution. Now, communities of this kind, or of a kind closely approximating to this, are by no means uncommon: thus, many of the small villages throughout the country enjoy, for long periods of time, excellent health, in spite of the most unsanitary conditions of water supply. Owing to the comparative isolation of such villages, zymotic diseases are but rarely introduced; and, therefore, the water from the foul wells which generally abound may be consumed for years with impunity and without revulsion.

Since, then, the wholesomeness or unwholesomeness of water depends upon the absence or presence of certain specific organisms, the question naturally arises whether there is any biological test which is capable of assisting us in the choice of a suitable source of water supply. At the present moment I think it may be emphatically stated that no biological test which has been yet devised can supply us with anything like the information which is obtainable by chemical analysis. We have exceedingly beautiful and ingenious tests for ascertaining the number of individual organisms present in a given water; we have also within the last few years obtained the requisite means of identifying various specific forms. These tests are, however, of but little value in determining the quality of water for dietetic use. A water may contain a multitude of organisms, and yet be perfectly wholesome, whilst, on the other hand, it may be almost wholly destitute of organic life, and yet those few organisms which it does contain may be of the most deadly character. At first sight some valuable assistance might be expected from the identification of noxious or pathogenic organisms, the study of which has been so actively pursued during recent years; but it must be remembered that such organisms will only be present under exceptional circumstances even in waters of the worst quality; and that, therefore, their absence on any given occasion can afford no permanent security whatever. Now, if there were any organisms absolutely characteristic of sewage in general, then a biological test applied with a view to discovering such organisms in water would be of the highest value. At present, however, no organisms absolutely distinctive of sewage are known to exist.

Under these circumstances there are two salient questions which must be satisfactorily answered before a source of water supply can be deemed safe. These questions are:—

1. Is the source such that any sewage or other refuse animal matters can gain access to the water?
2. If such matters have gained access to the water, has the latter passed through any process, either natural or artificial, which can ensure the removal or destruction of any pathogenic organisms which may have been present in the sewage matters with which the water has been polluted?

The first of these two questions must be answered by a personal inspection of the source itself, and the water must also be free from suspicion on analysis. Few waters can, of course, be found possessing such an unimpeachable pedigree that it can be positively stated of them that at no time have they received any accession of sewage matters; but there do exist very large volumes of water, like the waters of many

lakes in mountainous districts, which can have only received an altogether inappreciable amount of such sewage contamination, and these waters we are compelled to recognise as amongst the safest which nature affords.

The second question, which it is almost always necessary to put to a water, is, unfortunately, very difficult and often impossible to answer. The truth is that we are so little acquainted with the effect of various processes upon micro-organisms, that it is impossible to say whether, and to what extent, the risk of drinking sewage-polluted water is diminished by the processes of purification which it may have undergone since its pollution. Again, the difficulty of inspecting these processes, which usually take place beneath the earth's surface, is sufficiently apparent.

Under these circumstances it appears to be only reasonable that we should regard, as the most reassuring, those processes which are capable of reducing to a minimum the organic matter present in water. Now, of all the processes to which water is subjected in nature, we find that prolonged filtration through porous strata, especially such varieties as chalk, oolite, and sandstone, is the most efficient in reducing the quantity of organic matter. The waters derived from such sources stand, in fact, unequalled amongst natural waters for their great purity as regards organic matter, and it is on this account that they are daily becoming more appreciated for dietetic use. If this prolonged filtration is capable of almost wholly removing all organic matter both in suspension and solution, it is only reasonable to suppose, with our present knowledge, that it will be highly efficient also in removing those minute micro-organisms which may have been present in the original water. Water which has undergone this exhaustive filtration is obtained from many natural springs, but more generally by sinking deep wells into the water-bearing strata. During the past year two borings of this kind in the vicinity of London have attracted no little attention. The first of these, at Richmond, had been progressing for a number of years past, but, owing to the absence of any sufficient quantity of water being met with, the boring was continued to a depth of upwards of 1,400 feet, until finally the new red sandstone formation was in all probability reached. Here water was found, indeed, containing only a small proportion of organic matter, but remarkably rich in mineral salts, and altogether deficient in quantity. As the boring thus appeared to yield almost as good prospects of reaching coal as an adequate supply of water, it was finally abandoned as a failure only a few months ago.

Another, but far more successful boring, has been carried out by the Southwark & Vauxhall Company, at Streatham. This well yields an abundance of water containing the merest trace of organic matter, as shown by an analysis made in my laboratory, and forms an excellent illustration of the remarkable purification which prolonged filtration through porous strata is capable of effecting.

The waters which find their way into shallow wells undergo a process of purification by filtration, which is essentially of the same kind as that we have just considered, only less in degree, and consequently we find that, as a general rule, the amount of organic matter in shallow-well water is very much in excess of that present in deep-well or spring water. It is only reasonable to infer, therefore, that the process

of filtration to which shallow-well water is subjected must be very much less likely to remove micro-organisms, should they be present, than the far more perfect filtration which the deep-well water has undergone. And from the disastrous consequences which have so often resulted from the use of polluted shallow-well water, there can be no doubt that frequently the filtration is altogether inadequate to remove pathogenic micro-organisms should they be present.

Of essentially the same nature as the percolation of water through porous strata is the process of artificial filtration through sand, which is resorted to by water companies drawing their supplies from turbid sources. With our present knowledge it is very difficult to say what the precise value of this process from a biological point of view may be; that it is very much better than nothing there can be no doubt, but, on the other hand, it is equally certain that it by no means guarantees the complete removal of micro-organisms. Under these circumstances we must regard the process of filtration through sand as valuable in diminishing the risk which attends the use of polluted water, but by no means as guaranteeing the safety of such water.

In speaking of the filtration of water, I ought to mention that filtration through sand may be very advantageously supplemented by filtration through spongy iron. Filtration through a comparatively small column of this material exercises a greater purifying effect, as regards living organic matter, than much more exhaustive filtration through sand and similar materials. I find, however, that fresh and highly ferruginous sand is also, like spongy iron, capable of entirely removing micro-organisms, its power being doubtless due to the iron which it contains, but, as the ferruginous matter is gradually removed or rendered inert, it rapidly loses this power. Indeed, so powerful is the effect of iron upon the lower forms of life, that mere agitation of the water with this material for a few minutes, even without filtration, is capable of removing a very large proportion of the micro-organisms that may be present in the water. I have not, however, been able to effect the complete extinction of organic life even when the agitation of the water with the spongy iron was continued for fifteen consecutive minutes.

With the exception of exhaustive filtration through porous strata, there is no natural process of purification which offers any sort of guarantee that micro-organisms once introduced into water will be either removed or destroyed. The prolonged subsidence which water undergoes in lakes and large reservoirs may, doubtless, lead to the precipitation of a large proportion of the micro-organisms present, and this reduction will doubtless be the greater the more turbid the water was before subsidence, the settling suspended particles entangling and carrying down with them the still more minute living matter.

A similar improvement, as regards organic life, must take place, although to a much less extent, in the deeper pools of rivers, but the matters so deposited will be swept out by floods and carried down the stream; so that the risk, which always attends the abstraction of water for domestic purposes from sewage-polluted streams, must be greatly enhanced during times of flood. Bearing this in mind, it is almost unnecessary to point out how important it is that water companies drawing their supplies from such sources should exercise the greatest vigilance in

their intakes as much as possible during mes of flood. In order to be able to do this, cessary, of course, that they should be provided with adequate storage capacity. Any increase storage power of a water company drawing sewage-polluted river must, therefore, be considered as an improvement of no mean importance.

I must refrain from here calling attention to the improvements which have recently been carried out by some of the more advanced engineers attached to water companies deriving their supplies from sources which are not above suspicion, in providing adequate storage reservoirs and filtering apparatus, and thus reducing, as far as lies within their power, the risk which attends the supply of water of this character. As still more hopeful must be the endeavours, of which the boring by the London Company at Streatham, and of that by the London Company at Chingford are instances, are available for the inhabitants of this city of that most perfectly filtered water which is in the great natural reservoir of the chalk.

It is thus evident that in all questions relating to the source of a water supply the principal consideration to be borne in mind is, what is the condition of the water as regards the possibility of its containing pathogenic organisms of a pathogenic nature? As we have seen, comparatively few waters can be safely placed above the suspicion of ever containing such organisms, and in general we must therefore, to consider what available source will at least risk of still containing such living organisms. In deciding upon this point we must remember that the purification of water so as to render it fit for dietetic use is really the same problem as the sterilisation of an infusion of meat or of a solution of gelatine, and the value of each process of sterilisation, whether natural or artificial, must be judged by the light of such established facts as upon its sterilising power, and that process which affords the most reasonable prospect of effecting such sterilisation must be regarded as the most perfect and desirable.

In the selection of the best available source of water supply we should then be guided by the following principles:—

1. That the water contain only a moderate proportion of mineral ingredients, although very considerable latitude may be permitted in this respect.

2. That waters containing a large proportion of organic matter should, irrespectively of the origin of the organic matter, be deemed unfit.

3. That waters containing only a moderate or even small amount of organic matter be not deemed fit, until it can be distinctly shown, both by analysis and inspection, that they are either free from suspicion of any sewage contamination whatever, or have undergone some process which may reasonably be considered to offer a guarantee that such serious organised matters, which may at any time be introduced into any company sewage, shall have suffered removal.

In conclusion, we have yet to consider a difficulty of very frequent occurrence, and which is

arising from the fact that, although there exist an unlimited source of water supply, but that it can be rendered available at very great cost to the community, whilst another and inferior source be

either already in use or obtainable for a much smaller sum; then the question must arise whether the advantages attaching to the purer water will be commensurate with the additional cost which its supply entails. Now, I would urge that in the discussion of cases of this kind we should fully and impartially consider the relative merits of the two schemes, so that the choice between them may be made in the full light of the facts, and that no countenance should be given to the practice, which is, alas, too common, of attempting to prop up inferior sources of water supply by means of strained and partisan evidence, professing, indeed, to rest upon an impartial and scientific foundation.

THE LAW AS TO METROPOLITAN SCAVENGING.

ONE of the complaints made by the Royal Commission on the Housing of the Poor in their recent report was that the Metropolitan sanitary law is difficult of comprehension, being distributed over so many Acts of Parliament; and they recommended that it should be consolidated. In no point is this consolidation more desirable than in the enactments relating to scavenging, to which of late much attention has been directed. It is not generally known that there is still an old Act of George III. in existence which has never been formally repealed, but which under Section 73 of the Metropolitan Management Amendment Act of 1862 is, 'so far as the same is in force, and is not inconsistent with the provisions' of more recent Acts, to extend and apply to the whole metropolis as defined by the Act of 1855.

Duties of Scavengers under Act of 1817.—Under Section 59 of this Act (57 George III. c. 29) commissioners (for which vestries and district boards are now substituted) were to agree with persons to be 'the scavengers, rakers, or cleansers of the streets and public places.' Such persons, 'on a certain day in every week,' and oftener when required by the commissioners or any officer appointed by them, were to bring into the streets 'convenient carriages' and 'at or before their approach, by bell, horn, clapper, or otherwise by a loud noise or cry,' were to give notice to the inhabitants. Such scavengers, rakers, or cleansers were to carry away from the respective premises 'the soil, ashes, cinders, rubbish, dirt, and filth,' at their own cost and charges, under penalty of forty shillings for every neglect. Any person who refused to permit the filth to be taken away by the scavengers was liable to a penalty of five pounds. The dust could only be removed by the scavengers duly appointed (Section 60), and the right and benefit of the filth was to belong exclusively to such persons. By Section 61 it was enacted that in case the scavengers neglected for seven days to remove the refuse, then, after twenty-four hours' notice given to the scavenger, it was lawful for the householders who had given notice, 'to give away or to sell their dust, dirt, filth, cinders, or ashes to any person whomsoever,' without subjecting such persons to any penalty.

It is important to note, before we go further, that later Acts, though imposing the duty of scavenging upon the vestries instead of upon Commissioners of Paving, have not in any degree limited the rights of householders under this old local Act of George III.,

save in so far as expressly varied. But of the existence even of the Act of 1817 few people seem to be conscious. Indeed, as a matter of fact, several of those who have referred to the law in the recent correspondence in the *Times*, have talked confidently of the protection afforded by the Public Health Act of 1875, oblivious of the fact that that Act does not apply to London at all, and that the scavenging of the metropolis is regulated by the Metropolis Management Act of 1855, supplemented by the old local Act of 1817 above referred to and by one section of an Act of 1862.

Appointment of Scavengers.—Section 125 of the Metropolis Management Act of 1855 (18 & 19 Vict. c. 120) provides that—

It shall be lawful for every vestry and district board, and they are hereby required to appoint and employ a sufficient number of persons, or to contract with any company or persons, for the sweeping and cleansing of the several streets within their parish or district, and for collecting and removing all dirt, ashes, rubbish, ice, snow, and filth, and for the cleansing out and emptying of privies and cesspools, sewers, and drains, in or under houses and places within their parish or district; and such company or persons are hereinafter referred to as scavengers.

It is left optional therefore with the vestry whether they will appoint a staff of their own, under their own control, or contract with outside persons for the removal of the dust. The former is infinitely the better plan, but, involving a little more trouble to the authority itself, is by no means so general as it ought to be. Bind a scavenger by contract as you will, he will find means, if thereto inclined, to give an infinite amount of trouble to the vestry which appoints him, and of vexation to the householders who are dependent upon his ministrations.

Duties of Scavengers.—Householders are not, it is true, left absolutely without redress for the malfeasance of scavengers, for Section 125 of the Act of 1855 goes on to provide that—

Such scavengers or their servants shall, on such days and at such hours and in such manner as the vestry or district board shall from time to time appoint, sufficiently execute and perform all such works and duties as they respectively are employed or contract to execute or perform; and if any such company or person fail in any respect properly to execute and perform such works and duties, such company or person shall for every such offence forfeit a sum not exceeding five pounds.

It is to be noted in connection with this clause that default of the contractor or of the persons appointed by the vestry to perform the duty of scavenging is punishable by a fine of 5*l.* [it was 40*s.* under the Act of 1817]; but the Act does not say who is to put the law into motion, nor does it apparently provide for the default of the vestry itself. If the sanitary authority undertakes the duty of scavenging by its own officers, it is to be assumed that an aggrieved householder must seek his revenge by getting the vestry's hired servant mulcted in 5*l.* There is a case, somewhat obscurely reported, which would appear to show that the vestry has been held to be the responsible agent in the event supposed (*see* *Guardians of Holborn Union v. The Vestry of St. Leonard, Shoreditch* (35 L. T. (N.S.) 400; 40 J. P. 740; 25 W. R. 40), and clearly this is the only reasonable interpretation of their position.

It has been erroneously assumed that Section 21 of the Sanitary Law Amendment Act, 1874 (37 & 38 Vict. c. 89) applies to the Metropolis. This section provides that—

If any sanitary authority . . . fail without reasonable excuse after notice in writing from the occupier of any house . . . requiring such authority to remove any house refuse . . . to cause the same to be removed within seven days, the sanitary authority shall, on summary conviction, be liable to pay to the occupier of such house a penalty not exceeding five shillings for every day during which such default continues after the expiration of the said period.

This would quite meet the case; but unfortunately Section 21 (unlike others in the Act of 1874) does not appear to be available for the protection of Londoners. For wherever in this Act it is intended to include the Metropolis, its local authorities are always set out as 'nuisance authorities,' the term 'sanitary authority' meaning to the framers of the Act only the urban and rural authorities created by the Public Health Act of 1872. The section we have quoted was an amendment of the Local Government Act of 1858, which only concerned extra-metropolitan local boards; and, moreover, in the Consolidation Public Health Bill for the Metropolis, which Mr. Sclater-Booth introduced in 1877, no mention is made of this section in the Act of 1874. Ratepayers must therefore be content with such powers of heckling the vestries and district boards as Section 125 of the Metropolis Management Act of 1855 confers upon them.

Monopoly of Dust Removal.—The householder has very little option as to the disposal of his refuse, and is, in fact, entirely dependent upon the goodwill of the sanitary authority for its removal. For not only is 'all dirt, dust, nightsoil, ashes, and rubbish' collected by the scavenger the property of the vestry, who have full power to sell and dispose of it as they shall think proper (Section 127 of the Act of 1855), but it is absolutely a punishable offence for the householder to sell or otherwise dispose of his refuse. Section 89 of the Metropolis Management Amendment Act of 1862 (25 & 26 Vict. c. 102) lays down that—

If any person or persons other than the person or persons employed by or contracting with the vestry or district board of any parish or district, or those employed by or under such person or persons, shall receive, carry away, or collect any dirt, dust, cinders, rubbish, ashes, or breeze from any houses, or premises, or from any street or highway in any parish or district, it shall and may be lawful for any justice of the peace, upon complaint to him made, to grant a summons, or, if such justice shall think fit, a warrant to bring before him such offender or offenders; and any person convicted of any such offence shall forfeit to the said vestry or district board a sum not exceeding five pounds, to be recovered by a summary proceeding.

When, therefore, the dust is not removed, the sanitary authority are themselves responsible for the existence of a nuisance injurious to health, and are guilty of the very offence the suppression of which is one of their most important functions. As has already been indicated, the protection against the neglect of the sanitary authority which is afforded to extra-metropolitan householders by Section 43 of the Public Health Act of 1875 is wanting in London; and apparently all that the householder could do if the authority neglected to remove his dust would be (1) to try the effect of

making the authority responsible for the neglect of their servants to perform the duties laid down in Section 125 of the Act of 1855, or (2) to exercise the power given by Section 61 of the Act of 1817 of getting the dust removed by some one other than the duly authorised scavenger (though this would be troublesome and expensive).

Dustbins as a Nuisance.—If a 'dustbin' is in so offensive a state as to be a nuisance within the meaning of Section 7 of the Nuisances Removal Act of 1855, notice may be given to the sanitary authority by their officers or by any person 'aggrieved thereby.' Certainly the unhappy householder is 'aggrieved thereby'; but he could hardly set the law in motion against himself; and apparently redress under the law relating to nuisances could only be obtained in those cases where a person thinks that a nuisance or dangerous accumulation of rubbish exists, *not on his own premises*. There are two courses open in such an event. The complainant may either approach the local authority of the district, and leave them to investigate the matter and to take the necessary steps to have the nuisance removed (Section 11 *et seq.* Nuisances Removal Act, 1855), or he may himself complain to a justice of the existence of the nuisance, and obtain a summons for its removal (Section 13 of the Nuisances Removal Act, 1860). On the hearing of such a summons, obtained at the instance either of an individual or of a local authority, the magistrates, if satisfied that a nuisance exists, have power to order its abatement, and to order anything to be done which may be necessary to prevent its recurrence (Section 13 of Act of 1855). The ultimate safeguard for keeping a district free from pestilential collections of rubbish is, therefore, the power which either the local authority or an aggrieved individual has of invoking the authority of the law to prevent the continuance of a nuisance; but this, of course, could only be done when a dustbin was so offensive as to be a legal 'nuisance.'

Penalty for Obstructing Scavengers.—Section 126 of the Act of 1855 provides that—

Any occupier of any house or land or other person who refuses or does not permit any soil, dirt, ashes, or filth to be taken away by the scavengers appointed by or contracting with any vestry or board, or who obstructs the said scavengers in the performance of their duty, shall for every such offence forfeit and pay a sum not exceeding five pounds.

Very good; but how seldom do the local authority or the scavengers exercise their plain duty to remove the dust from each house at regular intervals, whether the dustbin be overflowing or not, and whether the occupier be willing or no! That a cart should be merely sent through a street, leaving it to chance whether the dustman's cry be heard, to effect the removal of the dust, is to invite people to retain this material in their dustbins.

Removal of Trade Refuse.—Section 128 of the Act of 1855 enacts that—

In case any scavenger be required by the owner or occupier of any house or land to remove any refuse of any trade, manufacture, or business, or of any building materials, such owner or occupier shall pay to the scavenger a reasonable sum for such removal.

In case of dispute as to the 'reasonable sum' to be paid, or as to what is to be considered as trade refuse, the matter is to be referred to the arbitra-

ment of two justices, whose decision is to be final and conclusive. There is no similar provision to this last in the Public Health Act, and we only find in the regular text-books reference made to one decision under this section of the 1855 Act, which helps to define the term 'trade refuse.' In that case, *Gay v. Cadby* (36 L. T. (N.S.) 410; 46 L. J. M. C. 260), it was held that the ashes of coal used for a manufacturer's engine were not 'refuse of any trade, manufacture, or business,' for the removal of which the scavenger was entitled to make a charge. No doubt many things are put into the dustbin which have no right to be there; but it will usually be found that the dustman is extremely alive to the presence of these, and has a very generous interpretation of Section 128 of the Act of 1855 to bolster him up in his refusal, without a further bribe beyond his customary *douceur*, to cart them off the premises. It might possibly be desirable that, as Mr. Eassie suggested in his letter to the *Times* of the 25th ultimo, 'the local authorities should positively define in detail what does and what does not constitute "household refuse" within their boundaries'; but to leave it to the authorities—that is, to the grimy individual who represents them for the nonce when he comes to fetch away your dust—an option to refuse the removal of anything that he chooses to class as outside the schedule, seems to leave the householder at the mercy of the scavenger in presence of a nuisance which it is important for him to have removed, and which cannot be conveniently got rid of in any other way than by the orthodox dust cart. (See p. 562.)

HEALTH STATISTICS OF NEW YORK.—The weekly bulletin of the Health Department of the City of New York, compiled by Dr. John T. Nagle, corresponds in some sort to the Registrar-General's weekly return in this country. It gives a mass of valuable statistical information as to the number of deaths occurring not only in New York, but in other American and in foreign cities, classified by ages, diseases, wards, and the like. Recent returns show the death-rate of New York to be unduly high, being not seldom over 30 in the thousand. Diphtheria seems to have been of late unusually and fatally prevalent in the city.

NEW AGENCIES FOR THE PROPAGATION OF SMALL-POX.—The last new thing in the way of agencies for the propagation of small-pox is reported by Dr. Dudfield in a recent report on Kensington. Five cases of small-pox occurred among the members of an amateur 'nigger troupe.' Dr. Dudfield thinks it a little doubtful whether the infection was conveyed by a member of the troupe previously and slightly affected, or by the 'properties,' purchased, about a fortnight previous to the first of the four cases, at Petticoat Lane! He also adverts in the same report to the unusual occurrence of three 'second cases' in three houses, too long after the first cases, and at a too considerable interval after disinfection of the premises, to enable him to account satisfactorily for their origin. As a matter of fact, it would appear that the people so attacked had received letters from the 'first cases' in hospital, and it becomes an interesting question whether this may not explain the infection. Patients appear to be rather encouraged to write to their friends, but the practice is objectionable, and one that should be as much restricted as possible, for beyond any question susceptible people may take small-pox infection conveyed in a sheet of paper. 'Possibly,' says Dr. Dudfield, 'a post-card would be less dangerous as regards the recipient of news, but, for obvious reasons, not less objectionable, unless, indeed, the post-card should be disinfected, an impracticable process in the case of enclosed letters.'

THE HOUSING OF THE POOR IN SCOTLAND.

APPARENTLY seduced by the favourable reception accorded to their first report, the Royal Commission on the Housing of the Poor hurried out a week after its publication a second report, dealing with the state of affairs in Scotland. This was an error of judgment, properly punished by the report falling upon almost deaf ears: for time had not been given for the proper mastication of the first course before the public was called upon to swallow the second. We are not saying that the comparative oblivion of the Scotch report is unmerited. On the contrary, we think it distinctly inferior in tone, in interest, and in style to the English report. It appears to have been hurriedly compiled, and its recommendations carelessly thought out; though it is just perhaps to say that the question of the homes of the poor is shown by it to be of far less serious import in Scotch than in English towns. Following our customary plan, we analyse the report according to the several sub-heads of the subject of which it treats, making such running comments thereon as arise naturally out of the recommendations. But obviously the question is not one merely of the amendment of this section, or the strengthening of that Act, or better administration or consolidation of areas. The housing of the poor affects more or less some of the great social problems of the day—such as the system of land tenure, local taxation, self-government, the powers of municipalities, the limits of State help to individuals, and many others. Such of these questions as are germane to the objects which the SANITARY RECORD sets itself to accomplish may perhaps be discussed in these columns at a later date, by the light of the evidence laid before this and other Royal Commissions. At present we must confine ourselves to the actual state of affairs in Scotland, and the recommendations of the Commission.

The Scotch Law as to Artisans' Dwellings.—It is nearly always necessary to speak with bated breath of Scotch law, as a thing uncanny and mysterious. But in respect to artisans' dwellings, Scotland appears to have done as much—or as little—in the way of legislation as England, except that there is no provision for general building by-laws. Scotland stopped short in its general public health legislation in 1867; but it has powers for the repression of nuisances and of overcrowding, and is even able to make regulations for houses let in lodgings, though this 'is almost unknown, even to officials whose lives are passed in administering the sanitary law.' Mr. Torrens's Acts extend over Scotland, but they 'have been practically a dead letter.' Similar Acts to Sir Richard Cross's Acts were passed in 1875 and 1880, but such authorities as have gone in for clearing unwholesome sites seem to have preferred private Acts of their own. Indeed, the general state of Scotch sanitary law would appear to be an *effete* general statute, which in the country is more or less totally ignored, and in the towns is superseded by sanitary codes of the local authority's own making. Naturally, the Commissioners recommend a 'consolidation' of the law, and even throw their *axis* over the cumbersome Burgh Police and Health (Scotland) Bill, now before Parliament, on the ground that 'it contains many provisions likely to improve the condition of the dwellings of the working classes.' The Commissioners advise

the introduction of an uniform system of administration in sanitary matters, noting that 'the existence of important local Acts has perhaps caused a neglect of general public Acts.' They also think that building by-laws should be made general throughout the country where there is no private Act.

The Single-Room System.—The general feeling expressed in the evidence as to the large towns of Scotland is that the condition of the housing of the working classes, though in many cases deplorable, is not of the extremely miserable character described as existing in London; that efforts have been made for its amelioration, not without marked effect; and that the causes of existing misery are to be ascribed as much to the habits of the people as to outside influences. The single-room system appears to be an institution co-existent with urban life among the working classes in Scotland.

The size and height of ancient Scotch houses, in the old town of Edinburgh for instance, would be sufficient to show that they were always intended for the habitation of many families, even if this were not a well-known historical fact. The system is so firmly established in Scotland that the Scotch law provides for the difficulties which may arise out of the joint-ownership of a house in portions. It is not in Edinburgh alone that are found these large tenement-houses, nor are they always ancient buildings. At Paisley they are said to be on the increase, and it seems in Scotch towns to be as usual to run up an edifice of great height, containing a number of separate dwellings, as it is in England to build a row of two-storeyed cottages. At Glasgow it is acknowledged that an extraordinarily high proportion of its population live in single rooms, but it is said that the single rooms are much larger than elsewhere. The single-room system is an incident of the tenement-system. In Edinburgh there are said to be 14,000 single-room tenements; in Glasgow 25 per cent. of the whole population live in single rooms, and in Dundee there are 8,221 houses of one room containing 22,870 inhabitants. The chief reason for this seems to be that the occupants of the single-room tenements cannot afford to pay for more accommodation. The custom of the poorer classes in Scotch towns may have something to do with their mode of life, but it is probably for the most part a question of rent. In Edinburgh rents seem to be very high, and consequently they bear a large proportion to wages, and are said by one witness to amount to a fourth of the wages.

The Commissioners think that much could be done to mitigate the evil of the single-room system by raising the standard of cubic feet of air required for each individual, and by making provision that the standard should be vigorously enforced. The regulations as to underground dwellings should also be made more stringent. On the general question they have come to the conclusion that 'although the evidence shows a not very desirable state of things in the housing of the working classes in the towns of Scotland, yet on the whole the only persons to whom reform might be looked for—the representatives of the more active local authorities—are not discontented with the condition of affairs.' For instance, Dr. Littlejohn, the health officer of Edinburgh, and medical adviser of the Board of Supervision, expresses himself as satisfied with the state of the sanitary laws, and does not consider that more power is required under them, though he would like to see the single-room system done away with.

Sanitary Defects of Houses.—Much evidence was given by witnesses from large towns to the effect

that a considerable proportion of the labouring classes in Scotland would be able to house themselves in far greater comfort if it were not for the large sums they spend in drink. The dilapidated condition of many of the habitations of the poor is another great evil. In some of the old parts of Edinburgh there are houses which are too decayed to be repaired.

When clearances have been made accommodation has been supplied for the more respectable artisans, but the poorest section of the population have been left to inhabit the defective houses which remained. Structural defects are not found solely in old quarters of the towns. At Glasgow the custom of building houses in hollow squares was said to be a great evil, and the back-to-back system in the crowded courts was described as 'the curse of Glasgow.' Complaints were made of the insufficiency of water-closets; and the water supply generally is not so good as it should be. Evidence was given which showed that there is a sufficient supply of houses for the better class of the working population in Edinburgh, but that the wants of the very poor have not been met. The legal expenses, as in England, are found to be a great difficulty, especially in connection with the system of fees.

The Commissioners appear to think that the enactment of proper building by-laws, and the improvement of the present public health law, will be sufficient for the correction of these evils, though they recommend a reduction of the cost of the transfer of land and of small houses.

Improvements Effected in Large Towns, and their Results.—Most of the urban witnesses appear to have spoken to an improved state of things in the towns, and it may be well, therefore, to notice some of the figures showing the work which has been done to ameliorate the condition of the dwellings of the working classes. In Edinburgh the improvements made by the City Improvement Trust have cost the city 300,000*l.*, nearly 3,000 houses occupied by the poor having been cleared away. In Glasgow 1,600,000*l.* has been spent by the Improvement Trust since 1870, 80 acres have been purchased for clearance, and about 30,000 people have been displaced out of 50,000 whom it was intended to displace. At Aberdeen 800 people have been displaced under Cross's Acts, and at Greenock 2,000 people, houses having been provided for about 600 of those turned out. At Leith the Town Council have spent 100,000*l.* in doing so little that the Commissioners think that the Corporation should not be relieved of the obligations imposed upon them by law. At Dundee some of the worst quarters of the town have been demolished, but a good deal remains to be done. The general result of these operations is shown by the death-rates. At Edinburgh the average rate from 1866 to 1875 was 26.26 per 1,000; from 1876 to 1885 it was 19.94 per 1,000. At Glasgow the mean death-rate from 1861 to 1870 was 30.5 per 1,000, from 1871 to 1880 it was 28.5, and from 1881 to 1885, 26.5 per 1,000. At Dundee the average death-rate was 28.86 from 1864 to 1875, and from 1874 to 1884 only 21.09 per 1,000, 1874 being the date of the great demolition.

Rehousing after Demolition.—In connection with town improvements it is interesting to note the policy adopted in Scotland for rehousing the people who have been displaced by demolitions. In all the Scotch towns the general feeling is that there is no obligation to rehouse the people who have been turned out. The clerk to the Edinburgh City Im-

provement Trust thinks the work is best left to private enterprise, and in this way is most amply done. The President of the Edinburgh Trades Council, speaking for the working classes, holds that the Town Council ought not to be in any way responsible for the housing of the people. At Glasgow, it was said that if the Town Council had shown any tendency to build on their own account it would have paralysed the independent efforts of people outside. It is curious that at Glasgow the labouring classes crowd into the town, not in order to be near their work, as in London, but for the convenience of town lodgings. They often work in the country or on the outskirts of the town and return to sleep in the centre of Glasgow, thus adding needlessly to the overcrowded state of the place.

Rural Districts.—The Commissioners give a familiar picture of the hovel which serves for a dwelling-place of the cottier in rural districts. There is no need to reproduce it; most of our readers know it well enough in its dirt, darkness, and misery. A good deal of evidence as to Highland houses was given by members of the Crofters' Commission. The majority of cottiers' dwellings are described as confined, dark, miserable, and unhealthy. Some of them have only one entrance for the cattle and the human inhabitants; they have no partition inside, and all the occupants, human and animal, live under the same roof in the same undivided space. Many of them have no windows, and receive light only by the door and by the aperture through which the smoke escapes. The condition of the interior is, of course, filthy. This is the worst type of house which the Commissioners have found in Scotland, but it is a very common type among the crofter population. Lord Napier and Ettrick, the chairman of the Crofters' Commission, offered some suggestions for the improvement of these dwellings. The Royal Commissioners find themselves unable to concur with his recommendations, and observe that 'the condition of the crofters' and cottiers' houses seems to depend on the conditions of their tenure of land'—a subject beyond the purview of the Commission. Not only in the Highlands, but throughout the three kingdoms, does this question of land tenure perpetually crop up in connection with the problem of housing the poor. The case of dwellers in towns is perhaps the most pitiful and sordid, but the rural labourer has his own peculiar difficulties in the dwellings question. We cannot now reopen this particular point. Years ago we drew attention to the patent evils of the overcrowding and dilapidation of village homes, and to the need for reform.* Probably the great land question will be one of the first things to which the new Parliament will set its hand, and it will then be well to remember how intimately it is bound up with the proper housing of the poorer members of the community.

DYNAMITE AND APOPLEXY.—On the 29th ult. John Dawson, a miner employed in the lead mines at Wearhead, near Bishop Auckland, died of apoplexy. The deceased had often complained of faintness, arising from inhaling the fumes of dynamite used in lead mines; a few days previously he was seized with a fit which completely prostrated him and rendered him unconscious. The medical men in the district are unanimous in their opinion that the use of dynamite tends to produce this malady, which has carried off several miners.

* See SANITARY RECORD, Vol. viii. p. 305.

THE VISIT OF THE ROYAL COMMISSION ON HOUSING THE INDUSTRIAL CLASSES TO DUBLIN.

(FROM AN OCCASIONAL CORRESPONDENT.)

THE visit of the Royal Commission to Dublin was looked forward to with great hopes by those interested in the homes of the poor in that city.

Most persons in Dublin who have paid attention to the subject have come to the conclusion that the present condition of the dwellings of the industrial classes is due rather to defects of administration than of legislation, and the character of the Commission, as well as the nature of the report relating to England, encouraged the belief that the investigation would be thorough, and be based not only on the evidence of officials, but on the independent testimony of those of long experience on the subject.

The Commissioners who came to Dublin were Sir C. Dilke, Sir R. Cross, Mr. Stanley, Mr. Morley, Mr. Collings, and Mr. E. D. Gray.

They opened their sittings at the City Hall on Saturday morning, the 23rd ult., sat continuously until 7 o'clock P.M. that day, when they completed the inquiry as to Dublin, with the exception of three or four witnesses taken on Tuesday and Wednesday. The Commissioners were reinforced by the addition of Earl Brownlow and the Bishop of Bedford on Tuesday morning, when they sat from 12.15 to 5 p.m., and for 1½ hours on Wednesday, and concluded the investigation. During 15½ hours they examined forty witnesses, giving an average of nearly twenty-three minutes to each witness, thus easily beating the shortest time on record for Commissions of Inquiry.

The selection of witnesses was conducted on the most extraordinary principles, and if the object of those consulted on this subject by the Commissioners was to hoodwink that body it was attended with perfect success. The list of witnesses originally selected on behalf of the local authority excluded the City engineer, the assistant engineer, who is surveyor to the Artisans' Dwellings Committee, the law agent, and the consulting sanitary officer.

These are the only officials now surviving who had anything whatever to do with the clearance and reconstruction of the Coombe area, which was dealt with by the Corporation in 1876-80, under Sir R. Cross's Act, with most beneficial results (see SANITARY RECORD, Nov. 18, 1876). Although the City and assistant engineer were, owing to external pressure, called on at the last moment, the value of their evidence was altogether neutralised, owing to the mode of examination pursued. The official witnesses were taken in batches, and great was the competition in garrulity; he who talked most talked best, and some of the witnesses could not get a word in edgewise to express their assent or dissent.

Similarly as regards Kingstown, a suburb of Dublin, which can boast of slums quite as bad as those of the metropolis (see SANITARY RECORD for October 15, 1884, p. 167); the evidence of the medical officer of health, of an ex-chairman of the Commissioners of immense experience, of the agents of the lords of the soil, and of others intimately acquainted with the district, was declined, and that of a private medical practitioner, who had only come to Kingstown within the past two years, accepted.

The owners of tenement houses in Dublin, whose

number may be estimated from the fact that 180,000 of the population live in those houses, offered to send a representative to explain their views, but the offer was declined, and the Commissioners are absolutely without evidence as to the position and difficulties of this class. It is not too much to say that the Commissioners could have got a clearer idea of the cause of the present state of things in Dublin, and the difficulties in the way of their removal, from this body than any other witnesses examined. A grave error was also committed in not examining the dispensary medical officers of Dublin, who are also health officers of their districts. The experience of some of these gentlemen extends for over twenty years, and would have been most valuable.

The repression of evidence did not stop here. Many witnesses, both official and independent, were prepared to give the Commissioners their views on the subjects noted in their 'briefs,' but they were politely dismissed after the merest outline of their evidence was taken, and some brought from a great distance were asked two or three questions or not examined at all. The Cork witnesses publicly stated that they might as well have sent their evidence by post.

It was specially desirable that the condition of Cork should have been inquired into, as the Commissioners did not seem to form a favourable opinion of that city. The death-rate of Cork for the past five years (25.5) is lower than that of Dublin (27.3), and the most successful effort, financially, to house the industrial classes in the three kingdoms has been made in the former city.

It was not unreasonable that the Commissioners should have declined multiplied evidence as to the state of the slums, although it is unfortunate that the slums which they visited were by no means the worst in Dublin. But the condition of slums does not materially differ in different places, and the Commissioners had already description of facts *ad nauseam*, although it may be doubted whether they ascertained the three leading features of the slums of Dublin, viz., their presence in all parts of the city, their daily increase, and their rapid deterioration. They should, however, have laboured to ascertain the real causes why the owners of such dwellings do not improve them and the remedies for removing the obstacles in the way of that improvement. To refuse to hear the evidence of these owners, and not to seek suggestions from those who have acquaintance with the difficulties mentioned, was to ignore the very *raison d'être* of the Commission.

Dublin, of all the cities in the three kingdoms, affords perhaps the most satisfactory example of the application of Sir R. Cross's Act; but it stands no less high in the rank of those cities which need the effective administration of the laws relating to existing repairable structures, and is very unfavourably circumstanced both in the condition and administration of other laws which seriously affect the housing of the working classes. The state of house tenure, the laws relating to valuation and taxation, the recovery of rent, and eviction in case of non-payment, all contribute largely to the difficulties which handicap the improving owner, and tend to throw the ownership of tenement-houses into the hands of unscrupulous persons.

It is a matter of very great regret that fuller evidence on these subjects was not sought by the Commission, the more especially as it is almost certain that legislation will follow their recommendations.

has been always the fate of Ireland to suffer two classes of Select Committees or Royal Commissions—the superficial and the exhaustive; commendations of the former are recorded in statutes, while those of the latter are in most too strong for the existing Government to act.

DRAINAGE AND SEWAGE PURIFICATION IN THE BLACK COUNTRY.

(FROM OUR OWN CORRESPONDENT.)

[Fourth Article.]

CONSIDERABLE time was lost in dealing with the question of uniting Walsall and Wednesbury for sewage purposes, and to obviate the difficulty to be experienced by the former place in getting the necessary land for their purpose. The Wednesbury Local Board District was at the time wholly without any system of sewerage. Mr. the Walsall surveyor, who had been entrusted with the preparation of a scheme for the borough, a difficulty likely to accrue to Wednesbury in getting Walsall to hold the land they required for sewage purposes, and in this he was supported by Mr. J. Marten, C.E., of Wolverhampton, an authority on drainage matters. Mr. Marten should recommend Wednesbury, if it went to a scheme on its own account, to go in for filtration rather than filtration, as being more suitable to its situation, and requiring but a few acres of land. In this respect, Wednesbury, having a system in vogue, could adopt any scheme it liked, whereas Walsall could not do with a precipitation system alone on account of having deep sewers already laid, in which they had to deal with water as well as with sewage matter. The Walsall people at first declined to consider in any way a proposition for a union of the two towns, but finally, in order to avoid a Parliamentary contest to get over the land difficulty, they agreed to a consideration of the Wednesbury Local Board withdrawing their opposition to the provisional order asked for by Walsall, the latter to be as soon as practicable apply to the Local Government Board for a provisional order for getting the two places into a united district for the purpose of receiving, storing, disinfecting, distributing or otherwise disposing of the sewage of those places. The Wednesbury people, who were beginning at this time to feel uncomfortable as to their share in the pollution of the River Tame and its tributary watercourses, eagerly closed with the terms proposed by their Walsall neighbours, and negotiations were actually in progress as to the terms of agreement when the attention of the Wednesbury Local Board was directed to a statement relative to the system of sewage treatment in vogue at Farnworth and Astley Bridge, in Lancashire, which was said to be almost perfect results at comparative small cost. A deputation was appointed to visit those places, and report to the Board upon the scheme. It was decided by the Board with this report that they should send Mr. Fereday (surveyor to the Board) to prepare plans and specifications for dealing with the sewage by tank precipitation on the Astley Bridge Farnworth principle. The question of union between Walsall and Wednesbury was set aside: a result for which the

latter place was duly grateful. The opposition to the provisional order asked for by Walsall being thus withdrawn, sanction was given by the Local Government Board to the scheme propounded by Mr. Boys, and eventually it was carried into effect, at a total cost, including the purchase of land for a sewage farm, of about 53,000*l.*, so far as the town of Walsall was concerned. That portion of the scheme which related to Bloxwich was left in abeyance for a time, the sewage there being of a domestic character, without the addition of the deleterious matters which flowed into the Walsall sewers. It was not until the end of last year that a move was made in the direction of completing the sewerage of the district under control of the Corporation of Walsall. An inquiry was then held (Nov. 19) by Captain Hildyard, R.E., on behalf of the Local Government Board, respecting an application made by the Walsall Town Council for permission to borrow 26,850*l.* for the execution of the Bloxwich portion of the scheme. The system proposed to be adopted was one of filtration, and the cost, including land and farm buildings, was estimated at 32,000*l.*, a portion of which they had remaining from the loan obtained for the carrying out of the Walsall scheme. Captain Hildyard took occasion to compliment the authorities upon the successful results achieved at Walsall, and the purity of the effluent obtained from the Bescot Sewage Farm. Sanction being given for the loan required the Walsall people may be considered to have, with the completion of the Bloxwich scheme, discharged themselves of the obligations and responsibilities resting upon them in an able and satisfactory manner. As they were one of the first places in the district to move in the matter, so have they been one of the first to dispose of it, being in this respect considerably in advance of their neighbours.

Returning now to Wednesbury, we find that, in May 1882, the surveyor to the Local Board of that place presented a report based upon the Farnworth and Astley Bridge system, in which he recommended three different outfalls, at a cost of 20,921*l.*, exclusive of the cost of land and the payments for way-leave through mining property. The Board, after long and wearisome discussion, approved the report, but wisely decided, before committing themselves to any expenditure upon it, to submit the scheme to Mr. Marten, C.E., together with the plans prepared by Mr. Fereday. In August, 1882, Mr. Marten sent in his report, which was to the effect that for various reasons he did not consider the scheme as it stood would enable them to discharge their statutory obligations. He pointed out that in order to obtain a satisfactory effluent under a precipitation scheme it was absolutely necessary that, after being mixed with the precipitant, the sewage should remain perfectly quiescent for a much longer period than Mr. Fereday's scheme would permit. Neither did he think the 13 acres of land, or that portion of it which would be available for the purpose, proposed to be acquired, would be sufficient for the purification of the liquid from the precipitation tanks to a sufficient extent to be passed into the river. He considered at least eight acres of additional land would have to be provided; suggested that storm-water should be kept out of the deep sewers as much as possible, and that one outfall only should be used, instead of three, adding that, in his opinion, it would be advisable in their case to rely for the purification wholly upon some system of precipitation and sub-

sidence, rather than upon any system of intermittent downward filtration or broad irrigation. Including 20 per cent. for interest on the outlay, engineering expenses, and contingencies, he estimated the cost of a practicable scheme of sewerage for Wednesbury at 30,780*l*. In the face of this adverse report, the Local Board, by a majority, rejected Mr. Fereday's scheme. They were not able to let the matter rest, however, for the Birmingham Corporation had served them with statutory notice of proceedings under the Rivers Pollution Act, and it was urgently necessary that something should be done. At this juncture a proposal was made by the Local Board of Darlaston, an adjoining town, for the union of Wednesbury, Darlaston, and Tipton into a united drainage district for the purpose of carrying out a sewerage scheme which should include the three towns, which were equally devoid of any system of sewerage, and equally responsible in regard to the pollution of the Tame. Somewhat similar conditions as to scarcity of available and suitable land ruled each town, and they were also similarly circumstanced so far as the prevalence of mines and the consequent difficulty and expense of deep drainage was concerned. The proposal was favourably taken up by Wednesbury, and in October 1882 a conference of representatives of the three places was held, at which Mr. Edward Pritchard, C.E., attended as an expert on behalf of Darlaston. The result of the conference was the preparation of a report by Mr. Pritchard, in which he dealt with the drainage of the three towns and a portion of the Local Board district of Coseley, the whole forming a tolerably compact group. The population to be provided for he estimated at 5,000 for the portion of Coseley included in the scheme, 16,967 for Darlaston, 37,516 for Tipton, and 30,705 for Wednesbury, giving a total of 90,188, a number largely in excess of the then population of the respective places, which in 1881 was, independently of the Coseley contingent, 68,151. Mr. Pritchard proposed to acquire for the purpose of structural works and for sewage purification and utilisation 111 acres of land near Newton Road Station, on the Grand Junction Railway, near the Bescot sewage farm belonging to Walsall, to which land he considered the sewage of the district would flow by gravitation. The method of purification he proposed to adopt was to be a combination of deposit and straining in tanks, with intermittent filtration to follow. The cost to the respective places he estimated at, for Tipton, 32,000*l*.; Wednesbury, 28,000*l*.; Darlaston, 15,000*l*.; Coseley, 4,500*l*.; or an equivalent to 17*s*. 7½*d*. per head of the population to be provided for. This report, embodying the most favourable and beneficial scheme which had been laid before them, was accepted by the Wednesbury Local Board, who instructed their clerk to 'prepare a petition to the Local Government Board for the union of the districts of Wednesbury, Tipton, Darlaston, and part of the parish of Coseley, for the purpose of carrying into effect a system of sewerage for the use of all the said districts, in accordance with the terms of the Public Health Act of 1875.' The Darlaston Local Board also approved of the scheme of union laid down by Mr. Pritchard. The Tipton Board declined to give in their assent to it on the ground that they had the question of the drainage of the place under consideration, and wished to be free to adopt the most beneficial plan. The petition of the Wednesbury Board was duly presented, and in March of

the following year (1883) Mr. J. T. Harrison, M.I.C.E., attended, on behalf of the Local Government Board, to hold an inquiry into the matter. This inquiry lasted three days, and opened up matters too lengthy to be dealt with in this article.

HOUSE VENTILATION.

By G. H. BLAGROVE, A.R.I.B.A.

It has often been said that the subject of house ventilation is but imperfectly understood by the public at large; and the fact is that the majority of people are apt to neglect it altogether or to mistake its object. Judging from phraseology in daily use, one might be led to imagine that the object of ventilation is to effect changes in the temperature, rather than the quality, of the air. 'The room is warm—open the window,' or 'the room is cold—light the fire,' are phrases in which the purity or impurity of the air seems regarded as of secondary importance; and we generally find that unless atmospheric impurities are sufficiently evident to offend the nose, they are disregarded altogether. Such being the attitude of the public upon this important question, it is left to architects, builders, and sanitary experts, to contrive methods of ventilation which shall operate effectually in houses, without unduly taxing the attention of the inmates. Some of these methods are successful, some only partially so, while others fail altogether; and too often the complaint is heard that the inmates themselves will persist in rendering abortive those expedients which have been provided for their own express benefit. It is time that householders at least should be no longer ignorant or indifferent upon a subject so closely affecting the health of the community; for whatever specialists may contrive to meet the case, efficient house ventilation must always depend mainly upon the inmates.

It is not to be supposed that ventilation is independent of temperature, or that the temperature of a room can be changed without in some degree promoting ventilation, however imperfect. A physician will order a fire to be lighted in a sick room, less for the purpose of warmth than to encourage ventilation. Heat causes air to expand and to become less dense, so that as the air of a room becomes heated, the colder and heavier air outside meets with less and less resistance in forcing its way down the chimney to fill the partial vacuum. Sometimes, in its downward progress, it carries some of the smoke with it, and this smoke may frequently be seen hanging in mid air, and apparently wanting an impetus to carry it up or down. This is because the smoke has been chilled by the downward rush of cold fresh air from without, and, being chilled, it has become condensed to about the same specific gravity as the air of the room. If every aperture could now be closed, to prevent the operation of disturbing currents, and if the atmosphere of the room were allowed to settle down to an equal temperature in every part, this smoke, together with the most vitiated part of the air, would gradually settle down in the lowest strata of the room, while the purest air would find its way to the top.

For carbonic acid gas, which is the most poisonous ingredient in ordinary air is, roughly speaking, about one-and-a-half times as heavy as what we ordinarily term pure air, so long as both are at the same temperature. It is only when heated, as it is when expelled from the lungs or thrown off by com-

n, that it can become sufficiently rarefied to the upper part of a room. This is usually the case, except when the atmosphere of a room comes so hot that there is not sufficient difference between its temperature and that of the cold air expelled by the lungs to enable the air to rise; in which case the pure air will find its way to the upper part of the room, while the cold air will be inhaled over again. It is consistent with these that render heated rooms injurious to health, rather than any effect produced by a high temperature upon the body.

We attempt to relieve the oppression of a room's atmosphere by opening ordinary windows, and the air is instantly raised against draught—the impact of cold air upon the person when it comes, which may produce catarrh, rheumatism, and other complaints. Recourse is, therefore, had to various devices for introducing fresh air into rooms without perceptible draught. Amongst these may be mentioned the old-fashioned ‘hopper’ ventilator, still to be seen in many of our churches and school-rooms. By it the in-rushing current of air gives an upward direction, after which it is allowed to diffuse itself, becoming gradually warmed by contact with the air of the room. A result is obtained by means of hinged top-panels above the windows, made to slope inwards when open, and furnished with side-gussets, to prevent the air from passing downwards into the room.

With such arrangements as these, however, there is a constant down-draught, which makes the atmosphere unpleasantly felt upon the heads of persons sitting beneath. The fresh air does not, in fact, receive the upward direction imparted to it on entering; but, being heavier than the air of the room, it is impelled downwards before it has had time to become warmed. Tobin's tubes are well known. By them the fresh air is given a definite upward direction on entering the room; and when the tubes are high enough, and the current sufficiently strong, the air spreads and diffuses itself on entering; in contact with the ceiling, and descends gradually, becoming warmed as it does so. Frequently, however, there is a draught to be felt when sitting near a Tobin tube, because the cold air is unable to spread itself as soon as it enters the room. It may occur through the temperature of the room being very much higher than that of the external air, the tubes not being high enough—should never be less than 6 feet high; but, so long as the upper part of a room remains considerably warmer than the lower part, a strong upward current will be maintained, and there will be little or no side-draughts.

A simple device for admitting a small amount of fresh air through a window without danger of draught is coming into general use, and deserves notice here. It consists in allowing an extra pane of glass to be raised to the sill of a window, so that the draught can be raised for an inch or two without opening at the bottom, the air finding its way only between the meeting rails. This is in a similar manner to the hopper ventilator, a hinged light already described, only the result it produces is generally too trifling to be of much use.

A great objection must be stated against all attempts for admitting fresh air in the upper part of a room, or for giving it an upward direction by means of Tobin tubes or other contrivances.

When the cold fresh air is brought suddenly into contact with the most impure portion of the atmosphere, which, as we have explained, is usually at the top, it chills it, condenses it, and brings it down. Thus, what would otherwise be a slow process—the condensation of the impure air—is greatly accelerated. There always will be a tendency for the pure and impure air to intermingle and to equalise their temperatures. It is quite erroneous to imagine that in order to ventilate a room we need only admit fresh air. By that we can only hope to dilute, not purify, the atmosphere, and it is exceedingly doubtful whether the atmosphere of most of our houses is ever completely changed from one year's end to another.

In all efficient schemes of ventilation the egress of the impure air is most essential. In ordinary houses no provision is made for this, for when the windows are closed there is usually no outlet above the level of the fireplace opening. This is often so low down in bedrooms that a person lying in bed is above it, and remains in the same unchanging atmosphere during the night. An outlet, to be of real service, should be placed at the highest part of the room—in the ceiling, if possible. If placed at any lower point there will exist a stratum of foul air down to that level, so long as the atmosphere remains heated; and this stratum of foul air will be a constant source of danger, as we have already explained. Having provided outlets, the next difficulty is to insure that the foul air shall find its exit through them, and not be checked in its course by the entrance of cold air from without. Sometimes the outlets are carried into a smoke flue, in which an upward current is established when there is a fire alight. We have also known a tube carried from an outlet in the ceiling through the thickness in the floor to an opening, provided with a sliding valve, in the fireplace of the room above. Here, also, heat was relied upon as an extractor. A number of mechanical extractors, which operate by means of revolving cowlings, fans, and similar expedients, have been patented, and many of them are of great efficacy. Sometimes extraction flues are carried up in stacks in the same manner as smoke flues, except that the outlet openings, instead of being at the top, are usually placed at the side, and provided with gratings. We believe that they would act more effectually if placed at the top, where they would be better protected against gusts of cold air. We presume that the same conditions which are favourable to the emission of smoke are applicable to foul air, which is quite as easily checked in its upward course.

It is probable that if we provide for the extraction of foul air, a sufficient amount of pure air will find its way into an ordinary dwelling-house through chimney openings, doors, and other channels, and that by throwing all the windows wide open for about an hour during the day in winter, and longer in summer, we may dispense with special fresh air inlets in rooms. When, however, we can provide for warming the air by contact with hot-water pipes or other means, it is desirable to have a constant supply. In the ventilation of public buildings water-sprays and filters are often used for cleansing the air from organic impurities previously to its admission. Such contrivances would be considered complicated and unnecessary in an ordinary house, but such is the impurity of a town atmosphere that we cordially recommend their adoption wherever practicable.

THE REGISTRAR-GENERAL'S LAST QUARTERLY RETURN.

By J. HAMPDEN SHOVELLER.

THE Registrar-General has just issued his quarterly return of marriages, births, and deaths in England and Wales. The statistics relating to marriages are for the fourth quarter of last year, while those relating to births and deaths are for the three months ending March last. The marriage-rate showed a considerable decline from that recorded in the corresponding quarter of the preceding year; both the birth-rate and the death-rate were below their respective averages. The mean temperature during the quarter at the Royal Observatory, Greenwich, was $40^{\circ} \cdot 3$, and was $1^{\circ} \cdot 5$ above the average in the corresponding period of 112 years. The rainfall amounted to 5.26 inches, which was a quarter of an inch above the average amount in the first quarter of the preceding 68 years.

During the last three months of 1884 the marriages of 117,106 persons were registered in England and Wales, equal to an annual rate of 17.1 per 1,000 of the population, estimated by the Registrar-General to be twenty-seven and a half millions of persons. This marriage-rate was 1.4 below the mean rate in the corresponding quarters of the ten years 1874-83, and, with one exception, was lower than that in any of the ten preceding corresponding quarters.

The births registered in England and Wales during the first quarter of this year were 232,015, corresponding to an annual rate of 34.2 per 1,000 of the estimated population. This birth-rate, although showing an increase of 1.0 per 1,000 upon the low rate that prevailed in the first quarter of 1884, was 1.4 below the average rate in the corresponding quarter of the ten years 1875-84. In the several counties the birth-rates last quarter ranged from 28.7 in Shropshire and 29.2 in Westmorland, to 38.4 in Essex, and 38.8 in Staffordshire, in Nottinghamshire, and in Monmouthshire. The 232,015 births registered in England and Wales during the quarter under notice exceeded the deaths by 84,108; this represents the *natural* increase of the population. It appears from returns issued by the Board of Trade that 37,686 emigrants embarked during last quarter from the various ports of the United Kingdom at which emigration officers are stationed; excluding foreigners, and distributing those whose nationality was undistinguished, the emigrants of British origin were 30,748, including 20,901 English, 3,238 Scotch, and 6,609 Irish. The proportion of emigrants last quarter to a million of the respective populations of the three divisions of the United Kingdom were 760 from England, 829 from Scotland, and 1,344 from Ireland. Compared with the corresponding quarter of 1884, the proportion of emigration last quarter showed a decline in each of the three divisions of the United Kingdom.

From returns published by the Local Government Board it appears that the average number of paupers relieved on the last day of each week during the quarter ending March last was 736,406, of whom 189,718 received in-door and 546,688 out-door relief. The proportion of the population in receipt of pauper relief almost corresponded with that recorded in the corresponding quarter of 1884.

The deaths of 147,911 persons were registered in England and Wales during the first quarter of this

year, equal to an annual rate of 21.8 per 1,000 of the estimated population. This rate, although showing an increase of 2.3 upon the unprecedentedly low rate in the corresponding quarter of last year, was 1.0 per 1,000 below the average rate in the first quarters of the ten years 1875-84. In the various counties the rates ranged from 18.1 in Sussex, 18.2 in Rutlandshire, and 18.4 in Westmorland, to 24.8 in Oxfordshire, 25.4 in Bedfordshire, and 27.1 in Monmouthshire. In the principal urban districts, comprising the chief towns, and containing an estimated population of more than sixteen millions of persons, the rate of mortality last quarter was equal to 22.3 per 1,000; in the remaining and chiefly rural population of nearly eleven millions, the rate was 21.0. The urban rate was 1.8 below, while the rural rate was 0.1 above, the average rates in the ten preceding corresponding quarters. In equal numbers living, the deaths were 106 in the urban to 100 in the rural population.

In the twenty-eight great English towns, including London, and having an estimated population of nearly nine millions of persons, the deaths registered corresponded to an annual rate of 22.7 per 1,000, which was 0.4 above the general urban rate. While the death-rate in London did not exceed 21.6 per 1,000, it averaged 23.6 in the twenty-seven provincial towns, among which it ranged from 18.0 in Brighton, 18.6 in Derby and in Birkenhead, and 19.5 in Hull, to 28.2 in Manchester, 30.1 in Preston, 32.9 in Cardiff, and 33.9 in Sunderland. The rates of mortality at different ages in the twenty-eight towns showed the usual wide divergencies; the death-rate among infants, measured by the proportion of deaths under one year of age to 1,000 births registered, ranged from 101 in Brighton to 218 in Cardiff. The rate of mortality among persons aged between one and sixty years did not exceed 9.6 in Derby, whereas it was equal to 23.5 in Sunderland; and among persons aged upwards of sixty years the death-rates ranged from 75.2 in Hull to 117.6 in Manchester.

The 147,911 deaths in England and Wales last quarter included 33,352 of infants under one year of age, 70,335 of children and adults aged between one and sixty years, and 42,224 of persons aged upwards of sixty years. Infant mortality was equal to 144 per 1,000 births, and was slightly below the average in the ten preceding corresponding quarters. In the twenty-eight towns the proportion of infant mortality also averaged 144 per 1,000; it was 133 in London, whereas it was 152 in the aggregate of the twenty-seven provincial towns, among which it ranged from 101 in Brighton, and 107 in Wolverhampton, to 186 in Sunderland, 187 in Preston, and 218 in Cardiff. Among persons aged between one and sixty years the rate of mortality last quarter was below the average, while among elderly persons it showed a slight excess.

The deaths registered in England and Wales during the quarter ending March last included 13,308 which were referred to the principal zymotic diseases; of these, 3,413 resulted from whooping-cough, 3,094 from measles, 1,744 from scarlet fever, 1,433 from fever, 1,384 from diarrhoea, 1,156 from diphtheria, and 1,084 from small-pox. These 13,308 deaths were equal to an annual rate of 1.96 per 1,000, against an average rate of 2.44 in the ten preceding corresponding quarters. The zymotic rate in the twenty-eight towns last quarter averaged 2.34 per 1,000, and ranged from 0.53 in Brighton and 0.81 in Derby to 3.87 in Norwich, 3.93 in New-

THE SANITARY RECORD:

JUNE 15, 1885.

The Editor will be glad to receive, with a view to publication, announcements of meetings, reports of proceedings, and abstracts or originals of papers read before the members of any sanitary or kindred association.

Local Authorities throughout the country would confer a favour on the EDITOR of the SANITARY RECORD by forwarding to him all documents relative to Water-supply, Sanitation, and Health matters generally, which come under their notice. He would also be glad to receive reports from Engineers of Waterworks, Sewerage Projects, and Domestic Drainage Improvements for notice, comment, and illustration.

The Editor would also feel obliged if Subscribers would favour him with particulars concerning any Societies or Companies or other organisations for Improving the Dwellings of the Poor with which they may be acquainted.

THE ETHICS OF METROPOLITAN DUST-BINS.

NOT a specially fascinating subject truly, but one which, through the medium of the columns of the *Times*, has been engaging the attention of newspaper readers during the last month, as it engages the attention of thousands of householders all the long year through. It is significant of the importance with which practical sanitary questions are regarded by the lay press, that it is only in holiday times and in the dead season that there is any chance of their getting a hearing. For the enthusiastic sanitarian the columns of the leading daily paper have, during this blessed Whitsuntide, been a perfect Elysium: the broad and brutal fact being that the conductors of that journal, being unusually hard up for material, bethought themselves that the printing of a letter on the recondite subject of dust-bins would be sure to start an animated correspondence. And so, in truth, it did, though whether we are any better off, and any of us have got a clearer idea of the respective responsibilities of the local authority and the householder on the question, is open to doubt. To the insider, if we may arrogate to ourselves so presumptuous a title, these periodical sanitary paroxysms of the *cacoethes scribendi* are not a little amusing. The columns of the *Times* are the orthodox receptacle for the outpourings of the aggrieved householder's vials of wrath. Every day of his life the editor has to harden his heart against the thousand and one abuses which he is invited to pulverise with the sledge-hammer of his

powerful pen. One day he relents, and lets in a specimen of the letters which diurnally swell his waste-basket. The result is electric. Hundreds of communications from all sources pour into Printing House Square, and unless the editor promptly sits upon the safety-valve, his life is a burden to him until some other question crops up which monopolises the available space, and strangles the controversy in its early and promising youth.

There was about this time last year a highly instructive paper-war on the subject of house drainage. It raged furiously for a time, and then was suddenly extinguished. House drainage is as bad as ever, but no one now writes to the papers about it, or, at least, no letter sees the light. The subject for our Whitsuntide distraction of this year was not dissimilar. We were invited to reform our metropolitan system of 'dust-bins,' and successive correspondents descended upon one and another phase of the question in terms so eloquent that phlegmatic John Bull had quite made up his mind that 'something must be done'—when the roar of Parliamentary debate began again, and domestic topics were forthwith clean forgotten.

Looking at this matter soberly and in earnest, and reflecting at leisure upon the eddies in the stagnant pool of metropolitan public opinion which the recent correspondence has excited, it is impossible not to be struck with the very general misconception which exists as to the respective (1) moral and (2) legal shares of the local authority and the householder respectively in the removal of 'matter in the wrong place.' Some letter-writers would impose very stringent and elaborate functions upon the local authority—functions which would involve a considerable increase of the rates, at the amount of which the householder even now periodically winces. Others again desire to cast all sorts of disabilities upon the householder if his cook or scullery-maid do not cremate all the refuse of his establishment, and leave nothing but dry and innocuous dust for the scavenger to clear away. And every one, without exception, and including even that eminent functionary the editor of the *Times* himself, has misapprehended and misconstrued the present metropolitan law on the subject. So that there may be advantage in our setting forth in order the actual legal enactments which now exist for the protection of the householder, and in indicating as briefly as may be the practical common-sense view of the question. The first part of this duty we fulfil this month in the legal article as to dust-bins on page 551; the second part, as to the needful reforms in metropolitan scavengering, we are obliged, by lack of space, to hold over until next month.

MESSRS. STEVEN BROS. & CO., Architectural, Sanitary and General Ironfounders, 35 and 36 Upper Thames Street, have secured the lease of new and extensive premises at 4 Upper Thames Street (opposite the *Times* Office, Queen Victoria Street), and when the extensive alterations are completed, they will be able to have on show the largest stock in London of baths and fittings, ranges, slow-combustion stoves, marble chimney-pieces, marble kerbs, tiles and tile hearths, stable fittings, ornamental gates, railings, verandahs, hot-water fittings, &c. Owing to the large and increasing demand for their manufactures, it has become absolutely necessary for them to remove their enormous stock to warehouses where it may be seen to better advantage than has hitherto been the case, owing to want of space at their present address.

BURIAL SOCIETIES INSURANCE.

IN accordance with a wish expressed at the end of the leader on this subject in THE SANITARY RECORD of May 15, page 508, the editor wrote to Mr. Farrow for the desired information. His reply is as follows.

'The Leek Burial Society consists of 8,463 members. It is purely a local society, managed by a committee of eleven persons, who have a personal knowledge of almost every family in the town. Every proposal is laid before this committee (see enclosed proposal form). Illegitimate infants are only admitted after a great deal of consideration. Proper attention is also paid to paragraph 3 of Rule 7 enclosed.

'In 1876 this society discontinued the insurance of infants under the age of one year, and in 1877 the rate of infant mortality (0-1) for the whole population of the town, fell down to 109 per 1,000 infants living, the lowest rate recorded since 1850, when in steps a number of insurance agents vigorously canvassing for infant insurance. The local society then came to the conclusion that it would be desirable to recommence infant insurance in order to maintain its position. At the present time, in addition to the local society's agents, there are at least twelve agents employed by other insurance offices.

'The rate of infant mortality of the town having risen to 186 in 1,000 in 1884, the medical officer of health and myself deemed it advisable to inquire into the subject. The local society allowed me free access to their books, which I carefully examined. The following is an abstract of the results. During the five years 1880-84, 1,188 infants under one year of age were admitted. The number of lapsed policies of infants under the age of one year during the same period was 70, and the number of deaths of infants under the age of one year was 105, for the same five years.

'It is therefore clear that, including the lapses, the rate of infant mortality in this society was 88 in 1,000; and, including half the lapses, it was 91 in 1,000, and, excluding the lapses altogether, it was 93 in 1,000.

'During the same five years (1880-84) the infant mortality (0-1) was 163 in 1,000, in the whole town.'

Our correspondent's letter is an acceptable contribution to the important subject of infant assurance, but does not afford any corroboration of the assertion that the death-rate of assured infants in Leek is below the average death-rate of infants in the whole of the urban sanitary district of Leek. It must be borne in mind that the rate of mortality of infants shows remarkable variations during the first year of life. The annual rate ranges, according to Dr. Farr's English Life Table, from 571 per 1,000 in the first month to 92 per 1,000 in the twelfth. It follows, therefore, that, before the true death-rate of the infants assured in the Leek Burial Society can be correctly calculated, it is necessary to know the precise ages in weeks or months at which each infant was assured. In many societies no infant may be assured under the age of one month; and although the Leek Society appears to have no such rule, it seems improbable that many are assured under that age. Now, the exclusion of infants under one month would at once reduce the rate of mortality by nearly a third. Moreover, it must be remembered that infants, in a burial society,

are assured at all ages up to eleven and a half months, and that the form of calculation adopted by our correspondent assumes that they had all been exposed to a year's risk of death. Therefore there are two important sources of error in our correspondent's figures, both of which tend to understate the rate of mortality of the assured infants, and to destroy its value for comparison with the rate among all infants. In the first place there is no evidence as to the precise age of the infants when assured, and in order that their mortality should be comparable with that of all infants, the assurance should take place at the instant of birth. In the second place, it is evident from our correspondent's letter that no correction has been made in the calculation of the rate of mortality for the undoubted fact that very few, if any, of the assured children were actually assured at birth and throughout the whole of the first year of life. These sources of error have affected all the published rates of mortality among assured children that have come under our notice. It is interesting and important to know that, according to our correspondent's figures, about half the infants born in Leek during the past five years have been assured in this local burial society. Accurate statistics of the mortality among these infants become all the more important and desirable.

NOTES OF THE MONTH.**VENTILATION OF SEWERS.**

MR. WEAVER having very ably advocated the plan (by no means a new one) of using the ordinary sewer ventilators in the roads as *inlets* of fresh air, and every house-drain and soil-pipe as an extractor of foul air, various objections have been urged against this proposal, notably by Mr. Buchan. The following letter from Dr. Alfred Carpenter (appearing in the *Journal of the Society of Arts* for May 8) should be read by all interested in the subject, for although it may not cover the whole of the objections, yet, as far as it goes, it appears to us to be conclusive:—

'It is always difficult in a limited discussion to explain every point so as to avoid giving rise to misapprehension. I am quite in accord with Mr. Buchan on some of his points. I quite agree with him as to the prudence of the course which he advocates in certain given instances. It is a way to prevent the evil which may arise from defective works and bad engineering. It will prevent evil to a given house when the house-owner is helpless, as against the crass immovability of a satisfied municipality when the authority is content to allow sewers of deposit (elongated cesspools) to exist in populous centres, and even in ordinary urban communities; but, nevertheless, it is not in the abstract a right proceeding, it is not strictly sanitary work, it is not natural. If a sewer flushes clean, as it ought to do; if it does not become the habitat of sewage confervoid growths upon its invert—that is, if it is regularly scoured above as well as below the line at which the sewage ordinarily falls; if there is nothing to intercept the passage of sewage from its origin to its departure at the outlet: then there will be no sewer gas, there will be no stink, there will be no danger to anybody.

'The openings on the inverts of the arch of the street sewer will be inlets for fresh air, and the

ventilators produced by the extension of the soil-pipe of every water-closet above the level of the house-top will be outlets for the air which has passed through the sewer. Thus a constant circulation will be promoted at all times by the ordinary laws which belong to gases, and which by their very nature prohibit stagnation in fluids of all kinds. Occasionally there may be down draughts, but they will be of no more movement than the down draughts through an ordinary chimney—indeed, they will be as infrequent as a down draught into a furnace when the fire is low. Fresh sewage is not dangerous to anybody; but if it is kept within the curtilage of the dwelling-house by means of interceptors, or if it be allowed to stagnate in a badly constructed sewer until fermentative changes have arisen within its substance, it then produces the chance of evil; but in the present day no authority ought to be allowed to keep sewage within its borders until such a change has taken place. It should be “moved on” out of range as rapidly as possible. The dangers which Mr. Buchan proposes to obviate are really increased by his interceptors. The house is the unit of sanitary work; and it is wrong for selfishness to assert itself so as to determine that no man shall assist the local authorities in its duty to provide for sewer ventilation.

I utterly object to the principle which is being tried to be established by various supposed authorities—viz., that the duties of the individual are antagonistic to the duties of the local authority in the matter of sewers. If each unit does his part, the duty of the local authority as to ventilation is simple. The latter has to convey away the sewage, and provide inlets for fresh air. The outlets must be at the highest points, and if they are so placed there will not be a particle of danger from the production of sewer gas. An authority has an important duty to perform—viz., to prevent the production of sewer air as a major part of its work. The provision for its escape, if it does accidentally form, will be best met by details in the construction of the house-drain. Concentration should not take place, and without concentration sewer gas is perfectly harmless. There will be no diffusion of enthetic germs, for they cannot live in fresh air long enough to spread infective disease; and if, perchance, a few should be discharged in the higher regions above the heads of a great or small community they die in a very few seconds.

The germs which reproduce enthetic disease cannot live in fresh air, any more than a fish can live in unaerated water. If discharged, they should be diffused above the heads of the people, and not at the street level. These are my reasons for advocating the extension of every soil-pipe, so that each water-closet has a ventilator in action, and by this means properly constructed sewers will admit fresh air at the street level; and under common conditions, foul air (if produced) will escape, where it will fail to set up even the smallest possible danger. I advocated this principle twenty years ago, and experience (since my first paper upon this subject) has amply proved that I am right.

SMALL-POX IN LEICESTER.

A MISLEADING paragraph has been going the round of the press, in which it is sought to connect the limitation of small-pox at Leicester with the anti-

vaccination proclivities of the population. It is undoubtedly true that three distinct outbreaks were reported in the town last year (the infection in each instance being conveyed from London), and that the disease did not spread on either occasion. But this was owing to the immediate removal of all the inmates of each house in which the disease appeared to the Fever Hospital, together with the thorough disinfection and lime-washing of the infected houses, and the further spread of the disease was arrested. Dr. Johnston remarks, in his annual report, that during the last eight years there have been no fewer than twenty importations of small-pox into the town and its immediate neighbourhood. The disease has, however, always been stamped out owing to the fact that the Health Committee have always succeeded in promptly removing to hospital, not only those stricken with the malady, but also all the other inmates of each infected house. This is certainly a very fortunate circumstance; but to base upon it the argument that vaccination is of no avail as a prophylactic is characteristic of the logical methods which are peculiar to the anti-vaccinators.

SANITARY CERTIFICATES FOR HOTELS.

WE are very glad to notice the extension of the system of municipal certification and inspection of the sanitary condition of hotels and lodging-houses in places of seaside resort. Scarborough has adopted such a plan with marked success, and the charmingly situated little town of Shanklin, in the Isle of Wight, has now followed suit at the instigation of the newly appointed and active health officer, Dr. Dabbs. In his first annual report, Dr. Dabbs observes that the sanitary work of 1884 has been very considerable, for he had to start the system of properly certificating houses and hotels. Up to the present date he has been very fairly successful in inducing the lodging-house keepers to consent to such examinations of their houses, and he trusts that before his next annual report the majority of the lodging-houses will have seen the necessity and real economy of the system.

THE NOTIFICATION OF CASES OF MEASLES.

IT is commonly held, and is no doubt the fact, that in measles large quantities of poison are given off for two or three days from a child affected by measles, before any rash appears on his body to indicate the nature of his illness. To ask for the notification of cases of measles to the health officer has therefore been regarded as of little avail for preventive purposes; and inasmuch as very many cases of measles occur during an epidemic, the sanitary authorities of those towns which have local Acts compelling the notification of infectious disease have, as a rule, declined to go to the heavy expense of paying medical men for a great number of certificates of measles, which would be chiefly useful for statistical purposes only. It is somewhat of a revelation, therefore, to find a health officer of one large town (Derby) speaking in favourable terms of the preventive results of the notification of measles, and to listen to one of the most capable of ‘combined’ medical officers of health (Mr. Fosbroke, of Stratford-upon-Avon) demanding such notification as the only means of checking the disease. Mr. Iliffe says that, in view of the increase in the severity of measles, it was decided, early in January 1884, to

t the medical men of Derby to certify cases of disease to the sanitary authority in the same way as they have to do in the case of other diseases under the local Act of 1879. So well was this Act acceded to, that between January 9 and January 25 no less than 362 certificates were received, amounting to 513 cases. The knowledge of the whereabouts of the cases being thus obtained, the sanitary authorities were enabled to visit the houses affected, to put a stop to practices, conducive to spreading disease, that were constantly going on—such as children going to school from infected houses and playing in the streets and courts with the rash on in full bloom. The evils and dangers likely to result from visiting and receiving visitors were likewise pointed out, and instructions with regard to disinfection and cleansing of clothing, &c., given. Mr. Fosbroke seems to be more or less fair about the unchecked spread of measles in the district last year, and remarks that 'until orders are compelled to register all cases of measles immediately they appear, so long will sanitary authorities be almost powerless to prevent this district from frequently assuming extended proportions.' No doubt the upspringing of measles in part of a town is terribly baffling to those who are sensible for its suppression; and if they could only have the power of learning of every case as soon as it is recognised, it would be a great advantage to sanitary officials. But what is chiefly wanted is the education of the population at large to detect special landmarks of each disease affecting the neighbourhood. This can best be done by the lavish issue of handbills by philanthropic persons who take an interest in the domestic economy of the neighbourhood and are willing to instruct them how to order their homes. The premonitory symptoms of measles, understood by parents, would teach them the utility of keeping the affected child from school and from a warm room, until the characteristic rash has cleared itself. Similarly, school teachers could be taught that if they saw a child wheezy, feverish, and coughing, and sent him back home before he had time to tell his fellow-scholars.

METROPOLITAN PUBLIC GARDENS ASSOCIATION.

THE opening of this association was held by permission of Lord Brabazon, the chairman, at 83 Lancaster Road on the 2nd inst., when there was a large attendance of members. The secretary announced that Mr. Levin and Melville had promised to pay for laying out of the ground attached to St. Paul's Church and Schools, Rotherhithe, and that a lady had given £500 for the improvement of the disused ground adjoining St. Peter's, Walworth. Lord Brabazon reported the victory gained by the association in the House of Commons in connection with the proposed recreation-ground in the Isle of Dogs. Necessary permission having been obtained, it was decided to lay out the disused burial-grounds of St. Andrew's, Bermondsey, and St. Mary-le-Strand, and the ground attached to St. Philip's, Old Kent Road, for the use of the public, and it was announced that offers of help in this direction had been made by the owners of six other burial-grounds and three gardens. The Rev. J. Johnston and Mr. G. Goschen brought before the meeting their need of assistance in the promotion of the schemes for providing a park for Kilburn and a recreation-ground

for Upper Norwood. Among the new subjects considered by the members were the planting of trees in Finchley New Road, Stamford Hill, Kirkdale, Sydenham, and the streets of Rotherhithe; the placing of seats in Brompton Road, the covered Mill Pond, Rotherhithe, Union Square, S.E., and the triangles at St. John's Wood and Hackney; and the laying-out of St. George's disused burial-ground, Battersea. It was announced that three or four public gardens would be opened by the Association during June.

JUBILEE OF THE STATISTICAL SOCIETY.

THE Statistical Society, one of the oldest and most useful of the learned societies that now overspread the universe, is celebrating its jubilee this month. It was originally founded on March 15, 1834, and of its original members only six, one of whom is our esteemed and venerable friend, Mr. Edwin Chadwick, have survived to celebrate its jubilee. In its time the Society was a power in the world of science, and it had in its ranks some of the best and acutest of nineteenth-century thinkers. The inroad of new societies, conducted with more spirit and on less old-fashioned lines, has sadly marred in recent years the interest in the Society's discussions, which are usually very stilted, not to say humdrum. But there has of late been a very considerable accession of new members, raising the total number to nearly a thousand, and it is to be hoped that this will infuse some much-needed vitality into the present Executive Committee of the Society. It was at first intended to celebrate the jubilee last year at the International Health Exhibition; but the death of the Duke of Albany is stated in the last report of the Council to have 'impeded the execution of this design.' Arrangements have now, however, been made for holding the jubilee on the 22nd, 23rd, and 24th inst., at the London University and elsewhere. The President of the year is Sir Rawson W. Rawson, K.C.M.G., C.B., who was elected a member in 1835, and has been in his time one of the most diligent of paper-readers before the Society. There is, perhaps, a special fitness in a gentleman with fifty years of statistical experience being President of the jubilee, but it seems a pity that some one of greater fame as a statistician than Sir Rawson Rawson (Mr. Goschen, for preference, though other names might be mentioned), could not have been induced to do the honours of English statistical science before the very numerous foreign guests who, we understand, are expected on this interesting occasion.

THE WATER SUPPLY AND DRAINAGE OF OXFORD.

AFTER a good many years of inaction, the local authorities of our University towns appear to have been at last stirred up to a sense of the importance of putting the sanitary arrangements of their districts upon a reasonably sound basis. A Provisional Order Bill, which has just received the Royal assent, gives power for the acquisition of a sewage farm for dealing with the sewage of Cambridge, and cleansing the river from the foulness which University men describe as 'unspeakable.' Oxford has hardly got so far as this; and all its high academic machinery seems to be required before even a commencement of sanitary reform can be made. We confess we cannot understand how, in matters coming directly

within the duties of the local authority, it should be necessary or even desirable to appeal for public subscriptions to defray the cost of the necessary works. But an University city is an exceptional place, and is apparently free to do as it thinks proper. Some time ago a circular was issued by the Oxford Valley Drainage Committee, signed, among others, by Professor Jowett (the Vice-Chancellor of the University), Mr. Alderman Hughes (Mayor of the city), and Dr. H. G. Liddell (Dean of Christ Church), explaining the nature of the works and inviting subscriptions. The Thames Valley Drainage Commissioners have undertaken to carry out the whole of the works which are involved in the removal of Iffley Lock, upon condition of their receiving a sum of not less than 14,000*l.*; and it was proposed accordingly that at least 18,000*l.* should be raised towards the completion of the whole plan, in which are included both the increase and improvement of the water supply, and also the drainage of the valley. A memorandum by the Dean of Christ Church states that if the Colleges would agree to contribute from 3,000*l.* to 4,000*l.* annually (that is, from about 150*l.* to 200*l.* each on the average) for three years, it was hoped that, with contributions from the University and city, and from the two boards which control the drainage of the valley, the requisite sum would be forthcoming. It is understood that the committee have got money and promises of money enough to do all the works contemplated; but the weak part of the situation is that the contribution by the city is conditional on the University helping the waterworks, and the College contributions are, some of them, conditional on the city doing a fair share towards the drainage. Apparently the city cares more about the waterworks, and the Colleges more about the drainage. It is earnestly to be hoped that this scheme, so important in relation to the health of the towns of the valley, and especially the University and Colleges, may not, after all that has been done, break down now through the jealousy and mutual distrust of town and gown.

FACTORY INSPECTION.

THERE was a not uninteresting debate in the House of Commons on its first sitting after the Whitsuntide holidays with reference to accidents in factories and the need for increased factory inspection. The importance of the first part of the case is undeniable; the economic justification of the second is open to question. For if, as Mr. Broadhurst contended, the fifty new inspectors which he would like to see appointed, could very well be taken from the ranks of the more intelligent working men, who would be contented with a salary of not more than 100*l.* to 150*l.* a year, does not this imply that the working man has even now quite sufficient acquaintance with the Factory Acts to take of his own motion the steps which will lead to a reform in the conditions under which he has to work? It would not do to press this argument too far; but it is easier to cry out for more inspectors than to show what improvements in the condition of the workpeople are likely to result from an increase in the inspectorate. The everyday working of a factory cannot be appreciated by an inspector in a more or less cursory and infrequent visit so well as by workpeople who spend their lives in the place. What appears to be required is not so much more inspection from Whitehall as the giving of power to the local governing body to make speedy

inquiry into any complaint of insanitary conditions or want of ventilation, or overwork, or dangerous machinery in the case of all factories, including in this term all assemblages of workpeople. Notwithstanding the increases that are perpetually being made in the staff of the Factory Department at the Home Office, it is still behind its work. We are quite of the opinion that at least a considerable share of the duties which these officials vainly strive to perform might far more satisfactorily, far more economically, far more completely, be accomplished by utilising the large staff of ready-made factory inspectors that now exist in every district of the kingdom in the persons of the local medical officers of health.

SMALL-POX AND VACCINATION IN CALCUTTA.

IN view of the general prevalence of small-pox at Calcutta last year and the small mortality in the town as compared with former epidemic years (the total deaths were 478), it was thought that 1885, according to the habit and history of the disease in the town, would prove to be an epidemic year of great severity. But the mortuary statistics of the first quarter of the year, as given in the report of the officiating health officer, Dr. J. O'Brien, do not tend to support these anticipations. In fact it would appear that 1884 was the year of the epidemic, but of an epidemic aborted and controlled by widespread vaccination. During the year which has just ended, close on 16,000 vaccinations and re-vaccinations were performed in the town, a larger number than in any previous year. Accordingly, small-pox instead of prevailing in epidemic form, as was expected, has subsided considerably. The total number of deaths registered from the disease during the quarter was 74 against 161, the average of the preceding decade. The decline was well marked in each of the three months, and most so in March, the total barely equalling one-third of the decennial average. The total number of vaccinations and re-vaccinations amounted to 6,998 against 6,029, the average of the four previous years. In those years, the first quarter was the season in which by far the largest amount of vaccine work was done; whereas during the past year, as vaccination was pressed on with equal vigour throughout the entire year, without the interruption of a recess, a smaller number of children remained to be protected. Accordingly, in last quarter, the figures assimilate more closely to the averages than in the three preceding quarters in which the out-turn of work was double and treble the average.

TYPHOID FEVER AT YORK.

A VERY complete and excellent report has been presented to the Town Council of York by Mr. S. W. North, the local Health Officer, with reference to a serious outbreak of typhoid fever which occurred in that city during the second half of last year. Of course typhoid fever is never quite absent from York, but its dimensions last year were so abnormal as to call for very special inquiry. The outcome of the investigations made by Mr. North, and also, on behalf of the Local Government Board, by Dr. Hubert Airy, is briefly that the defective character of the drainage was largely responsible for the recent epidemic. The interest of the out-

break is therefore more local than general, for there is nothing very remarkable in the conclusion that, given water-logged sewers connected with imperfectly-trapped drains, an outbreak of typhoid fever will result when a flood drives out of the sewers, by the easiest avenue of escape, the foul air which has been stored in them during a period of dry, hot weather. Altogether there were in 1884 fifty-seven deaths from typhoid fever at York, and 327 recognised cases of that disease. A study of the drainage areas and the levels of the sewers, with the distribution of fever, shows that the largest proportion of cases of fever occurred on the lines of sewers having the lowest levels, and for this reason most subject to the influence of variations in the height of the river, and most liable to have the sewage detained in them by the effects of flood. The constant invasion of the sewers from the outlet by flood water not only causes the sewage to be retained during such floods, but increases the tendency to deposit. These deposits become the receptacles of infected secretions, and a favourable soil for the reproduction of the infective agent, a source from whence it may be carried into streets and houses on higher levels by every influx of flood water which forces sewage and foul gas into the branch drains, and by defective joints in house drains into the interior of dwellings. All these conditions become aggravated when, as is the case in York, the sewers are not ventilated, never flushed, and from which the deposits are never removed, except so far as heavy rains may accomplish their removal, made still worse by the retention and use of old sewers even after new ones have been constructed. The practice of allowing the old sewers and drains to remain without being broken up, and to be frequently used, greatly increases the probability of rendering the subsoil foul, and the area on which the city is built unwholesome. No proper cleansing is possible, and accurate knowledge of the position and condition of such sewers is liable to be lost. In the end they become cesspools of the worst description. Imperfect street gullies serve still further to increase the evil. The lesson to be learned from the epidemic is the very obvious one of a complete overhauling and reconstruction of the sewerage arrangements of the city. To do them justice, the Town Council do not appear to be unmindful of this necessity; but it is perhaps lucky for the inhabitants that Sect. 399 of the York Improvement Act of 1884 made it compulsory upon the Council, within two years of the passing of the Act, to prepare a scheme for the efficient drainage of the city for the approval of the Local Government Board.

INSPECTORS OF THE LOCAL GOVERNMENT BOARD.

OUR 'Captious Correspondent' writes: To become an inspector of the Local Government Board would appear to be the passport to fame and fortune. Sir John Lambert, once a poor-law inspector in the Midlands, and afterwards secretary of the Local Government Board, has, for his recent services as chairman of the Boundary Commission, been sworn of Her Majesty's Privy Council. Mr. Walter Sendall, another inspector, is now on his way to the West Indies to take up a colonial governorship. Mr. Courtenay Boyle, after enjoying double emoluments for three years as an inspector of the Local Government Board in England and as the private

secretary to the Lord-Lieutenant in Ireland, is about to finally settle down as an assistant secretary of the Whitehall Board, and has been honoured with a Companionship of the Bath for his dexterity in filling two appointments, and being officially in two places at one and the same time. Mr. Henry Longley, once inspector for the metropolis, is now chief charity commissioner; Mr. George Culley, some time inspector in the North, is one of the commissioners of woods and forests; and Mr. F. W. Beaumont, another inspector, now holds the lucrative office of treasurer of the county of Surrey. The lines of these gentlemen would appear to have fallen in particularly pleasant places.

SANITARY REGULATIONS IN THE PORT OF LONDON.

NEW regulations have just been made by the Port of London Sanitary Authority, with the approval of the Local Government Board, for the removal to hospital of persons brought within the port by any ship or boat who are infected with a 'dangerous infectious disorder,' which includes cholera, diphtheria, erysipelas, measles, scarlatina, small-pox, typhoid or enteric fever, and typhus fever. Every master of a ship arriving in the Port of London, with any person on board, whether a passenger or belonging to the ship's crew, suffering from a dangerous infectious disorder, must stop on arrival off the Custom House at Gravesend, and forthwith send notice of the case to the medical officer of the port sanitary authority stationed at Gravesend. The medical officer of health must as soon as practicable visit the ship, and ascertain whether the person referred to in the notice is suffering from a dangerous infectious disorder. If the patient can properly be removed, and proper hospital accommodation can be provided for him, the master must forthwith cause such person to be removed to such hospital according to the directions of the medical officer of health. If any dangerous infectious disorder should break out on board any ship arriving in the port after she has passed Gravesend, the master must give notice to the medical officer of health of the port, at his office at Greenwich, that there is on board a person suffering from such a disorder, and the same procedure is thereupon to be adopted as in the other case. Infringement of these regulations is punishable by a fine of 5*l*.

THE DRAINAGE OF THE HOUSES OF PARLIAMENT.

THERE has certainly been no undue haste in deciding what is to be done to prevent the recurrence of the offensive effluvia in the Houses of Parliament, on which we recently commented. A Select Committee was appointed last session, but did little more than turn over its duties to the Local Government Board, though it so far influenced the local authority as to secure the closing of the offensive ventilation gratings of the sewer in the roadway to the west of Westminster Hall. According to Mr. Herbert Gladstone, the expediency of the proposals made by Major Tulloch, of the Local Government Board, was doubted by the officers responsible for the drainage system, and a protracted and complete examination, accompanied by numerous and careful experiments on the movement of the air in the main sewer, has confirmed the doubt. Sir Robert Rawlinson, the

Chief Engineering Inspector of the Local Government Board, has, on behalf of his Board, made an additional report, which is said not to bear out the opinions expressed by Major Tulloch, as described by us in our April number. A complete report, containing a detailed account of all the experimental data which have been obtained, will very shortly be completed. Honourable members will do well, for their own comfort and peace of mind, to keep this matter well under the notice of the Office of Works, in view of the advent of seasonably hot weather.

THE VACCINATION OFFICERS' ASSOCIATION.

THE first annual report of this excellent and promising little society has been issued. Its financial exhibit is not on a very stupendous scale, but it at least shows a balance to the credit of the society—a result which secretaries of institutions far more pretentious would be sincerely desirous of emulating. The association was inaugurated on February 16, 1884, and during the year forty-four members and twenty-four honorary members were entered upon its roll. Nine general meetings and six committee meetings were held, and the following subjects brought forward, discussed, and resolutions passed thereon, viz.:—Cases of removal; alteration in death-sheet to show where child was born; alteration of words in certificate forms, B and C; inefficient vaccination; inaccurate registration; house-to-house visitation; opposition to vaccination; debate raised by Dr. Cameron in the House of Commons upon the system of vaccination as adopted in Glasgow, as compared with that practised in the metropolis; the National Health Society's pamphlet; the half-yearly returns of vaccination; resolution of St. James's vestry as to the transfer of public vaccination from the authority of guardians of the poor to that of vestries; the recrudescence of small-pox in the metropolis; certificates of insusceptibility. This very comprehensive list of subjects shows that throughout the year the members have earnestly directed their efforts towards promoting the objects for which the association was formed. Having made so excellent a beginning, the society may fairly claim and expect an increased share of public support.

SMALL-POX IN VIENNA.

WE have more than once in Vaccination Notes contrasted the Austrian and German death-rates from small-pox, and shown that the mortality in Vienna alone far exceeds that of the whole German Empire, and in some years even that of Prague has been nearly as high. We see that the authorities of the Austrian metropolis have at length awoke to the gravity of their position, and are taking vigorous measures for the isolation of small-pox patients in special hospitals, the removal of the healthy members of the families attacked, the exclusion of such for a time from workshops and schools, compulsory vaccination of unvaccinated children in infected houses, and disinfection of houses, bedding, clothes, and vehicles. They have also resolved on urging general vaccination and revaccination, on prohibiting the use of public vehicles for the conveyance of small-pox patients, and providing for that purpose special ambulances. All coffins are to be taken to a central mortuary, or to be made air-tight, and all funereal upholstery and drapery are forbidden. A

steam disinfecting oven is to be set up at the municipal fever hospital, and a transportable one obtained for the disinfection of houses.

VITAL STATISTICS OF BERLIN, MUNICH, AND FRANKFORT FOR 1884.

IN Berlin the birth-rate during the past year was 35·88, exclusive of stillborn. The death-rate, 26·49. The deaths of infants under one year were 33·3 per cent. of the births, and 39·13 of the total deaths. This is a fearful mortality when we consider that in our own large towns the percentage of infant deaths to births (the only useful way of estimating it) ranges from 14 in London to 20 in Leicester. Still this is an improvement on former years, especially as regards infectious diseases, and the occurrence of but two deaths from typhus and none from relapsing fever contrasts very favourably with many towns of central and eastern Europe. Small-pox was more prevalent than of late, having caused 20 deaths in a population of 1½ million. In Munich the death-rate was 30·45, the deaths of infants 39·7 of the total, or 31·12 per cent. in the births. The birth-rate 28·92 per 1,000 inhabitants. No deaths occurred from typhus or small-pox in a population of over 240,000. In Frankfort, with 146,000 inhabitants, the death-rate was only 20·40 per 1,000, the birth-rate 28·25. The deaths of infants were 26·5 per cent. of the total deaths, and 19·1 of the births. There were no deaths from small-pox; indeed, there has not been one for many years.

MEASLES IN THE NORTH.

THE continued excessive death-rate of Newcastle is naturally exciting much uneasiness in that city. There is no doubt that it arises mainly from the serious epidemic of measles which prevails there. It is said that the system of living in tenements, so common in that city amongst the working classes, offers great facilities for the spread of the disease, and presents insurmountable obstacles to necessary isolation. It is debatable whether tenemented property is, after all, blameable so much as suggested, as in Sunderland, where the epidemic has been raging with equal if not greater virulence, tenemented property does not exist to anything like the same extent as in Newcastle. In Hebburn and Jarrow, which are also seriously affected by the epidemic, tenemented property is almost unknown. We are afraid that the chief factor will be found in the gross ignorance and culpable folly of parents, against which the most perfect sanitary arrangements and best medical skill unhappily so often prove powerless. In the week ending June 6 the average death-rate of Newcastle was 31 per 1,000. Measles caused 13 deaths, or an average of 4·4 per 1,000.

UNCERTIFIED DEATHS.

AT a recent meeting of the Glasgow Philosophical Society Dr. John Glaister read a paper on the necessity for legislative reform in Scotland in regard to uncertified deaths. In Scotland there existed a large percentage of 'uncertified deaths.' There existed a clamant necessity for reform in the machinery, as at present established, for the registration of deaths; first, in the Acts themselves, in so far that as the English Act tends to bring about earlier official knowledge of the cause of death, and that by

reason of the shorter period within which a certificate must be produced, and also by reason of the fact that it is enacted that the legal informant of the death should personally convey it to the registrar, the Scotch law should be so amended; and, secondly, that it should not be permitted to inter a body before a certificate of the cause of death be forthcoming, and in the event of no such certificate being produced, that some other official other than the procurator-fiscal should be appointed to inquire into the cause of every death which is not otherwise certified, with full powers to make a thorough inquiry. This, Dr. Glaister thought, could be best effected by appointing the medical officers of health for this duty, since it falls distinctly within the confines of their duties, would be less repugnant to the Scotch mind than the inquest of the coroner, and would meet the requirements of the case as efficiently as the coroner, and very much better than the procurators-fiscal have ever been able to accomplish.

A DESERVED HONOUR.

DR. CHARLES CAMERON, the superintendent officer of health for the City of Dublin, and chief Government analyst, has received the honour of knighthood from the Lord Lieutenant, in recognition of his distinguished services in the promotion of the public health, and his scientific attainments. No mark of Government favour was ever bestowed with more popular approbation, for Sir Charles Cameron is not only held in high esteem by his personal colleagues, but by the general public. To his advice and exertions are largely due the efforts made of late years by the Corporation to improve the sanitary condition of Dublin. The College of Surgeons have recognised his devotion to this branch of medical science by electing him their professor of hygiene and chemistry, and he has been recently elevated by them to the high dignity of their president.

HOSPITALS ASSOCIATION.—We are asked to mention that Mr. J. L. Clifford-Smith has resigned the office of honorary secretary of this association.

A HEAVY RATE.—The Wisbech Town Council and Urban Sanitary Authority made a rate of 4s. 4d. in the pound at their quarterly meeting on Friday, May 15.

'THE FOWLS OF THE AIR.'—A Sunday-school teacher, reading these words to her class, proceeded to ask them, 'What are "the fowls of the air?"' After a pause, one little girl solved the problem by replying—'Please, miss, it's the bad smells.'

LEAD POISONING.—The coroner of Newcastle held an inquest on the 9th inst. on the body of Eliza Lucy Arthur, aged 35 years, who died suddenly on the previous day at her lodgings, 116 Conyers Road. The jury expressed their opinion that the death of the deceased had been accelerated by working at a white lead factory.

TYNE PORT SANITARY AUTHORITY.—A meeting of this authority was held in the Town Hall, Newcastle, on June 10, the chairman (Alderman Wilson) presiding. Inspector Taylor reported that in April and May he visited 1,078 British steamers, 608 British sailing vessels, 337 foreign steamers, and 264 foreign sailing vessels. He also made 264 extra visits. Twenty-two cases of sickness had come under his notice, but only one infectious case—that of typhoid fever on a Danish vessel from Hamburg. Fourteen smoke letters have been sent out, and several verbal cautions given. Dr. Armstrong, medical officer of the authority, stated that special precautions were still in force to prevent the introduction of cholera into the Tyne. The Government inspector considered that the port was well looked after.

THE PUBLIC HEALTH

DURING APRIL 1885.

THE mean temperature during the month of May at the Royal Observatory, Greenwich, was 49°·6; it was as much as 3°·0 below the average May temperature in one hundred years, and below that recorded in the corresponding month of any year since 1879. An excess of temperature prevailed on twelve days of the month, while on the other nineteen days it was below the average. The warmest day of the month was the 28th, when the mean was 63°·1, and showed an excess of 6°·6; the coldest day was the 7th, when the mean did not exceed 42°·3, and was 8°·0 below the average. Rain was measured at Greenwich on nineteen days of the month, to the aggregate amount of 2·1 inches, which corresponded with the average May rainfall in sixty-one years, though it exceeded that recorded in the same month of any preceding year since 1879. During the first five months of this year the rainfall at Greenwich has amounted to 9·4 inches, which was more than half an inch above the average for the same period in sixty-one years. The sun was above the horizon during 482½ hours during May, but only 151·7 hours of bright sunshine were recorded at Greenwich; this amount was considerably below that registered in the corresponding period of any of the five preceding years. The wind was very variable until the last week of the month, when south-westerly winds prevailed.

In the twenty-eight large English towns dealt with by the Registrar-General in his weekly return, which have an estimated population of nearly nine millions of persons, 21,661 births and 14,111 deaths were registered during the four weeks ending the 30th ult. The annual birth-rate, which had steadily declined from 36·4 to 34·6 per 1,000 in the four preceding months, further fell to 31·7 during May (principally owing to the delay in registration during the last week of the month, being Whit-week). In these twenty-eight towns the lowest birth rates last month were 26·6 in Brighton, 26·6 in Huddersfield, and 27·6 in Halifax; in the other towns the rates ranged upwards to 38·7 in Sunderland, 39·2 in Preston, and 39·8 in Cardiff. The birth-rate in London last month did not exceed 30·6 per 1,000, whereas it averaged 32·7 in the twenty-seven provincial towns.

The annual death-rate in the twenty-eight towns, which had been 21·2, 22·5, and 23·2 per 1,000 in the three previous months, declined to 20·7 during May. This rate was below that recorded in the corresponding period of either of the three preceding years. The lowest rate of mortality last month in these towns was 14·6 per 1,000 in Brighton. The rates in the other towns, ranged in order from the lowest, were as follow:—Bolton, 15·5; Derby, 17·8; Bradford, 17·9; Leicester, 18·0; Bristol, 18·4; Halifax, 19·0; Nottingham, 19·2; London, 19·3; Hull, 19·3; Birmingham, 19·7; Plymouth, 19·9; Leeds, 20·0; Huddersfield, 20·6; Norwich, 20·9; Salford, 21·0; Portsmouth, 21·0; Wolverhampton, 21·2; Sheffield, 21·6; Birkenhead, 21·6; Sunderland, 22·9; Liverpool, 24·5; Oldham, 24·8; Cardiff, 25·3; Blackburn, 27·5; Manchester, 27·5; Preston, 31·6; and the highest rate during the month, 31·7 per 1,000 in Newcastle-upon-Tyne. While the death-rate in London, as above stated, did not exceed 19·3 per 1,000, it averaged 21·8 in the twenty-seven provincial towns. The 14,111 deaths from all causes in the twenty-eight towns during the four weeks of May included 1,942 which were referred to the principal zymotic diseases, of which 680 resulted from measles, 523 from whooping-cough, 175 from small-pox, 157 from diarrhoeal diseases, 152 from 'fever' (principally enteric), 139 from scarlet fever, and 114 from diphtheria. These 1,942 deaths were equal to 13·8 per cent. of the total deaths, and to an annual rate of 2·84 per 1,000. This zymotic death-rate corresponded with the rate in the preceding month, and was below that recorded in the corresponding period of 1884. The zymotic death-rate in London during May was equal to

3.05 per 1,000; in the twenty-seven provincial towns it averaged 2.67 per 1,000, and ranged from 0.5 in Brighton, and 0.7 in Derby and in Bolton, to 4.6 in Birkenhead and in Cardiff, 5.9 in Blackburn, and 7.2 in Newcastle-upon-Tyne.

Measles was the most fatal zymotic disease in the twenty-eight towns during May. The rate of mortality from this disease in these towns, which had increased from 0.42 to 1.10 per 1,000 in the four preceding months, declined during May to 1.00. In London the death-rate from measles was 1.08 per 1,000, while in the twenty-seven provincial towns it averaged 0.92, and showed the highest proportional fatality in Liverpool, Manchester, Birkenhead, and Newcastle-upon-Tyne. The recent epidemic of measles in Sunderland appears to have almost disappeared, only 16 deaths having been referred to this disease during the four weeks of May, whereas the average weekly number during the three preceding months had been no fewer than 18. The death-rate from whooping-cough, which had been 0.65, 0.71, and 0.72 per 1,000 in the three previous months, further rose to 0.77 during May, but was considerably below the high rate (0.96) recorded in the corresponding period of last year. In London the rate of mortality from this disease was equal to 0.71 per 1,000, while it averaged 0.82 in the twenty-seven provincial towns, among which the highest rates were recorded in Birkenhead, Oldham, Plymouth, and Blackburn. The rate of mortality from 'fever' (principally enteric or typhoid) showed a slight increase upon that recorded in the two previous months; in London the fever death-rate last month was 0.20 per 1,000, and was below the average of the twenty-seven provincial towns, among which this disease was somewhat prevalent in Salford, Sunderland, and Norwich. The rate of mortality from diarrhoeal diseases showed a further slight increase upon that returned in recent months, but was below the average of the three preceding years. The death-rate from scarlet fever corresponded with that in the previous month; while the rate of mortality from this disease in London did not exceed 0.15 per 1,000, it averaged 0.25 in the provincial towns, among which the highest rates were recorded in Sunderland and Wolverhampton. The death-rate from diphtheria was equal to 0.17 per 1,000, and showed a slight further increase upon the rates in the two preceding months; this disease was last month more than twice as prevalent in London than in the aggregate of the twenty-seven provincial towns. During the four weeks of May 175 fatal cases of small-pox were recorded in the twenty-eight towns; the fatality of this disease showed a further increase upon that in recent months. Of the 175 deaths, 155 occurred in London (exclusive, however, of 91 deaths of London residents from this disease in the Metropolitan Asylum Hospitals situated outside Registration London), 9 in Manchester, 4 in Sunderland, 3 in Sheffield, 2 in Hull, 1 in Bristol, and 1 in Liverpool. Judged by the returns of the Metropolitan Asylum Hospitals, the prevalence of small-pox in London showed a marked further increase. The number of small-pox patients under treatment in these hospitals, which had been 1,103 and 1,282 at the end of the two preceding months, further rose to 1,389 at the end of May. The average weekly number of new patients admitted to these hospitals, which in the two previous months had been 203 and 273, was 270 during May.

The rate of infant mortality in the twenty-eight towns, measured by the proportion of deaths under one year of age to registered births, was equal to 151 per 1,000 during May, which exceeded that recorded in the corresponding periods of any of the three preceding years. While the rate of infant mortality last month did not exceed 137 per 1,000 in London, it averaged 161 in the twenty-seven provincial towns, among which it ranged from 94 and 98 in Brighton and Birkenhead, to 195 in Oldham, 213 in Newcastle-upon-Tyne, 242 in Blackburn, and 281 in Preston.

The death-rate from diseases of the respiratory organs, judged by the metropolitan returns, was below the average during May. The weekly number of deaths referred to these diseases in London averaged 29½, and the annual death-rate was equal to 3.8 per 1,000. In Liverpool the annual rate of mortality from these diseases was last month equal to 4.6 per 1,000.

The causes of 302 of the 14,111 deaths recorded in the twenty-eight towns during the four weeks of May were not certified, either by registered medical practitioners or by coroners. These uncertified deaths were equal to a proportion of 2.1 per cent. of the total deaths, which was lower than that recorded in any recent month. In London the proportion of uncertified deaths did not exceed 1.0 per cent., while it averaged 3.0 per cent. in the twenty-seven provincial towns. All the causes of death were duly certified in Brighton and Derby during the month under notice; in the other towns the proportion of uncertified deaths ranged upwards to 6.1 per cent. in Sheffield, 6.2 in Hull, and 7.1 in Leeds.

Among the population living in the outer ring of suburban districts around London, estimated at rather more than a million persons, the annual death-rate from all causes during May was equal to 16.9 per 1,000, against 16.0, 17.2, and 15.9 in the corresponding months of the three preceding years 1882-83-84. During the four weeks ending the 30th ultimo, 113 fatal cases of small-pox, 64 of measles, 36 of whooping-cough, 16 of diphtheria, 13 of diarrhoea, 9 of scarlet fever, and 6 of 'fever,' were recorded in the outer ring. These 257 deaths were equal to an annual rate of 3.1 per 1,000, which slightly exceeded the rate in the preceding month. The fatality of measles, scarlet fever, and whooping-cough showed an increase, while that of the other diseases declined. Of the 113 deaths from small-pox in the outer ring, 89 occurred in the district of West Ham (including 1 of a London resident registered in the Metropolitan Asylum Hospital at Plaistow), 8 in Edmonton, 4 in Croydon, and 4 in Bromley districts. Of the 64 fatal cases of measles, 24 were returned in Croydon district, and 22 in West Ham. Five deaths from diphtheria were recorded in the sub-district of Tottenham.

NOTIFICATION OF INFECTIOUS DISEASES IN THIRTY-ONE URBAN SANITARY DISTRICTS.

THE table on page 571 contains uniform statistics relating to sickness and mortality in thirty-one of the thirty-nine urban sanitary districts of England and Scotland in which the notification of infectious diseases is compulsory. The population of the thirty-one towns for which we are enabled to publish complete statistics for the month of May is estimated at rather more than three millions of persons. The annual death-rate from all causes during May in these thirty-one towns averaged 20.00 per 1,000 persons estimated to be living therein, against 22.05 and 22.66 in the two preceding months. The rate of mortality in the twenty-eight towns dealt with by the Registrar-General in his weekly return was 20.70 during May, and therefore exceeded by 0.70 the rate in the thirty-one towns in the accompanying table. The death-rates last month were considerably below the average in Burton-upon-Trent, Bolton, Lancaster, Barrow-in-Furness, Accrington, and Edinburgh; while they showed an excess in Oldham, Jarrow, Blackburn, and Newcastle-upon-Tyne. The rate from the eight infectious diseases dealt with in the table averaged 0.50 per 1,000, showing a slight further decline from the rates recorded in recent months. No death from any of these infectious diseases was recorded last month in Hartlepool, Lancaster, Leek, and only one in the ten other towns: they caused the highest rates in Leicester, Barrow-in-Furness, Salford, and Burton-upon-Trent. Small-pox caused one death in Halifax; scarlet fever was proportionally most fatal in Barrow-in-Furness, Salford, and

Burton-upon-Trent; enteric fever in Edinburgh, Leicester, and Salford; diphtheria in Burton-upon-Trent, Oldham, and Portsmouth; measles in Birkenhead and Jarrow; and whooping-cough in Barrow-in-Furness, Blackburn, and Oldham. Two deaths from typhus were recorded in Salford, and a fatal case of puerperal fever in Bolton, in Nottingham, and in Salford. With reference to the notified cases of infectious disease in the thirty-one towns, it appears that the proportion of the population reported to be suffering from one or other of the eight diseases specified in the table was 4.46 per 1,000, which was slightly below the proportion in the preceding month. No case of any of these diseases was notified in Leek during the month under notice; and, whereas the rate did not exceed 1.07 per 1,000 in Derby, 1.14 in Bury, and 1.31 in Hartlepool, it ranged upwards in the other towns to 7.77 in Barrow-in-Furness, 8.27 in Portsmouth, 9.06 in Burton-upon-Trent, 9.51 in Rotherham, 11.77 in Reading, and 16.47 in Leicester. The excessive rates in these last-mentioned towns were due to the prevalence of scarlet fever. Four cases of small-pox were notified during the month in Salford, and 3 in Birkenhead; scarlet fever showed the greatest proportional prevalence in Barrow-in-Furness, Burton-upon-Trent, Leicester, Reading, and Rotherham; diphtheria in Burton-upon-Trent and Portsmouth; and enteric fever in Edinburgh, Nottingham, and Portsmouth.

SPECIAL REPORTS.

SOCIETY OF MEDICAL OFFICERS OF HEALTH.

A MEETING of the Society was held at 1 Adam Street, Adelphi, on Friday, May 15, T. Orme Dudfield, M.D., President, in the chair.

The President referred to the recent legal decisions with regard to the burning of bricks in proximity to inhabited dwelling-houses (see p. 589), and it was resolved that a letter should be addressed to the Metropolitan Board of Works suggesting that this trade should now be brought under regulations when carried on near dwelling-houses.

THE ETIOLOGY OF GOITRE.

Dr. Thursfield read a paper on the 'Etiology of Goitre in England.' The author stated that his attention was first directly drawn to the matter some three years ago, in consequence of being requested by a sanitary authority to inquire into an epidemic prevalence of goitre amongst the children in some schools. The undoubted epidemic nature of the disease was so diametrically opposed to the etiological views almost universally given in the text-books on medicine that he was led to extend his inquiries. After referring to the official definition of goitre of the College of Physicians as 'enlargement of the thyroid gland, endemic in certain mountainous districts, but not limited to them,' he stated that the primary causes of goitre were climatic, physiological, including sex, heredity, &c., industrial, dietetic, neurotic, and strumous diathesis. Climatic influence is the chief factor, and the endemic prevalence of goitre is not found at much less altitude than is indicated by a fall in the column of mercury equal to about three-quarters of an inch; this diminished atmospheric pressure, together with the climbing of hills, leading to sudden alterations in the circulation. Of the thyroid gland little is known, save its anatomical structure, and it has this peculiarity, that of all the glands of the body which we can see or feel, it is most prone to and most capable of alteration in volume, and it is to this peculiarity that goitre is due. That goitre is frequently entitled to be called an industrial disease he had no doubt. Carrying weights on the head or otherwise, so as to interfere with the cerebral circulation is a most potent contributing cause. With regard to dietetic influence, he was disposed to think that in some of the localities water

containing iron was certainly a factor in the production of the disease. He believed that endemic goitre is disappearing in England, owing chiefly to the disuse of the practice of carrying weights on the head.

DISCUSSION.

The President, in moving a vote of thanks to Dr. Thursfield for his very interesting paper, observed that, in all probability, many of those present would be in the same position with himself in having only a theoretical acquaintance with the subject. He appealed to the country members present to favour the Society with their experiences, whether confirmatory or otherwise, of the views of Dr. Thursfield, whose paper would form an interesting item in the next volume of the 'Transactions.'

Dr. T. Moore said that his experience in Worcestershire was that goitre was very prevalent there; he came to the same conclusions as Dr. Thursfield, that the majority of the cases were attributable to the women carrying weights on their heads, and he concluded that the weight must interfere with the circulation. Other medical men to whom he mentioned the cases came to the same conclusion. There was not a great amount of saline matter in the water they drank and there was a little iron, but he had no opinion on this point. In India, where both sexes carried weights upon their heads, the disease was very prevalent.

Dr. Seaton asked if the reader of the paper had had any experience in Derbyshire, because he thought that in the hilly districts of that county the disease would be noticed. He had frequently observed the people carrying weights in the Swiss valleys, where goitre was most marked. He had no recollection of seeing in the text-books the carrying of weights as a probable cause of goitre, nor had he, when at St. Thomas's Hospital, heard this point referred to, but at the same time it occurred to him that the cause assigned by Dr. Thursfield was a very possible and probable one.

Mr. Murphy asked whether Dr. Thursfield could inform the society whether goitre occurred as frequently amongst men as women in India, and observed that both sexes in that country carry weights on their heads.

Dr. Thursfield, in reply, said he was surprised that his paper had been received with so little opposition. Dr. Aitken, whom he knew well, used to refer to goitre as an Indian disease, but without any connection with carrying weights on the head. Goitre in India was as common in the male as in the female. He was gratified to find that carrying weights on the head as a contributory cause had been noticed by someone else, but he believed that goitre arose from no single cause.

DIARRHŒA AT SETTLE.

Mr. F. E. Atkinson read a paper on an epidemic of diarrhœa which prevailed in the rural district of Settle during October and November of last year. From Oct. 5 to Nov. 5, 218 cases occurred in 120 houses, 188 in Settle and 30 in Giggleswick; up to Oct. 18 two or three fresh cases occurred every day, but after that they increased, until on Oct. 23 as many as 27 fresh persons were attacked; after this date the epidemic rapidly declined, and on the 29th ceased. The chief symptoms were: rigor, headache, pains in the abdomen, vomiting and diarrhœa, the stools often containing mucus or blood; delirium and hicough occurred in the worst cases. The disease lasted from a few hours to a fortnight, and there was a tendency to relapse. The large majority of persons who were attacked were over five years of age. It was possible to eliminate the sewerage system, and all articles of food but water. The chief water supply is obtained from springs from which the water is conveyed to a reservoir, but may be supplied to the town without entering the reservoir, twenty-nine houses being always thus supplied, it has also a supplemental supply only to be used in case of emergency; the latter commences in high land at the corner of a field.

where it receives the overflow from two cattle-troughs which are supplied from a spring higher up. On Oct. 13 the water in the reservoir was at its lowest point, and there was a certain amount of vegetable growth at the bottom, and on Oct. 14 the supplemental supply was received. The troughs referred to were surrounded with manure, which would percolate into the stream. On Oct. 24 the water was supplied direct, and not through the reservoir, which was found full of slimy green vegetable matter. It must be noted that the water of the reservoir was polluted throughout; that on Oct. 14 it received an additional polluted supply; and that on Oct. 24 the reservoir was no longer used. These dates correspond with the increase and termination of the outbreak, allowing four days as incubation period. Corroborative evidence that the water supply was responsible for the outbreak is to be found in the facts that of those attacked all but eleven persons had been known to receive their water from the reservoir, and the latter might have drunk the water at other houses; again, the twenty-nine houses supplied directly from the springs escaped, together with the 180 inhabitants of the Giggleswick Grammar School, and the residents in a number of other houses who had private supplies.

DISCUSSION.

The President, in moving a vote of thanks to Mr. Atkinson, said he thought he had proved his case, but he was surprised to hear it said that no epidemic of diarrhoea had previously been traced to a polluted water supply. Specific pollution of water often originated epidemics of enteric fever. This had been the case recently at Kidderminster, where pollution of water by sewage simply had previously given rise to febrile attacks of a non-specific character. In London there was, so far as he knew, no cause to attribute epidemic or endemic disease to the use of water except in the well-known instances of cholera. Other disease in single households had been occasioned by neglect of cleanliness in regard to the cistern, and he thought it would not be difficult to find recorded cases of diarrhoeal disease traced to a polluted water supply.

Dr. Thursfield knew of cases of local epidemics proceeding from water, but he had some difficulty in deciding what the disease really was. He was, however, fortunate in making a *post mortem* in one case when he found symptoms of typhoid fever; several outbreaks of diarrhoea had come under his experience in which well-marked cases of typhoid occurred. He did not think any reliance was to be placed on analysis, and a great deal of harm was done by analysts in reporting water to be pure which was really unwholesome.

Mr. Cassal said that analysts themselves were responsible for the fact that so little value was attached to their reports; for instance, Mr. Allen's report on the water at Settle stated that the loss in the solid constituents on ignition was 2.24 grains per gallon, but no mention was made of changes undergone during ignition. Again, it was said that the free ammonia was 0.2, and the albuminoid 0.1 per million, and that these results 'corresponded uniformly with those characteristic of a pure water.' Such a water was highly suspicious and ought to have been submitted to microscopic and cultivation tests. Mr. Cassal, in conclusion, expressed a strong opinion that water analysis was of the greatest value when due regard was had for the method of collection and analysis, and the proper interpretation of results.

Dr. Seaton thought that no one ought to give a positive opinion as to the purity of a water supply unless he had a practical acquaintance with the district. He had known many cases of disease caused by the action of one public analyst in reporting an impossibility, viz., what the condition of the water was a week before his examination. The speaker concluded by referring to Mr. Wanklyn's report on the water supply to the Leek Workhouse which passed through a peaty neighbourhood and gave some people diarrhoea whenever they first drank it.

Mr. Atkinson briefly replied that the symptoms of

typhoid fever appeared to him to be distinct from those of dysenteric diarrhoea. The symptoms exhibited were characteristic of the latter affection, and the fact that the outbreak was traced to the water supply pointed to a specific contamination of the water. If he had been at home at the time he would have taken other samples of water for cultivation, and would have acquainted the analyst with the surroundings. He believed that vegetable organic matter in water occasionally produced diarrhoea.

THE ANTWERP EXHIBITION.

(FROM OUR OWN CORRESPONDENT.)

REVISITING this Exhibition a month after it had been opened, I found it, both internally and externally, far from complete. The façade was still without features, except such contortions as great patches of boarding, stucco, or stone-coloured canvas on brick and iron foundations and walls could give. No doubt, when all the stuccoing, patching, and plastering is done there will be a pretty presentable view of that much mingling of many styles in which Belgian architects indulge. With more iron and glass much better could have been done, and done at once; the great advantage about the style of exhibition building which Joseph Paxton invented being that the ornamental and useful were cast pretty simultaneously and much in the same mould, and put up together, so that as soon as the building would be utilised it lacked little but paint for full completion. The Belgians have, it is true, put a good deal of iron into their Antwerp Exhibition building, but they are spending, and for weeks will have to spend, much time and much money in hiding it. This is very manifest in an immense triumphal arch which is being erected in front of the principal entrance. This arch is surmounted with a great open globe, to represent the whole world, the industries of which are so largely represented within the main building. The framework is of iron, the globe included. All but the globe, however, is being covered in. Rather clumsy imitation rockery is being grouped about the base of each pillar or buttress of the arch, to form cascades and waterfalls, the upper of its two great limbs and the arch itself being covered with planks, which are to be wrapped in stucco clothing of Greek, Roman, Byzantine, and Renaissance art, with a little Egyptian thrown in, such as make such a strange appearance of the Palais de Justice at Brussels. The great globe will be gilt and coloured, and flaunting flags will make it visible for miles on the great broad river which connects Antwerp with the sea, and for miles on the great flat land round about.

But the cascades and the waterfalls will be a great treat to the inhabitants of Antwerp, who never knew a fountain until this Exhibition came. Before the arch a great fountain plays, smaller ones add their picturesque sprays, and when the cascades come into play, the display of water-work will be a local wonder indeed. The astonishment of uninitiated visitors is great at learning on entering the main building that all this water is put in motion by two little Pulsometers, and that all is arranged in so simple a manner that a little water and a little steam make all this display at a very small cost. Ten years ago few persons knew what was meant by the word Pulsometer, and now it is fast becoming a household word, and contributing largely to health and wealth as well as adornment. The idea of the Pulsometer is scarcely novel, for since the first application of steam as a motive power, there were ever attempts to solve the problem how best, by the reciprocal expansion and condensation of steam, to raise water; but the comparatively recent Aquameter of the United States may be regarded as the most successful effort, until Messrs. M. Neuhaus and J. C. Hodgkin brought out the Pulsometer in London. That firm became the Pulsometer Engineering Company, Limited. In 1880 Mr. Neuhaus went to Berlin and opened Pulsometer works there, and the pulsometers at work and on view at Antwerp are furnished by

him. They form a very interesting exhibit, and manifest the principal advantage of the system—that of maximum strength and duration of force with a minimum consumption of steam, and the power of easily raising muddy water and thick liquids to a great height. The illustrations of the advantages of the system in mine, dock, and excavation drainage are plain and satisfactory.

To the attractions of the fountains are fast being added that of flowers, and the most famous florists of Belgium are doing their best to make what not long ago was a sandy desert smile with floral beauty.

Unlike most Continental exhibitions, there are here few separate and particular exhibits or exhibition buildings in the open grounds, but there are plenty of handsome erections for providing for the hunger and thirst of the visitors of all nations. What is most surprising, too, is that provisions are to be had of the best quality at the lowest of prices. There is less provision here, however, than at any Continental exhibition I have visited for the sale of non-alcoholic fluids. It is clear from what is to be seen, as well within as without the grounds, that the good folks of Antwerp prefer beer and wine to coffee, so much so that at more than one café I found coffee was not to be had. The numerous intimations in refreshment-house windows that whisky, brandy, and stout are to be had within, imply that most of the examples of the genus *homo* seen in Antwerp from England are not of a teetotal character.

Not content, however, with providing that refreshments should be cheap and good within the grounds of the Exhibition, its managers appointed a Lodgings Committee, which soon had a list of something like 1,500 'lodgings to let,' at all prices, from 15 francs to 1 franc 50 centimes a day. Every place was visited before being put upon the list, and was classified according to accommodation and comfort. The Lodging Office is plainly to be seen at the railway station by the passenger as he alights from his train.

To supplement this provision for all sorts and conditions of visitors, the committee went a step further, and obtaining from the Municipality the use of the old Athenée turned it into a People's Hotel, where 500 beds are provided at one franc a night, light and attendance included! To provide for the health of the lodgers two physicians are attached to this establishment, and furnish a daily report as to its sanitary condition. The reaction of these arrangements upon the hotel keepers is one of the most salutary character. They early leagued together to make hotel rates as high as they were during the exhibition at Amsterdam two years ago, but soon found that if they persevered in the face of the Exhibition Committee's lodging movement they would soon have little or nothing to do.

With the magnificent boats of the Great Eastern Company to carry him across the sea in comfort for a very low price, and with this assurance that he can lodge and live in Antwerp more cheaply than in London, any one may go and study the manifold curiosities of that old city as well as those of the world's art and industry to be found in its great exhibition, for a trifle.

It is a great Exhibition, too; one admirable in its extent, arrangement, and contents, well worth a visit. What may be called the great nave leading from the main entrance to the machine hall in the rear is cut by the main gallery which runs the whole length of the building, and though here and there there are yet gaps of uncompleted exhibits, one has but to stand at the junction of the four roads, and whichever way one looks there is a glorious display of luxury, wealth, taste, utility, and all the wondrous products of the arts of peace making plenty. Here within view of the eye thus centrally placed there has been keen competition between Frenchmen and Belgians as to who should exhibit the finest products with the most tasteful and taking display. No one appears to have spared expense, and all have brought to the arrangement of their goods that wealth of taste and talent for

exposition only to be found on the Continent. It is wonderful what that taste and talent can do. The Belgians had plenty of ill-looking coal, all the rough accessories of the coal pit, rude iron and the material and apparatus of iron works to show, and have disposed them in such form and with such grace, that though they elbow exhibits of luxurious art in furniture, upholstery, porcelain, and palatial adornment, there is nothing in them incongruous or out of place, or offending the eye, even though it wander into the neighbouring parts, where Italy in general and Venice in particular are showing their wealth of luxury and of taste in all the wondrous products of that sunny land of art.

It struck me as I surveyed the interesting scene that this fact presented a lesson for health and life, teaching how things were not so much in themselves repugnant, but as they were disposed by the disposition of those who used them. But then the Exhibition shows what Bishop Hall found years ago in every good eye—that it can only see in the direction in which it is turned; and I am free to confess that the continental eye of taste that has made up the charming *coup d'œil* presented by the Antwerp Exhibition, does not seem to have been very much turned in a sanitary direction, and that, judging by the comparative paucity of health exhibits, and the multiplicity of others, continental life is more intent upon external show than internal conservation.

Still I was felicitating myself in the great gallery, admirably proportioned and set apart for the display of machinery and heavy iron products, on the absence of Krupp and all material of war, when my way was barred by the struggles of a little army of labourers to haul in a monster gun sent by the French. This cannon comes from the well-known works of Cail of Paris. It is in steel and of the calibre of 34 centimetres, is 11 metres 20 in length, and weighs 37½ tons. Its diameter at the breech is 1'04, and at the powder chamber 245 millimetres. The projectile to be used varies from 400 to 600 kilogrammes, according to the character of its internal conformation, and will contain as much as 40 kilogrammes of compressed gunpowder; while the charge to be employed varies between 180 and 200 kilogrammes. The initial velocity of the shot is 650 metres; and the range from 17 to 18 kilometres, or the distance by one route of Versailles from Paris. To give to this cannon of 34 metres a resistance capable of supporting the reaction of a charge of 180 kilogrammes, a peculiar mode of hooping is adopted, which its inventor, Colonel de Bange, distinguishes as biconical. The gun is, as already stated, of steel, and four rows of hoops of the same metal by virtue of their biconical form clamp one into the other, thus giving it a strength and range which it is said no German gun of the same calibre, produced at a much greater cost, can claim. This gun, and the allusion of its inventor and maker to German cannon, constitute the only exhibit that disturbs the evidence everywhere present at the Antwerp Exhibition of peace, industry and true progress in continental nations. The evidence of the war spirit is in all other respects singularly absent, and it is satisfactory to know that not only is there no Krupp but no other German gun on the ground to reply to the vaunt of this Paris cannon; and that the French war authorities themselves pooh-pooh the pretensions of Messrs. Bange and Cail and their monster cannon.

SANITARY MATTERS IN FRANCE.

(FROM OUR OWN CORRESPONDENT.)

M. NOCARD, professor at the Veterinary School of Alfort, has recently discovered that poultry can contract tuberculosis from human beings. A farmer at Charenton had in his employ a farm servant suffering from phthisis. In order to find him work that would not try his strength, this man had the care of the poultry. He fed the

birds, gave them fresh water, &c. He coughed constantly, and expelled a considerable quantity of expectoration, which, it was observed, was greedily swallowed by the fowls. Six or seven weeks after the phthisical servant had care of the poultry yard, two of its denizens died. Mortality among them increased. The owner sent a fowl to the Veterinary School at Alfort, where it was ascertained that the lungs and liver were full of tubercles, about the size of a pea, and of a greyish yellow colour. In a microscopical preparation there were a considerable number of bacilli. All the fowls were killed, and the poultry yard was disinfected. A less honest farmer would have sent the fowls to market, a probability that doubtless has been and will be realised. As it is supposed that the milk of cows can communicate tuberculosis, the question arises whether tuberculous fowls are not dangerous as articles of food.

A general report of the Municipal Paris Laboratory has just appeared. This laboratory is the outcome of a report made by M. Dumas in 1876, when he urged the Prefecture of the Police to establish a test office, where, by paying a small sum, every purchaser could ascertain that wine is not artificially coloured. The scheme became greatly enlarged, and the laboratory now analyses and tests all articles of food, wines, beer, &c. It is composed of four laboratories, two camera obscura offices, a room for instruments and apparatus, among which are a gas-motor, an electrical machine, a turbine, a ventilator, a laboratory for analysing gas, spectrum analyses, organic analyses and dialyses and distillation, and a room especially arranged for microscopic photography, &c. Qualitative analyses are gratis, quantitative analyses are paid for according to a fixed tariff. Besides general business, the laboratory makes analyses for the Prefecture of the Seine, for the Paris Octroi, for hospitals and prisons, colleges, universities, and the army.

There are twenty experts attached to the laboratory, who perform the duties of inspectors in the markets and among the Parisian tradesmen. They are armed with considerable power, and can destroy adulterated goods on their own responsibility immediately adulteration is demonstrated. If the goods of a tradesman are suspected to be adulterated, the inspectors have the right to seize specimens. Since the laboratory has been founded, an important number of analyses have been made of articles of food, wine, beer, cider, milk, butter, coffee, chocolate; also drugs and different kinds of chemical products. The quantity of lead used in tinning and in soldering the cases containing preserved food has been ascertained, also the proportion of salicylic acid added to articles of food. Sewage has been analysed, also the contents of the *tinettes* (the receptacles into which excrement from water-closets is received), the air of the sleeping rooms at Alfort, cesspool-gases, soil from cemeteries, Seine water, and samples of water used for drinking purposes sent by different communities. Coloured toys, syrups, articles of food coloured by means of copper salts, have been tested to ascertain the presence of nitrates; meat examined for trichinæ. The milk taken from the bottles used in the Paris *crèches* has also been examined, and the influence of different kinds of food on cows' milk has been tested. The influence exercised by the Municipal Laboratory has diminished the dilution of wine by water.

The pupils who attend the sanitary lectures at the Paris Faculty of Medicine visit every Thursday, under the direction of Dr. Landouzy, such public establishments as may be useful to their studies on sanitation. They have visited the laboratory at the Parc Montsouris, where MM. Marie-Davy and Miquel showed them the apparatus and instruments used for meteorological observations. The Cité barracks and the Municipal laboratory will be visited by Dr. Landouzy's pupils. At the Laboratory they will observe how analyses of water and milk are made.

The etiology and prophylaxis of scrofula in infants constitute the subjects of the prize essay of the Commission d'Hygiène de l'Enfance. M. Marjolin, in his report to

the Académie de Médecine on the essays sent in, regretted that the authors had not furnished any personal observations, but had principally gathered together facts for the most part well known. M. Marjolin in his résumé of these essays stated the following conclusions. Scrofula is most often hereditary. When directly inherited it is most dangerous. Frequently scrofula is induced by scanty or improper food, long and painful teething, faulty sanitation, unhealthy dwellings, want of cleanliness, and fevers. The treatment is indicated by the nature of its etiology, healthy houses, pure air, cleanly habits, and a sufficiency of suitable food.

The Académie de Médecine has awarded the prize for essays on infant sanitation to nine competitors. The sum at their disposal is 2,000 francs (80*l.*). This is divided in sums of 1,000 francs (40*l.*) to Dr. Ségournet de Revin, 500 francs (20*l.*) to Dr. Rousse; 200 francs (8*l.*) to Dr. Caradec; 200 francs to Dr. Adrien. Medals were given to other candidates. The subject of the essay was 'Faire connaître par des observations précises le rôle que peut jouer dans la pathologie infantile le travail de la première dentition'—'Proof, by exact study, of the influence exercised by the first dentition on infantile pathology.'

Dr. A. J. Martin has been awarded the Auguste Monbigne prize of 4,000 francs (160*l.*) for his essay on Foreign Civil Sanitary Administration ('l'Administration sanitaire civil à l'étranger').

Dr. Benoist de Grandière has just published a small book on hygiene, entitled 'Notions d'Hygiène.' This volume is as useful and as modest as its title indicates. It is specially addressed to schoolmasters and pupils, most of whom will do well to read it. It has already reached a fourth edition.

M. Gaillet and M. Huet have been awarded a gold medal for the apparatus they have invented for purifying water used in factory boilers. The water is first mixed with lime-water in order to change the carbonate of lime, which, under the influence of carbonic acid, is dissolved into an insoluble carbonate. This carbonate is precipitated into a long and narrow apparatus, so constructed to save space. In the interior of this apparatus there are a series of diaphragms, inclined at an angle of 45°; the water rises slowly and gradually deposits the precipitate, which accumulates on the diaphragms and slides down to the lower angular part of the compartments, whence it is easily withdrawn by opening a tap arranged expressly. This apparatus is much admired for its ingenuity, and it is believed that it will be of great use in factories.

Dr. Proust is appointed to replace Dr. Bouchardat in the Chair of Hygiene at the Paris Faculty of Medicine.

An article entitled 'Experiments upon the Vitality of the Choleraic Comma-Bacillus,' by MM. W. Nicati and W. Rietsch (of Marseilles) forms the principal contribution to the *Revue d'Hygiène* for May. The authors have already answered affirmatively upon the question of the choleraic nature of Koch's comma-bacillus. The article in question contains a table showing the comparative resistance of the bacilli to various disinfectants.

The agents were employed of varying strengths, and in each case the solutions were examined in three stages, after five, ten, and fifteen minutes' exposure respectively.

The writers examine the protective influence attributed by M. Koch to the stomach, but they conclude that the effects obtained are to be attributed simply to the action of the acid juices. The gastric juices being always rich in hydrochloric acid, ought to kill almost instantly the bacilli contained in the food which they envelop. If this is admitted, we shall find nothing surprising in the undoubted fact that those adventurous experimentalists who have swallowed solid choleraic matter (in pills, for example) should not have been attacked by the disease.

The authors consider that if the same matter were taken in water, and on an empty stomach, the result would be very different; their experience leading them to the conclusion that water is the principal agent in the propagation of this much-dreaded epidemic.

A report of a meeting of the Société de Médecine Publique informs us that M. le Dr. P. Rodet presented to the society a translation of 'A Code of Rules for the Prevention of Infectious and Contagious Diseases,' lately published by the London Society of Medical Officers of Schools Association. The reading of this paper provoked a considerable amount of adverse criticism, to which we need not refer in detail, as the discussion is adjourned for two months, at the expiration of which period it will probably be resumed with considerable liveliness.

It will no doubt be found that some confusion has been caused by the doctor's inaccurate translation. He has obviously created a good deal of obscurity by confusing the three words, *impétigo* (impetigo), *teigne* (scurf), and *herpes tonsurans* (ringworm).

The attention of anti-vaccinators is directed to the following figures. The town of Bordeaux opened a gratuitous service of vaccination on Nov. 22, 1881. The effect of this in reducing the number of deaths from small-pox was startling in the extreme.

1876 to 1878	585	deaths from small-pox.
1879 to 1881	545	" " "
1882 to 1884	110	" " "

THE NEW CITY HOSPITAL, ANTWERP.

By U. G. BLACK, F.R.C.S.E.

THE New City Hospital, with circular wards, at Antwerp, was inaugurated with much civic ceremony in October last. It is situated in the Borgerhout quarter, in the north-east district of the new city, outside the new Boulevards, and near the end of the Rue des Images. The site is an open one, with grounds and streets, or roads, all round it, so that there is an abundance of free ventilation. The ground on which the hospital is built is an oblong square, with length north and south, about 223 mètres or 731 feet, and breadth east and west, about 192 mètres or 623 feet, with an estimated total contents of 3·89 hectares, or about 10·50 English acres.

The south side is formed by the Rue des Images, the west side by the Rue de Lazareth, the north side by the Rue Boerhaave, and the east side by the Rue van Helmont.

The hospital is placed in the meridional centre of the grounds, with administrative offices abutting on the Rue des Images and grand entrance, and is estimated at about 190 mètres long or 623 feet, and about 150 mètres broad, or 492 feet outside the towers. It resembles in appearance one of the old Welsh castles of the Edwardian era, as Chepstow or Conway, with their cylindrical towers, curtain walls between each, and square barbicans for the grand entrance. The walls are built of red brick, with yellow sandstone facings and mouldings, while the conical roofs of the towers and the pent roofs of the other buildings are all slated. The grounds around are fenced in from the streets by high iron railings, resting on elevated brick-work with yellow coping stones, and with ornamental brick pillars interposed here and there, and the space inside is kept grassed, and laid out with gravel walks.

On approaching the building the first thing arresting the attention are the towers, and the square block of offices at the grand entrance, and they are disposed outside the wall or enceinte of the hospital, three on each side, and two at the north end. Each tower is of two storeys, with attic and basement besides. The offices are of three storeys, and the connecting corridors of two storeys all round, so that communication is secured continuously everywhere on the same levels. On entering the arch of the carriage-way into the first court, the chapel is to be seen in the centre, facing the gate, with corridors of two storeys connecting it with the corresponding towers at the sides. Further on, in the next court, are situated the kitchen, pharmacy, and store rooms of three storeys, in a central block, connected, as before, by cross-corridors to the corresponding towers on the outside. Still further back lies the official and medical and sister residentiary of three storeys, con-

nected, as before, with corresponding towers on the outside walls by two-storey corridors. Lastly, at the north end of the last court lie the hydropathic or bath establishments, connected right and left with the last two towers by lateral internal angled corridors. In the open space at the north side of the hospital grounds is a square block of buildings, with tall chimney, for the laundry or blanchisserie, containing steam boilers and all the requisite machinery, with a back gate leading into the adjoining street.

The construction of each tower appears to be similar, and therefore a description of one may suffice for all. As already stated, each tower is circular, opening by passages into two corresponding corridors inside the court. Each storey or ward holds twenty beds and fittings, which are disposed radially round the circumference of the room, and with a window between every bed. In the centre of each ward is a round glass-house or conning tower, for the use of the doctors and nurses on duty, duly fitted up with tables, chairs, cupboards, shelves, and telephones.

The ventilation of the circular wards is effected principally by artificial means, by channels carried up the centre of the towers, conveying the diseased air outside on the louver placed on the top of the tower roof. They are heated by hot-water pipes placed round the walls, and there are no open fireplaces anywhere.

On the outside of the tower there is a square turret or annexe, attached by corresponding small corridor to the tower, which contains lavatory, baths, closets, and hot chamber. On the inside aspect of the tower, and connecting it with the enceinte, is a covered way and short annexe, containing two private or solitary wards, doctors' and nurses', and visiting rooms.

On the west side of the Grand Bureau in front lies a square house or block of two storeys connected with the general enceinte by a covered way, and containing the operating theatre and instrument-rooms. On the east side, similarly situated, lies the mortuary establishment, of a very complete and modern character, comprising *morgue* with sixteen slabs, necrotomy room with two slabs, laboratory and instrument rooms.

Beyond this lies the funeral establishment, with coaches, ambulance carriages, and litters, connected with the street by gate for the exit of processions and burials. The chapel is of course a Roman Catholic one, fitted with the usual altars, shrines, &c., and is provided with gallery all round for the use of the sick of the upper or second floors, opening into the corresponding cross corridors, and towers beyond them right and left. The kitchen or cuisine is fitted up with the most modern apparatus for cooking in all its branches. There are no open fire-grates, and all the heating is done by furnaces and steam, so that there is no messing with ashes and cinders.

The chief cooking-range is placed in the centre of the hall, with descending flue, and a large flat plate on which are the various orifices for pans and kettles for cooking, &c., and ovens are placed at the sides. Along in the middle of the chamber further on is the apparatus for boiling the soup and bouilli, the standard diet of the sick, in large kettles, like kettle-drums, which are swung on horizontal pivots for the convenience of turning over for emptying their contents into the cans for service in the wards. These kettles are heated by steam admitted into their double linings, which can be turned on or off in each separate drum as required, and no special furnace or flues are supplied for them. Round the sides of the big kitchen are disposed other and smaller steam-heated apparatus for making various other articles of diet, as coffee, cocoa, vegetables, potatoes, puddings, milk, &c. The two other smaller kitchen rooms adjacent are intended for the collection of the dietary material, and its allocation to its uses, and then to the separation and distribution of the various articles to the sick wards. Access on the same levels is had along the different cross covered ways by means of carriages, and to the towers and apartments.

A A Administrative Block.
 B Operating Theatre.
 C Chapel.
 D Kitchen and Pharmacy.
 E Residential.
 F Bathing Establishment.

G Laundry.
 H Ambulance and Coach-shed.
 I Mortuary and Post-mortem Rooms.
 W (1), W (2), &c. Circular Wards.
 O, O, &c. Ward Offices and Baths.
 Z, Z Private Wards and Offices.

X, X, &c. Corridor, Enclosure, Connecting Administrative Block Wards, &c.
 Z, Z, &c. Cross Corridors, connecting Kitchen, Chapel, and Residential with Wards, &c.

There are also in this central building accommodation for the dining of servants and nurses, &c., and for the conversation and recreation of any patients who are able to move about.

On the north side of this block, and looking to the third court, is the pharmaceutical establishment or dispensary, where there is a finely fitted-up laboratory, together with store-rooms and offices—all communicating with the central cross corridor.

The bathing establishment is of an elaborate character, and fitted up with the most modern apparatus. It comprises male and female single baths (hot and cold), Turkish apparatus for hot and moist air, douches of all sorts (hot and cold), massage chamber, and various requisite offices attached. The baths are connected with the rest of the levels by the cross covered ways at the north end of the avenue, going to the last of the towers.

The residential building, just opposite the baths in the fourth court, is of three storeys, and contains offices and private rooms for the use of the resident medical staff and other officials and sisters.

A stroll round the galleries may probably give a good idea of the internal arrangements of the lobbies and rooms all round. If the lower gallery be entered on the left of the grand entrance, it will be found to be well lighted on each side by windows. The door of the operating theatre on the left is then reached, and subsequently the cross gallery leading to the first west tower and to the chapel on the right side. The circular wards can be entered from here. Passing along the covered way and its annexe, containing the doctors, nurses, and solitary wards, the visitor passes round the central glass tower inside, returning into the grand gallery. He next passes north on to the next cross corridor leading to the second west tower, with its circular ward on one side and the kitchen on the other, which may also be visited, as before detailed.

Passing on still further along the main gallery, the intersection of the cross corridors of the third west tower and the residential are reached; and going on beyond this a little brings the visitor to an angle in the passage turning to the right. Here he meets with the door leading on the left into the fourth tower, with its circular ward; and, lastly, at the far end (north) he reaches the bathing establishment. Passing through this, he enters the Eastern Grand Gallery, and notices similar doors and cross corridors as he walks along south as seen on the west gallery, proceeding to the four towers on the east side, and the residential, kitchen, and chapel in the courts, till he arrives at the entrance of the Morgue, lying on the left, and lastly, the grand entrance at the gate. There are flights of stairs at different select positions in the cross corridors, leading up to the second storeys of the galleries above, which are similar in arrangement to the lower ones, and give access to the second storeys of all the towers outside, and of all the buildings inside the courts, but differ in being open above to the air. The towers themselves may be roughly estimated at about 61 feet in diameter inside, and 36 feet in height of walls inside, *i.e.* they are nearly about half square cylinders, and would have therefore above 105,192 cubic feet of capacity *en masse*, and 2,922 square feet in area. Now as there are 20 beds in each circular ward of the tower, this estimate will give to each bed a gross amount of 2,629 cubic feet of space, including everything. The total accommodation for the sick in the whole towers will amount to $40 \times 8 = 320$ beds, but as there are 2-4 extra beds to each ward, the grand total will probably be nearer 350 beds altogether.

The staff of attendants must be very numerous to manage such extensive premises efficiently, as there would be 8 nurses to each tower, or 64 total; and doctors, apothecaries, clerks, bathmen, cooks, storemen, laundrymen, &c., must bring up the total number of administrators to 150 at the nearest estimate.

It may be submitted in an engineering point of view, that edifices on the Edwardian castle principle could only

be applicable to horizontal flat sites of ground, at Carnarvon, and Conway, in North Wales, and unsuited for sloping or hilly situations.

It will be apparent that the circular wards will less ground and space than the rectangular ward same number of beds, as the latter would require over 80 feet long for the 10 beds a side, an breadth of 60 feet, a height of 36 feet, an are square feet, and a capacity in the gross of 162, feet for the two wards.

However, in the case of this new hospital, of ground space for sick wards has been discarded increased space devoted to administrative building interior courts, so that the total ground taken up greater than in the older establishments. But advantage secured by this modern method of depends upon the complete isolation of wards, access afforded to all parts of the building, and external ventilation which is provided.

HOUSING THE WORKING CLASSES: NEWCASTLE-ON-TYNE.

THE annual report of Mr. H. E. Armstrong contains an interesting supplement on the sanitary condition of Street (West) and Back George Street. It appears the excellent plans accompanying the report, are unfortunately we are unable to reproduce) that the ment of the houses is rather peculiar. The block ings is placed between two streets, each house stories in height and has one frontage towards each. On the ground floor there are two entrance doors each frontage) connected by a through passage. are two living rooms on this floor with a steel flight staircase between them at right angles to passage. The staircase terminates on the first floor a small landing, and doors on either side of it open into two living rooms. Each of these living as also each of those on ground floor, is provided window and fireplace. Each first-floor living room into a small bedroom having a window but no fire.

The basement tenements are approached by a few steps in the back and front areas, and consist of a room entered from the area, and a small bedroom from the living room. Each room has a window the living rooms have fireplaces. The water-closets for the entire building), ash-pits, and coal cellars, are placed under the footways, and approached from the Each building, it will be seen, consists of two tenements of two rooms each in the basement, two tenement room each on the ground floor, and two tenements rooms each on the first floor.

Mr. Armstrong considers that the greatest defect in these houses is that of insufficient ventilation, due to causes, *i.e.* position, structure, and capacity of rooms.

The position of the basement tenements, placed back, renders through ventilation impossible, and the water-closets and ash-pits are placed in the encumbered areas which light these rooms, their ventilations are drawn through the windows and doors to the fireplaces of the living rooms. These evils are intensified by the small size of the rooms. The living average 12 ft. by 15 ft., and the bedrooms about 8 ft. by 15 ft., and the height varies from 8 ft. to 8 ft. 6 in. Thus the former rooms contain each about 1,450 cubic feet, and the latter about 1,050 cubic feet.

The bedrooms having no fireplaces are typical examples of what the report designates as 'well-room' rooms having no other openings than door and window both of these being placed at the same corner of narrow apartment, which is badly ventilated even door and window are open, because the air enters by one aperture passes directly out by the other, leaving stagnant the atmosphere of three-quarters of the room.

On the first floor the bedrooms are also 'well-

uced back to back, no through ventilation is

years ago an attempt was made to improve n of the rooms by certain structural alterations; proposed to convert each pair of back-to-nements into one dwelling. This proposal it in three instances only.

tive required was to make an opening from of the 'well-room' into the kitchen, either the door to that end, or by putting in an ator there. It will be evident that either of is defective, inasmuch as the only ventilation that of interchange of air between the two unitary arrangement under all circumstances, / bad in case of infectious disease in the 'enty-eight cases of cellar 'well-rooms' the l the position of the doors, and in as many / ventilators were introduced. DWELLINGS, SEWARD STREET, ST. LUKE'S, E.C.

TWO-ROOM TENEMENTS.

l Central Dwellings Co., of 57 Conduit er Square, are meeting an undoubted want ildings for those workers who cannot and : from their sphere of daily labour. Not- he concessions which have already been

made (not without pressure being brought to bear) by the various railway companies, the travelling facilities are by no means all that the working class require, and to give all that is demanded would entail considerable interference with a large section of the community who are entitled to by their position and are prepared to pay for a certain amount of exclusiveness in their daily journeys. It must also be remembered that a large number of working men insist upon living in a central position, and like to be able to get to their homes at irregular and uncertain hours, and many a man with a small family prefers to live in two rooms in central London rather than occupy three rooms in the suburbs. Again, there are many widows and single women who are compelled to live in a position from whence they can more readily go in search of the piece-work for different manufacturers and employers, and to whom one or two extra railway journeys, however short, would often mean a serious waste of time and opportunities. Bearing this in mind, the directors have wisely

determined to provide, not only the regulation three-room tenements, but also single rooms and two-room tenements, this latter description being the subject of our present illustration. These buildings are now in course of erection in Seward Street, St. Luke's, E.C., and the somewhat unusual feature of a private balcony to each tenement calls for a passing remark as evincing the interest taken in consulting the wants of tenants who can readily and practically appreciate the results of such forethought. Even in the better quarters of London, during the fine weather, the balconies and spaces over the porticoes are much used by the inhabitants who have no ready access to the squares and gardens in the neighbourhood, and it goes without saying that a balcony of the description shown can be made to serve a like useful purpose, more particularly as it has the further advantage of not being open at the top, but is formed in a sort of recess. The water-closet, too, is cut off from the rooms, which, from a sanitary point, is undeniably an important feature. A scullery, or wash-house, with coppers and sinks, common to four such tenements, is provided on each floor, entered from the same landing which gives access to the living-room. Over the entrance door to each set will be a swing fanlight for ventilation, this being a point of construction which has hitherto escaped the attention of most builders, and the directors of the company have determined to introduce ideas of comfort and sanitary well-being which, apparently slight in theory, are of great practical value in reality, and although not expensive in the first place, are often overlooked by the ordinary builder, and not discovered until too late to carry out. In the SANITARY RECORD of Oct. 15, 1884, p. 154, reference will be found to the dangerous state of the staircases to many buildings of this class, owing to their slippery nature, and to obviate this danger it is now proposed to adopt a special form of construction to which we will refer when the definite shape is decided upon.

We have said there will also be a number of single rooms provided, and in each case a separate water-closet will be allotted, experience proving that liberality in this respect is the most paying policy, independently of the sanitary consideration. Fireproof construction will be used throughout, with a drying-ground on the roof, which will be paved with asphalt.

The exterior promises to be of more attractive appearance than is generally given to such blocks, for there is no denying that a sombre and stern look characterises the majority; but, in the example before us, there are but six stories in height instead of the customary seven, and by a skilful use of red brick pilasters, panels, and window dressings, there will be a dignified effect, more the result of careful design than expense of material.

Another peculiarity is the absence of *basements*, as these rooms find no favour with good tenants, and can never be satisfactorily lighted, and are often difficult to drain. Moreover, as a matter of pounds, shillings, and pence, it is found that they are more expensive to build than any other floor. There are other points of interest which are being developed, and as the plans will vary somewhat in each of the blocks (there are seven in all), some comparisons may be instituted, and will be referred to as the works further proceed. They are now rapidly being pushed on with by Messrs. Brown, Son, and Blomfield, under the superintendence of Mr. Marshall N. Inman, architect to the company.

It is a sign of the times that notwithstanding the semi-private nature of the undertaking, the Lord Mayor will shortly lay the foundation stone, and such a mark of approval is a strong testimony of the benefits which may accrue, not only to the tenant, but also to the investor, who is not averse to a pecuniary recognition of his philanthropy.

THE OPENING OF THE SOUTHBOROUGH WATERWORKS.

On the 27th ult. the ceremony of declaring the new waterworks at Southborough open was performed by Mr. Deacon, of Mableton. Southborough has grown in a few years from a village to a town, and, as usual in rapidly-growing places, it has been a matter of some difficulty for the sanitary authorities to keep abreast of their work. By the completion of the present works, a village almost without paving, lighting, drainage, or proper water supply has been finally converted into a town with a good water supply, well paved, lighted, and drained. The late Dr. Fairlie Clarke, who was for some years on the Local Board, did yeoman's service in making the water supply a burning question.

Owing to its position on the crest of the hill between Tunbridge and Tunbridge Wells, the supply of water in the neighbourhood was limited, and pumping was a necessity. Many of the springs in the neighbourhood are similar in analysis to the famous chalybeate spring at Tunbridge Wells, useful medicinally, but unfit for dietetic purposes. In Bentham Wood was a spring of which Dr. Frankland reported—'It is of excellent quality for drinking, and being also very soft it is well adapted for washing and steam purposes.' This spring, after many difficulties, the Local Board have secured. At the foot of the common a pumping-engine has been erected, worked by two gas-engines. At the summit of the hill a reservoir has been made, from which all but a very few houses can be supplied by the pressure of gravity alone.

Into this reservoir Mr. Deacon turned the water on May 27, after which some demonstrations were made to show the pressure of the water and the height to which a jet could be thrown in case of fire, and finally there was a public luncheon in a marquee beside the reservoir.

Dr. KOCH, well-known by his numerous researches on bacteriology, has been named Professor of Hygiene at the Berlin Medical Faculty.

EXHIBITS AT THE INVENTIONS EXHIBITION.

SOAPS, DISINFECTANTS, &c.

MESSRS. JAMES ALEXANDER & CO., Paradise Street, Lambeth, at Stand 272A, South Central Gallery, show some elegant toilet soaps, their principal specialty being 'Savon Hamamelis,' or Hazel Soap, in which the extract of *Hamamelis Virginica*, or common Witch Hazel, forms a component part. It is almost needless to add that the drug Hazeline, now so popular here, is made from the same plant. The witch hazel is a plant indigenous to North America, and the green bark of the tree has been used from time immemorial by the Aboriginal Indians for pultices, its healing powers being remarkable. Incorporated into soap in the form of a pure distilled extract, its soothing effects upon the skin, particularly if rough or chapped, being perceptible after one or two applications. It is also admirably adapted for washing the head and hair. It glides smoothly over the skin, and the lather it makes is of a lasting character; for shaving purposes, too, it is a real luxury. Owing to the chemical constituents of Hamamelis less alkali is required in its manufacture than in most other soaps. A casual visit to Messrs. Alexander's works favourably impressed the writer with the scrupulous care exercised in each department and of the purity of the ingredients used. The motto of the firm from the time they commenced business has been 'Pure Soap,' an excellent standard which they have doubtless carried out. The Hamamelis soap is put up in tablets, scented and unscented, in natural colour; another kind is made as a transparent soap. Savon Hamamelis is a decided acquisition to the list of toilet soaps, and may be confidently recommended as a soothing and healthy soap. In addition to the soaps a tooth powder and a pomade are also made, in which the extract of Hamamelis is also introduced with excellent effects.

Mr. Eugene Rimmel, 96 Strand, W.C. (1,436) has a case containing a good selection of elegant toilette requisites, of which sanitary perfumery forms a portion. A new apparatus is shown named the Myrogene, intended for extracting the perfume from fresh flowers.

At 1,466 Messrs. F. C. Calvert & Co., Bradford, Manchester, have a case containing samples of their well-known preparations connected with the coal tar industry, of which they were the original manufacturers. The exhibits comprise carbolic acids of various degrees of purity, and disinfecting powders of different strengths. Experts will no doubt be attracted by the splendid series of sulphocarbolates, many of which are exhibited for the first time. Amongst the novelties may be mentioned the 50 per cent. carbolic disinfecting powder, manufactured under patent, presenting the powerful disinfecting properties of the acid in a highly concentrated form, yet one that may be handled with perfect safety. Another is a novel preparation, named 'Dento-phenoline,' a mouth-wash or dentifrice water of exceeding fragrance, and one likely to become a favourite when better known. Another of the carbolic preparations is the ointment fast coming into favour as a household requisite. There is also a collection of carbolic soaps, including toilet, household, medical, and dog soap, all which can be recommended, their excellent properties being well known.

The little domestic vaporiser, in the form of a small night-light stand, is very useful for purifying the air in sick rooms, and in cases of whooping-cough, diphtheria, &c. A special night-light is used in the appliance, suitable alike for tropical climates or home use, the top being formed of a dish-shaped surface, into which is placed carbolic powder or liquid acid, which will give off its vapour at a gentle heat for three hours, when it can be renewed if necessary. Messrs. Calvert's preparations of carbolic acid may be relied on as containing a guaranteed percentage in each article.

Mr. Jas. B. Austin, Lime Kiln Dock, Hotwells Road, Bristol, has a case at 1,461 of various requisites containing

dic powder, but, as we have failed to obtain samples, we are unable to speak of their merits.

Evelyn Pierrepont, 22 Old Burlington Street, W. 1 Central Gallery (1,735), exhibits some new and ingeniously contrived toothbrushes to be used in pairs, shown in illustration. Dr. Pierrepont argues that too little attention has been paid either by dentists or others to the shape of tooth-brushes, although he is told to take all possible care of their teeth, he points out that the ordinary tooth-brushes are at all adapted for cleansing the inner side of the teeth, which require as much care as the outer surface. His brushes may be described as concave and convex

regards the bristle 'line,' the former being used for the interior and the latter for the exterior surface. The bristles are also bent, and the brushes themselves are smaller than the ordinary ones. The bristles are of different lengths to suit the requirements of the teeth. The brushes are, of course, used separately, and are well adapted to carry out the idea of the inventor. They are in several different sizes, and in three separate groups of bristle, for hard or soft gums, and besides cleaning the surface, penetrate the interstices between the teeth. The advantages offered by these tooth-brushes doubtless commend them to the public.

CHEMICALS, PIGMENTS, &c.

South Central Gallery.

Mr. H. B. Condy, Battersea, S.W., at 1,445, has a display containing some valuable chemicals, including a new permanganate Disinfectant, and a white lead made by a new and rapid process, harmless to the workmen. Condy's Disinfectant, of which the exhibitor was the inventor, has, in every respect, been surpassed by the new disinfectant, which comprises some valuable improvements. It combines the principles of a disinfectant, a deodoriser, an antiseptic, a neutraliser of ammonia, and a precipitating agent, and has the further characteristic odour of ozone, which has not previously been united in any one compound. In the manufacture of this disinfectant an alkaline salt is first produced, out of which potash is crystallised, the mother liquor consisting of an alkaline salt in which permanganic acid replaces its valent of sulphuric acid. It also contains a certain quantity of sulphate of alumina, to which it partly owes its power of increasing the oxidising effect of the permanganic acid and of neutralising ammonia, as well as its antiseptic quality. When placed in contact with decomposing organic matter, the sulphate of alumina plays a part that would be taken by sulphuric acid; and by adding more sulphate of alumina a greater amount of ozone is obtained. One part of this disinfectant to ten parts of water furnishes a strong disinfecting fluid, besides acting in this capacity is a good antiseptic, neutraliser of ammoniacal gas. Its effect, therefore, in decaying matter is not only to thoroughly disinfect

and destroy all odour, but to neutralise ammonia, and to arrest decomposition; thus preserving its value for future employment. While preserving all the above-named properties, this fluid can be made entirely inodorous. A mixture consisting of a teaspoonful of disinfecting fluid to a quart of water will render tainted provisions pure, and used in dairies or larders will have the effect of preventing provisions from becoming tainted. It is also claimed that it is the most perfect water purifier possible, as the base of the permanganate salt being insoluble, forms a flocculent precipitate which clarifies the water and carries down all suspended matter.

Another preparation shown is a new Medicinal Salt, Hyposulphate of Soda. This salt is introduced as a useful substitute for sulphate of magnesia (Epsom salts), combining all its useful properties, with other advantages, such as being antiseptic and less drastic in its effects.

A new method of decomposing chloride of sodium and potassium in aqueous solution is also exhibited. This produces a hyposulphate of either alkali in crystalline form, and chloride manganese in solution. At a low red heat these latter salts can be converted into sulphate for the manufacture of carbonate of soda or potash. The means employed by Mr. Condy in this process are so simple, that sulphate of soda or potash for alkali or glass making may be manufactured without the aid of vitriol chambers or reverberatory furnaces, and consequently with a much less expensive plant; in fact this process is calculated to effect a complete revolution in the manufacture of these extensively used chemicals. Mr. Condy is quite prepared to sell his patent outright or to grant licences for the use of his process.

Knowing that any improvement in the manufacture of white lead, by which the evil effects of the old stack system is avoided would be read with interest by the subscribers to the SANITARY RECORD, the writer visited Mr. Condy's factory, and was shown the entire process. In saying that it is rapid, the inventor hardly does justice to the importance of his system, for when it is stated that he accomplishes in seven days what by the old stack system requires four or five months to produce, and without any of the danger to health inherent in the Dutch system, some idea may be formed of its commercial value. The inventor produces white lead of an unvarying uniform quality, a result which cannot be effected by the Dutch process, as change of weather and inability to control the temperature of the stacks greatly interfere with it, identical in composition with the very best white lead made by the stack system, viz. $2(\text{PbO}, \text{CO}_2) + \text{PbO}, \text{HO}$, and this is effected without the hands coming in contact with the lead, until it is withdrawn from the drying kilns. The workmen then wear thick leather gloves on their hands and respirators over their mouths, so a fair idea may be formed of the valuable hygienic as well as commercial advantages offered by Mr. Condy's new process. Briefly explained, the process is as follows: The pig lead is first melted and then granulated; it is then placed in vats, and, with the addition of acetic acid, and its own heat, becomes oxidised; it is afterwards pumped to another set of vats, where, by the addition of an alkaline carbonate it is precipitated, and assumes the form of a thick paste. In this state it is removed to filter presses, where the superabundant liquid is withdrawn, and is then removed in small earthen pans to the drying kiln, in which it remains about three or four days. Being then in the form of a dry cake, easily broken up, it is placed into casks and headed up, ready for transport to the grinders, when it is transformed into the semi-liquid state by means of linseed oil, and is ready for the painter to mix. It would be impossible to produce finer white lead than that made by Mr. Condy's system, and from specimens of covering of other leads shown the writer, he is inclined to think it is some 20 per cent. superior in covering power. Another advantage gained is that a valuable by-product is secured, viz., acetate of soda, which is used in the manufacture of acetic acid. When the merits of the Condy White-

Lead are better known to the public it will doubtless take that position in the commercial world to which it is fairly entitled.

Messrs. J. B. Freeman & Co., Grove Works, Battersea, S.W., exhibit (1,448, South Central Gallery), examples of their patent non-poisonous White Lead, which is worthy the careful attention of all sanitarians. This white lead, though innocuous, must not be confounded with the zinc whites, of which so much has of late years been advanced; for while possessing all the qualities of the best white lead made by the old system as to density, ability to withstand weather, covering power, &c., it is as free from danger to health to the workers who make or use it as the zinc whites, and a house may be painted with it without the removal of the occupants, and without any smells or ill effects resulting from its use. At the same time it may fairly claim advantages not possessed by the orthodox white lead. As in the case of the preceding white lead described, the writer has visited Messrs. Freeman's works and made himself thoroughly acquainted with the details. Messrs. Freeman have been manufacturers of white lead for generations, and have been fully alive to the injuries to health incidental to the old stack process, and the beautiful, new, innocuous pigment they have succeeded in producing has been the result of many years' exhaustive experiments, and great expense. This lead also differs from the ordinary kind in being a 'sulphate' and not a 'carbonate' of lead. But it may be said that a sulphate is not a pigment in the sense white lead is generally understood to be. This is correct; but, as will be presently shown, an addition made to it, which embraces the patent the firm have taken out for their commodity, secures the desired end. The mode of manufacture is ingenious and rapid, the result being attained within a week as against about four months by the stack system. After the pig lead is melted it is poured through a machine which quickly forms it into small flakes, or 'feathers'—to use a trade term—on to an inclined plane, up which it is carried and thrown off. This machine is the invention of the firm, the object being, when the operation of making white lead is commenced, to secure the largest amount of surface to be acted upon by the acid. The lead is then collected and placed in vats, which are specially constructed to produce rapid oxidation of the metal. An acidulated liquor of acetic acid and water is then introduced to the mass; and, without going into too many minutiae, for every 5 tons of lead so treated sufficient is carried down in the form of a liquid each time it is drawn off to produce 900 lbs. of sulphate of lead. Sulphuric acid is then introduced into the liquor, when the lead is deposited in a beautiful white precipitate. This is now taken out and washed with water, and then deposited in large vats or backs. When these vats are nearly full they are emptied of the sulphate of lead, which is the real nature of their contents, and which is of the consistency of a thick paste. It is then dried in the usual way. The great value of this invention has now to be imparted to it. It has already been pointed out that sulphate of lead is not a pigment for a painter, so it has to be turned into one. To this pure precipitated sulphate of lead a certain proportion of oxide of zinc is added, and then submitted to the most important part of the process, whereby a complete change is effected in its properties, and a body and density much in excess of the old white lead is imparted to it; the compound before treatment weighing only 112 lbs. per cubic foot, and after treatment over 200 lbs. per cubic foot. This marvellously transformed compound, for it has as yet not been clearly shown by chemists how the increased density is obtained, is the non-poisonous white lead which the writer is describing. The greatest density of the best white leads made by the old system is about 184. It will thus be seen that Messrs. Freeman's lead is heavier than the ordinary kinds, and, furthermore, it only takes about 7 lbs. of oil per cwt. to mix it, as against 8 or 8½ lbs. required for the others. Its

colour is whiter than that of any other lead, and it has the further advantage of retaining it under the most adverse atmospheric conditions. Materials coated partly with this white lead, and partly with the ordinary kinds, that had been exposed to the action of sulphuretted hydrogen, were shown to the writer, in which Messrs. Freeman's lead had not changed in colour, while the other half had become a deep brown, almost amounting to a black. The reports of Dr. H. C. Bartlett, F.C.S., &c., Mr. A. H. Church, M.A., F.C.S., Professor of Chemistry to the Royal Academy of Arts, Sir Chas. A. Cameron, M.D., President Royal College of Surgeons, Ireland, Vice-President Institute of Chemistry of Great Britain, the late G. W. Wigner, Esq., F.I.C., F.C.S., &c., more than prove the facts here advanced, while the number of testimonials in possession of the firm from painters and decorators in various parts of the kingdom are unanimous in pronouncing this non-poisonous white lead as the best they have ever used. The value of the invention to the manufacturer, as enabling him to carry on his business with a mere minimum of capital as compared with what is required by the old Dutch process, has not been adverted to, but it is nevertheless very great. Thus in every point of view a greater advantage is secured, a smaller amount of capital is required for the working, a larger proportion of lead of a superior quality is produced, and, what is of far greater importance, danger to health is avoided; a benefit not to be overlooked by sanitarians. Messrs. Freeman also exhibit a case of non-poisonous colours of almost every variety of shade.

The Patent Liquid Fireproof Cyanite Paint Company, of Chelsea, and 82 Bishopsgate Street, Within, E.C. (1,440, Stand 266, South Central Gallery), exhibit their patented material bearing the above title. It would probably be more correctly described as a priming than a paint, notwithstanding that it is a preservative to wood, as well as a powerful agent in arresting the progress of fire. It is applied with a brush in the ordinary manner, one coat being necessary in all cases, and sometimes two coats are advisable. One gallon will cover about 500 square feet for the first coat, but the second will take only about half as much. It penetrates and so incorporates itself with the wood a certain depth of the surface, and consequently cannot be scraped off unless the material is taken with it. In this condition it has somewhat the appearance of a wood stain, and for certain purposes these coatings are sufficient; but it can be painted and varnished without any detriment to the cyanite. Anxious to witness its effect under fire, the writer was accorded the privilege of attending a demonstration a few days since in the open air, when it was subjected to severe tests. A flight of wooden stairs were fitted up, to which two coats of the cyanite had been applied. These were well soused with benzoline, back and front, and surrounded with shavings similarly treated, and set light to. As may be supposed, the whole structure was soon enveloped in strong flames, that gave off intense heat, yet, strange to say, they burnt themselves completely out in a very few minutes, leaving only a slightly charred surface that did not penetrate the wood more than one-eighth of an inch; and with that exception the stairs were as sound as before. Two large packing-cases, standing upright and open in the front, were also operated upon. To more effectually show the difference, one of these had not been coated with the solution; and, it is almost needless to say, was entirely burnt in a short space of time. Owing to the flames being concentrated in the interior of the other case, they remained in force a longer time than in the case of the flight of stairs; but they, too, became extinct, though owing to the intense heat generated, and to a strong breeze, they now and again showed signs of vitality. Sufficient, however, was demonstrated to show that the fire could easily have been extinguished when at its height with ease had the usual appliances been used, and this is of course the great advantage to be obtained

use of the cyanite. The report of Captain Shaw, superintendent of the London Fire Brigade, who has considerable attention to the invention, is appended:—'The wooden stairs cyanited resisted strong as well, and practically were not weakened. I have doubt that cyanite would be most useful in preventing spread of fire, and I should be glad to see it more. I consider that wooden stairs cyanited are in case much safer than stone.' So fully impressed are principal fire insurance offices of the value of cyanite their rates of insurance are materially reduced for all things treated with it: in the case of theatres from and upwards per cent. to 10s. 6d. and upwards, which is a most practical acknowledgment of its worth. I learn that Sir William Harcourt's new Hampshire mansion has been completely cyanited by the company, having witnessed tests similar to the above.

1) Messrs. Griffiths, Berdoo, & Co. (Sanitary Paint Co., Ltd.), 34 Leadenhall Street, E.C., and Liverpool 12) show their non-poisonous colours, and Knight's 13) white, a non-poisonous substitute for white lead; Mr. Thos. Griffiths, 1 Queen Victoria Street, E.C. 3) exhibits a similar preparation.

GAS AND OIL LAMPS, &c.

East Annex.

1) Messrs. Wm. Sugg & Co., Limited, Vincent Works, Westminster, S.W. (1,479), at an attractive stand, combine the scientific and the useful, exhibit the different burners with which their names have become associated—street-lanterns, sun-burners, gas-governors, &c. scientific apparatus comprise an illuminating power meter, improved cubic foot measure and meter, Filling's, Harcourt's Patent Aerobometer, Joslin's Patent meter, an improved Canadian pattern, Letheby Photometer, and a jet photometer of ten-candle test. All these meritorious inventions, and will be appreciated by gas users. But the most unique feature connected with the stand is the 'Cromartie' Gas lamp and Gaselier, which has become a favourite with all who use gas as a lighting medium. The burner is the ordinary fish-tail kind. It is surrounded with concentric tubes, one of which supplies air to keep up combustion, the other carry off the products, and this can easily be arranged to by means of an extended tube between the ceiling and ceiling boards above, and so into the outer atmosphere. Each of the jets is covered with a small inverted shade, not unlike that of an incandescent electric globe, and the flame curving inwards to the tube has a pretty effect. The quantity of gas consumed by the burners is by measurement only two feet per hour and gives considerable illuminating power. The neatness of the effect is increased by covering the lights with different coloured shades, and the invention can easily be applied to brackets or any form of gas-lighting.

2) Stand 1,480 is occupied by The Manufacturing Company, 43 Farringdon Road, who exhibit Bromhead's automatic Dry Gas Regulator, intended to regulate the admission of gas after it leaves the meter. The word 'Automatic' is used to distinguish it from those in which mercury and substances are used, the material employed being a leather diaphragm, which rises and falls with the valve using the supply.

3) J. S. Fairfax, 3 St. Paul's Road, Camden Square, (1,492), shows a chromatic stereoscope on stand, to which a mineral-oil lamp is attached for night use. By this charming effects of light and colour are obtained. Stand 1,493 is occupied by Kynoch & Co., Limited, Piccadilly, who show a collection of mineral-oil lamps of various designs, the novelty being in the burner, which is called a 'circular wick duplex.' It is, in reality, a burner with two flat wicks, each operated upon independently, as in the ordinary duplex, the advantages of easy manipulation as compared with a circular wick piece, as there is no fear of the half-circular wicks singeing evenly.

The Albo-Carbon Light Company, 132 Horseferry Road, S.W., make a handsome display at 1,495 of their special mode of burning gas by introducing a variety of designs of the 'containers' for the albo-carbon, suitable for all descriptions of lights, from the office to the drawing-room.

Mr. Wm. Tice, Thornilee, Sutton, occupies 1,501 with a collection of his dry gas regulators, and a street gas lamp regulator. He also shows a simple mode of warming railway carriages.

Browne & Co., 186 Piccadilly (1,503), contribute a commendable collection of mineral-oil lamps, their burner known as the 'Mitrailleuse' being a prominent feature.

Mr. Kinnear (1,505), 91 Finsbury Pavement, E.C., shows a self-lighting gas-burner and tap, to which a governor is attached, by the use of which it is claimed that 25 per cent. of gas is saved, and immunity from explosions secured. The gas is really never entirely turned off in this tap, a minute blue flame unseen at the burner being always alight, which is extinguished when the gas is fully turned on, but is brought into use again when the principal flame is extinguished.

Mr. W. Daniell Linslade, Leighton Buzzard (1,507) exhibits what he terms an improved oil-lamp and chandelier, which in the case of a pendant light consists in laying the wicks (flat ones) along the arms springing from the pendant from the oil reservoir. By this means the trouble of trimming is much reduced, as the wicks will last a long time. The oil reservoir being above the wicks, a free flow is always secured.

Mr. George Bower, St. Neot's, Hunts (1,517), exhibits the 'Bower duplex regenerative gas lamp, of which an illustration in elevation is appended. This light is the outcome of patents taken out by Grimston, Thorp, and Mr. Bower himself, all of whom have worked in a somewhat similar direction, each patent being now practically merged in the 'Bower' lamp, of which Mr. George Bower is now the owner. As gas lights under one or other of the original patents may have been seen by some of our readers, it may be pointed out that the idea is to burn the gas at a very high temperature, viz., to heat intensely just as much air as is necessary for the complete combustion of

the gas. To effect this the tube down which the gas passes to the burners is surrounded by an outer tube and regenerator into which the air is admitted. The whole of the air for combustion passes through the regenerator and over a series of gills or plates that become red hot. Another tube is provided for carrying off the products of combustion which may, if desired, be cast

ried off to the outer atmosphere, but if allowed to discharge themselves into the room are far less deleterious than those produced from burning gas in the ordinary manner, as they consist only of carbonic acid gas and water; the same compound that is given off by wax or sperm. Blackened ceilings and injury to pictures or decorations are by this means reduced to a mere minimum. The candle power of this lamp in the smallest size from 16-candle gas equals 6-candle power per cubic foot in the small size, and 8-candle power per cubic foot in the larger size, or a light equal to 200 candles for less than one penny per hour, and this without the aid of reflectors of any kind. This latter fact must be borne in mind, for it has been too much the custom to measure the power of a light by the aid given it by reflectors, which, if they increase it in one direction must, of necessity, detract from it in another. The Bower gas-light can be applied to all descriptions of lighting.

tion represents the open fire, but the recent alterations have not as yet been shown in a drawing. One of these is a movable bottom fire-grating, which, by means of a ratcheted lever moved from the front, enables the fuel to be lifted towards the hot plate and adjusted to any height. This effects great economy in fuel, dispenses entirely with the poker, and ensures a good hot plate at all times for boiling or frying, which is done to perfection. The idea is not introduced as a new one, but Mr. Constantine carries out the arrangement in a more simple manner than heretofore practised, and one not likely to become disarranged or out of order. Another excellent improvement is the arrangement for the introduction of heated fresh air, which is admitted underneath and carried up a chamber at the sides of the fire box and discharged through a series of holes towards the top amidst the burning fuel, thus materially improving combustion, and tending to reduce the quantity of smoke. Mr. Constantine

FOOD AND STIMULANTS.

East Anness.

Messrs. George Mason & Co., Limited, 417 King's Road, Chelsea (1,562), have an attractive stand of their various meat extracts, including their carefully prepared Beef-tea Jelly, an admirable food for the invalid when first recovering from illness, and Concentrated Beef-tea, a powerful solidified extract of the best parts of the finest Scotch ox beef, but immediately made soluble by the addition of hot water. There are also essences of veal, mutton, and chicken, and invalid turtle soup. Another speciality is the Meat Lozenges made by the firm, which are superior in flavour to similar preparations of the kind generally.

Mr. J. Edmunds, Stonefield, Liverpool Road (No. 1,609), is present with a collection of his curry powders, and different kinds of chutneys, &c. Mr. Edmunds does not exhibit anything that has not already been announced on other occasions, excepting a new-shaped bottle for chutney, having an overlapping cover of glass lined with cork, which presents a secure seal from atmospheric air, when in use, and without the necessity of using an inner cork to the bottle. It is taper in shape, with a wide mouth, and free from any obstructions that would prevent free access to the contents.

HEATING AND COOKING APPARATUS.

Eastern Arcade.

Mr. T. J. Constantine, 61 Fleet Street, E.C., at 1,536 exhibits his popular 'Treasure' Cooking Range with still further improvements. Attention has so often been called to this excellent kitchener, that on the present occasion the recent improvements only need be mentioned. They are carried out in connection with the latest prior improvement of the open fire for cooking in front. The illustra-

also exhibits his improved cooking pots and saucepans, which have marked advantages over the old Warren cooking utensils. These utensils, however, have been fully described on previous occasions: all who save economy in cooking, or desire the best results, should avail themselves of them.

Those persons who are interested in the efforts of the Smoke Abatement Institution to minimise smoke from coal fires should make themselves acquainted with the kitchen range shown by Mr. Henry Thompson, 33 Alwyne Road, Canonbury (1,551). This exhibit is not tabulated in the first catalogue, as it has been admitted since the opening of the Exhibition; its claims as a smoke consumer having been the cause of its admission. Attention has so often been called to the efforts of the inventor in minimising the production of smoke that there is no further necessity to dilate on them. Mr. Thompson is not connected, as a manufacturer of stoves and ranges, with the trade; but has given his constant attention to the subjects of the economisation of fuel and diminution of smoke for some years. At the Smoke Abatement Exhibition he exhibited an invention, then in a somewhat crude form, but possessing good points. At the Healtheries last year he showed a sitting-room grate and a kitchen range, going still further in the right direction, for which he was awarded a gold medal, the only award for prevention of smoke; and so recently as already mentioned, as to secure admission after the Exhibition was opened, he has perfected the nearest approach to a smokeless fire that can at present be obtained in an open fire grate, unaccompanied by mechanism of any kind. A grate to be smokeless, or approaching to that ideal, must be made so without leaving anything to chance or inattention to its mechanism on the part of the user; in other words, it must be perfectly automatic in its action. Mr. Thompson has done wisely to introduce his improvements in the first place in a kitchen range, for every householder knows that it is in the kitchen

that the greatest amount of smoke is generated. Unfortunately, the inventor has not been able to secure a place in the Exhibition where he can show the range in action, which is very much against his interests, but addresses to any reasonable extent can be given where these ranges are in operation, and where they can be seen under the most reliable conditions. Before long, however, a depot will be opened in London where the kitcheners will be in action, and sitting-room grates at moderate prices will shortly be ready, made on the same principle. The illustration shows the kitchen range in elevation; it does not differ in appearance from those of the ordinary kind, neither is there anything in its manipulation beyond what is required in the commonest cooking stove; in fact, there is less care required, and no servant can make any mistake in using it. The coal is put on in the usual manner, and nothing more is required than to keep the fire alight. The reduction and almost non-creation of smoke is effected in the following manner:—In the fire-box are

time in watching its action. Presuming that a moderate amount of smoke at least would be visible when the fire was fed, the fire-box was filled to repletion with a highly bituminous coal, but he was surprised to find on immediately proceeding to watch the chimney-pot (one of the ordinary description) that but the merest discoloration possible was visible, while the surrounding chimnies were giving off their full complement of smoke, and the feeding was repeated during his visit with like results. The effect on the hot water arrangements of this house was all that could be desired, the water in the bathroom coming in at a higher temperature than usual. Another advantage in this range is that it presents a good open roasting fire, and that the ovens are always hot. It has been shown that the heat must always pass around them, as it is the only access to the flue. It must be evident that chimney-sweeping is reduced to a minimum whenever this stove is used. The cook will also be pleased to find that there is only one damper requiring attention in place of three in

laid hollow oblong-shaped bars extending from the top of the back downwards, and so on to the front of the range at the bottom. These leave a small chamber at the back, but are open to the ashpit underneath. At a certain distance from the top the bars are perforated at the back. The air entering at the front of them becomes highly heated, the bars being always in contact with the live coals, and this heated air is given off in the chamber at the back. The products of combustion are bound to pass through the interstices of the bars to this chamber, where they come in contact with the heated air, and are turned into flame, the combustion being complete. The mass then passes down to the right and left hand sides of the fire-box to a narrow channel, up which it travels over the top and entirely round the ovens on each side, passing into the ash-pit under the fire, which is necessarily highly heated, containing as it generally does red hot embers, and then passes into the flue at the back. Be it remembered that this is the only access to the chimney. The gases must pass this way, as it is the only outlet for them. That the mode is effective the writer can state authoritatively, having visited a house where one of them was in use, and spent a considerable

most other kitcheners. Any existing range, particularly those with back boilers, can be altered to Mr. Thompson's principle at a small expense, and many by well-known makers have been so treated and with successful results, according to testimonials in the possession of the inventor. The consumption of fuel appears to be reduced, which is easily accounted for by the whole of it being thoroughly burnt, instead of passing up the chimney unconsumed to pollute the atmosphere.

ELECTRICAL APPLIANCES.

Eastern Arcade.

Another mode of insulating telegraph and other electrical conductors is shown at 1,314 by Callender's Bitumen Telegraph and Waterproof Company, Limited, 101 Leadenhall Street, E.C. By this process the wires are first put in tubes and bedded in and covered with a bituminous compound. The tubes are then laid in rows in iron troughs, and filled up with the compound.

For the same purpose a patent box street-curb is shown at 1,354 by Mr. Wm. Riddall, 10 South Street, Finsbury.

which presents a very easy mode of reaching the wires, the lid of the box, which forms a curb to the pavement, only having to be unscrewed and taken off.

Another arrangement (1,412) is shown by Stuart & Co., Thomas Street, Edinburgh, consisting of a granolithic pavement with conduits of the same material formed underneath. This also forms a ready means of reaching the wires, the removal of a continuous line of slabs directly over the conduit laying the entire range open for inspection.

An important advance in the electric bath is shown (1,363) by Mr. Moses Humm, 727 Commercial Road, E., the novelty being so pronounced that (as the bath is not in action) many electricians are sceptical of the ability of the inventor to carry out what he promises. Desiring before speaking of the invention to test the accuracy of all that is advanced, the writer visited the inventor's establishment, where a number of electric baths on his principle are fitted up, and where he availed himself of Mr. Humm's desire that he would test their efficiency. Mr. Humm is an electrician of many years' standing, and has been experimenting for a long time on the invention now shown, and he has valuable testimonials

a body made of brass *repoussé* work, but others, with china and glass bodies in every variety of design, are in course of manufacture. The Messrs. Rose have been engaged for a long time in perfecting this lamp, and have reduced domestic electric lighting to the simplest form, a fact of which any person who will spend a few minutes at their stand can easily convince himself. To pour a liquid resembling mineral oil in appearance, but without its smell, into a lamp, and the next moment, by the mere turning of a knob, to obtain an incandescent electric light as powerful as that of a duplex lamp, and that will last as long without attention, without smoke, smell, or heat, is a consummation now within the reach of all purchasers of Messrs. Rose's lamps. There are no wires running along or under the table, nor anything to interfere with its free removal to any part of the room. This is not only electricity made easy, but certain in action, and an advance in the science few had hoped for in so short a time. This lamp, however, is the only one in the Exhibition of its kind. Briefly, without entering into the minutiae of its construction; the lamp is made to hold a container divided into two parts, in which the solution that produces

from persons of all ages and both sexes who have taken his baths. The arrangements of the electrical apparatus serving the bath are of his own invention, and differ considerably from those generally employed. An illustration of the bath is appended, with the battery attached at the head. It is built of marble, has a conductor running from top of the head to bottom, and a perforated marble bottom. On entering the bath the electric current is turned on, which can be regulated to the greatest nicety. The current enters the water direct, passes through the body its entire length, through the apertures in the marble bottom, and returns to the battery, where the circuit becomes complete. There is no holding of bars, as in the usual electric bath, or anything different to taking a bath under ordinary circumstances, yet such is its effect that a Turkish bath would not have more effect upon the system as regards its cleansing properties, and if it be contrasted with its Turkish analogue as a means of alleviating pain, or even of curing certain complaints, it must be pronounced far in advance of it. To this the writer can bear testimony of a reliable nature. This is the first electric bath of its peculiar construction, and it is much to be regretted that the arrangements at the Exhibition preclude its being shown in action. The arrangements for imparting the electric current are under complete control, they are of the most simple character, and the apparatus is supplemented by several well-contrived appliances for local application.

Messrs. A. V. & G. F. Rose, Ellerslie, Cavendish Road, Brondesbury, N.W. (1,341), exhibit a novel and meritorious invention in the form of a self-contained Electric Table Lamp, which differs scarcely in appearance from an ordinary oil lamp. The one shown has

the current is placed. The liquid is then poured in, and by means of a regulating screw on either side of the body the strips of metal that connect the elements forming the battery with the bulb are raised or lowered, and this produces the light, which can be turned on or off at will by means of a small switch of the usual character. If a less powerful light is required, one side only of the container may be used, the alteration being effected by disconnecting the other by means of the set screw.

Our drawing depicts the lamp in elevation; any kind of ornamental shade may be used with it. It is uncom-

dilate upon the advantages of the electric light for all purposes, or the great advantages of this lamp over others, further than to draw attention to the comfort derived from its use on hot summer nights, or in hot tropical climates. The cost of burning is very more than that of a duplex mineral oil lamp, while it is much purer and more brilliant. The lamp will be on view at Messrs. W. P. & G. Phillips's, 40, Ford Street, as well as at the principal lamp shops throughout the country.

372. Mr. H. W. Ferris, 9 Dorset Road, Merton, exhibits a portable electric alarm attached to the bottom of a door-mat. By this means any person passing upon the mat sets the electric current in motion and rings the bell. It offers a security at any time of the night in a similar manner as an electric alarm bell to a window.

Mr. J. W. Gray & Son, 115 Leadenhall Street, E.C., exhibit their patent system of lightning conductors for buildings for testing.

Mr. S. Waters, 24 Ladbroke Square, W., shows a set of bulbs for incandescent lamps, one half of each silvered to form a reflector. By this means the illumination of an incandescent lamp is increased, or the electric current may be economised.

SANITARY APPLIANCES.

Mr. Humpherson & Co., 331 King's Road, Chelsea, S.W. 22, South Gallery, North Court, exhibit two appliances that deserve attention. The first is a new Preventing Cistern, on the syphon principle, described below. The regulations of the Exhibition prevent the admission of closets prevent the firm from showing the cistern to the best advantage, and from showing an excellent closet of their invention. Notwithstanding the many water-waste preventers on the syphon principle now before the public, Messrs. Humpherson succeeded in introducing a valuable improvement in the construction. By the addition of a well at the bottom of the cistern, the full flush of two gallons is obtained, which is not the case with the flat-bottomed cistern. It would unquestionably be a great gain from a sanitary point if the water companies could be induced to the regulation allowance of water from two to two half or three gallons. It is undeniable that

the present system is not sufficient to produce a 'clean' flush to the closets, and the writer has found in most of the towns of the Midland and Northern districts visited by him that the larger quantity named is generally allowed. If the towns in question cannot boast of so good a supply of water as the metropolis, yet the authorities see the necessity of the increased quantity for flushing. It will be

observed that Messrs. Humpherson's cistern is worked with a ball valve, which is the only mechanism in it, and the union connecting it with the discharge-pipe is outside. It has a full 1½ inch water-way in every part, which secures a powerful flush to the last, and it acts effectually whether the lever is held the whole time or not. Owing mainly to the full water-way, it is especially useful in places where only a low head of water can be obtained, flushing well at a height of only two feet. The syphon chambers are three in number, instead of two, as in most others, the inner one being of strong galvanised iron, and the outer ones of copper. This arrangement causes the air to become more securely bound between the cylinders in the following manner:—A small quantity of water being retained in the well after the cistern has been emptied, when the water again enters the cistern, the air, as we have observed, becomes bound, thus preventing the water from passing over the inner cylinder. When the lever is raised, a partial vacuum is formed, and the water is forced into it by the pressure of the atmosphere, causing it to overflow the centre pipe, when the contents are discharged by the syphon action. Another advantage is that the lever cannot be drawn down too low so as to interfere with its return to its proper position, and the inlet of water is practically noiseless.

The other invention shown is also a patented one of Mr. Humpherson's introduction, and will be found invaluable under many conditions. It consists of an improved pipe-joint, useful for many purposes, but more particularly for the object the inventor had in view, viz., the making of a sound, or hermetically sealed joint between an earthenware trap and a metal soil-pipe, which has always been a troublesome matter, and often not a reliable one for any length of time. The appended illustration

A. Metal Pipe socketed to receive earthenware.
B. Earthenware Trap or Pipe.
C. Rebated Rubber Ring.
D. Metal Ring fitted with Screw for adjustment.

will enable our readers to fully understand the invention. It consists of a grooved metallic ring, into which is fitted an India-rubber rebated ring, which

slips over the junction of the pipes. By means of the screw and nut the metal ring is drawn together and the rubber expanded. A perfect joint is thus secured, capable of resisting any amount of pressure, caused by expansion, and comporting itself as readily to contraction, in fact accommodating itself to all variations of temperature. The rubber being vulcanised is calculated to last a number of years, and it will be seen how very easy it is to substitute a new ring. The utility of this invention is apparent, and will doubtless secure its adoption for many purposes where the thorough junction of pipes is a desideratum.

DOMESTIC APPLIANCES.

East Annex.

The Arabian Coffee Company, 42 Basinghall Street, E.C. (1,560), attract a considerable amount of attention to their unique process of roasting, grinding, and making coffee by one combined apparatus. These various processes are accomplished with ease, and may be carried out by any person after having once been shown, while the compactness of the apparatus is not among the least of its notable features. These appliances, which are illustrated below, are made in different sizes for domestic use, and on a large scale for coffee-palaces, clubs, and large institutions. In those for domestic use a flat box-shaped spirit lamp supplies the heat, or gas may be utilised. The illustrations represent the apparatus in a combined form, the stand containing the roaster and the coffee-mill, the receptacle for holding the coffee being underneath the stand, and the coffee-urn, as it stands on the table after it has been removed from the stand. The coffee-roaster, it

will be seen, is fitted on the eccentric principle, so that with each rotation of the cylinder the berries are not only always being agitated, but they are thrown from one end of the cylinder to the other by the eccentric motion, so that every one is constantly being turned over, or in a

state of change. The coffee having been put in the cylinder by means of a sliding door at one end, water is put into the coffee-urn by simply removing the glass lid at the top, and the urn placed on the stand covering the coffee-roaster, as shown in the accompanying illustration.

The spirit lamp is now placed under the coffee roaster, and the operator turns the handle of the roaster slowly, the heat that supplies the roaster is at the same time boiling the water in the coffee urn. In about five minutes the coffee is roasted. Until the introduction of this apparatus there has not been any appliance for effecting the operation so rapidly, and without loss of the fragrant aroma given off by the berry. As to the economy of the apparatus, if it be taken into consideration that roasting, grinding, and making is accomplished within about twelve minutes, it will be clear that the apparatus is a very valuable one. The best results the berry is capable of giving are also secured, consequently a much smaller quantity of coffee than is generally used is required to produce a finer flavoured beverage with all the valuable constituents of the berry should this machine be adopted. An ounce of plantation coffee, costing in its green state less than one penny, made in an ordinary sized machine, produces much stronger coffee than the great majority of people would care to drink, and it is stated that the finest flavoured infusion may be obtained by using this apparatus with less than half the quantity usually used. It is therefore an apparatus that may be employed in public institutions with economy, and produces a better and more wholesome beverage than is made by the usual method. The prices are moderate; a fair sized apparatus for domestic use, the urn being of brass and tinned inside, can be sold complete with all the accessories for two guineas.

Mr. J. Coppard, 35 Holloway Road, N., shows a good collection of sausage and mincing machines, an improved folding and self-tilting cask stand, and several useful domestic requisites.

At 1,567, Messrs. W. and J. Burrow, 15 Seething Lane, E.C., exhibit their well arranged wine-bins, wine-stills, &c., and a variety of articles connected with the brewing and wine trade.

Mr. James G. Moxon, 24 Grand Avenue, Leadenhall Market, E.C. (1,371), has an ingenious letter-box and door-plate, intended to be used in connection with an electric bell, or an ordinary small gong. On raising a handle the letter-box plate is opened for the insertion of the letter and the bell rings, calling attention to the arrival. The box, which has a division in the centre connected with the handle and plate, admits the letter to the first compartment, but when the handle is released the divided plate opens to allow the letter to fall into the lower compartment, and closes again, thus preventing any tampering with the letter-box, for an attempt to do so will cause the bell to ring again. The invention is ingenious and a safeguard, besides calling the attention of the inmates of the house to the fact that something has been put in the letter-box.

Messrs. Malen et Dégliès, Paris, through their English agents, E. Salaman & Co., 3 Cross Lane, Eastcheap, E.C. (1,582), show a collection of their apparatus for making coffee, from the small size holding only two cups to the monster machine as used in the French Army and Navy and large institutions abroad, capable of making at one time 2,400 cups of coffee. The large sizes are heated by gas, charcoal, or coal fuel, the smaller ones for the table by means of a spirit lamp. We append a sectional illustration of the machine; the coffee is placed on a perforated plate in the upper part of the vessel, the water being in the lower compartment. When, by means of the spirit lamp at the bottom of the apparatus, the water boils, it is forced up the central tube, and, with the assistance of a mushroom-shaped plate, is spread over the coffee in small streams, passing through it to the lower reservoir, and this action continues as long as the lamp is kept alight, so that there is a continual cir-

culatation of water through the coffee. The action, it will be seen, is also automatic, and may be performed on the breakfast table. It is claimed that a large saving of coffee

is effected by this machine, for it is urged that water passing only once through the coffee, as in most filtering coffee-pots, is not capable of extracting all the strength in the berry. In the large sizes of this apparatus, owing to the interior construction, a great economy in fuel is also secured. When the coffee is made, the central tube may be withdrawn by means of the lever shown at the side.

MECHANICAL APPLIANCES.

(South Gallery.)

Messrs. W. J. & C. T. Burgess, Holborn Viaduct and Brentwood (16) exhibit their improved water-lift or Noria, intended to be used with the aid of bullocks, horses, or mules, of which an illustration is appended. They are made in several sizes, capable of raising from 3,000 to 18,000 gallons per hour. Though adapted for general farm use at home, they are more extensively used in India, Egypt, and the Colonies. They are very simple in con-

struction, and equally efficient, and raise more water for the power employed than any other form of pump. They are arranged to raise water from great depths, and, no fixing being required, can be moved from place to place at a trifling

cost. It will be observed by the illustration that the raising is effected by an endless series of buckets, each discharging its contents as it passes the equilibrium, and the chains holding the buckets are adjusted to the depth of water. They can be 'speeded' according to the motive power to be employed, and the apparatus can be easily taken to pieces, and the weight so adjusted that no one, or collection of parts is rendered too heavy for beasts of burden to carry. A modification of this appliance is made for hand-power work, and will be found most advantageous for home use, raising a considerably greater quantity than can be done by the ordinary means.

NUISANCE FROM BRICK-BURNING. Two important cases dealing with the nuisance arising from brick-burning have recently been decided by the High Court of Justice. In both cases the plaintiffs succeeded in proving nuisance, and two judges granted injunctions restraining the defendants from carrying on their businesses so as to create a nuisance. In a case from Streatham (*Dunston v. Neal and Seely v. Neal*) the plaintiffs complained that the noxious smells arising from the brickfield seriously interfered with them in the enjoyment of their premises—so much so that in certain states of the wind (although they lived about 400 and 800 yards, respectively, distant from the source of nuisance), they were unable to open their windows. The cause of nuisance arose from the use of dustbin refuse in the manufacture and in the burning of bricks, the effect being to produce noxious fumes, which gave rise to nausea, loss of appetite, headache, and malaise. Some witnesses said they had traced the smell at a distance of a mile. The quantity of bricks made averaged 2,000,000 yearly, and the materials used were 500 yards of refuse, 500 yards of road scrapings, and 5,000 yards of clay. Mr. Justice Cave, in delivering judgment in favour of the plaintiffs, said the plaintiffs had to make out that there was a nuisance which substantially affected themselves in health, or in the comfort and enjoyment of their premises. The evidence satisfied him that so far as the brick-burning went there was no nuisance to health in the sense of causing disease or illness. There remained the question whether there was a nuisance which affected the plaintiffs in the comfort and enjoyment of their premises, but he should first inquire whether there was a nuisance which affected anybody. In face of the medical evidence given for the plaintiffs, he could not believe that the use of refuse of an organic nature (animal and vegetable), in brickmaking, did not create a nuisance to the neighbourhood. On the whole the evidence for the plaintiffs very much preponderated, and his lordship was clearly of opinion that there was a nuisance at the brickfield. He was satisfied that this was a nuisance which could be perceived at the plaintiffs' premises, and to such an extent as to render the occupation of their houses uncomfortable and unenjoyable. His lordship, therefore, directed judgment for the plaintiffs, with an injunction to restrain the burning of bricks in such a way as to interfere with the comfort of the plaintiffs. In a case from Hampstead (*Attorney-General v. Ellt*), Mr. Justice Wills, at the request of the defendants, consented to view the brickfield, which lies in a hollow near the Hampstead Heath Railway Station, and adjoins the grounds of the North-Western Infectious Hospital. Upon coming into court, when the case was resumed, his lordship said he found a nuisance to exist, and with the consent of the defendants he stopped the case, delivering judgment in favour of the plaintiff, with costs.

THE Council of the Society of Arts have (with the approval of the President (H.R.H. the Prince of Wales)) awarded the Albert Medal to Mr. Henry Doulton, 'in recognition of the impulse given by him to artistic pottery in this country.' It will be universally acknowledged that never has such a recognition been better deserved nor more honestly earned.

MUNICIPAL FINANCE. LOCAL TAXATION.

SOME interesting and instructive figures are given in a memorial recently presented to the Liverpool City Council by a local Land and House Owners' Association. The figures were originally intended as support to a prayer that some effort should be made to reduce local taxation.

The memorialists give a comparative statement of the taxation of Liverpool and Glasgow which, if accurate, affords food for reflection:—

	Liverpool.	Glasgow.
Area in square miles	8	8
Population	366,753	515,589
Rateable value	£3,093,507	£3,072,551
Raised in rates	£488,002	£358,178
Per head	17s. 2d.	13s. 10½d.
In the pound	2s. 12d.	2s. 4d.
Other revenues	£115,823	£51,171
Per head	4s. 1d.	11. 11½d.
In the pound	9d.	4d.
Total expenditure	£600,115	£409,349
Per head	£1 15s. 3d.	15s. 10½d.
In the pound	3s. 10½d.	2s. 8d.
Total debt	£5,794,757	£4,564,019
Per head	£16 4s. 3d.	£8 17s. 0d.

The following statistics given are of course open to the criticism that the citizen gets much more for his rates nowadays than he did in 1851, as in many departments of present municipal activity, even at the earlier date, matter for private arrangement did not exist at all. But such as they are they show the rapidity

with which the financial burdens of our large towns are growing:—

	Rateable Value.		Increase of R. V. per cent.	Increase of Rate per cent.
	1851.	1884.		
Parish	1,076,514	1,918,541	78	171
Kirkdale	29,640	273,681	823	137
Everton	86,276	303,081	252	115
West Derby	79,580	227,471	185	93
Toxteth	283,653	385,838	111	137

The figures as to the amounts received from rates in the years 1851, 1861, 1871, and 1883 are remarkable:—

Rate.	1851.	1861.	1871.	1883.
Water	£4,510	£17,019	£53,500	£60,032
Paving	28,691	56,970	47,780	60,325
Sewer	7,665	23,725	23,168	53,625
General	14,977	21,114	56,171	121,072

It is much to be wished that the local burdens of all our large cities could be analysed and compared in the same way. We are afraid that the expenditure of many corporations is wasteful and extravagant.

NEW INVENTIONS.

HAGEN'S PATENTS. IMPROVEMENTS IN STE- AND SOIL- PIPES, AND THE ODOUR-LESS WATER-CLOSET.

the disconnection of soil- and waste-pipes from the main drains and sewers, sanitary engineers have succeeded in excluding sewer gas from dwellings; but to all intents with the state of waste- and soil-pipes now in it, will be only too apparent that a large amount of air, arising from the orifices of various receptacles for water, still emanates even where special attention is directed to the thorough cleansing of the fittings or appliances themselves. This is owing in a great measure

the invariable practice of fixing the branch waste- or soil-pipe with direct fall from the fitting to the main soil-pipe; and though a syphon trap be placed at or near the top of the waste-pipe, this will not always insure the exclusion of soil-pipe air, for they are not un- frequently unsealed by syphonage and evaporation, and then there is a clear inlet for foul air through a length of fouled pipe. Even when this does not occur, the water of the pipe becomes impregnated with the emanations from the soil-coated pipes rising and accumulating at the top of the pipe where the water-seal is fixed. Again, these traps

are fixed a foot or more below the orifice of fitting; this in itself admits of the fouled surface of pipe being a source of contamination. It is well known that any amount of water flushing will never remove the slumy and corroded lining from the inside of foul pipes, and yet these things are allowed to exist in some of the largest houses. By an improved arrangement which has been patented by Mr. F. W. Hagen, of 16 Parliament Street, Hull, the branch waste- and soil-pipes are made thoroughly self-ventilating, and accessible from the outside of dwelling. They are as efficient as they are simple, as will be seen from the following description, and have already been severely tested in numerous places where they have been fixed during the last twelve months, and found thoroughly efficient. Messrs. Reeves & Hagen state that there are already over sixty in use in connection with w.c.'s, baths, sinks, and basins.

The following is a description of the invention, illustrated below: From within two inches of the surface of the bottom of the slop receptacle—be it bath, basin, sink, &c.—the branch-waste is made to rise either in a straight or curved line direct through the external wall, towards the vertical or main soil-pipe or waste, which latter should be ventilated at both ends. The advantage gained by this arrangement is that whilst the water has to travel as it were upwards in its course towards the main pipe, yet at an easier gradient than an ordinary S trap, any noxious vapour generated in the pipes is allowed to follow its own

bent and will be induced to rise outwards away from the water-seal, and up the ventilating pipe. At the junction of the branch with the vertical or main pipe and opposite the end of the branch-waste, a gullet-formed opening is provided, which gives direct access the entire length of the waste- and main-pipe, and is covered with a close-fitting hinged flap or screw cap. At the receptacle end of the branch waste-pipe the level of the water-seal is within an inch of the surface of the bottom of receptacle, and is sealed with a 2 in. dip, which prevents any possibility of effluvia forcing its way through, with a clear way over it up through the main ventilating pipe with exhaust cowl on the top. For water-closets the branch soil-pipe dips 2 in. into the water-seal of the basin, the top of the branch rising longitudinally towards the main soil-pipe. It is made without solder or seam, within the building, and being dipped into the water-seal of the basin at the receptacle end no escape of soil-pipe air can possibly enter the

building, as it will be drawn upwards and be carried off by the ventilating pipe without. An additional advantage is that the arrangement is less expensive than the old method, requiring shorter lengths of branch pipes, and several can be branched on to the main soil-pipe without the slightest risk.

Messrs. Reeves & Hagen have also patented an Odourless w.c., which appears to meet with general satisfaction.

As shown in the sketch, the branch soil-pipe in this invention enters the outlet arm and dips into the water-seal, so that soil-pipe air cannot possibly escape internally. The appliance is fitted on the finished floor of the apartment with a connection as shown direct through the outer wall. When fixed, an arm-chair seat is placed in position, which is loose and movable at any time, though sufficiently firm to resist unintentional disturbance.

The basin is made shallow so to induce hand-cleansing with a cloth, so necessary to keep a basin wholesome; and at the bottom, in bold letters, 'Cleanse to this line twice a week' is stamped on each basin, while at the side of the elbow of chair an enamelled label is fixed, with the following:—'Cleanliness the Handmaid of Health.'

INVENTION OF A NEW PAN-WAGGON.

THERE has recently been patented, by Mr. W. Barton, of Wolverhampton, a new sanitary van, or pan-waggon, which is claimed to possess advantages over those now in use, and which has recommended itself to those who have seen it on this account. The van is built in sections, each of which is perfectly water-tight, being constructed of galvanised iron. Only two pans are exposed at one time, while the men are changing them, and they are inclosed by self-adjusting doors, which close hermetically, rendering it impossible for any odour to escape. Even though composed of iron, the van is lighter in weight than the wooden ones now in use by the Wolverhampton Corporation, and is very little, if any, more expensive. By the use of this van it is considered that the work can be done in the daytime without public inconvenience. Even should the excreta leak from the pans, or overflow in the waggon, it would not affect the exterior, as it would be caught in the bottom of the van and discharged by means of a plug-hole at the depot. The van has been highly approved of by the Corporation of Wolverhampton.

A RUSSIAN HYGIENIC MACHINE.

IN the Russian Court at the Inventions Exhibition, under Group III., is to be seen an ingenious contrivance, patented by Dr. K. Proussak. It consists of a wooden seat, with an ordinary dished hole and hinged flap, adaptable to a common privy. The flap, which opens sideways, is raised or lowered by means of a cast-iron handle fixed to its outer edge. The two sketch diagrams below respectively show the apparatus in section when closed, and when opened for use. When opened, as seen in fig. 1, a

FIG. 1.

strong steel spring attached to the upper side of the flap forces down an arm, which acts upon a lever, to which is attached a hollow hemisphere of zinc or other metal. This hemisphere fits tightly into the lower end of the open metal pan which serves as a basin, thus preventing any cold up-draught.

To the under side of the flap is fixed an India-rubber ring, which, on the closing of the flap, becomes tightly compressed against the seat by the force of the spring acting from above, the object being to prevent foul gases from arising. When the apparatus is closed after use, as shown in fig. 2, the arm to which the spring is attached draws up

FIG. 2.

the end of the lever, thus releasing the hemisphere from under the pan, and allowing the contents to fall through.

The dotted lines on the right side of each diagram show a receiver and a pipe, by which water may be poured through the apparatus while the flap remains closed.

AUSTIN'S POROUS DISINFECTOR.

THIS useful invention has now passed into the hands of Messrs. Sharp & Co., the Sanitary and Ventilating Engineers, 4 Holborn Circus, E.C. It may be described as follows. 'A porous cell, hermetically sealed, and containing any crystal disinfectant (e.g. Pot. Permang.) is placed in the water-cistern supplying the closet. In a short time the action of the water on the porous cell (endosmosis) dissolves very gradually portions of the crystals nearest the circumference of the cell, and, on the principle of exosmosis, the water in which the "disinfector" is placed becomes impregnated with disinfectant, thus forming an efficient disinfecting fluid, which is always ready for use.'

Originally designed for the above and other allied uses, it is now proposed by Mr. Sampson Low, B.A., F.M.S. (with the full concurrence of the original patentee), to introduce the 'disinfector' in a slightly modified form, by which means it is rendered most suitable to the everyday requirements of medicine.

The 'disinfector' is now made, filled with any disinfectant or antiseptic crystals, in such a size (3 in. x 1 in.) that it can be easily carried about in a surgeon's instrument case. By merely dipping the 'disinfector' in water an efficient disinfecting fluid can readily be obtained.

It is a most convenient method of practising antiseptics, and no hospital-ward should be without its 'disinfector.' It is, moreover, very economical; one 'disinfector' lasts a year, allowing for daily usage, and costs but half-a-crown. The appliance can be seen in action at the establishment of Messrs. Sharp & Co., 4 Holborn Circus, London, E.C.

A CONSIDERABLE DIFFERENCE OF OPINION.—At the last meeting of the Northallerton Rural Sanitary Authority, it was proposed to appoint Mr. Lumley as Medical Officer of Health at £40 per annum instead of £60; but a letter from the Local Government Board was read, stating that that amount would not be a fair remuneration for the 'efficient discharge of his important duties,' upon which the Clerk was instructed to write, in answer, and state that the Authority was unanimously of opinion that £40 was 'ample to secure the proper discharge of the duties of the office.'

REVIEWS.

A BATCH OF TEXT-BOOKS ON PUBLIC HEALTH.

- (1) *The Laws Relating to Local and Municipal Government*, comprising the Statutes relating to Public Health, Municipal Corporations, Highways, Burial, Gas and Water, Public Loans, Compulsory Taking of Lands, Tramways, Electric Lighting, Artisans' Dwellings, &c., Rivers' Pollution, the Clauses Consolidation Acts, and many others. By C. NORMAN BAZALGETTE, M.A., and GEORGE HUMPHREYS, B.A., Barristers at Law. Pp. 1762. Super-royal 8vo. London: Stevens & Sons, 119 Chancery Lane, W.C. 1885. Price 34. 3s.
- (2) *The Public Health Act, 1875*. Annotated, with an Appendix containing the various Incorporated Statutes. By W. G. LUMLEY, Esq., LL.M., Q.C., and EDMUND LUMLEY, B.A. Second Edition, with very extensive additions, by WM. PATCHETT, Esq., Q.C., and ALEXANDER MACMORRAN, Esq., M.A. Pp. 1075. London: Shaw & Sons, Fetter Lane. Price 36s.
- (3) *The Laws Concerning Public Health*. Edited by WM. ROBERT SMITH, M.D., B.Sc., F.R.S. Edin. Pp. 812. London: Sampson Low, Marston, & Co.
- (4) *Handy Guide to Public Health*. By THOS. WHITE-SIDE HINE, B.A., M.B., Medical Officer of Health for the Borough of Sheffield. Pp. 207. London: Baillière, Tindal, & Cox.
- (5) *Sanitary Law: a Digest of the Sanitary Acts of England and Scotland*. By H. ABBEY HUSHAND, M.B., C.M. Pp. 240. Edinburgh: E. & S. Livingstone.

We are constantly being asked to advise as to the best text-book on the subject of public hygiene now in the market: intending purchasers being confused and distracted, as well they may be, by the perpetual flow of new text-books, and hand-books, and pocket-books, and summaries by a multitude of eminent hands. Our answer has been, and must be, that very much depends upon the purpose for which the book is needed. If for the elucidation of subtle points of law and learned speculations as to what was the intention of Parliament in using a particular form of words, then one of the text-books by sanitary lawyers must be employed; if a less formal exposition of the law be desired, then one of the summaries which have been prepared will be useful; if not only sanitary law but sanitary practice be sought for, then one of the standard manuals of hygiene must be acquired. But no one book that we can name contains a sufficient leaven of all these. Yet it must constantly happen that a sanitarian wants to know not only the canons of hygiene, but how these canons have been crystallised into law, and how the exact language of the law has been interpreted by the Courts of the realm. As has been well said, 'To hit the happy medium, to be neither too technical nor too slatternly, neither too sketchy nor too hair-splitting, should be the characteristics of the perfect handbook of sanitary law.' And this, it must be confessed, notwithstanding the imposing array of books at the head of this notice, has yet to be written.

It would be unfair to pit the books before us one against another, when their professed object is so very different. We may take it, however, that they are one and all designed for the enlightenment and instruction of their devotees. There are evidences in almost all of a sincere desire to be helpful, and we should hesitate to say of any one of them that there was any conscious padding. But in one case, at least, a little hardening of the editor's heart might have saved some pages of a swollen volume for the insertion of the indispensable but crowded-out index. The central figure of each book is, of course, the Public Health Act; but there is endless variety not only in the adornments with which it is bedecked, but in the supernumeraries which different stage-managers regard as necessary for its befitting exhibition.

To gauge the value or merit of books by their weight in pounds avoirdupois is, perhaps, hardly a scientific method of appraisement; and yet the temptation is irresistible to point to Messrs. Bazalgette and Humphreys' book (1) as the finished product of our wisdom in sanitary legislation. It transgresses by nearly two pounds the laws of the Postmaster-General as to the limit of weight for the parcels post; it contains nearly 1,800 closely-printed pages of super-royal octavo; and it reproduces some 150 statutes affecting local and municipal government. The heart of the boldest reviewer may fail within him as he essays to criticise this younger brother of the Post Office London Directory.

Mr. Lumley's successors, whose book (2) has a more restricted range, manage to escape with as few as eighty other Acts besides the principal Act. We are quit of the Public Health Act and its exposition by page 445; the remaining 630 pages are devoted to the 'appendix.' The wealth of material begets in Dr. Smith such despair that he forbears from criticism or exposition altogether, and uses up his 800 pages with a heterogeneous mass of Acts more or less connected with the public health, and with a motley crowd of circulars and model by-laws, not arranged in any way that is understandable, and provided with no key in the shape of an index. Such a book it is hopeless to criticise, except in the direction of pointing out its omissions or redundancies. The Scotch public health law—always a sealed book except to the elect—is insufficiently set forth by Dr. Smith; and the Artisans' Dwellings Act of 1868, perhaps the most important of the series of Dwellings Acts—is omitted, though those of 1875, 1879, and 1882 are printed in full. It is not easy to understand why the Contagious Diseases Acts should be set forth *in extenso*, whilst the Registration of Births and Deaths Act is held unworthy even of mention. On the whole, we are sorry not to be able to recommend Dr. Smith's book as a useful or a practical manual of ready reference.

The scheme of the two more important works (1 and 2) under consideration is essentially different. Messrs. Bazalgette and Humphreys aim at comprehending within two covers all the 'laws which urban and rural authorities and municipal corporations are called upon to administer.' Thus the Public Health Act, whilst holding the first place in their thoughts and in their pages, has to take its chance of annotation and exposition with the rest of the Acts. Messrs. Patchett and Macmorran, on the other hand, go much more into detail over the Act of 1875, and only garnish it, as it were, with the eighty odd other Acts which are more or less incorporated with it. Whilst, therefore, for greater convenience of review, we group the two books together, it must be understood that they are not really comparable, and that it would be unfair to say of either of them that it was better than the other. If the typography of No. 2 is clearer than that of No. 1 (the microscopic difference of type between the text and the notes of the latter is occasionally very confusing), the index of No. 1 is incomparably more complete and businesslike than that of No. 2. And, after all, by what is a man advantaged if he possess the most complete and accurate of works, and have not a sensibly compiled key to it?

Messrs. Bazalgette and Humphreys announce with a certain pride in their preface that they give 142 statutes and substantial parts of statutes. The table of contents accounts, indeed, for as many as 141, and there are at least three Acts—the Labouring Classes Dwelling Houses Act, 1867 (page 1,262), the Public Libraries Amendment Act, 1866 (page 723), and the Poor Law Act, 1879 (page 1,370)—which, though given in full in their proper places, have unaccountably slipped out of the table of contents. Other Acts there are, such as the Epidemic and other Diseases Prevention Act of 1883 and the Public Health (Fruit Pickers') Lodgings Act of 1882, which, though not considered worthy of mention either in the index or in the table of contents, may be found with a little research on pages 110 and 215. We would venture to suggest to the learned authors that students of this book may sometimes desire to refer to the text of a particular Act, a volume

to which they may come across in promiscuous reading, and that it would be worth while to give a definite and separate line in the index to Acts of this description, now effectually concealed from the vision of the ignorant. And in this connection it may be pointed out that Sect. 248 of the Public Health Act directs that the accounts of every rural sanitary authority shall be audited 'in the same manner' as the accounts of guardians are audited. Might it not have been well, in order to have completed the story, to have described in the book the manner in which such accounts are to be audited by printing some of the clauses of the Acts of 1844, 1848, 1849, and 1866 which relate to this question?

On the whole, we have no reason to quarrel with the statutes printed in the volume, except, perhaps, on the ground that the relation of some of them with local government is very remote. We have only discovered one Act—the Baths and Washhouses Act of 1882—which is actually omitted from the book, and which we could have desired to see included. It is true that this Act is a very short one; but it is as long as some of those deemed worthy of separate mention, and it makes an alteration of some importance in Sects 24 and 27 of the Baths and Washhouses Act of 1846, by giving power to local authorities to provide baths, &c., not only within the district, but also in the immediate neighbourhood thereof. The Contagious Diseases (Animals) Act of 1878 is really chiefly important for the Orders of Council made under it, and these, we think, might usefully have been printed. Probably the memorandum as to the sanitary requirements of cemeteries, promised on page 1,145, was crowded out at the end, but it is infinitely more to the purpose than the circular on the same subject which the authors find room to print on pages 1,552–54. The circular as to annual reports of medical officers of health, printed on page 1,486, is now out of date. It would have been well to print the regulations issued by the Local Government under Sect. 2 of the Canal Boats Act of 1877 (page 1,470). The preface promises 'the standing orders of the House of Parliament relating to local Bills and Provisional Orders,' and these might, if given properly, have proved, as hoped by the authors, of 'practical value.' But the only standing orders printed are those relating to provisional orders, and a stray clause as to reports by select committees. Supposing standing orders to claim a place in the book, it would be needful to give the classes into which Parliament divides local Bills, the advertisements in the local papers and in the *London Gazette* that are necessary before such Bills can be introduced, the notices and applications to owners and occupiers, the different dates for deposit of plans and copies of Bills, the Government departments to which plans and Bills are to be sent, and the other important requirements, neglect of any one of which may prove fatal to a Bill.

We have now exhausted the wormwood in our inkbottle, and are free to speak in terms of the highest praise for the really remarkable perseverance and patience with which Messrs. Bazalgette and Humphreys have gone through their 142 Acts, and have tried to make out of them an understandable code of sanitary law. We have dipped into their annotations in all sorts of places, and have usually found them accurate and helpful. In cases of doubt they are judiciously silent, where less cautious commentators commit themselves to questionable interpretations. We cannot complain of this, and, indeed, the scheme of the work puts out of the question any argumentative reference in detail to particular clauses. The special value of the book will probably prove to be its inclusion of all Acts which can conceivably affect local municipal administration, the careful cross-references which make up a large proportion of the notes, and the very complete and serviceable index. Faultless it could perhaps hardly be expected to be; the possibilities of error in a technical volume of 1,800 pages being amazing. The criticisms on which we have ventured have certainly been made from no lack of appreciation of the laborious and careful work which Messrs.

Bazalgette and Humphreys have bestowed upon the book, and the insignificant character of the blemishes pointed out may inferentially be taken as a tribute to the great merit of the volume as a whole. But really the publishers ought to supply a special lectern with the book, if they expect it to come into general use. One thinks twice before lifting from its shelf a book which turns the scale at something like eight pounds and a half.

Nor is Messrs. Patchett and Macmorran's book quite free from the imputation of unwieldiness, though its portability is greater than that of the ponderous tome of the other brace of lawyers. Perhaps it is necessary that all the eighty Acts in the second edition of 'Lumley' should be printed *in extenso*; but we are not sure that those who are specially interested in the exact verbiage of Acts of Parliament on a particular subject may not prefer to search for minutiae of legislative language in special manuals, such as Mr. Dalton's book on 'Local Loans,' and Messrs. Michael and Will's book on 'Gas and Water.' This, however, is largely a matter of taste; and for those who like to invest in a single law book about the Public Health Act and its incorporated statutes, probably Messrs. Patchett and Macmorran's volume is as good and complete a book as could be found. But it is not without its defects. The first edition of the work was brought out in a hurry by Mr. Lumley immediately after the passing of the Public Health Act, and bore, as was to be expected, evidences of hasty compilation. If the learned author had been alive to have himself revised the second edition, the errors and crudities of the first would no doubt have been set right. But the present editors (whom not to know is perhaps to argue oneself unknown, but of whom it is safe to say that their forensic distinction has not been won by outward and visible erudition in sanitary cases) are probably unacquainted with the official details familiar to Mr. Lumley. These, trivial in themselves, are nevertheless important to be given correctly. For example, the Public Works Loan Commissioners do not, as stated on page 279, lend money at 3½ per cent. The lowest rate at which they will make advances is, and always has been, 3¼ per cent.; and the scale of charges quoted in the footnote to Sect. 243 has for some considerable time been quite out of date. There is a newer set of instructions as to applications for provisional orders than that quoted on page 348, and numerous other instances might be cited of want of touch with official documents and practice. It is but fair to say, however, that on all the important clauses of the Public Health Act, especially those that lend themselves to ingenious legal permutations, Messrs. Patchett and Macmorran's notes are very full and precise. They have taken enormous pains to give the very latest decisions of the Courts, even going so far as to reprint some pages for this purpose. We cannot, however, compliment them on their chronological arrangement of the appended Acts correlated to the Act of 1875. Surely it would have been simpler to print all the Artisans' Dwellings Acts together, the Waterworks Clauses Acts together, and so forth. Facility of reference is an indispensable desideratum in all text-books of this description, but it appears to be almost the last thing that compilers can bring themselves to consider.

The other books (4 and 5) mentioned at the head of these observations need no extended notice. Dr. Hime's little gold-edged guide is the best of the two, but it is marred by one or two serious errors. On p. 146 he stultifies his own remarks on p. 137 as to the Alkali Acts; and on p. 145 his remarks on p. 122 as to the Canal Boats Act. A descriptive list of circulars issued by the Local Government Board is quite useless for any practical purpose. But the tables and information on various sanitary points—such as rainfall, water analysis, soils, and the like—are very capably done, and the Public Health Act itself is annotated carefully and intelligently. Dr. Husband's book (5) is very confusing, with its objectionable initials on every page (L. A. standing for Local Authority, and so forth), and his interpretations of the law are not

always legally defensible. There is no index and no table of contents. For reference purposes the book is therefore useless as 'a digest of the Sanitary Acts of England and Scotland.'

L'Hygiène dans la Construction des Habitations Privées.
Par le Dr. FÉLIX PUTZEYS et M. E. PUTZEYS. Librairie Polytechnique, Liège.

THIS work, which is the joint production of a doctor and an engineer, is a satisfactory résumé of the better known works upon the subject that have appeared in England, France, and Germany. If we may divide it into two parts, theoretical and practical, for each of which, as we are informed, one author is separately responsible, we should say that the doctor's half is much better done than the engineer's.

The theoretical requirements of each division of the work are well stated, but when the practical application of these requirements has to be made we find an enumeration of the principal systems or appliances, but we are left to discover their relative merits very much by ourselves. This want of guidance will be found to be rather embarrassing by the young student, for whose benefit the work was primarily designed.

The book is divided into eight chapters. The first chapter is upon the selection of a site for a house. In speaking of the temperature of soils some experiments are referred to which were carried out at Brussels to ascertain the temperature of the subsoil at different depths beneath the surface. The result of these experiments accords very nearly with that obtained in a similar manner in England. 'In Brussels (MM. Putzeys say) a thermometer, placed at 3·88 mètres underground, attained its maximum in September and its minimum in April. Another thermometer, sunk to a depth of 24 feet, marked the highest temperature on December 15, and the lowest on July 15. As you descend the difference between winter and summer diminishes more and more, and it ceases to be perceptible in temperate zones at a distance of from 17 to 26 mètres from the surface. At this level the uniform degree of heat is about equal to the average temperature of the locality.'

A reference is made to the observations of M. Delbrück (de Halle), and of M. Pfeiffer (de Weimar), who consider that they have verified the existence of a connection between the temperature of the soil and the development or extinction of choleraic epidemics.

After referring to the undoubted decrease in pulmonary consumption in England wherever works of deep drainage have been carried out, MM. Putzeys make the following statement about the military prison of Möllersdorf, near Vienna, on the authority of Nowak:—'The prisoners before being sent there had to undergo a medical examination, and they were never retained there if they showed any disposition towards tubercular consumption; and yet among 200 prisoners we find as many as 50 deaths every year, although the diet and occupations of the prisoners, and the general attention bestowed upon them are superior to those to be met with in other military prisons. This frightful mortality is almost entirely caused by consumption, to which disease even the most hardy fall victims. The soil of this prison is clayey, and is saturated with water. Moisture oozes from all the walls, and betrays itself all over the building by a mouldy smell.' Dreadful, indeed, as is such a state of affairs, we are not told of the undertaking of any remedial measures.

The subdivisions treating of damp-proof courses and hollow walls are tolerably complete, and that on 'ground air,' or the air contained in various soils, is a useful summary of our knowledge upon the subject. We were in some doubt as to the identity of the Mr. Knight whose opinions are quoted at p. 46; but we find from a footnote that Knight's Annotated Model By-laws are referred to.

Chapter II. refers to building materials. Speaking of the facility with which air passes through many materials

which we are apt to regard as impervious, he quotes the rather startling experiment of Von Pettenkofer. Upon an impervious base he constructed with bricks and ordinary mortar a portion of wall having a superficial surface of 1 square mètre, and, being 0·30 mètre thick (about 1 foot); each of the larger faces was covered with a sheet of metal having a small tube attached to it at its centre, and the three exposed edges were carefully covered with an impervious coating. It was found that on blowing down one of the tubes the current of air that escaped from the other extinguished a candle readily. The important subject of humidity in dwellings is treated of at considerable length, with detailed explanations of various ways of obviating or curing this dangerous defect.

Chapter III. treats of the house and its adjuncts. The height that should be permitted to a house in proportion to the width of the street upon which it abuts is a subject whose consideration leads our authors to lay down some very sensible rules. In Paris it appears that the following proportions have to be preserved.

	Mètres.		Mètres.
In streets less in width than 7·80	the height must not exceed	11·70	
" " " " " " " "	9·75	" " " "	14·75
" " " " " " " "	9·75	" " " "	17·55
On the Boulevards and in streets having a width of 20	" " " "	20	

In Liège the following proportion is insisted upon.

	Mètres.		Mètres.
In streets less in width than 4	the height must not exceed	8	
" " " " " " " "	4 to 8	" " " "	11
" " " " " " " "	8 to 10	" " " "	13
" " " " " " " "	10 to 12	" " " "	15
" " " " " " " "	12 to 14	" " " "	17
" " " " " " " "	14 to 16	" " " "	18
" " " " " " " "	a width of 16 mètres at least, and on quays	" " " "	19
" " " " " " " "	a width of 20 metres or more	" " " "	20

These regulations are condemned as being insufficient for the purpose of providing sufficient air and light to the houses, and the learned work of Ad. Vogt, of Bern, is referred to as being the only treatise that has put this subject upon a satisfactory basis. This painstaking writer assumes that every building should be exposed to the sun for at least four hours upon the shortest day of the year, and gives a valuable table by which the angle of incidence may be calculated for various latitudes.

The advice given upon the disposition of the various apartments of the house and of such adjuncts as laundry and stables is clear and to the point.

Chapter IV., which treats of warming, contains a tolerably complete account of grates, stoves, and of systems of warming by hot air, hot water, gas, and steam. The stove invented by the ingenious M. Wazon is well worth attention. It professes to be smoke-consuming, at the same time that it extracts the foul air from the room, and delivers fresh air, warmed or cool, as may be desired.

Chapter V. treats of ventilation. Chapter VI. is a fairly exhaustive study of systems of lighting by oil, gas, and electricity. Chapter VII. takes up the subject of water supply; and in Chapter VIII. the disposal of domestic waste (sewage, waste water, ashes, &c.), is considered in detail. The various systems of sewage disposal are divided as follows:—

1. Water carriage.
 - a. Single system of sewers.
 - b. Double system of sewers.
2. Dry disposal.
 - a. Earth closets.
 - b. The Goux system.
 - c. Ash closets.
3. Other systems.
 - a. Fixed cesspits.
 - b. Movable cesspits.
 - c. Liernur's pneumatic system.

The first of these three divisions of the subject is treated of at great length; drains, waste and soil pipes, traps, closets of all kinds (illustrating most of the best known

English appliances), flushing tanks, waste-preventing cisterns, &c., are clearly described. The other systems are necessarily disposed of at more moderate length, and the work concludes with a useful chapter upon the best means for disposing of the sewage of an isolated country house.

This work contains a great deal of information on sanitary subjects, and in parts is singularly complete. The plates at the end of the volume that have been specially drawn are all that could be desired, but the illustrations in the text are simply trade catalogue engravings, some of them of a rather coarse description. The English blocks, with their lettering and dimensions, in some cases, must have a strange appearance to foreign eyes. If MM. Putzeys in another edition would not only describe the various systems of warming, lighting, drainage, &c., but would attempt a judicial comparison of their merits, we think that they would add considerably to the value of a very useful volume.

Description d'un Nouveau Système de Pavillons Permanents pour le Traitement des Maladies Epidémiques et Contagieuses. Par le Dr. Félix Putzeys et E. Putzeys. Librairie Polytechnique, Liège.

THIS description of Dr. Putzeys' pavilions for contagious diseases is interesting, and may with advantage be compared with similar work that has been lately carried out in this country.

The subject of Dr. Putzeys' essay covers simply the construction, heating, and ventilation of a detached one-storied pavilion, the unit as it were of a large hospital, and he does not enter into such subjects as the choice of site, the aspect and prospect of the building, the necessary space that should intervene between the blocks, or their relative disposition and grouping.

The importance of these points is fully admitted, but the author considers them to be outside the scope of his present work.

The drawing accompanying the essay shows a ward for twenty beds, the dimensions of which are as follows: 31·20 mètres in length, 7 mètres in width, and 5·35 mètres in height, to the centre of the curved ceiling. At a height of 4 mètres cambered wrought iron trusses are placed, and the lower curved members of the trusses are connected together with slightly arched fillings-in of tiles or thin Dutch bricks.

Dr. Putzeys claims two advantages for his cambered ceilings. Firstly, he obtains larger cubical contents with the same height of ridge and walls; and secondly, that he rounds off the angles of the ceiling which is admittedly desirable as diminishing the corners that retain dust and germs.

Now for our part we cannot see that the second advantage is obtained; and though the first advantage is gained, it is only obtained at considerable additional expense. We would suggest that the arrangement which is being advocated in England, namely, that of flat ceilings with well-rounded junction between the latter and the walls is at once a better and cheaper disposition. The vertical angles of the walls should also be rounded off, although they are not so shown in the work before us.

The section of the pavilion represents a surface of 32 square mètres, giving a cube of 50 mètres per bed. If we refer to similar work in England, we shall find that 6 feet 6 inches lineal of wall space, 85 feet superficial of floor space, and 1,000 feet cube of air space per bed is generally considered sufficient, so that Dr. Putzeys' provision may be accepted as being liberal in the extreme.

The pavilion is extended at each end beyond the limits of the ward. In the extension at one end we find a central passage, which forms the entrance lobby of the building, with, on one hand, the 'tisanerie,' having a closed kitchen used in preparation of food and medicines, &c., and in this room the bath is kept. On the other hand the doctor's room is shown, with a closed

stove for warming the apartment. The addition at the other end is similarly divided into three. In the centre is a passage for exit, with on one side a room containing two water-closets and a urinal, and on the other side a similar room with two lavatory basins and a sink.

It would seem to be very undesirable to have a separate exit passage; we fancy that this door would practically be always locked, and so we think the space might have been better utilised. We would point out that the closets are not at all well placed, and should have been detached from the ward by cross ventilated lobbies; that the 'tisanerie' is not a proper place for the bath (for filling and emptying which no provision appears to have been made); that a doctor's room would be more appropriately placed (in our view) in the general administrative buildings; and that the 'tisanerie,' which practically represents the nurse's room, is not provided with a window overlooking the ward.

To continue the doctor's description of his pavilion, we find that he requires that the walls and ceiling shall be rendered in Keen's cement or with stucco trowelled to a polished surface, so that it can be frequently washed with disinfectants.

The walls, he considers, should have a thickness of 33 centimetres, which is practically 1½ brick. In very exposed positions he recommends hollow walls, though their use in England is not so limited, and is greatly to be recommended for hospital buildings under all circumstances.

Dr. Putzeys advises the execution of careful subsoil drainage, and the installation of an impermeable platform of concrete covered with asphalt under the building. The floor is shown to be of hard wood parquet bedded in bitumen upon the concrete.

The water-closets are fitted up in the ordinary English manner.

The ventilation is ingeniously arranged. Between the ceiling and the ridge a continuous foul air duct is formed, delivering into a foul air chamber over the 'tisanerie' and doctor's room, which is obtained by placing flat ceilings over these rooms at the level of the springing of the trusses. From this foul air chamber eight flues in an internal wall descend and enter a duct under the floors of the rooms, and this duct in turn is connected with air spaces in rear of the stoves already mentioned.

When the stoves are in use the air chambers become heated, and a powerful extraction current is established. In the ceiling of the ward are numerous openings into the foul air duct, fitted with movable metal louvres. Dr. Putzeys states that the fire in the 'tisanerie' is always in use, so that the system of extraction is constantly in action, but in order to provide for an emergency, when the stove might be out of use, he has provided three extraction cowls in direct communication with the foul air duct, but closed when the ordinary system of extraction is in use by a Boyle's ventilator arranged in form of a valve.

For the proper ventilation of an infectious ward our author considers that each patient should be provided with 150 mètres of fresh air per hour, which means the complete changing of the atmosphere of the room three times in each hour. The principal inlets of fresh air that can be used in warm weather being the windows, we notice that he has advisedly discarded the Continental casements and employs double hung sashes with fan sashes on centres. Air is also admitted at the skirting level, and in winter is warmed by passing over hot water pipes.

At each window a coil of hot water pipes is placed to assist in the general warming of the ward. Where the proper attendance cannot be obtained to look after a hot water circulation, Dr. Putzeys admits the use of stoves, but not otherwise.

This system has been adopted in a pavilion recently erected at Verviers, and has, we are told, given great satisfaction.

In conclusion, we think that the design before us is a great improvement upon anything of the sort that we have seen abroad, especially in the careful treatment of the

subject of ventilation, though we venture to think its author might probably improve it by reference to work of the kind recently carried out here.

NOTES ON BOOKS.

1. *Gas Works Statistics*, 1885. Seventh Issue, pp. 110. Price 3s. 6d.
2. *Water Works Statistics*, 1885. Fifth Issue, pp. 40. Price 2s. 6d.
3. *The Gas and Water Companies' Directory*, 1885. Ninth Issue, pp. 258. Price 4s.

Edited by CHARLES W. HASTINGS. Scientific Publishing Company, Limited, 22 Buckingham Street, W.C.

THESE three useful publications are correlated the one with the other. No. 1 gives particulars as to gas companies and gas departments of corporations in as many as 1,049 towns at home and abroad, stating in the great majority of cases the number of tons carbonised, the annual make and sale of gas and its illuminating power, the price per 1,000 cubic feet, the number of consumers, and the dividend paid. If particulars are desired as to the capital expenditure of each company, its address or officers, Book No. 3 must be referred to. This gives the date of formation of the undertaking, its share and loan capital issued, its dividends, the name of the chairman, engineer or manager, secretary, address, distance from London and by what lines of railway, population, and the like. Similar particulars as to water companies are also given in No. 3; and in No. 2, which is a much thinner book than the others, are contained particulars as to the source of water supply and whether by gravitation or pumping, the quantity raised per annum, the water rate or other charge, if constant service is given, &c., in 286 English and foreign towns. No doubt Mr. Hastings is aware of the Parliamentary Return as to Urban Water Supply in 1879, which contains particulars as to 944 districts. Might he not extend his list considerably from this source? All these books are carefully, and, so far as we have been able to check them, accurately compiled, and they ought to be very useful to those connected with the important enterprises of gas and water.

The Science of Sanitation in Plain Language.

THIS is a sensible little pamphlet by Sharp & Co., of 11 Holborn Circus. After describing the ordinary defects of sanitary work, Messrs. Sharp describe and illustrate three systems. 1. The old pan-closet and closed soil-pipe. 2. 'A system of house-drain ventilation of 1875 date,' that bears some resemblance to the arrangement authorised by the Model By-laws. 3. Their 'continuous' system of house-drain ventilation, in which the soil-pipe is used as an inlet for fresh air, and an extraction-pipe is attached to the house side of the disconnecting-trap placed in front of the premises. A few general hints on sanitary subjects conclude this pamphlet, which Messrs. Sharp have allowed to tell its own tale without the interposition of any of the usual testimonials.

Perfect Ventilation. By the Æolus Waterspray Ventilating Company, 235 High Holborn, W.C.

THIS work treats in an exhaustive manner of the Æolus Waterspray system of ventilation, and calls attention to the many notable buildings, both at home and abroad, that have been successfully ventilated by its aid. It is unnecessary to enter into details of the Æolus system, which is widely known, and to the value of which our own columns have borne testimony. This little work under review, profusely illustrated, shows the application of the Æolus to all kinds of buildings, and in connection with heating apparatus also. Examples of the cost of working,

as compared with other systems of heating, are given, showing an advantage in favour of the Æolus. Illustrations of the heating apparatus used by the company are shown, and ventilation generally is exhaustively discussed, including a very cheap mode adapted for workmen's houses, industrial dwellings, &c. A chapter is devoted to the Æolus automatic system of ship ventilation, and prominence is given to several ventilators, cowls, &c., the interest in which the company have acquired, and special features of other makers that they use in connection with their own. A portion of the work is devoted to electro-motors and other electrical apparatus connected with bells, burglar and fire alarms, &c. The work is concluded with a number of well-executed diagrams of some of the principal buildings ventilated by the company, including the offices of the *Daily Telegraph*. It has, we believe, been compiled by Mr. R. Oakley, the engineer to the company.

Tenth Report of the State Board of Health for Minnesota. 1884.

WE are much indebted to the Boards of Health of the American States for the very valuable and voluminous reports of their doings, with which they favour us. If we cannot review them at length, it is from no lack of appreciation of their interest, but because (sanitary matters in America being a good deal behind our own experiences) the lessons which the reports teach are of no special significance to us in England. The Minnesota Board of Health is evidently extremely anxious to do its duty, and to get the laws of public hygiene understood and acted upon by the people entrusted to its care. The record of its efforts to stamp out small-pox, for example, may be commended to the attention of our English Local Government Board. Americans seem to have an unconquerable hankering after statistics, but to be incapable of summarising events or epidemics. If we may venture upon a friendly criticism of this report (it would equally serve for the report of any other State Board of Health), we would say that its effect is almost wholly lost by diffusiveness. A closely reasoned epigrammatic account of the Board's doings and aspirations might command general attention. It is hopeless to expect people to wade through 400 pages of diurnal detail.

LAW REPORTS.

UNWHOLESOME MEAT AT FRODSHAM.

AT the Eddisbury Petty Sessions, Cheshire, on Wednesday, the 27th ult., Rupert J. Saunders, of Main Street, Frodsham, butcher and sausage-maker, was summoned by the Runcorn Union Rural Sanitary Authority for having in his possession a quantity of meat for the purpose of preparation for sale, the same being unwholesome and unfit for food of man. Mr. W. H. Linaker, of the firm of Messrs. Linaker and Linaker, appeared to prosecute on behalf of the sanitary authority, and Mr. Dreaper, of Chester, defended. Mr. James Farrington, inspector, proved the seizure of the meat, and Dr. J. Adams, medical officer of health, gave evidence as to the state and condition of the same. The defendant was fined 10s. and costs.

THE FOOD AND DRUGS ACT.—A HEAVY FINE.

AT the Birmingham Police-court, before Messrs. Ellis and Marris, Adam Simpson, farmer, of Haunton Manor Farm, near Tamworth, was summoned, at the instance of Mr. John Parker, chief inspector of nuisances, for selling milk adulterated with 24 per cent. of added water. Mr. C. A. Carter, assistant town clerk, prosecuted. Mr. Parker, inspector under the Food and Drugs Acts, visited New Street Station on April 28 last, and took a sample of the milk consigned by the defendant to James Holt, of Cowper Street, Birmingham, and submitted the same to the public analyst, which, upon analysis, was found to contain 24 per cent. of added water. The churn which

contained the milk was labelled 'Contents warranted new and pure milk,' and signed A. Simpson—[an ominous name—ED.] The guard of the train that conveyed the milk deposited that the churn was placed in his van at Elford Station, and had not been disturbed until taken out at Birmingham, when Mr. Parker took charge of it. Defendant stated that he was totally unaware of the adulteration. Some time ago he complained to his cowman that there was not a sufficient quantity of milk, and he supposed his man had put water in to make up the quantity; he was very sorry that such a thing had occurred. Defendant was fined 10*l.* and costs.

SANITARY JOTTINGS.

PUBLIC HEALTH SOCIETY OF CALCUTTA.—The third lecture under the auspices of this Society was delivered by Thomas Jones, Esq., the subject being 'Drainage and Preventable Disease in Calcutta.'

An epidemic of measles has raged in Dublin since the beginning of the year. It has not, however, assumed to anything like the same proportions as in former years. In the month of April 71 deaths from this disease occurred. This rate of mortality, though high, was, however, 3·3 per 1,000 persons less than in the previous month.

In consequence of an outbreak of small-pox at Brompton-in-Cleveland, the schools have been closed by order of the School Board.

There were ninety-two applications for the surveyorship of Wednesbury, at 200*l.* per annum, the majority of whom were very experienced men.

A meeting representing the East Kent Combination of Sanitary Authorities has decided to forward a memorial to the Local Government Board, urging upon them the desirability of a legislative enactment for the compulsory notification of infectious diseases. Instances were pointed out where the concealment of these diseases by medical men and others, until they broke out in a district, had been attended by disastrous results.

SEWERAGE.

Mr. Laws, City Engineer of Newcastle, has prepared a plan for the efficient sewerage of the Ouseburn district of that city. Some years ago the Ouseburn was a nearly pellucid rivulet, and a walk along its picturesque banks was most enjoyable; now this small stream receives the sewage of the suburban district of Gosforth, comprising about 6,000 inhabitants, which, it is almost needless to state, has materially diminished its attractiveness, as well as proved a nuisance in the locality through which it passes. Mr. Laws' scheme embraces a main sewer and two branches to serve other districts, the cost of which to the city he estimates at 12,664*l.* He also urges the desirability of the co-operation of the Gosforth Local Board in the scheme to render it efficient, which they have agreed to give.

The annual report of Mr. W. S. Till, borough surveyor of Birmingham, shows that during 1884 2 miles 7 furlongs 97 yards of public sewers were constructed, making the total length of sewers under the charge of the Town Council 186 miles, 7 furlongs, 30 yards; 372 private drains were laid into sewers, and 6 miles 6 furlongs 194 yards of streets and roads were declared highways, bringing the total highways in the borough to 192 miles 3 furlongs, 129 yards. There were also constructed 4 miles 1 furlong 33 yards of undeclared highways, and 2 miles, 3 furlongs and 2 yards of private road and passages. Plans were approved for 1,285 new buildings, an increase of 50 compared with the previous year, and there were 947 notices concerning dangerous structures forwarded to owners, an increase of 180 on those of 1883, the result probably of the recent inquiry into the general condition of the dwellings of the poor.

The pumping station and sewerage works in connection with the Stourbridge Main Drainage Board were formally

opened on April 29. The Board was formed in 1881, as the result of a joint application by the Improvement Commissioners and the Rural Sanitary Authority to the Local Government Board for a provisional order. The district covered includes Stourbridge, Upper Swinford, Amblecote, and Wollaston, with a total population amounting to nearly 20,000. The system of treatment eventually carried out was broad irrigation, the sewage being collected at the pumping station, whence it is conveyed to about 130 acres of land near Whittington. The estimated dry weather flow of sewage is between 500,000 and 600,000 gallons per day. Duplicate pumping-engines have been supplied by Messrs. Hathorn, Davey, & Co., and have a total lifting capacity of 2,000,000 gallons per day. The rising main is 2½ miles in length, composed of 14-inch iron pipes, and by causing the main at its highest point between the pumping station and the farm to act as a syphon, by an arrangement which is under the control of the engineer, it is calculated that one-fifth of the pumping power will be saved. The carriers on the sewage main consist of about six miles' length of earthenware pipes. The original estimate for the works was 18,116*l.*; the actual cost is not expected to exceed 17,600*l.*, or, including cost of land, about 25,000*l.* There is a great deal yet to be done in the matter of drainage of the district before the Stour will be entirely cleansed from the pollution which has hitherto flowed into it.

WATER SUPPLY.

Messrs. Le Grand & Sutcliffe, Artesian Well Engineers and Contractors, Bunhill Row, London, have recently succeeded in tapping a fine spring of water at Alnwick by means of an Abyssinian tube-well bored to a depth of 72 feet. The same firm have also settled a most important 'water question' at Southampton, where, as a result of their operations, there is now a daily supply of four million gallons of excellent water.

CORRESPONDENCE.

Audi alteram partem.

[All communications must bear the signature of the writer, not necessarily for publication.]

THE VENTILATION OF HOUSE-DRAINS AND SOIL-PIPES.

As three letters have now appeared in the *SANITARY RECORD*, in reference to our 'Continuous Current' system of house-drain and soil-pipe ventilation, which you kindly noticed in your March number, we beg leave to reply to them.

Referring to H. C. B.'s objections—p. 486—to the arrangement of what he terms our anti-vacuum pipes (which arrangement, by the way, we doubt if he has rightly understood), we can only say that, even granting that 'the angle of reflection' from the periphery of a soil-pipe may be equal to the 'angle of incidence' thereon, we entirely fail to see how the passage of soil from an upper closet could choke up the pipes in question.

Referring to his views on traps, we cannot do better than quote Mr. Baldwin Latham, who says (*Sanitary Engineering*, p. 425): 'It cannot be too fully impressed upon all persons using traps that no trap can be relied upon unless protected by a ventilator to relieve it from pressure.'

In reply to Mr. Masters (p. 486), we can only suggest that the difference, which he seems unable to perceive, between his system and our own, may be that, whereas his is (as he says) intermittent, ours has been shown to be continuous in action.

The aim which we had in view when we illustrated our system was not to claim any great discovery, but to call forth opinions as to which is really the best, simplest, and least expensive method of dealing with the important question of drain ventilation.

As far as we can understand Lieut.-Col. Turnbull's system, it seems to differ very materially from our own, as we employ a single ventilation-current, whereas he appears to employ two—one for the drain and another for the soil-pipes. The merits of rotary cowls were fully discussed in your October and November numbers, 1884.

11 Holborn Circus, London, F.C. SHARP & CO.

DRAIN TESTING WITH 'SANITAS' OR 'TEREBENE' OIL.

The communication from Mr. MacMahon, on page 502, is interesting; but, so far as my experience goes, testing by smell alone is not nearly so satisfactory as by both sight and smell combined. With the smoke test you can convince people of leaking drains, &c., where any amount of smell would hardly do so. And the smoke also indicates more clearly where the defect is.

I know a case of a gentleman who had his drainage all sorted; then two years after it was professionally tested by the oil test, when all was found correct except a slight smell somewhere near an upper flat w.c. The gentleman requested to have the exact spot where the defect was pointed out, but this could not be done. He demurred to disturbing his fittings, and sent for another party to apply the smoke test, when the defect—a small leak at a joint in the soil-pipe—was soon discovered and put right in a few minutes.

The oil test, as Mr. MacMahon points out, has one advantage—viz., in not requiring particular apparatus, and it is serviceable in many cases.

W. P. BUCHAN.

SPINDLE-VALVE STENCH-TRAPS.

In regard to the spindle-valve stench-trap shown on page 531, as patented by Mr. T. S. Truss, Chiswick, Middlesex, in 1884, I would like to ask him wherein consists its difference between, or 'improvement' upon, the spindle-valve trap illustrated by figure 70 in my patent of July 9, 1878?

I would also ask Mr. Francis William Kelly, Minneapolis, Minn., wherein does his 'anti-syphoning Ball Trap,' dated Sept. 9, 1884, differ from the siphon ball-trap of mine illustrated at Fig. 278 of the fourth edition of my book on 'Plumbing,' published in January 1883?

21 Renfrew Street, Glasgow.

W. P. BUCHAN.

DAMAGES FOR DEFECTIVE DRAINS.

I venture to think that the paragraph which appears under the above heading in the current number of the *SANITARY RECORD* (page 500), is somewhat misleading, as it might be supposed from this that the landlord of a house, and not the tenant, is the party liable for maintaining the drains in an efficient sanitary condition. In an ordinary lease, as drawn at the present time, I believe that there is, almost without exception, a covenant which provides that the tenant shall keep the drains, amongst other things, in good repair, and, this being so, there can hardly be a doubt as to the tenant's liability. I have been unable to obtain a full report of the case in question (*Chichester v. Lance*), but it seems to me that it is exceptional, and it is stated in a paragraph relating thereto which appeared in the *Globe* of April 15, that the 'house had been taken for three years, under an agreement which made no special mention of the drains.'

It is to be hoped that when it becomes law that landlords are to be held responsible for the sanitary state of their houses, it will, at the same time, be made illegal for tenants to, in any way, interfere with the drains, for so much ignorance exists, in respect of the most simple sanitary matters, that it is quite possible for a house to be

delivered up to a lessee in a perfect sanitary state, and before long to become quite the reverse. In a case which came under my own observation, a short time since, the tenant of a house had closed the end of a bath waste, which was properly disconnected from the drain, as he objected to pipes being left open at the end, feeling quite sure that it was not correct.

A SANITARY ENGINEER.

PREVENTION OF FIRES IN THEATRES.

Our attention has lately been drawn to an article on the above subject appearing in your issue of May 15, p. 509. Will you allow us to point out the objection to tungstate of soda, recommended by Captain A. W. Shean, which is this—viz., that it scales off, and has to be applied every two or three weeks to be effective. Our cyanite, on the contrary, is permanent in effect when once applied, and we may add, while on the subject, that it is the only means of fire prevention which has been certified and approved by Sir William Harcourt, Bart., Captain Shaw, C.B., C. J. Phipps, Esq., F.S.A. (architect of over forty theatres), Thomas Verity, Esq., Surveyor to the Lord Chamberlain, and other distinguished authorities. You further mention that wood may be made incombustible by soaking over four or five days in certain chemicals. Now, with our cyanite, soaking is perfectly unnecessary; one liberal coat with a brush, or at most two coats, rendering the wood perfectly fireproof—i.e. proof against flame.

Amongst the large number of buildings which we have cyanited (including the Home Secretary's private house) we may mention that cyanite has been used in nearly all the theatres in London of recent construction, including the Prince's, Empire, Novelty, re-constructed Criterion, &c.

E. E. MARRIOTT.

ERRATA.

In the *SANITARY RECORD* for May 15, page 540, in the last paragraph of Mr. Fredk. H. Smith's letter, commencing 'If after eight hours,' &c., read 'after,' instead of 'if.' After the words 'Mr. W. H. Drake' in next line, read 'has' for 'had.'

In Mr. Barnes Austin's letter, page 540, after the word 'judgment,' six lines from the bottom, there should have been a full stop. Also for the word 'when,' substitute 'However.'

THE HOUSING OF THE WORKING CLASSES.

*How best to help the slender store,
How mend the dwellings of the poor!*

THE HOUSING OF COLLIERIES.—Although much has been done during recent years by the owners of collieries and others to improve the homes of our mining population, much more requires to be done before that large section of the industrial community are afforded full opportunities of obeying the canons of health or morality. Thousands of pitmen in the counties of Durham and Northumberland now live in old cottages provided by their employers, which have been built upwards of forty years ago, and are a reproach to our boasted civilisation. Many of these wretched hovels are situated within a circuit of twenty miles round Newcastle; they consist of one room from which a ladder reaches up through a trap-door to an unceiled and miserable loft or garret, which is only separated from the sky by a layer of tiles, which rarely suffices to keep out the rain, rendering this upper storey useless for habitation. The family, therefore, whatever their number may be, necessarily crowd into their one only habitable apartment, often with the most pernicious results. As an illustration of the evil effects of these un-

sanitary dwellings, we quote from a report presented to the Hexham Rural Sanitary Authority at their last monthly meeting, by Dr. MacLagan, medical officer of health, who stated that on May 27 a case of scarlatina was reported from Water Row, Wylam. On visiting this case he found that this very small one-roomed cottage and loft held nine persons. The father, a miner, was at work, and the mother also was at work in some gardens near; the seven children of the family being under the care of the eldest, who could not be more than ten years of age. The child affected was in bed, having the baby beside her, the latter's arms being round her neck. While in the cottage, a troop of children came in, whom he found to be the children of the neighbours. Under such circumstances it was almost a hopeless task to attempt to stay the progress of an outbreak of infectious disease. On the same day a case of scarlatina was reported from Wylam, where it was said to be well known that children went to the school this child attended from infected houses. Dr. MacLagan further stated that the condition of many of the cottages in which several of these cases of infectious disease had appeared was deplorably inadequate either for purposes of health or decency, and probably if the members of the Royal Commission directed their attention to the housing of miners in many of the rural villages of England, they might find quite as much to warrant their interference in such homes as in the worst parts of many large towns. The Chairman remarked that all they could do would be to summon this unfortunate miner for overcrowding. They could not close the houses; they were built before the Act became law, otherwise he would close the whole of Wylam; it was the plague-spot in the district. They were damp, miserable houses, and it was heart-breaking to go and see them. It will be remembered that George Stephenson, the eminent engineer, was born in one of these colliery cottages at Wylam, and it is unfortunate, after the lustre he shed on his native place, that it should now be in such evil repute. Wylam, however, is by no means singular amongst colliery villages in the north for its sanitary deficiencies; its counterpart may be seen at Seghill, Westmoor, and other pit-villages near to Newcastle. If inquiries were instituted, revelations could be made as to the condition of these places which would startle even the Royal Commissioners.

The Duke of Northumberland proposed to build some new workmen's dwellings at Alnwick, but, as the Local Board did not approve of the plans submitted to them, the project has been abandoned for the present.

CREMATION NOTES.

A CREMATION society has been formed at Worcester, Massachusetts.

Two 'crematories' are about to be erected in the Communal cemeteries of Ravenna and Luga.

A deputation from the Urne Society has waited on the President of the Austrian Cabinet to ask that cremation should be authorised. This society comprises 800 members, amongst whom every class is represented; they have collected sufficient funds for the construction of a crematory apparatus.

PARKS AND OPEN SPACES.

God Almighty first planted a garden, and indeed it is the purest of all pleasures.

ON May 29 the ground attached to Christ Church, Battersea, which has been laid out and provided with seats by the Metropolitan Public Gardens Association, was formally opened to the public by the Countess of

Cadogan. This ground has been handed over in association by the Rev. H. Guildford Sprigg, vicar, is proving a most attractive resting-place in the thoroughfare.

Mr. Peter Denny, of Helenslie, and Mr. John McElroy of College Park, formally presented the inhabitant Dumbarton with a public park on Saturday, May 15. It has cost about 20,000*l*.

EXHIBITIONS.

At the eleventh Congress of the Italian Medical Congress will be held next September at Perouse, there will be an Exhibition of sanitary as well as of medical and surgical appliances.

SANITARY INSTITUTE OF GREAT BRITAIN. HEALTH EXHIBITION, 1885.

An Exhibition of Sanitary Apparatus and Appliances and of Domestic Use and Economy, will be held in the Fleece Belgrave Gate, Leicester, from Sept. 22 to Oct. 10, 1885, in connection with the Eighth Autumn Congress of the Institute.

Four Silver Medals are offered by the Gas Department Corporation of Leicester for Gas Stoves exhibited under the following classes:—

1. For the best Gas Stove or Gas Apparatus for cooking for families, to include means for heating a good supply of water.
2. For the best Gas Cooking Stove suitable for an artisan for at least six persons.
3. For the best and most economical Gas Fire.
4. For the best arrangement for Heating Baths by Gas.

Silver medals are also offered by the Exeter Gas Company for the best Gas Stove or Gas Apparatus for cooking purposes, including a sufficient supply of hot water. 2. For the best and most economical open Gas Fire.

Forms of application for space and other particulars can be obtained of E. L. Box, Curator, 74A Margaret Street, London, W.

COMPETITIONS.

AMBULANCES.

THE Empress of Germany has offered 5,000 francs (£200) for the best model ambulance of wood. This prize will be competed for at Geneva. The merits of the ambulances will be judged by the International Committee of the Red Cross of Geneva.

WESTGARTH PRIZES.

The Committee appointed by the Council of the Society of Writers to consider the Essays sent in for the above prizes, have reported effect that in their opinion none of the Essays realise the merits of the offer in such a manner as to justify them in recommending that the full amount of the prizes offered by Mr. Westgarth should be awarded. They recommended, however, that amounting in all to £600 should be awarded as under:—

Three prizes of £100 each, to H. H. Bridgman, 41 Poulton Street, Adelphi, W.C.

Three prizes of £50 each, to A. Wynter Blyth, Court Hill, Marylebone, W., and R. Greene, Berry Wood, Northampton; Dunscombe, City Engineer, Liverpool; C. Scott, Tottenham, and J. W. E. Tilley, Royal Avenue, Belfast.

Six prizes of £25 each, to A. H. De Wind, Comber, co. Louth; J. S. Fairfax, 3 St. Paul's Road, Camden Square, N.W.; J. Tetley, 8 North Audley Street, W.; T. E. Julian, 22 Palace Road, S.W.; W. H. Newell, M.D., 201 Palisade, Jersey City, N.J.; United States of America; G. W. Usill, Lodge, Southfields, Wandsworth, S.W.

The Council, after consultation with Mr. Westgarth, have reported to the Committee, and awarded the prizes as recommended. It has been determined that the three Essays to which prizes were awarded shall be published on behalf of the Society.

SANITARY DWELLINGS.

The Sassoon Institute of Bombay has offered its gold medal supplemented by a money prize of 300 rupees from the Municipal Commissioners, for the best design for sanitary dwellings for labouring classes.

THE PRIZE OF THE COMMISSION DE L'HYGIÈNE DE L'ENFANCE.

The Commission de l'Hygiène de l'Enfance offer a prize of 1,600 francs (£64) for the best essay on the following subject:—*Rechercher quels peuvent être les rapports de la syphilis rachitique dans la première enfance* (To discover the relation between rickets and syphilis in infants.)

APPOINTMENTS.

MEDICAL OFFICERS OF HEALTH.

- BARST**, Charles Theodore Uvo, L.R.C.P. Edin., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Willington Quay Urban Sanitary District, Northumberland, at £40 per annum, *vice* Fletcher, resigned.
- BEAUND**, James Montague, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the North Division of the Stratton Rural Sanitary District, Cornwall, at £25 for one year.
- BYDEN**, Robert Thomas, L.R.C.P. Edin., L.R.C.S. Edin., has been re-appointed Medical Officer of Health for the Windhill Urban Sanitary District, Yorkshire, at £35 for one year.
- LEGG**, Walter, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Boston Port Sanitary District for one year (no fixed salary).
- EDLIN**, Edward Holberton, F.R.C.S. Edin., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Compton-Gifford Urban Sanitary District, Devonshire, at £21 per annum.
- ISHER**, Thomas, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Garstang Rural Sanitary District, Lancashire, at £50 for the year ending June 24, 1886.
- IRIFFITHS**, David, M.B., C.M. Univ. Edin., has been re-appointed Medical Officer of Health for the Llandilolabont division of the Swansea Rural Sanitary District, at £60 for one year.
- IND**, Albert, L.R.C.S. Edin., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the South Molton Urban Sanitary District, at £30 for one year, from the 24th inst.
- JONES**, Charles Richard, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Great Torrington Urban Sanitary District, at £10 for one year.
- LOUGHTON**, Lambert, L.R.C.P. Edin., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Amersham Rural Sanitary District, at £50 per annum, *vice* Hosegood, whose appointment has expired.
- MARSHALL**, William Norris, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Newent Rural Sanitary District, at £40 for one year.
- MASON**, George, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Wisbech Urban Sanitary District, at £40 for one year.
- MILLETT**, George Bown, L.R.C.P. Edin., M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Penzance Division of the Penzance Port Sanitary District, at £5 for one year.
- MORGAN**, Edward Rice, M.R.C.S. Eng., L.S.A. Lond., has been appointed Medical Officer of Health for the Llangafelach Division of the Swansea Rural Sanitary District, at £60 for one year, *vice* Davies, deceased.
- OSBURN**, Cecil Anthony Perrier, L.R.C.P. Edin., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Huntingdon Urban Sanitary District, at £24 per annum, *vice* Oldman, deceased.
- QUICK**, John, M.R.C.S. Eng., and L.M., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Penzance Rural Sanitary District, at £80 for one year.
- REES**, Hugh, M.R.C.S. Eng., L.S.A. Lond., the Medical Officer of Health for the combined Local Sanitary Districts, has been appointed Medical Officer of Health for the newly-formed Menai Bridge Urban Sanitary District, at £5 per annum.
- SMITH**, David Chadwick, M.D. Univ. Dub., has been appointed Medical Officer of Health for the Mutford and Lotingland Rural Sanitary District, and the Lowestoft Urban Sanitary District, at the rate of £130 per annum, from June 24 to September 20, *vice* Jeffery, deceased.
- STEELE**, William Dyne, M.D. Univ. Aberd., has been re-appointed Medical Officer of Health for the Abergavenny Urban Sanitary District, at £60 for one year.
- STUART**, William, M.B., C.M. Univ. Aberd., has been re-appointed Medical Officer of Health for the South Division of the Stratton Rural Sanitary District, at £15 for one year.
- TWING**, Alfred Hughes, M.R.C.S. Eng., L.S.A. Lond., has been re-appointed Medical Officer of Health for the Kingsbridge Rural Sanitary District, Devonshire, at £100 for one year.
- SYKES**, John Frederick Joseph, B.Sc. (Public Health), M.B., C.M. Edin., L.R.C.P. Lond., has been appointed Medical Officer of Health and Examiner of Gas for the Parish of St. Pancras, Middlesex, at £300 per annum, *vice* Murphy, resigned.
- WALKER**, Hunter Urquhart, L.R.C.P. Edin., L.R.C.S. Edin., has been appointed Medical Officer of Health for the Worksop Urban Sanitary District, at £15 per annum, *vice* Hannan, resigned.

SURVEYORS, CLERKS TO GUARDIANS, INSPECTORS OF NUISANCES, &c.

- BOVEY**, Mr. John, Jun., has been appointed Collector of General District Rates, Water Rents, and Highway Rates to the Lower Brixham Local Board and Urban Sanitary Authority, Devonshire, at £37 per annum, *vice* Calley, resigned.
- BRENNARD**, Mr. Robert, has been elected a Member of the Ovenden Local Board and Urban Sanitary Authority, *vice* Bailey, deceased.
- CHURCH**, Mr. Walter, has been appointed Inspector of Nuisances for the Newbury Rural Sanitary District, at £70 per annum, *vice* Marshall, deceased.

- COCHRANE**, Mr. Thomas, Manager of the Carlisle and Cumberland Bank, has been appointed Treasurer to the Longtown Guardians and Rural Sanitary Authority, Cumberland, *vice* Jackson, deceased.
- COLEMAN**, Mr. A. T., has been elected a Member of the Ivybridge Local Board and Urban Sanitary Authority, *vice* Pooley, resigned.
- COLE**, Mr. H., has been elected a Member of the Ivybridge Local Board and Urban Sanitary Authority, Devonshire, *vice* Sherwill, resigned.
- COPLAND**, Mr. William Wallace, has been appointed Surveyor and Inspector of Nuisances to the Sheerness Local Board and Urban Sanitary Authority, at £70 and £80 per annum, *vice* Stringfellow, resigned.
- DAVIES**, Mr. Evan, has been elected a Member of the Mold Local Board and Urban Sanitary Authority, *vice* Roberts.
- DAVIES**, Mr. James, has been elected a Member of the Mountain Ash Local Board and Urban Sanitary Authority, *vice* Prichard, resigned.
- DAVIES**, Mr. Owen, has been appointed Inspector of Nuisances to the newly-formed Menai-Bridge Local Board and Urban Sanitary Authority, at £12 per annum.
- DUFTON**, Mr. Benjamin, has been appointed Clerk to the Pudsey Local Board and Urban Sanitary Authority, at £80 per annum, *vice* Lawson, resigned.
- DUNNETT**, Mr. Coleman, Branch Manager of the London and County Bank, has been re-appointed Treasurer to the Sandgate Local Board and Urban Sanitary Authority, in consequence of a technical informality in his previous appointment.
- EDINGER**, Mr. Philip, has been appointed Surveyor, Inspector of Nuisances, and Waterworks Manager to the Frome Local Board and Urban Sanitary Authority, at £180 per annum, *vice* Stow.
- EVANS**, Mr. Robert Benjamin, has been appointed Clerk to the Bethesda Improvement Commissioners and Urban Sanitary Authority, Carnarvonshire, at £60 per annum, *vice* Thomas, resigned.
- FORD**, Mr. Robert, has been elected a Member of the Ivybridge Local Board and Urban Sanitary Authority, *vice* Head, resigned.
- FOX**, Mr. Ambrose, has been re-appointed Inspector of Nuisances for the Garstang Rural Sanitary District, at £50 for the year ending June 24, 1886.
- GARRETT**, Mr. Thrale George, has been appointed Inspector of Nuisances for the Davenport Rural Sanitary District, at £45, for one year (not to devote the whole of his time to the duties), *vice* White, whose appointment has expired.
- HUGHES**, Mr. Thomas, has been appointed Collector to the newly formed Menai-Bridge Local Board and Urban Sanitary Authority, at 3 per cent. commission.
- JACKS**, Mr. William, has been elected a Member of the Kenilworth Local Board and Urban Sanitary Authority, *vice* Foster, deceased.
- JOHNS**, Mr. Samuel, has been appointed Surveyor and Inspector of Nuisances to the Wallingford Union Rural Sanitary Authority, and Inspector under the Canal Boats Act, at £100 per annum, from year to year, *vice* Withers, whose appointment has expired.
- JULIAN**, Mr. Frederic Mason, Solicitor, has been appointed Clerk to the Smallthorne Local Board and Urban Sanitary Authority, Staffordshire, at £30 per annum, *vice* Tomkinson.
- KINNEIR**, Mr. Henry, has been appointed Clerk to the Swindon New Town Local Board and Urban Sanitary Authority, at £125 per annum, *vice* Townsend, deceased.
- LONSDALE**, Mr. Horace Blamire, Solicitor, has been appointed Clerk to the Carlisle Guardians and Rural Sanitary Authority, at £150 per annum, as Clerk to the Guardians; £50 per annum, as Clerk to the Rural Sanitary Authority; £30 per annum, as Clerk to the Assessment Committee; £15 per annum, as Clerk to the School Attendance Committee; and £12 12s. per annum, as Returning Officer at uncontested elections of Guardians, *vice* Mounsey, resigned (but who retains the office of Superintendent Registrar of Births, &c.).
- LUGG**, Mr. John, has been appointed Inspector of Nuisances for the Bideford Urban Sanitary District, Devonshire, at £10 10s. per annum, *vice* Major.
- MACKRELL**, Mr. James, has been elected a member of the Elland Local Board and Urban Sanitary Authority, Yorkshire, *vice* Farrar, resigned.
- MANSELL**, Mr. W. R., has been elected a Member of the Wellington (Salop) Board of Improvement Commissioners and Urban Sanitary Authority, *vice* Corbett, deceased.
- MARSHALL**, Mr. Alfred, has been elected a Member of the Tunbridge Wells Board of Improvement Commissioners and Urban Sanitary Authority, *vice* Timins, deceased.
- MINTON**, Mr. E. E., has been appointed Treasurer *pro tem.* to the Leek Guardians and Rural Sanitary Authority, *vice* Whyatt, deceased.
- MITCHESON**, Mr. Thomas, Solicitor, has been appointed Clerk to the Liversedge Local Board and Urban Sanitary Authority, Yorkshire, at £50 per annum, *vice* Curry.
- O'KELLY**, Mr. Peter Francis, has been elected a Member of the Cannock Local Board and Urban Sanitary Authority, *vice* McGhie, resigned.
- OLLIVE**, Mr. J. E. S., has been appointed Clerk to the Wirral Guardians and Rural Sanitary Authority, at £130 per annum as Clerk to the Guardians; £80 per annum as Clerk to the Rural Sanitary Authority; £18 per annum as Clerk to the Assessment Committee; £12 per annum as Clerk to the School Attendance Committee; and £20 per annum as Returning Officer, *vice* Gregory, resigned.

OSBORNE, Mr. G. E., has been elected a Member of the Gillingham Local Board and Urban Sanitary Authority, *vice* Tassell, deceased.

PENTLOW, Mr. George, has been appointed Inspector of Nuisances for the Thrapston Rural Sanitary District, at £50 per annum, *vice* Spendlove, resigned.

PUGHE, Mr. William, Banker, has been appointed Treasurer to the newly-formed Menai-Bridge Local Board and Urban Sanitary Authority.

RIDDELL, Mr. Edward Mitford Hutton, Banker, has been appointed Treasurer to the Newark Town Council and Urban Sanitary Authority, *vice* Barton, resigned.

ROBBS, Mr. Decimus Mallett, Solicitor, has been appointed Clerk to the Gainsborough Local Board and Urban Sanitary Authority, at £200 per annum, *vice* Hayes, resigned.

SCOTT, Mr. E. M., has been appointed Surveyor to the Wednesbury Local Board and Urban Sanitary Authority, at £200 per annum, *vice* Fereday.

SHARMAN, Mr. S. E., has been re-appointed Inspector of Nuisances for the Sevenoaks Rural Sanitary District for one year.

SMALLRIDGE, Mr. G., has been elected a Member of the Ivybridge Local Board and Urban Sanitary Authority, *vice* Robinson, resigned.

STEPHENSON, Mr. Richard John, Manager of the South Molton Branch of the National Provincial Bank of England, has been appointed Treasurer to the South Molton Guardians and Rural Sanitary Authority, *vice* Johnson, resigned.

STEPHENSON, Mr. John, has been re-appointed Inspector of Nuisances for the Boston Port Sanitary District, for one year (no fixed salary).

TAVLEUR, Mr. E. H., has been elected a Member of the Ivybridge Local Board and Urban Sanitary Authority, *vice* Crispin, resigned.

TOWNSEND, Mr. Henry Fox, has been appointed Clerk to the Swindon Old Town Local Board and Urban Sanitary Authority, at £60 per annum, *vice* Mr. James Copleston Townsend, deceased.

TURNOCK, Mr. William, has been appointed Clerk to the Chester Guardians and Rural Sanitary Authority, at £150 per annum as Clerk to the Guardians; £200 per annum as Clerk to the Rural Sanitary Authority; £45 per annum as Clerk to the Assessment Committee; £20 per annum as Clerk to the School Attendance Committee; and fees as Returning Officer, *vice* Keartland, deceased.

WALLIS, Mr. W. S., has been elected a Member of the Halsted Local Board and Urban Sanitary Authority, *vice* Dallman, resigned.

WELSFORD, The Rev. Henry Charles, has been elected a Member of the Ellesmere Local Board and Urban Sanitary Authority, *vice* Allinson, resigned.

WILLIAMS, Mr. John, has been re-appointed Inspector of Nuisances for the Cirencester Urban Sanitary District, at £50 for the year ending June 24, 1886.

WILLIAMSON, Mr. John, has been elected Chairman of the Cannock Local Board and Urban Sanitary Authority, *vice* McGhie, resigned.

WOLLSTEIN, Mr. John, has been appointed Collector to the Much-Wenlock Local Board and Urban Sanitary Authority, Shropshire, at £15 per annum, *vice* Smith.

WOLSTENHOLME, Mr. Jeremiah, has been appointed Surveyor to the Town Council and Urban Sanitary Authority of Blackpool, at £300 per annum, *vice* Sunderland, resigned.

VACANCIES.

MEDICAL OFFICER OF HEALTH for the Leicester Urban Sanitary District; Medical Superintendent of the Fever Hospital, Public Analyst, and Police Surgeon: £500 per annum. Application, 23rd inst., to John Storey, Town Clerk.

TREASURER to the Wem Guardians and Rural Sanitary Authority.

SURVEYOR to the Colchester Town Council and Urban Sanitary Authority.

SURVEYOR to the Wilsden Local Board and Urban Sanitary Authority.

INSPECTOR OF NUISANCES for the Hartlepool Port Sanitary District: £80 per annum.

INSPECTOR OF NUISANCES for the Morpeth Rural Sanitary District: £60 per annum, from year to year. Application, 16th inst., to George Brumell, Clerk to the Authority.

COLLECTOR to the Burton-upon-Trent Town Council and Urban Sanitary Authority: £200 per annum. Application, 24th inst., to T. N. Whitehead, Town Clerk.

COLLECTOR to the Elland Local Board and Urban Sanitary Authority.

COLLECTOR to the Yealdon Local Board and Urban Sanitary Authority.

LOCAL INTELLIGENCE.

Upon the application of the East Grinstead Local Board and Urban Sanitary Authority, the enactment contained in the 90th sect. of the Public Health Act, relating to bye-laws as to houses let in lodgings, has been declared by the Local Government Board to be in force within the district.

The Sevenoaks Local Board and Urban Sanitary Authority have increased the salary of Mr. Jabez Mann, the surveyor, from £175 to £200, as from March 25, the commencement of the financial year.

The Chepping-Wycombe Town Council have increased the salary of the Town Clerk and Clerk to the Urban Sanitary Authority, from £150 to £200 per annum, and made him a special allowance of £100 for extra services in connection with the drainage works.

At a public meeting in the Court House, Buxton, on Wednesday, May 27, Captain E. L. Darwin, J.P., the late chairman for 124 years of the Local Board and Urban Sanitary Authority, was presented with an illuminated address, a gold watch and chain, and a purse of gold, subscribed for by 600 inhabitants of the town.

There were ninety-two applications for the Surveyorship to the Wednesbury Local Board and Urban Sanitary Authority, at £200 per annum.

The Woolwich Local Board and Urban Sanitary Authority have, upon the recommendation of a committee, increased the salary of the Clerk from £250 to £300 per annum, to take effect from March 15 last.

The Malvern Local Board and Urban Sanitary Authority have increased the salary of Mr. Fraser, the Assistant Surveyor, from £70 to £100 per annum.

The Guildford Guardians and Rural Sanitary Authority have been invested with urban sanitary powers, rights, &c., under sect. 150 of the Public Health Act, 1875, so far as it relates to naming streets and numbering houses, and to ruinous and dangerous buildings, with the contributory places of Purbright, Saint Nicholas Guildford, Stoke, and Woking, and of the Charterhouse, Crownpits, and Farncombe special drainage districts.

At the monthly meeting of the Basingstoke Town Council and Urban Sanitary Authority last month, a motion that the town clerk be paid a salary to include all legal expenses was referred to a committee of the whole council for consideration, and at the meeting on Thursday, the 4th inst., the following report was presented, read, and adopted:—“The committee (consisting of the whole council) beg to report that, having fully considered the subject of Mr. Smith’s motion, that the town clerk be paid a salary to include all legal expenses, are of opinion that the present arrangements of the duties of the town clerk and the mode of his remuneration have hitherto worked with advantage to the interests of the town, and the committee perceive no grounds for recommending any alteration therein. The committee take this opportunity of recording their sense of the efficient and faithful manner in which the present town clerk has at all times conducted the important duties and interests committed to his care. The town clerk thanked the council for the vote of confidence in him which was embodied in the concluding clause of the report, and pointed out that the items in the treasurer’s abstract under the head of ‘professional charges,’ and even under the head of ‘legal expenses,’ included many items which did not go into his pocket, and were bills from other professional men, and included also payments out of pocket for stamps, fees to counsel, &c.

There were ninety-six applicants for the appointment of architect to the Town Council and Urban Sanitary Authority of Norwich, at £200 per annum, with offices, &c.

There were 790 applicants for the Blackburn surveyorship, at £120 per annum.

The Local Government Board have consented to the application of the Wellingborough Rural Sanitary Authority to be invested with urban powers, rights, &c., under Sects. 15 and 158, and the last part of Sect. 44, of the Public Health Act, in respect of the parish of Rushden; and will issue an order so soon as the necessary formalities have been complied with.

The Llanrwst Guardians and Rural Sanitary Authority have been invested with Urban powers, rights, &c., under Sect. 171 of the Public Health Act, 1875, so far as relates to hackney carriages, with the contributory places of Bettws y Coed, Dolwyddelan, Llanrhyllyn, Llanrwst, Penmachno, Trefriew, and Tre-Gwydir.

NOTES AND QUERIES.

Having for some time back been in the receipt of Queries appertaining strictly to sanitary work, and which it would be easy to answer, without having to refer our correspondent to competent professional advisers, we have opened a column in which to register such Queries and Replies thereto as can fairly be expected from us; and our subscribers and readers are invited to make such use of this column as will tend to benefit themselves and the community. Both Queries and Replies will, however, be subjected, if unnecessarily long, to a strict curtailment.

159. MUNICIPAL PROVISION OF GAS WORKS.

1. Sect. 161 of the Public Health Act of 1875 gives power to an urban authority to make and supply gas for both public and private purposes, and Sect. 162 gives them power to acquire by agreement the undertaking of any existing gas company. Are these powers new, and if not, since when have they been exercisable under older Acts?

2. What powers have rural authorities to provide their district with lighting?

BATSWAIN.

1. These powers were first specifically given to urban authorities by the Act of 1875. Before that time they were compelled to apply to Parliament for a special Act for the purpose. 2. None as such. But they may apply to the Local Government Board for urban powers under Sect. 276, and, if successful, would then have all the lighting powers of an urban authority under Sects. 150, 151, 161, 162, and 163. If the rural authority had adopted the Watching and Lighting Act of the 4th William IV., and afterwards became urban, that Act would be superseded by Sect. 163 of the Public Health Act.—ED.]
